SOLUTIONS TO POTENTIAL PROBLEMS

PROTECTION SYSTEM	PROBLEM	SOLUTION
Blue & Red LED On	Amplifier temperature has reached the operating limit.	Install the appliance in a well-ventilated place and ensure that the ventilation system is not obstructed. The amplifier will return to normal operation as soon as the temperature drops.
Blue LED on and Red flashing with no audio on output	Short circuit in the audio output or impedance of the speakers below the rated impedance of the amplifier.	Make sure that there is no short circuit in the speaker connection cables and that there is no shorted speaker connected to the system, or that the impedance of the speakers is not less than the minimum impedance of the amplifier.
Blue LED on and Red LED flashing as per the music	LED clipping indicating that the distortion in the output is going over 5%.	The system can operate with the amplifier with the Clip LED flashing, but the speakers connected to the output will suffer coil overheating due to Clip distortion.
Flashing Yellow LED	Amplifier input voltage below 9V.	Check the charge of the batteries where the amplifier is connected. In addition, poor contact in the power cables can also generate voltage drops. Check the voltage at the input of the amplifier and the output of the batteries to verify that the voltage drop is not occurring in the cables or connections.
Red LED and Yellow LED on	Problem with the amplifier.	Please refer to our nearest authorized service center.
