PLUGIN PARAMETERS

TOOLBAR

The Toolbar allows you to manage the plugin presets, register the plugin and set some global parameters.

Click the **AUDIORITY** logo, in the top left corner of the Toolbar, to visit our website and social profiles, register the plugin, change the interface size and customize the paths for license and preset files. The **HQ** button will enable oversampling, useful to reduce aliasing when the signal saturates. Use the **Randomize** and **Reset** buttons to experiment with random presets or restoring it to its saved version. The **NOTIFICATIONS** (bell) icon will show you when a new update is available and other relevant news and offers.

PEDAL CONTROLS

TONE	Post distortion passive tone control stage. Set it to minimum to get a darker sound and to the max to get a brighter sound.
DIST	Sets the distortion amount. Set it to the minimum to get a some light dirt to use the pedal as a booster, or to the max for a fully distorted tone.
LEVEL	Controls the output volume of the pedal.

GLOBAL CONTROLS (BOTTOM RIGHT)

TYPE	Switch between different circuit models. Check next paragraph for more details.
GATE	Noise gate threshold.
IN	Pre effect gain.
OUT	Post effect gain.
MIX	Dry/wet signal mixer.

CIRCUIT TYPES (MODS)

We implemented different versions of the pedal circuit, each one with different tonal characteristics. Below you'll find a description of the circuit type. Each of these mods implements a slightly different Tone circuit.

DEFAULT

Our first circuit version follows the original schematic. This is the v1.0.x version of the pedal.

LC STOCK

A version following the measurements done to the hardware we have in our stock. Sounds fuller compared to the DEFAULT type.

CGS Mod

Based on CGS Guitar DS-1 mod. It reduces the internal gain, improving low end response and extending clipping to the lower frequencies. Diodes are changed to 2 x 1N4001 and LED, to get a more natural asymmetric clipping.

FAT Mod

Based on AMZ Fat mod, it reduces the gain of Q2 transistor gain stage, while improving the low end response.

JCM Mod

Based on Wampler's JCM Mod, to get Marshall-type tones. Uses 2 x 1N4148 (in series) and 2 x 1N4001 diodes (in series). Low frequencies are tighter and excluded from clipping.

K-Mod

Based on the classic SEEING EYE mod for the DS-1. One of the diodes is replaced with a LED for asymmetric clipping.

Vintage Mod

This version of the circuit try to replicate the vintage MIJ-sounding DS-1. Diodes are 1S2473 and opamp is adapted to mimic MIJ specifics.

Bass Mod

This mod enables the DS-1 to work best with low frequency instruments. This excludes low frequencies from clipping, changes the Tone range. One of the diodes is replaced by a 1N4001 for asymmetric clipping.

TIPS

To get best results, place this plugin BEFORE your amp simulator!

Use it as a booster by setting DIST to minimum and using LEVEL to control the outgoing signal volume.

Some artists place an overdrive pedal before this one, to get a wider range of tones.
