## CONTENTS

---

### CHAPTER 1

#### Using the Command-Line Interface 1

- Using the Command-Line Interface 2
- Understanding Command Modes 2
- Understanding the Help System 3
- Understanding Abbreviated Commands 4
- Understanding no and default Forms of Commands 4
- Understanding CLI Error Messages 5
- Using Configuration Logging 5
- Using Command History 5
  - Changing the Command History Buffer Size 5
  - Recalling Commands 6
  - Disabling the Command History Feature 6
- Using Editing Features 7
  - Enabling and Disabling Editing Features 7
  - Editing Commands through Keystrokes 7
  - Editing Command Lines that Wrap 9
- Searching and Filtering Output of show and more Commands 10
- Accessing the CLI 10
  - Accessing the CLI through a Console Connection or through Telnet 11

## Cisco TrustSec 69

### CHAPTER 3

### Cisco TrustSec Commands 71

address (CTS) 73

clear cts environment-data 74

clear cts policy-server statistics 75

content-type json 76

cts authorization list 77

cts change-password 78

cts credentials 79

cts environment-data enable 81

cts policy-server device-id 82

cts policy-server name 83

cts policy-server order random 84

cts policy-server username 85

cts refresh 86

cts rekey 88

cts role-based enforcement 89

cts role-based l2-vrf 90

cts role-based monitor 92

cts role-based permissions 93

cts role-based sgt-caching 95

cts role-based sgt-map 96

cts sxp connection peer 98

cts sxp default password 101

cts sxp default source-ip 103

cts sxp filter-enable 105

cts sxp filter-group 106

cts sxp filter-list 108

cts sxp log binding-changes 110

cts sxp reconciliation period 111

cts sxp retry period 112

|                                 |     |
|---------------------------------|-----|
| debug cts environment-data      | 113 |
| debug cts policy-server         | 115 |
| port (CTS)                      | 116 |
| propagate sgt (cts manual)      | 117 |
| retransmit (CTS)                | 119 |
| sap mode-list (cts manual)      | 120 |
| show cts credentials            | 122 |

## IP Addressing Services 401

### CHAPTER 5

### IP Addressing Services Commands 403

|                               |     |
|-------------------------------|-----|
| clear ip nhrp                 | 407 |
| clear ipv6 access-list        | 408 |
| clear ipv6 dhcp               | 409 |
| clear ipv6 dhcp binding       | 410 |
| clear ipv6 dhcp client        | 411 |
| clear ipv6 dhcp conflict      | 412 |
| clear ipv6 dhcp relay binding | 413 |

|                                        |     |
|----------------------------------------|-----|
| clear ipv6 eigrp                       | 414 |
| clear ipv6 mfib counters               | 415 |
| clear ipv6 mld counters                | 416 |
| clear ipv6 mld traffic                 | 417 |
| clear ipv6 mtu                         | 418 |
| clear ipv6 multicast aaa authorization | 419 |
| clear ipv6 nd destination              | 420 |
| clear ipv6 nd on-link prefix           | 421 |
| clear ipv6 nd router                   | 422 |
| clear ipv6 neighbors                   | 423 |
| clear ipv6 nhrp                        | 425 |
| clear ipv6 ospf                        | 426 |
| clear ipv6 ospf counters               | 427 |
| clear ipv6 ospf events                 | 429 |
| clear ipv6 pim reset                   | 430 |
| clear ipv6 pim topology                | 431 |
| clear ipv6 pim traffic                 | 432 |
| clear ipv6 prefix-list                 | 433 |
| clear ipv6 rip                         | 434 |
| clear ipv6 route                       | 435 |
| clear ipv6 spd                         | 436 |
| debug nhrp                             | 437 |
| fhrp delay                             | 439 |
| fhrp version vrrp v3                   | 440 |
| ip address dhcp                        | 441 |
| ip address pool (DHCP)                 | 444 |

# Using the Command-Line Interface

---

This chapter contains the following topics:

- [Using the Command-Line Interface, on page 2](#)

# Using the Command-Line Interface

This chapter describes the Cisco IOS command-line interface (CLI) and how to use it to configure your switch.

**Note**

The documentation set for this product strives to use bias-free language. For purposes of this documentation set, bias-free is defined as language that does not imply discrimination based on age, disability, gender, racial identity, ethnic identity, sexual orientation, socioeconomic status, and intersectionality. Exceptions may be present in the documentation due to language that is hardcoded in the user interfaces of the product software, language used based on RFP documentation, or language that is used by a referenced third-party product.

## Understanding Command Modes

The Cisco IOS user interface is divided into many different modes. The commands available to you depend on which mode you are currently in. Enter a question mark (?) at the system prompt to obtain a list of commands available for each command mode.

When you start a session on the switch, you begin in user mode, often called user EXEC mode. Only a limited subset of the commands are available in user EXEC mode. For example, most of the user EXEC commands are one-time commands, such as **show** commands, which show the current configuration status, and **clear** commands, which clear counters or interfaces. The user EXEC commands are not saved when the switch reboots.

To have access to all commands, you must enter privileged EXEC mode. Normally, you must enter a password to enter privileged EXEC mode. From this mode, you can enter any privileged EXEC command or enter global configuration mode.

Using the configuration modes (global, interface, and line), you can make changes to the running configuration. If you save the configuration, these commands are stored and used when the switch reboots. To access the various configuration modes, you must start at global configuration mode. From global configuration mode, you can enter interface configuration mode and line configuration mode.

This table describes the main command modes, how to access each one, the prompt you see in that mode, and how to exit the mode. The examples in the table use the hostname *Switch*.

**Table 1: Command Mode Summary**

| Mode      | Access Method                     | Prompt  | Exit Method                          | About This Mode                                                                                                                                                   |
|-----------|-----------------------------------|---------|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User EXEC | Begin a session with your switch. | Switch> | Enter <b>logout</b> or <b>quit</b> . | Use this mode to <ul style="list-style-type: none"><li>• Change terminal settings.</li><li>• Perform basic tests.</li><li>• Display system information.</li></ul> |

| Mode                    | Access Method                                                                                               | Prompt          | Exit Method                                                                                                                                              | About This Mode                                                                                                                                                                                              |
|-------------------------|-------------------------------------------------------------------------------------------------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Privileged EXEC         | While in user EXEC mode, enter the <b>enable</b> command.                                                   | #               | Enter <b>disable</b> to exit.                                                                                                                            | Use this mode to verify commands that you have entered. Use a password to protect access to this mode.                                                                                                       |
| Global configuration    | While in privileged EXEC mode, enter the <b>configure</b> command.                                          | (config) #      | To exit to privileged EXEC mode, enter <b>exit</b> or <b>end</b> , or press <b>Ctrl-Z</b> .                                                              | Use this mode to configure parameters that apply to the entire switch.                                                                                                                                       |
| VLAN configuration      | While in global configuration mode, enter the <b>vlan vlan-id</b> command.                                  | (config-vlan) # | To exit to global configuration mode, enter the <b>exit</b> command.<br><br>To return to privileged EXEC mode, press <b>Ctrl-Z</b> or enter <b>end</b> . | Use this mode to configure VLAN parameters. When VTP mode is transparent, you can create extended-range VLANs (VLAN IDs greater than 1005) and save configurations in the switch startup configuration file. |
| Interface configuration | While in global configuration mode, enter the <b>interface</b> command (with a specific interface).         | (config-if) #   | To exit to global configuration mode, enter <b>exit</b> .<br><br>To return to privileged EXEC mode, press <b>Ctrl-Z</b> or enter <b>end</b> .            | Use this mode to configure parameters for the Ethernet ports.                                                                                                                                                |
| Line configuration      | While in global configuration mode, specify a line with the <b>line vty</b> or <b>line console</b> command. | (config-line) # | To exit to global configuration mode, enter <b>exit</b> .<br><br>To return to privileged EXEC mode, press <b>Ctrl-Z</b> or enter <b>end</b> .            | Use this mode to configure parameters for the terminal line.                                                                                                                                                 |

For more detailed information on the command modes, see the command reference guide for this release.

## Understanding the Help System

You can enter a question mark (?) at the system prompt to display a list of commands available for each command mode. You can also obtain a list of associated keywords and arguments for any command.

**Table 2: Help Summary**

| Command     | Purpose                                                             |
|-------------|---------------------------------------------------------------------|
| <b>help</b> | Obtains a brief description of the help system in any command mode. |

| Command                                                                                                                                        | Purpose                                                                   |
|------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| <i>abbreviated-command-entry ?</i><br><br><pre># di? dir disable disconnect</pre>                                                              | Obtains a list of commands that begin with a particular character string. |
| <i>abbreviated-command-entry &lt;Tab&gt;</i><br><br><pre># sh conf&lt;tab&gt; # show configuration</pre>                                       | Completes a partial command name.                                         |
| <i>?</i><br><br><pre>Switch&gt; ?</pre>                                                                                                        | Lists all commands available for a particular command mode.               |
| <i>command ?</i><br><br><pre>Switch&gt; show ?</pre>                                                                                           | Lists the associated keywords for a command.                              |
| <i>command keyword ?</i><br><br><pre>(config)# cdp holdtime ? &lt;10-255&gt; Length of time (in sec) that receiver must keep this packet</pre> | Lists the associated arguments for a keyword.                             |

## Understanding Abbreviated Commands

You need to enter only enough characters for the switch to recognize the command as unique.

This example shows how to enter the **show configuration** privileged EXEC command in an abbreviated form:

```
# show conf
```

## Understanding no and default Forms of Commands

Almost every configuration command also has a **no** form. In general, use the **no** form to disable a feature or function or reverse the action of a command. For example, the **no shutdown** interface configuration command reverses the shutdown of an interface. Use the command without the keyword **no** to re-enable a disabled feature or to enable a feature that is disabled by default.

Configuration commands can also have a **default** form. The **default** form of a command returns the command setting to its default. Most commands are disabled by default, so the **default** form is the same as the **no** form. However, some commands are enabled by default and have variables set to certain default values. In these cases, the **default** command enables the command and sets variables to their default values.

## Understanding CLI Error Messages

This table lists some error messages that you might encounter while using the CLI to configure your switch.

**Table 3: Common CLI Error Messages**

| Error Message                           | Meaning                                                                          | How to Get Help                                                                                                                                                                       |
|-----------------------------------------|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| % Ambiguous command: "show con"         | You did not enter enough characters for your switch to recognize the command.    | Re-enter the command followed by a question mark (?) with a space between the command and the question mark.<br><br>The possible keywords that you can enter with the command appear. |
| % Incomplete command.                   | You did not enter all the keywords or values required by this command.           | Re-enter the command followed by a question mark (?) with a space between the command and the question mark.<br><br>The possible keywords that you can enter with the command appear. |
| % Invalid input detected at '^' marker. | You entered the command incorrectly. The caret (^) marks the point of the error. | Enter a question mark (?) to display all the commands that are available in this command mode.<br><br>The possible keywords that you can enter with the command appear.               |

## Using Configuration Logging

You can log and view changes to the switch configuration. You can use the Configuration Change Logging and Notification feature to track changes on a per-session and per-user basis. The logger tracks each configuration command that is applied, the user who entered the command, the time that the command was entered, and the parser return code for the command. This feature includes a mechanism for asynchronous notification to registered applications whenever the configuration changes. You can choose to have the notifications sent to the syslog.

**Note** Only CLI or HTTP changes are logged.

## Using Command History

The software provides a history or record of commands that you have entered. The command history feature is particularly useful for recalling long or complex commands or entries, including access lists. You can customize this feature to suit your needs.

### Changing the Command History Buffer Size

By default, the switch records ten command lines in its history buffer. You can alter this number for a current terminal session or for all sessions on a particular line. These procedures are optional.

Beginning in privileged EXEC mode, enter this command to change the number of command lines that the switch records during the current terminal session:

```
# terminal history [size number-of-lines]
```

The range is from 0 to 256.

Beginning in line configuration mode, enter this command to configure the number of command lines the switch records for all sessions on a particular line:

```
(config-line)# history [size number-of-lines]
```

The range is from 0 to 256.

## Recalling Commands

To recall commands from the history buffer, perform one of the actions listed in this table. These actions are optional.

### Note

The arrow keys function only on ANSI-compatible terminals such as VT100s.

**Table 4: Recalling Commands**

| Action                                           | Result                                                                                                                                                                                                                                                               |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Press <b>Ctrl-P</b> or the up arrow key.         | Recalls commands in the history buffer, beginning with the most recent command. Repeat the key sequence to recall successively older commands.                                                                                                                       |
| Press <b>Ctrl-N</b> or the down arrow key.       | Returns to more recent commands in the history buffer after recalling commands with <b>Ctrl-P</b> or the up arrow key. Repeat the key sequence to recall successively more recent commands.                                                                          |
| <b>show history</b><br><br>(config)# <b>help</b> | While in privileged EXEC mode, lists the last several commands that you just entered. The number of commands that appear is controlled by the setting of the <b>terminal history</b> global configuration command and the <b>history</b> line configuration command. |

## Disabling the Command History Feature

The command history feature is automatically enabled. You can disable it for the current terminal session or for the command line. These procedures are optional.

To disable the feature during the current terminal session, enter the **terminal no history** privileged EXEC command.

To disable command history for the line, enter the **no history** line configuration command.

## Using Editing Features

This section describes the editing features that can help you manipulate the command line.

### Enabling and Disabling Editing Features

Although enhanced editing mode is automatically enabled, you can disable it, re-enable it, or configure a specific line to have enhanced editing. These procedures are optional.

To globally disable enhanced editing mode, enter this command in line configuration mode:

```
Switch (config-line)# no editing
```

To re-enable the enhanced editing mode for the current terminal session, enter this command in privileged EXEC mode:

```
# terminal editing
```

To reconfigure a specific line to have enhanced editing mode, enter this command in line configuration mode:

```
(config-line)# editing
```

### Editing Commands through Keystrokes

This table shows the keystrokes that you need to edit command lines. These keystrokes are optional.

**Note**

The arrow keys function only on ANSI-compatible terminals such as VT100s.

**Table 5: Editing Commands through Keystrokes**

| Capability                                                   | Keystroke                                          | Purpose                              |
|--------------------------------------------------------------|----------------------------------------------------|--------------------------------------|
| Move around the command line to make changes or corrections. | Press <b>Ctrl-B</b> , or press the left arrow key. | Moves the cursor back one character. |

| Capability                                                                                                                                 | Keystroke                                           | Purpose                                                                                                                                                                                            |
|--------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                            | Press <b>Ctrl-F</b> , or press the right arrow key. | Moves the cursor forward one character.                                                                                                                                                            |
|                                                                                                                                            | Press <b>Ctrl-A</b> .                               | Moves the cursor to the beginning of the command line.                                                                                                                                             |
|                                                                                                                                            | Press <b>Ctrl-E</b> .                               | Moves the cursor to the end of the command line.                                                                                                                                                   |
|                                                                                                                                            | Press <b>Esc B</b> .                                | Moves the cursor back one word.                                                                                                                                                                    |
|                                                                                                                                            | Press <b>Esc F</b> .                                | Moves the cursor forward one word.                                                                                                                                                                 |
|                                                                                                                                            | Press <b>Ctrl-T</b> .                               | Transposes the character to the left of the cursor with the character located at the cursor.                                                                                                       |
| Recall commands from the buffer and paste them in the command line. The switch provides a buffer with the last ten items that you deleted. | Press <b>Ctrl-Y</b> .                               | Recalls the most recent entry in the buffer.                                                                                                                                                       |
|                                                                                                                                            | Press <b>Esc Y</b> .                                | Recalls the next buffer entry.<br><br>The buffer contains only the last 10 items that you have deleted or cut. If you press <b>Esc Y</b> more than ten times, you cycle to the first buffer entry. |
| Delete entries if you make a mistake or change your mind.                                                                                  | Press the <b>Delete</b> or <b>Backspace</b> key.    | Erases the character to the left of the cursor.                                                                                                                                                    |
|                                                                                                                                            | Press <b>Ctrl-D</b> .                               | Deletes the character at the cursor.                                                                                                                                                               |
|                                                                                                                                            | Press <b>Ctrl-K</b> .                               | Deletes all characters from the cursor to the end of the command line.                                                                                                                             |
|                                                                                                                                            | Press <b>Ctrl-U</b> or <b>Ctrl-X</b> .              | Deletes all characters from the cursor to the beginning of the command line.                                                                                                                       |
|                                                                                                                                            | Press <b>Ctrl-W</b> .                               | Deletes the word to the left of the cursor.                                                                                                                                                        |
|                                                                                                                                            | Press <b>Esc D</b> .                                | Deletes from the cursor to the end of the word.                                                                                                                                                    |
| Capitalize or lowercase words or capitalize a set of letters.                                                                              | Press <b>Esc C</b> .                                | Capitalizes at the cursor.                                                                                                                                                                         |
|                                                                                                                                            | Press <b>Esc L</b> .                                | Changes the word at the cursor to lowercase.                                                                                                                                                       |
|                                                                                                                                            | Press <b>Esc U</b> .                                | Capitalizes letters from the cursor to the end of the word.                                                                                                                                        |

| Capability                                                                                                                                                                                                                                                                                                                                                       | Keystroke                              | Purpose                              |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------|--------------------------------------|
| Designate a particular keystroke as an executable command, perhaps as a shortcut.                                                                                                                                                                                                                                                                                | Press <b>Ctrl-V</b> or <b>Esc Q</b> .  |                                      |
| Scroll down a line or screen on displays that are longer than the terminal screen can display.<br><br><b>Note</b> The More prompt is used for any output that has more lines than can be displayed on the terminal screen, including <b>show</b> command output. You can use the <b>Return</b> and <b>Space</b> bar keystrokes whenever you see the More prompt. | Press the <b>Return</b> key.           | Scrolls down one line.               |
|                                                                                                                                                                                                                                                                                                                                                                  | Press the <b>Space</b> bar.            | Scrolls down one screen.             |
| Redisplay the current command line if the switch suddenly sends a message to your screen.                                                                                                                                                                                                                                                                        | Press <b>Ctrl-L</b> or <b>Ctrl-R</b> . | Redisplays the current command line. |

## Editing Command Lines that Wrap

You can use a wraparound feature for commands that extend beyond a single line on the screen. When the cursor reaches the right margin, the command line shifts ten spaces to the left. You cannot see the first ten characters of the line, but you can scroll back and check the syntax at the beginning of the command. The keystroke actions are optional.

To scroll back to the beginning of the command entry, press **Ctrl-B** or the left arrow key repeatedly. You can also press **Ctrl-A** to immediately move to the beginning of the line.

**Note** The arrow keys function only on ANSI-compatible terminals such as VT100s.

In this example, the **access-list** global configuration command entry extends beyond one line. When the cursor first reaches the end of the line, the line is shifted ten spaces to the left and redisplayed. The dollar sign (\$) shows that the line has been scrolled to the left. Each time the cursor reaches the end of the line, the line is again shifted ten spaces to the left.

```
(config)# access-list 101 permit tcp 131.108.2.5 255.255.255.0 131.108.1
(config)# $ 101 permit tcp 131.108.2.5 255.255.255.0 131.108.1.20 255.25
(config)# $t tcp 131.108.2.5 255.255.255.0 131.108.1.20 255.255.255.0 eq
(config)# $108.2.5 255.255.255.0 131.108.1.20 255.255.255.0 eq 45
```

After you complete the entry, press **Ctrl-A** to check the complete syntax before pressing the **Return** key to execute the command. The dollar sign (\$) appears at the end of the line to show that the line has been scrolled to the right:

```
(config)# access-list 101 permit tcp 131.108.2.5 255.255.255.0 131.108.1$
```

The software assumes that you have a terminal screen that is 80 columns wide. If you have a width other than that, use the **terminal width** privileged EXEC command to set the width of your terminal.

Use line wrapping with the command history feature to recall and modify previous complex command entries.

## Searching and Filtering Output of show and more Commands

You can search and filter the output for **show** and **more** commands. This is useful when you need to sort through large amounts of output or if you want to exclude output that you do not need to see. Using these commands is optional.

To use this functionality, enter a **show** or **more** command followed by the pipe character (|), one of the keywords **begin**, **include**, or **exclude**, and an expression that you want to search for or filter out:

```
command | {begin | include | exclude} regular-expression
```

Expressions are case sensitive. For example, if you enter | **exclude output**, the lines that contain *output* are not displayed, but the lines that contain *Output* appear.

This example shows how to include in the output display only lines where the expression *protocol* appears:

```
# show interfaces | include protocol
Vlan1 is up, line protocol is up
Vlan10 is up, line protocol is down
GigabitEthernet1/0/1 is up, line protocol is down
GigabitEthernet1/0/2 is up, line protocol is up
```

## Accessing the CLI

You can access the CLI through a console connection, through Telnet, or by using the browser.

You manage the switch stack and the switch member interfaces through the active switch. You cannot manage switch stack members on an individual switch basis. You can connect to the active switch through the console port or the Ethernet management port of one or more switch members. Be careful with using multiple CLI sessions to the active switch. Commands you enter in one session are not displayed in the other sessions. Therefore, it is possible to lose track of the session from which you entered commands.

### Note

We recommend using one CLI session when managing the switch stack.

If you want to configure a specific switch member port, you must include the switch member number in the CLI command interface notation.

To debug a specific switch member, you can access it from the active switch by using the **session stack-member-number** privileged EXEC command. The switch member number is appended to the system prompt. For example, *Switch-2#* is the prompt in privileged EXEC mode for switch member 2, and where the

system prompt for the active switch is Switch. Only the **show** and **debug** commands are available in a CLI session to a specific switch member.

## Accessing the CLI through a Console Connection or through Telnet

Before you can access the CLI, you must connect a terminal or a PC to the switch console or connect a PC to the Ethernet management port and then power on the switch, as described in the hardware installation guide that shipped with your switch.

CLI access is available before switch setup. After your switch is configured, you can access the CLI through a remote Telnet session or SSH client.

You can use one of these methods to establish a connection with the switch:

- Connect the switch console port to a management station or dial-up modem, or connect the Ethernet management port to a PC. For information about connecting to the console or Ethernet management port, see the switch hardware installation guide.
- Use any Telnet TCP/IP or encrypted Secure Shell (SSH) package from a remote management station. The switch must have network connectivity with the Telnet or SSH client, and the switch must have an enable secret password configured.

The switch supports up to 16 simultaneous Telnet sessions. Changes made by one Telnet user are reflected in all other Telnet sessions.

The switch supports up to five simultaneous secure SSH sessions.

After you connect through the console port, through the Ethernet management port, through a Telnet session or through an SSH session, the user EXEC prompt appears on the management station.

# broadcast-underlay

To configure the underlay in a LISP network to use a multicast group to send encapsulated broadcast packets and link local multicast packets, use the **broadcast-underlay** command in the service submode.

[no] **broadcast-underlay** *multicast-ip*

| <b>Syntax Description</b>   | <i>multicast-ip</i> The IP address of the multicast group used to send the encapsulated broadcast packets                                                                                                                                                                                                             |         |              |                             |                              |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|-----------------------------|------------------------------|
| <b>Command Default</b>      | None.                                                                                                                                                                                                                                                                                                                 |         |              |                             |                              |
| <b>Command Modes</b>        | LISP Service Ethernet (router-lisp-inst-serv-eth)                                                                                                                                                                                                                                                                     |         |              |                             |                              |

| Release                     | Modification                                                                                                                                                                                                                                                                                                          |         |              |                             |                              |
| Cisco IOS XE Everest 16.6.1 | This command was introduced.                                                                                                                                                                                                                                                                                          |         |              |                             |                              |
| <b>Usage Guidelines</b>     | <p>Use this command to enable the broadcast functionality on the fabric edge node in a LISP network. Ensure that this command is used in the router-lisp-service-ethernet mode or router-lisp-instance-service-ethernet mode.</p> <p>Use the <b>no</b> form of the command to remove the broadcast functionality.</p> |         |              |                             |                              |

The following example shows how to configure broadcast on a fabric edge node:

```
device(config)#router lisp
device(config-router-lisp)#instance-id 3
device(config-router-lisp-inst)#service ethernet
device(config-router-lisp-inst-serv-eth)#eid-table vlan 250
device(config-router-lisp-inst-serv-eth)#broadcast-underlay 225.1.1.1
device(config-router-lisp-inst-serv-eth)#database-mapping mac locator-set rloc2
device(config-router-lisp-inst-serv-eth)#exit-service-ethernet
```

# database-mapping

To configure an IPv4 or IPv6 endpoint identifier-to-routing locator (EID-to-RLOC) mapping relationship and an associated traffic policy for Locator/ID Separation Protocol (LISP), use the **database-mapping** command in the LISP EID-table configuration mode. To remove the configured database mapping, use the **no** form of the command.

```
[ no ] database-mapping eid-prefix / prefix-length { locator-set RLOC-name [ proxy | default-etr
| default-etr-route-map | route-tag ] | ipv6-interface interface-name | ipv4-interface interface-name
| auto-discover-rlocs | limit }
```

## Syntax Description

|                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>eid-prefix / prefix-length</i>           | Specifies the IPv4 or IPv6 endpoint identifier prefix and length that is advertised by the router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>locator-set</b> <i>RLOC-name</i>         | Specifies the routing locator (RLOC) associated with the value specified for the <i>eid-prefix</i> .<br><br>Use the following keyword options for database mapping: <ul style="list-style-type: none"> <li>• <b>proxy</b> : enables configuration of static proxy database mapping</li> <li>• <b>default-etr</b> : enables configuration of default ETR database mapping</li> <li>• <b>route-tag</b> <i>route-tag</i>: monitors the RIB entry for a match with the <i>route-tag</i> specified</li> <li>• <b>default-etr-route-map</b> <i>route-map</i>: specifies the route-map to look for <b>default-etr</b> RIB route updates and dynamically changes the locator set for this database mapping.</li> </ul> |
| <b>ipv4 interface</b> <i>interface-name</i> | Specifies the IPv4 address and name of the interface that is used as the RLOC for the EID prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>ipv6 interface</b> <i>interface-name</i> | Specifies the IPv6 address and name of the interface that is used as the RLOC for the EID prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>auto-discover-rlocs</b>                  | Configures the Egress Tunnel Router (ETR) to discover the locators of all routers configured to function as both an ETR and an Ingress Tunnel Router (ITR)—such routers are referred to as xTRs—in the ETR LISP site when the site uses multiple xTRs and each xTR is configured to use DHCP-learned locators or configured with only its own locators.                                                                                                                                                                                                                                                                                                                                                        |
| <b>limit</b>                                | Specifies the maximum size of local EID prefixes database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Command Default

No LISP database entries are defined.

## Command Modes

LISP Instance Service (router-lisp-instance-service)

|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| Release                       | Modification                                        |
|-------------------------------|-----------------------------------------------------|
| Cisco IOS XE Fuji 16.9.1      | Introduced support for the keyword <b>proxy</b> .   |
| Cisco IOS XE Bengaluru 17.5.1 | Introduced support for <b>default-etr-route-map</b> |

## Usage Guidelines

In the LISP-instance-service configuration mode, the **database-mapping** command configures LISP database parameters with a specified IPv4 or IPv6 EID-prefix block. The *locator* is the IPv4 or IPv6 address of any interface used as the RLOC address for the eid-prefix assigned to the site but can also be the loopback address of the interface.

When a LISP site has multiple locators associated with the same EID-prefix block, multiple **database-mapping** commands are used to configure all of the locators for a given EID-prefix block.

In a MultiSite scenario, the LISP border node advertises the site EID that it's attached to on the transit map-server to attract site traffic. To advertise, the border node has to obtain the route from the internal border and proxy register with the transit site map-server accordingly. The **database-mapping eid-prefix locator-set RLOC-name proxy** command enables the configuration of a static proxy database mapping.

In Cisco IOS XE Bengaluru 17.5.1 and later releases, **database-mapping eid-prefix locator-set RLOC-name default-etr-route-map route-map** command monitors the specified *route-map* for route updates corresponding to the *eid-prefix*. If there is an update from the route map and if the route map has a defined LISP locator set, the **locator-set** of this database mapping is changed to the one specified in the *route-map*.

By default, RIB metric (BGP MED attribute) information for the specified **default-etr eid-prefix** is obtained. You can disable the default using the **default-etr disable-metric** command.

Enabling the **default-etr-route-map** option allows you to match other BGP attributes like AS\_PATH, COMMUNITIES, and so on, and modify the locator set of the database mapping accordingly.

## Examples

The following example shows how to map the eid-prefix with the locator-set, RLOC, in the EID configuration mode on an external border:

**Note** Ensure that the locator-set RLOC is already configured.

```
device(config)# router lisp
device(config-router-lisp)# instance-id 3
device(config-router-lisp-inst)# service ipv4
device(config-router-lisp-inst-serv-ipv4)#eid-table vrf red
device(config-router-lisp-inst-serv-ipv4-eid-table)# database-mapping 172.168.0.0/16
locator-set RLOC proxy
device(config-router-lisp-inst-serv-ipv4-eid-table)# database-mapping 173.168.0.0/16
locator-set RLOC proxy
device(config-router-lisp-inst-serv-ipv4-eid-table)# map-cache 0.0.0.0/0
map-requestdevice(config-router-lisp-inst-serv-ipv4-eid-table)#exit
device(config-router-lisp-inst-serv-ipv4)#
```

The following example shows how to dynamically change the eid-prefix/locator-set mapping, using the **default-etr-route-map** keyword:

```
device(config)# router lisp
device(config-router-lisp)# instance-id 1
device(config-router-lisp-inst)# service ipv4
```

```

device(config-router-lisp-inst-serv-ipv4)#eid-table default
device(config-router-lisp-inst-serv-ipv4-eid-table)# database-mapping 0.0.0.0/0 locator-set
RLOC default-etr-route-map abc
device(config-router-lisp-inst-serv-ipv4-eid-table)#exit
device(config-router-lisp-inst-serv-ipv4)#

```

|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>eid-table vrf</b> <i>vrf-name</i> | Associates the instance-service instantiation with a virtual routing and forwarding (VRF) table or default table through which the endpoint identifier address space is reachable. |

# dynamic-eid

To create a dynamic End Point Identifier (EID) policy and enter the dynamic-eid configuration mode on an xTR, use the **dynamic-eid** command.

**dynamic-eid** *eid-name*

## Syntax Description

*eid-name* If *eid-name* exists, it enters *eid-name* configuration mode. Else, a new dynamic-eid policy with name *eid-name* is created and it enters the dynamic-eid configuration mode.

## Command Default

No LISP dynamic-eid policies are configured.

## Command Modes

LISP EID-table (router-lisp-eid-table)

## Command History

| Release                     | Modification                 |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

## Usage Guidelines

To configure LISP mobility, create a dynamic-EID roaming policy that can be referenced by the **lisp mobility** interface command. When the **dynamic-eid** command is entered, the referenced LISP dynamic-EID policy is created and you enter the dynamic-EID configuration mode. In this mode, all attributes associated with the referenced LISP dynamic-EID policy can be entered. When a dynamic-EID policy is configured, you must specify the dynamic-EID-to-RLOC mapping relationship and its associated traffic policy.

## Related Commands

|----------------------|------------------------------------------------------------------------------------------|
| <b>lisp mobility</b> | Configures an interface on an ITR to participate in LISP mobility (dynamic-EID roaming). |

# eid-record-provider

To define the extranet policy table for the provider instance use the **eid-record-provider** command in the lisp-extranet mode.

**[no] eid-record-provider instance-id** *instance id* { *ipv4 address prefix* | *ipv6 address prefix* } **bidirectional**

## Syntax Description

|                                       |                                                                                                               |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <b>instance-id</b> <i>instance id</i> | The instance-id of the LISP instance for which the extranet provider policy applies.                          |
| <i>ipv4 address prefix</i>            | Defines the IPv4 EID prefixes to be leaked, specified in a.b.c.d/nn form.                                     |
| <i>ipv6 address prefix</i>            | Defines the IPv6 EID prefixes to be leaked, prefix specified in X:X:X:X::X/<0-128> form.                      |
| <b>bidirectional</b>                  | Specifies that the extranet communication between the provider and subscriber EID prefixes are bidirectional. |

## Command Default

None.

## Command Modes

router-lisp-extranet

## Command History

| Release                     | Modification                 |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

## Usage Guidelines

Use the **no** form of the command to negate the eid-record-provider configuration.

```
device(config)#router lisp
device(config-router-lisp)#extranet ext1
device(config-router-lisp-extranet)#eid-record-provider instance-id 5000 10.0.0.0/8
bidirectional
device(config-router-lisp-extranet)#eid-record-subscriber instance-id 1000 3.0.0.0/24
bidirectional
```

# eid-record-subscriber

To define the extranet policy table for the subscriber instance use the **eid-record-subscriber** command in the lisp-extranet mode.

[no] **eid-record-subscriber instance-id** *instance id* { *ipv4 address prefix* | *ipv6 address prefix* } **bidirectional**

|                           |                                       |                                                                                                               |
|---------------------------|---------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>instance-id</b> <i>instance id</i> | The instance-id of the LISP instance for which the extranet provider policy applies.                          |
|                           | <i>ipv4 address prefix</i>            | Defines the IPv4 EID prefixes to be leaked, specified in a.b.c.d/nn form.                                     |
|                           | <i>ipv6 address prefix</i>            | Defines the IPv6 EID prefixes to be leaked, prefix specified in X:X:X:X::X/<0-128> form.                      |
|                           | <b>bidirectional</b>                  | Specifies that the extranet communication between the provider and subscriber EID prefixes are bidirectional. |

**Command Default** None.

**Command Modes** LISP Extranet (router-lisp-extranet)

|                        |                             |                              |
|------------------------|-----------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>              | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

**Usage Guidelines** Use the **no** form of the command to negate the eid-record-subscriber configuration.

```
device(config)#router lisp
device(config-router-lisp)#extranet ext1
device(config-router-lisp-extranet)#eid-record-provider instance-id 5000 10.0.0.0/8
bidirectional
device(config-router-lisp-extranet)#eid-record-subscriber instance-id 1000 3.0.0.0/24
bidirectional
device(config-router-lisp-extranet)#eid-record-subscriber instance-id 2000 20.20.0.0/8
bidirectional
```

# eid-table

The **eid-table** command associates the instance-service instantiation with a virtual routing and forwarding (VRF) table or default table through which the endpoint identifier address space is reachable.

**[no] eid-table** {*vrf-name* | **default** | **vrf** *vrf-name*}

|                           |                               |                                                                                                  |
|---------------------------|-------------------------------|--------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>default</b>                | Selects the default (global) routing table for association with the configured instance-service. |
|                           | <b>vrf</b><br><i>vrf-name</i> | Selects the named VRF table for association with the configured instance.                        |

**Command Default** Default VRF is associated with instance-id 0.

**Command Modes** router-lisp-instance-service

|                        |                             |                              |
|------------------------|-----------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>              | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

**Usage Guidelines** This command is used only in the instance-service mode.

For Layer 3 (service ipv4 / service ipv6), a VRF table is associated with the instance-service. For Layer 2 (service ethernet), a VLAN is associated with the instance-service.

**Note** For Layer 2, ensure that you have defined a VLAN before configuring the eid-table.

For Layer 3, ensure that you have defined a VRF table before you configure the eid-table.

In the following example, an XTR is configured to segment traffic using VRF named vrf-table. The EID prefix associated with vrf-table is connected to instance ID 3.

```
device(config)#vrf definition vrf-table
device(config-vrf)#address-family ipv4
device(config-vrf-af)#exit
device(config-vrf)#exit
device(config)#router lisp
device(config-router-lisp)#instance-id 3
device(config-router-lisp-inst)#service ipv4
device(config-router-lisp-inst-serv-ipv4)#eid-table vrf vrf-table
```

In the following example, the EID prefix associated with a VLAN, named Vlan10, is connected to instance ID 101.

```
device(config)#interface Vlan10
device(config-if)#mac-address ba25.cdf4.ad38
device(config-if)#ip address 10.1.1.1 255.255.255.0
device(config-if)#end
device(config)#router lisp
device(config-router-lisp)#instance-id 101
device(config-router-lisp-inst)#service ethernet
```

```
device(config-router-lisp-inst-serv-ethernet)#eid-table Vlan10
device(config-router-lisp-inst-serv-ethernet)#database-mapping mac locator-set set
device(config-router-lisp-inst-serv-ethernet)#exit-service-etherne
device(config-router-lisp-inst)#exit-instance-id
```

# encapsulation

To configure the type of encapsulation of the data packets in the LISP network, use the **encapsulation** command in the service mode.

**[no] encapsulation { vxlan | lisp }**

| <b>Syntax Description</b>   | <b>encapsulation vxlan</b> Specifies VXLAN-based encapsulation.                                                                                                                                                                                                                                                            |         |              |                             |                              |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|-----------------------------|------------------------------|
|                             | <b>encapsulation lisp</b> Specifies LISP-based encapsulation                                                                                                                                                                                                                                                               |         |              |                             |                              |
| <b>Command Default</b>      | None.                                                                                                                                                                                                                                                                                                                      |         |              |                             |                              |
| <b>Command Modes</b>        | LISP Service IPv4 (router-lisp-serv-ipv4)                                                                                                                                                                                                                                                                                  |         |              |                             |                              |
|                             | LISP Service IPv6 (router-lisp-serv-ipv6)                                                                                                                                                                                                                                                                                  |         |              |                             |                              |
| <b>Command History</b>      | <table> <tr> <th>Release</th><th>Modification</th></tr> <tr> <td>Cisco IOS XE Everest 16.6.1</td><td>This command was introduced.</td></tr> </table>                                                                                                                                                                       | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release                     | Modification                                                                                                                                                                                                                                                                                                               |         |              |                             |                              |
| Cisco IOS XE Everest 16.6.1 | This command was introduced.                                                                                                                                                                                                                                                                                               |         |              |                             |                              |
| <b>Usage Guidelines</b>     | <p>Use the <b>encapsulation vxlan</b> command in the service ethernet mode to encapsulate Layer 2 packets. Use the <b>encapsulation lisp</b> command in the service ipv4 or service ipv6 mode to encapsulate the Layer 3 packets.</p> <p>Use the <b>no</b> form of the command to remove encapsulation on the packets.</p> |         |              |                             |                              |

The following example shows how to configure an xTR for data encapsulation

```
device(config)#router lisp
device(config-router-lisp)#service ipv4
device(config-router-lisp-serv-ipv4)#encapsulation vxlan
device(config-router-lisp-serv-ipv4)#map-cache-limit 200
device(config-router-lisp-serv-ipv4)#exit-service-ipv4
```

# etr

To configure a device as an Egress Tunnel Router (ETR) use the **etr** command in the instance-service mode or service submode.

[ **no** ] **etr**

## Command Default

The device is not configured as ETR by default.

## Command Modes

router-lisp-instance-service

router-lisp-service

## Command History

| Release                     | Modification                 |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

## Usage Guidelines

Use this command to enable a device to perform the ETR functionality.

Use the **no** form of the command to remove the ETR functionality.

A router configured as an ETR is also typically configured with database-mapping commands so that the ETR knows what endpoint identifier (EID)-prefix blocks and corresponding locators are used for the LISP site. In addition, the ETR should be configured to register with a map server with the **etr map-server** command, or to use static LISP EID-to-routing locator (EID-to-RLOC) mappings with the **map-cache** command to participate in LISP networking.

The following example shows how to configure a device as an ETR.

```
device(config)#router lisp
device(config-router-lisp)#instance-id 3
device(config-router-lisp-inst)#service ipv4
device(config-router-lisp-inst-serv-ipv4)#etr
```

## etr map-server

To configure a map server to be used by the Egress Tunnel Router (ETR) when configuring the EIDs, use the **etr map-server** command in the instance mode or instance-service mode. To remove the configured locator address of the map-server, use the **no** form of this command.

**etr map-server** *map-server-address* { **key** [ **0** | **6** | **7** ] *authentication-key* | **proxy-reply** }

### Syntax Description

|                           |                                                                                                                 |
|---------------------------|-----------------------------------------------------------------------------------------------------------------|
| <i>map-server-address</i> | The locator address of the map server.                                                                          |
| <b>key</b>                | Specifies the key type.                                                                                         |
| <b>0</b>                  | Indicates that password is entered as clear text.                                                               |
| <b>6</b>                  | Indicates that password is in the AES encrypted form.                                                           |
| <b>7</b>                  | Indicates that password is a weak encrypted one.                                                                |
| <i>authentication-key</i> | The password used for computing the SHA-1 HMAC hash that is included in the header of the map-register message. |
| <b>proxy-reply</b>        | Specifies that the map server answer the map-requests on behalf the ETR.                                        |

### Command Default

None.

### Command Modes

LISP Instance Service (router-lisp-inst-serv)  
LISP Service (router-lisp-serv)

### Command History

| Release                     | Modification                 |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

### Usage Guidelines

Use the **etr map-server** command to configure the locator of the map server to which the ETR will register for its EIDs. The authentication key argument in the command syntax is a password that is used for a SHA-1 HMAC hash (included in the header of the map-register message). The password used for the SHA-1 HMAC may be entered in unencrypted (cleartext) form or encrypted form. To enter an unencrypted password, specify 0. To enter an AES encrypted password, specify 6.

Use the **no** form of the command to remove the map server functionality.

The following example shows how to configure a map server located at 2.1.1.6 to act as a proxy in order to answer the map-requests on the ETR .

```
device(config)#router lisp
device(config-router-lisp)#instance-id 3
device(config-router-lisp-inst)#service ipv4
device(config-router-lisp-inst-serv-ipv4)#etr map-server 2.1.1.6 key foo
device(config-router-lisp-inst-serv-ipv4)#etr map-server 2.1.1.6 proxy-reply
```

# extranet

To enable the inter-VRF communication in a LISP network, use the **extranet** command in the LISP configuration mode on the MSMR.

**extranet** *name-extranet*

| <b>Syntax Description</b>   | <i>name-extranet</i> Specifies the name of the extranet created.                                                                                |         |              |                             |                              |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|-----------------------------|------------------------------|
| <b>Command Default</b>      | None.                                                                                                                                           |         |              |                             |                              |
| <b>Command Modes</b>        | LISP (router-lisp)                                                                                                                              |         |              |                             |                              |
| <b>Command History</b>      | <table><tr><th>Release</th><th>Modification</th></tr><tr><td>Cisco IOS XE Everest 16.6.1</td><td>This command was introduced.</td></tr></table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release                     | Modification                                                                                                                                    |         |              |                             |                              |
| Cisco IOS XE Everest 16.6.1 | This command was introduced.                                                                                                                    |         |              |                             |                              |

```
device(config)#router lisp
device(config-router-lisp)#extranet ext1
device(config-router-lisp-extranet)#
```

# first-packet-petr

To prevent the loss of the first packet (and subsequent packets until map-cache is resolved), use the **first-packet-petr** command on the Map Server, in the LISP-service or the LISP-instance-service configuration mode. To disable the configuration of this command, use its **no** form.

Configuring this command ensures that even the first packet that is sent out from the fabric edge device reaches its destination through a first-packet-handler border that is available.

```
[no] first-packet-petr remote-locator-set fpetr-RLOC
```

|                           |                                                |                                                                                                                                                                                                    |
|---------------------------|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>remote-locator-set</b><br><i>fpetr-RLOC</i> | Specifies a remote locator-set, which is a set of IP addresses of remote devices, that connect to an external network or to networks across sites or to Data Center through remote or local sites. |
| <b>Command Default</b>    | None.                                          |                                                                                                                                                                                                    |
| <b>Command Modes</b>      | LISP-instance-service<br>LISP-service          |                                                                                                                                                                                                    |
| <b>Command History</b>    | <b>Release</b>                                 | <b>Modification</b>                                                                                                                                                                                |
|                           | Cisco IOS XE Amsterdam 17.3.1                  | The command was introduced.                                                                                                                                                                        |

**Usage Guidelines**

The ITR or the fabric edge device drops the initial packets sent to it until it learns the destination EID reachability from the local MSMR. To prevent the drop of the first packet, configure the **first-packet-petr** command on the local MSMR.

Configure the **first-packet-petr** command on the local map server to ensure that when the fabric edges boots up and resolves the 0/0 map-cache entry, it gets the first packet forwarding RLOCs.

When an MSMR receives a request to connect to an external network (like internet), it first checks for the availability of an external border. If the map server does not find the default-ETR border or the internet service providing border, it responds with the remote RLOCs that are configured with the **first-packet-petr** command.

**Note** You can configure the **first-packet-petr** command only on a control plane that is within a fabric site. You cannot configure this command on the control plane of a transit site.

## Example

The following example first defines a remote locator set and associates the remote RLOCs with the first-packet-petr command:

```
Device(config)#router lisp
Device(config-router-lisp)#remote-locator-set fpetr
Device(config-router-lisp-remote-locator-set)#23.23.23.23 priority 1 weight 1
Device(config-router-lisp-remote-locator-set)#24.24.24.24 priority 1 weight 1
```

```
Device(config-router-lisp-remote-locator-set)#exit-remote-locator-set

Device(config-router-lisp)#service ipv4
Device(config-lisp-srv-ipv4)#first-packet-petr remote-locator-set fpetr
Device(config-lisp-srv-ipv4)#map-server
Device(config-lisp-srv-ipv4)#map-resolver
Device(config-lisp-srv-ipv4)#exit-service-ipv4
Device(config-router-lisp)#
```

The configured behavior is inherited by all instances under service ipv4.

To override the behavior for a particular instance, configure the first-packet-petr command for that instance. In the following example, instance 101 disables the first-packet-petr command.

```
Device(config-router-lisp)#instance-id 101
Device(config-router-lisp-inst)#service ipv4
Device(config-router-lisp-inst-service-ipv4)#no first-packet-petr remote-locator-set
Device(config-router-lisp-inst-service-ipv4)#exit-service-ipv4
```

# instance-id

To create a LISP EID instance under the router-lisp configuration mode and enter the instance-id submode, use the **instance-id** command.

**instance-id** *iid*

---

**Command Default**

None.

---

**Command Modes**

LISP (router-lisp)

---

**Command History**

| Release                     | Modification                 |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

---

**Usage Guidelines**

Use the instance-id command to create a LISP eid instance to group multiple services.

Configuration under this instance-id will apply to all services underneath it.

```
device(config)#router lisp
device(config-router-lisp)#instance-id 3
device(config-router-lisp-inst)#
```

## ip pim lisp core-group-range

To configure the core range of address of a Protocol Independent Multicast (PIM) Source Specific Multicast (SSM) on a LISP sub-interface, use the **ip pim lisp core-group-range** command in interface configuration mode. To remove SSM address range, use the **no** form of this command

[no] **ip pim lisp core-group-range** *start-SSM-address range-size*

### Syntax Description

*start-SSM-address* Specifies the start of the SSM IP address range.

*number-of-groups* Specifies the size of group range.

### Command Default

By default the group range 232.100.100.1 to 232.100.100.255 is assigned if a core range of addresses is not configured.

### Command Modes

LISP Interface Configuration (config-if)

### Command History

| Release             | Modification                 |
|---------------------|------------------------------|
| Cisco IOS XE 16.9.1 | This command was introduced. |

### Usage Guidelines

Native multicast transport supports only PIM SSM in the underlay or the core. Multicast transport uses a grouping mechanism to map the end-point identifiers (EID) entries to the RLOC space SSM group entries. By default, the group range 232.100.100.1 to 232.100.100.255 is used as the SSM range of addresses on a LISP interface to transport multicast traffic. Use the **ip pim lisp core-group-range** command to manually change this SSM core group range of IP addresses on the LISP interfaces.

The following example defines a group of 1000 IP addresses starting from 232.0.0.1 as the SSM range of addresses on the core for multicast traffic.

```
Device(config)#interface LISP0.201
Device(config-if)#ip pim lisp core-group-range 232.0.0.1 1000
```

# ip pim lisp transport multicast

To enable multicast as the transport mechanism on LISP interface and sub-interface, use the **ip pim lisp transport multicast** command in the LISP Interface Configuration mode. To disable multicast as the transport mechanism on the LISP interface, use the **no** form of this command

**[no] ip pim lisp transport multicast**

## Syntax Description

This command has no keywords or arguments.

|                        |                                                                                |
|------------------------|--------------------------------------------------------------------------------|
| <b>Command Default</b> | If this command is not configured, head-end replication is used for multicast. |
|------------------------|--------------------------------------------------------------------------------|

|                      |                                          |
|----------------------|------------------------------------------|
| <b>Command Modes</b> | LISP Interface Configuration (config-if) |
|----------------------|------------------------------------------|

|                        |                     |                              |
|------------------------|---------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>      | <b>Modification</b>          |
|                        | Cisco IOS XE 16.9.1 | This command was introduced. |

## Example

The following example configures multicast as the transport mechanism on a LISP Interface:

```
Device(config)#interface LISP0
Device(config-if)#ip pim lisp transport multicast
```

## Related Commands

|-----------------------------|------------------------------------------------------------------|
| <b>ip multicast routing</b> | Enables ip multicast routing or multicast distributed switching. |

# ip pim rp-address

To configure the address of a Protocol Independent Multicast (PIM) rendezvous point (RP) for a particular group, use the **ip pim rp-address** command in global configuration mode. To remove an RP address, use the **no** form of this command

```
[no] ip pim [vrfvrf-name] rp-address rp-address [access-list]
```

|                           |                    |                                                                                                                |
|---------------------------|--------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>vrf</b>         | Optional) Specifies the multicast Virtual Private Network (VPN) routing and forwarding (VRF) instance.         |
|                           | <i>vrf-name</i>    | (Optional) Name assigned to the VRF.                                                                           |
|                           | <i>rp-address</i>  | IP address of a router to be a PIM RP. This is a unicast IP address in four-part dotted-decimal notation.      |
|                           | <i>access-list</i> | (Optional) Number or name of an access list that defines the multicast groups for which the RP should be used. |

**Command Default** None.

**Command Modes** Global Configuration (config)

|                        |                      |                              |
|------------------------|----------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>       | <b>Modification</b>          |
|                        | Cisco IOS XE 16.8.1s | This command was introduced. |

**Usage Guidelines** Use the **ip pim rp-address** command to statically define the RP address for multicast groups that are to operate in sparse mode or bidirectional mode.

You can configure the Cisco IOS software to use a single RP for more than one group. The conditions specified by the access list determine for which groups the RP can be used. If no access list is configured, the RP is used for all groups. A PIM router can use multiple RPs, but only one per group.

The following example sets the PIM RP address to 185.1.1.1 for all multicast groups:

```
Device(config)#ip pim rp-address 185.1.1.1
```

# ip pim sparse mode

To enable sparse mode of operation of Protocol Independent Multicast (PIM) on an interface, use the **ip pim sparse-mode** command in the Interface Configuration mode. To disable the sparse mode of operation use the **no** form of this command

```
[no] ip pim sparse mode {
```

## Syntax Description

This command has no keywords or arguments.

### Command Default

None.

### Command Modes

Interface Configuration (config-if)

### Command History

| Release              | Modification                 |
|----------------------|------------------------------|
| Cisco IOS XE 16.8.1s | This command was introduced. |

### Usage Guidelines

The NetFlow **collect** commands are used to configure nonkey fields for the flow monitor record and to enable capturing the values in the fields for the flow created with the record. The values in nonkey fields are added to flows to provide additional information about the traffic in the flows. A change in the value of a nonkey field does not create a new flow.

### The following example configures pim sparse mode of operation:

```
Device(config)#interface Loopback0
Device(config-if)#ip address 170.1.1.1 255.255.255.0
Device(config-if)#ip pim sparse-mode
```

| <b>ip multicast routing</b> | Enables ip multicast routing or multicast distributed switching.. |

# ipv4 multicast multitopology

To enable Multicast-Specific RPF topology support for IP Multicast routing, use the **ipv4 multicast multitopology** command in the VRF configuration mode. To disable the Multicast-Specific RPF Topology support, use the **no** form of this command.

[no] **ipv4 multicast multitopology**

## Syntax Description

This command has no arguments or keywords.

### Command Default

None.

### Command Modes

VRF Configuration (config-vrf)

### Command History

| Release                   | Modification                 |
|---------------------------|------------------------------|
| Cisco IOS XE 16.8.1s      | This command was introduced. |
| Cisco IOS XE Fuji 16.8.1a |                              |

**The following example shows how to configure Multicast-Specific RPF Topology:**

```
Device(config)#vrf definition VRF1
Device(config-vrf)#ipv4 multicast multitopology
```

# ip pim ssm

To define the Source Specific Multicast (SSM) range of IP multicast addresses, use the **ip pim ssm** command in global configuration mode. To disable the SSM range, use the **no** form of this command.

```
[no] ip pim [vrf vrf-name] ssm { default | range access-list }
```

|                           |                                    |                                                                                                        |
|---------------------------|------------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>vrf</b>                         | Optional) Specifies the multicast Virtual Private Network (VPN) routing and forwarding (VRF) instance. |
|                           | <i>vrf-name</i>                    | (Optional) Name assigned to the VRF.                                                                   |
|                           | <b>range</b><br><i>access-list</i> | Specifies the standard IP access list number or name defining the SSM range.                           |
|                           | <b>default2</b>                    | Defines the SSM range access list to 232/8.                                                            |

**Command Default** None.

**Command Modes** Global Configuration (config)

|                        |                      |                              |
|------------------------|----------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>       | <b>Modification</b>          |
|                        | Cisco IOS XE 16.8.1s | This command was introduced. |

**Usage Guidelines** When an SSM range of IP multicast addresses is defined by the **ip pim ssm** command, no Multicast Source Discovery Protocol (MSDP) Source-Active (SA) messages will be accepted or originated in the SSM range.

**The following example sets the SSM range of IP multicast address to default**

```
Device(config)#ip pim ssm default
```

|                         |                             |                                                                   |

|                         | <b>ip multicast routing</b> | Enables ip multicast routing or multicast distributed switching.. |

# itr

To configure a device as an Ingress Tunnel Router (ITR) use the **itr** command in the service submode or instance-service mode.

[ **no** ] **itr**

## Command Default

The device is not configured as ITR by default.

## Command Modes

LISP Instance Service (router-lisp-instance-service)

LISP Service (router-lisp-service)

## Command History

| Release                     | Modification                 |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

## Usage Guidelines

Use this command to enable a device to perform the ITR functionality.

Use the **no** form of the command to remove the ITR functionality.

A device configured as an ITR helps find the EID-to-RLOC mapping for all traffic destined to LISP-capable sites.

The following example shows how to configure a device as an ITR.

```
device(config)#router lisp
device(config-router-lisp)#instance-id 3
device(config-router-lisp-inst)#service ipv4
device(config-router-lisp-inst-serv-ipv4)#itr
```

# itr map-resolver

To configure a device as a map resolver to be used by an Ingress Tunnel Router (ITR) when sending map-requests, use the **itr map-resolver** command in the service submode or instance-service mode.

**[no] itr [map-resolver map-address] prefix-list prefix-list-name**

## Syntax Description

**map-resolver map-address** Configures map-resolver address for sending map requests, on the ITR.

**prefix-list prefix-list-name** Specifies the prefix list to be used.

## Command Default

None.

## Command Modes

router-lisp-instance-service

## Command History

| Release                     | Modification                                          |
|-----------------------------|-------------------------------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced.                          |
| Cisco IOS XE Fuji 16.9.1    | Introduced <b>prefix-list</b> as part of the command. |

## Usage Guidelines

Use this command to enable a device to perform the ITR map-resolver functionality.

Use the **no** form of the command to remove the map-resolver functionality.

A device configured as a Map Resolver accepts encapsulated Map-Request messages from ITRs, decapsulates those messages, and then forwards the messages to the Map Server responsible for the egress tunnel routers (ETRs) that are authoritative for the requested EIDs. In a multi-site environment, the site border relies on Map Resolver prefix-list to determine whether to query the transit site MSMR or site MSMR.

The following example shows how to configure an ITR to use the map-resolver located at 2.1.1.6 when sending map request messages.

```
device(config)#router lisp
device(config-router-lisp)#prefix-list wired
device(config-router-lisp-prefix-list)#2001:193:168:1::/64
device(config-router-lisp-prefix-list)#192.168.0.0/16
device(config-router-lisp-prefix-list)#exit-prefix-list

device(config-router-lisp)#service ipv4
device(config-router-lisp-serv-ipv4)#encapsulation vxlan
device(config-router-lisp-serv-ipv4)#itr map-resolver 2.1.1.6 prefix-list wired
device(config-router-lisp-serv-ipv4)#
```

# locator default-set

To mark a locator-set as default, use the **locator default-set** command at the router-lisp level.

[no] **locator default-set** *rloc-set-name*

| <b>Syntax Description</b>   | <i>rloc-set-name</i> The name of locator-set that is set as default.                                                                            |         |              |                             |                              |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|-----------------------------|------------------------------|
| <b>Command Default</b>      | None                                                                                                                                            |         |              |                             |                              |
| <b>Command Modes</b>        | LISP (router-lisp)                                                                                                                              |         |              |                             |                              |
| <b>Command History</b>      | <table><tr><th>Release</th><th>Modification</th></tr><tr><td>Cisco IOS XE Everest 16.6.1</td><td>This command was introduced.</td></tr></table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release                     | Modification                                                                                                                                    |         |              |                             |                              |
| Cisco IOS XE Everest 16.6.1 | This command was introduced.                                                                                                                    |         |              |                             |                              |
|                             |                                                                                                                                                 |         |              |                             |                              |
| <b>Usage Guidelines</b>     | The locator-set configured as default with the <b>locator default-set</b> command applies to all services and instances.                        |         |              |                             |                              |

# locator-set

To specify a locator-set and enter the locator-set configuration mode, use the **locator-set** command at the router-lisp level.

[no] **locator-set** *loc-set-name*

|                           |                                                               |                              |
|---------------------------|---------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <i>loc-set-name</i> The name of locator-set.                  |                              |
| <b>Command Default</b>    | Name                                                          |                              |
| <b>Command Modes</b>      | LISP (router-lisp)                                            |                              |
| <b>Command History</b>    | <b>Release</b>                                                | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.6.1                                   | This command was introduced. |
| <b>Usage Guidelines</b>   | You must first define the locator-set before referring to it. |                              |

# map-cache

To configure a static endpoint identifier (EID) to routing locator (RLOC) (EID-to-RLOC) mapping relationship, use the **map-cache** command in the instance-service ipv4 or instance-service ipv6 mode.

```
[no ] map-cache destination-eid-prefix/prefix-len { ipv4-address { priority priority weight weight }
| ipv6-address | map-request | native-forward }
```

|                           |                                                                                 |                                                                                                                                                                                                                                                                       |
|---------------------------|---------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>destination-eid-prefix/prefix-len</i>                                        | Destination IPv4 or IPv6 EID-prefix/prefix-length. The slash is required in the syntax.                                                                                                                                                                               |
|                           | <i>ipv4-address</i> <b>priority</b> <i>priority</i> <b>weight</b> <i>weight</i> | IPv4 Address of loopback interface. Associated with this locator address is a priority and weight that are used to define traffic policies when multiple RLOCs are defined for the same EID-prefix block.<br><br><b>Note</b> Lower priority locator takes preference. |
|                           | <i>ipv6-address</i>                                                             | IPv6 Address of loopback interface.                                                                                                                                                                                                                                   |
|                           | <b>map-request</b>                                                              | Send map-request for LISP destination EID                                                                                                                                                                                                                             |
|                           | <b>native-forward</b>                                                           | Natively forward packets that match this map-request.                                                                                                                                                                                                                 |
|                           |                                                                                 |                                                                                                                                                                                                                                                                       |

**Command Default** None.

**Command Modes** LISP Instance Service (router-lisp-instance-service)

| <b>Command History</b> | <b>Release</b>              | <b>Modification</b>          |
|------------------------|-----------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

**Usage Guidelines** The first use of this command is to configure an Ingress Tunnel Router (ITR) with a static IPv4 or IPv6 EID-to-RLOC mapping relationship and its associated traffic policy. For each entry, a destination EID-prefix block and its associated locator, priority, and weight are entered. The value in the EID-prefix/prefix-length argument is the LISP EID-prefix block at the destination site. The locator is an IPv4 or IPv6 address of the remote site where the IPv4 or IPv6 EID-prefix can be reached. Associated with the locator address is a priority and weight that are used to define traffic policies when multiple RLOCs are defined for the same EID-prefix block.

```
device(config)#router lisp
device(config-router-lisp)#instance-id 3
device(config-router-lisp-inst)#service ipv4
device(config-router-lisp-inst-serv-ipv4)#map-cache 1.1.1.1/24 map-request
```

# map-cache extranet

To install all configured extranet prefixes into map-cache, use the **map-cache extranet** command in the instance-service ipv4 or instance-service ipv6 mode.

## map-cache extranet-registration

### Command Default

None.

### Command Modes

LISP Instance Service (router-lisp-instance-service)

### Command History

| Release                     | Modification                 |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

### Usage Guidelines

To support inter-VRF communication, use the **map-cache extranet** command on the Map Server Map Resolver (MSMR). This command generates map requests for all fabric destinations. Use this command in the service ipv4 or service ipv6 mode under the extranet instance.

```
device(config)#router lisp
device(config-router-lisp)#instance-id 3
device(config-router-lisp-inst)#service ipv4
device(config-router-lisp-inst-serv-ipv4)#map-cache extranet-registration
```

# prefix-list

To define a named LISP prefix set and to enter the LISP prefix-list configuration mode, use the **prefix-list** command in the Router LISP configuration mode. Use the **no** form of the command to remove the prefix list.

[no] **prefix-list** *prefix-list-name*

|                           |                                                                                                                                                                                                             |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>prefix-list</b> <i>prefix-list-name</i> Specifies the prefix list to be used and enters the prefix-list configuration mode.<br>Specifies IPv4 EID-prefixes or IPv6 EID-prefixes in the prefix-list mode. |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                        |                            |
|------------------------|----------------------------|
| <b>Command Default</b> | No prefix list is defined. |
|------------------------|----------------------------|

|                      |                    |
|----------------------|--------------------|
| <b>Command Modes</b> | LISP (router-lisp) |
|----------------------|--------------------|

| <b>Command History</b> | <b>Release</b>           | <b>Modification</b>          |
|------------------------|--------------------------|------------------------------|
|                        | Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

|                         |                                                                                                                                                                                                                                                                                                   |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | Use the <b>prefix-list</b> command to configure an IPV4 or IPV6 prefix list. This command places the router in prefix-list configuration mode, in which you can define IPV4 prefix list, or IPV6 prefix list. Use the <b>exit-prefix-list</b> command to exit the prefix-list-configuration mode. |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

```
device(config)#router lisp
device(config-router-lisp)#prefix-list wired
device(config-router-prefix-list)#2001:193:168:1::/64
device(config-router-lisp-prefix-list)#192.168.0.0/16
device(config-router-lisp-prefix-list)#exit-prefix-list
```

## route-import database

To configure the import of Routing Information Base (RIB) routes to define local endpoint identifier (EID) prefixes for database entries and associate them with a locator set, use the **route-import database** command in the instance service submode. To remove this configuration, use the **no** form of this command.

```
[no] route-import database
{ bgp | connected | eigrp | isis | maximum-prefix | ospf | ospfv3 | rip | static } { [route-map] locator-set
locator-set-name proxy }
```

| Syntax Description                            |  |                                                                                                |
|-----------------------------------------------|--|------------------------------------------------------------------------------------------------|
| <b>bgp</b>                                    |  | Border Gateway Protocol. Imports RIB routes into LISP using BGP protocol.                      |
| <b>connected</b>                              |  | Connected routing protocol                                                                     |
| <b>eigrp</b>                                  |  | Enhanced Interior Gateway Routing Protocol. Imports RIB routes into LISP using EIGRP protocol. |
| <b>isis</b>                                   |  | ISO IS-IS. Imports RIB routes into LISP using IS-IS protocol.                                  |
| <b>ospf</b>                                   |  | Open Shortest Path First                                                                       |
| <b>ospfv3</b>                                 |  | Open Shortest Path First version 3                                                             |
| <b>maximum-prefix</b>                         |  | Configures the maximum number of prefixes to pick up from the RIB.                             |
| <b>rip</b>                                    |  | Routing Information Protocol                                                                   |
| <b>static</b>                                 |  | Defines static routes.                                                                         |
| <b>locator-set</b><br><i>locator-set-name</i> |  | Specifies the Locator Set to be used with created database mapping entries.                    |
| <b>proxy</b>                                  |  | Enables the dynamic import of RIB route as proxy database mapping.                             |

**Command Default** None.

**Command Modes** LISP Instance Service (router-lisp-instance-service)

| Command History | Release                  | Modification                 |
|-----------------|--------------------------|------------------------------|
|                 | Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

**Usage Guidelines** Use the **route-import database** command with the **proxy** option to enable the dynamic import of RIB route as proxy database mapping. When RIB import is in use, the corresponding RIB map-cache import, using **route-import map-cache** command must also be configured, else the inbound site traffic will not pass the LISP eligibility check due to the presence of RIB route.

The following example shows how to configure the dynamic import of RIB route as proxy database:

```
device(config)#router lisp
device(config-router-lisp)#instance-id 3
```

```
device(config-router-lisp-inst)#service ipv4
device(config-router-lisp-inst-serv-ipv4)#eid-table default
device(config-router-lisp-inst-serv-ipv4)#database-mapping 193.168.0.0/16 locator-set RLOC
proxy
device(config-router-lisp-inst-serv-ipv4)#route-import map-cache bgp 65002 route-map
map-cache-database
device(config-router-lisp-inst-serv-ipv4)#route-import database bgp 65002 locator-set RLOC
proxy
```

# service

The **service** command creates a configuration template for all instance-service instantiations of that particular service.

**[no] service {ipv4 | ipv6 | ethernet}**

|                           |                         |                                                               |
|---------------------------|-------------------------|---------------------------------------------------------------|
| <b>Syntax Description</b> | <b>service ipv4</b>     | Enables Layer 3 network services for the IPv4 Address family. |
|                           | <b>service ipv6</b>     | Enables Layer 3 network services for the IPv6 Address family. |
|                           | <b>service ethernet</b> | Enables Layer 2 network services.                             |

**Command Default** None.

**Command Modes** LISP Instance (router-lisp-instance)  
LISP (router-lisp)

| <b>Command History</b> | <b>Release</b>              | <b>Modification</b>          |
|------------------------|-----------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

**Usage Guidelines** The **service** command creates a service instance under the instance-id and enters the instance-service mode. You cannot configure **service ethernet** for the same instance where **service ipv4** or **service ipv6** is configured.

Use the **no** form of the command to exit the service submode.

```
device(config)#router lisp
device(config-router-lisp)#instance-id 3
device(config-router-lisp-inst)#service ipv4
device(config-router-lisp-inst-serv-ipv4)#

device(config)#router lisp
device(config-router-lisp)#instance-id 5
device(config-router-lisp-inst)#service ethernet
device(config-router-lisp-inst-serv-ethernet)#
```

# show lisp instance-id ipv4 database

To display the operational status of the IPv4 address family and the database mappings on the device, use the **show lisp instance-id ipv4 database** command in the privileged EXEC mode.

**show lisp instance-id** *instance-id* **ipv4 database**

## Command Default

None.

## Command Modes

Privileged Exec

## Command History

| Release                      | Modification                                |

      proxy database size:               1
      Inactive (deconfig/away) size:     0
    Encapsulation type:                 vxlan

```

## show lisp instance-id ipv6 database

To display the operational status of the IPv6 address family and the database mappings on the device, use the **show lisp instance-id ipv6 database** command in the privileged EXEC mode.

**show lisp instance-id** *instance-id* **ipv6 database**

### Command Default

None.

### Command Modes

Privileged Exec

### Command History

| Release                      | Modification                                |
|------------------------------|---------------------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced.                |
| Cisco IOS XE Fuji 16.9.1     | Support for display of proxy database size. |

### Usage Guidelines

Use the command **show lisp instance-id id ipv6 database** to display the EID prefixes configured for a site. The following is a sample output:

```
device#show lisp instance-id 101 ipv6 database
LISP ETR IPv6 Mapping Database, LSBs: 0x1

EID-prefix: 2610:D0:1209::/48
  172.16.156.222, priority: 1, weight: 100, state: up, local

device#
```

## show lisp instance-id ipv4 map-cache

To display the IPv4 end point identifier (EID) to the Resource Locator (RLOC) cache mapping on an ITR, use the **show lisp instance-id ipv4 map-cache** command in the privileged Exec mode.

**show lisp instance-id** *instance-id* **ipv4 map-cache** [*destination-EID* | *destination-EID-prefix* | **detail**]

|                           |                               |                                                                                                                            |
|---------------------------|-------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>destination-EID</i>        | (Optional) Specifies the IPv4 destination end point identifier (EID) for which the EID-to-RLOC mapping is displayed.       |
|                           | <i>destination-EID-prefix</i> | (Optional) Specifies the IPv4 destination EID prefix (in the form of <i>a.b.c.d/nn</i> ) for which to display the mapping. |
|                           | <b>detail</b>                 | (Optional) Displays detailed EID-to-RLOC cache mapping information.                                                        |
| <b>Command Default</b>    | None.                         |                                                                                                                            |
| <b>Command Modes</b>      | Privileged Exec               |                                                                                                                            |
| <b>Command History</b>    | <b>Release</b>                | <b>Modification</b>                                                                                                        |
|                           | Cisco IOS XE Everest 16.5.1a  | Introduced this command.                                                                                                   |

**Usage Guidelines** This command is used to display the current dynamic and static IPv4 EID-to-RLOC map-cache entries. When no IPv4 EID or IPv4 EID prefix is specified, summary information is listed for all current dynamic and static IPv4 EID-to-RLOC map-cache entries. When an IPv4 EID or IPv4 EID prefix is included, information is listed for the longest-match lookup in the cache. When the detail option is used, detailed (rather than summary) information related to all current dynamic and static IPv4 EID-to-RLOC map-cache entries is displayed.

The following are sample outputs from the **show lisp instance-id ipv4 map-cache** commands:

```
device# show lisp instance-id 102 ipv4 map-cache
LISP IPv4 Mapping Cache for EID-table vrf blue (IID 102), 4008 entries

# show lisp instance-id ipv6 map-cache

To display the IPv6 end point identifier (EID) to the Resource Locator (RLOC) cache mapping on an ITR, use the **show lisp instance-id ipv6 map-cache** command in the privileged EXEC mode.

**show lisp instance-id** *instance-id* **ipv6 map-cache** [*destination-EID* | *destination-EID-prefix* | **detail**]

|                           |                               |                                                                                                                            |
|---------------------------|-------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>destination-EID</i>        | (Optional) Specifies the IPv4 destination end point identifier (EID) for which the EID-to-RLOC mapping is displayed.       |
|                           | <i>destination-EID-prefix</i> | (Optional) Specifies the IPv4 destination EID prefix (in the form of <i>a.b.c.d/nn</i> ) for which to display the mapping. |
|                           | <b>detail</b>                 | (Optional) Displays detailed EID-to-RLOC cache mapping information.                                                        |
| <b>Command Default</b>    | None.                         |                                                                                                                            |
| <b>Command Modes</b>      | Privileged Exec               |                                                                                                                            |
| <b>Command History</b>    | <b>Release</b>                | <b>Modification</b>                                                                                                        |
|                           | Cisco IOS XE Everest 16.5.1a  | Introduced this command.                                                                                                   |

**Usage Guidelines** This command is used to display the current dynamic and static IPv6 EID-to-RLOC map-cache entries. When no IPv6 EID or IPv6 EID prefix is specified, summary information is listed for all current dynamic and static IPv4 EID-to-RLOC map-cache entries. When an IPv6 EID or IPv6 EID prefix is included, information is listed for the longest-match lookup in the cache. When the detail option is used, detailed (rather than summary) information related to all current dynamic and static IPv6 EID-to-RLOC map-cache entries is displayed.

The following is a sample output from the **show lisp instance-id ipv6 map-cache** command:

```
device# show lisp instance-id 101 ipv6 map-cache
LISP IPv6 Mapping Cache, 2 entries

::/0, uptime: 00:00:26, expires: never, via static
  Negative cache entry, action: send-map-request
2001:DB8:AB::/48, uptime: 00:00:04, expires: 23:59:53, via map-reply, complete
  Locator   Uptime   State    Pri/Wgt
  10.0.0.6   00:00:04   up       1/100
```

The following sample output from the **show lisp instance-id x ipv6 map-cache detail** command displays a detailed list of current dynamic and static IPv6 EID-to-RLOC map-cache entries:

```
device# show lisp instance-id 101 ipv6 map-cache detail
LISP IPv6 Mapping Cache, 2 entries

::/0, uptime: 00:00:52, expires: never, via static
  State: send-map-request, last modified: 00:00:52, map-source: local
  Idle, Packets out: 0
  Negative cache entry, action: send-map-request
2001:DB8:AB::/48, uptime: 00:00:30, expires: 23:59:27, via map-reply, complete
  State: complete, last modified: 00:00:30, map-source: 10.0.0.6
  Active, Packets out: 0
  Locator   Uptime   State    Pri/Wgt
```

```
10.0.0.6 00:00:30 up          1/100
  Last up-down state change:      never, state change count: 0
  Last priority / weight change:  never/never
  RLOC-probing loc-status algorithm:
    Last RLOC-probe sent:        never
```

The following sample output from the show ipv6 lisp map-cache command with a specific IPv6 EID prefix displays detailed information associated with that IPv6 EID prefix entry.

```
device#show lisp instance-id 101 ipv6 map-cache 2001:DB8:AB::/48
LISP IPv6 Mapping Cache, 2 entries

2001:DB8:AB::/48, uptime: 00:01:02, expires: 23:58:54, via map-reply, complete
  State: complete, last modified: 00:01:02, map-source: 10.0.0.6
  Active, Packets out: 0
  Locator  Uptime    State      Pri/Wgt
  10.0.0.6 00:01:02 up          1/100
    Last up-down state change:      never, state change count: 0
    Last priority / weight change:  never/never
    RLOC-probing loc-status algorithm:
      Last RLOC-probe sent:        never
```

# show lisp instance-id ipv4 server

To display the LISP site registration information, use the **show lisp instance-id ipv4 server** command in the privileged EXEC mode.

**show lisp instance-id *instance-id* ipv4 server** [*EID-address* | *EID-prefix* | **detail** | **name** | **rloc** | **summary**]

|                           |                    |                                                                             |
|---------------------------|--------------------|-----------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>EID-address</i> | (Optional) Displays site registration information for this end point.       |
|                           | <i>EID-prefix</i>  | (Optional) Displays site registration information for this IPv4 EID prefix. |
|                           | <b>detail</b>      | (Optional) Displays a detailed site information.                            |
|                           | <b>name</b>        | (Optional) Displays the site registration information for the named site.   |
|                           | <b>rloc</b>        | (Optional) Displays the RLOC-EID instance membership details.               |
|                           | <b>summary</b>     | (Optional) Displays summary information for each site.                      |

**Command Default** None.

**Command Modes** Privileged Exec

| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|------------------------|------------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** When a host is detected by the tunnel router (xTR), it registers the host with the map server (MS). Use the **show lisp instance-id x ipv4 server** command to see the site registration details. TCP registrations display the port number, whereas UDP registration do not display port number. The port number is 4342 by default for UDP registration.

The following are sample outputs of the command :

```
device# show lisp instance-id 100 ipv4 server
LISP Site Registration Information
* = Some locators are down or unreachable
# = Some registrations are sourced by reliable transport

Site Name      Last      Up      Who Last      Inst      EID Prefix
Register      Registered
XTR            00:03:22  yes*#   172.16.1.4:64200  100      101.1.0.0/16
              00:03:16  yes#    172.16.1.3:19881  100      101.1.1.1/32
```

```
device# show lisp instance-id 100 ipv4 server 101.1.0.0/16
LISP Site Registration Information

Site name: XTR
Allowed configured locators: any
Requested EID-prefix:

EID-prefix: 101.1.0.0/16 instance-id 100
First registered:    00:04:24
Last registered:    00:04:20
```

```

Routing table tag:      0

# show lisp instance-id ipv6 server

To display the LISP site registration information, use the **show lisp instance-id ipv6 server** command in the privileged EXEC mode.

**show lisp instance-id** *instance-id* **ipv6 server** [*EID-address* | *EID-prefix* | **detail** | **name** | **rloc** | **summary**]

|                           |                    |                                                                             |
|---------------------------|--------------------|-----------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>EID-address</i> | (Optional) Displays site registration information for this end point.       |
|                           | <i>EID-prefix</i>  | (Optional) Displays site registration information for this IPv6 EID prefix. |
|                           | <b>detail</b>      | (Optional) Displays a detailed site information.                            |
|                           | <b>name</b>        | (Optional) Displays the site registration information for the named site.   |
|                           | <b>rloc</b>        | (Optional) Displays the RLOC-EID instance membership details.               |
|                           | <b>summary</b>     | (Optional) Displays summary information for each site.                      |

**Command Default** None.

**Command Modes** Privileged Exec

| <b>Command History</b> | <b>Release</b>              | <b>Modification</b>          |
|------------------------|-----------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

**Usage Guidelines** When a host is detected by the tunnel router (xTR), it registers the host with the map server (MS). Use the **show lisp instance-id ipv6 server** command to see the site registration details.

## show lisp instance-id ipv4 statistics

To display Locator/ID Separation Protocol (LISP) IPv4 address-family packet count statistics, use the **show lisp instance-id ipv4 statistics** command in the privileged EXEC mode.

**show lisp instance-id** *instance-id* **ipv4 statistics**

---

**Command Default**

None.

---

**Command Modes**

Privileged Exec

---

**Command History**

| Release                     | Modification                 |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

---

**Usage Guidelines**

This command is used to display IPv4 LISP statistics related to packet encapsulations, de-encapsulations, map requests, map replies, map registers, and other LISP-related packets.

The following are sample outputs of the command :

```
device# show lisp instance-id 100 ipv4 statistics
```

## show lisp instance-id ipv6 statistics

To display Locator/ID Separation Protocol (LISP) IPv6 address-family packet count statistics, use the **show lisp instance-id ipv6 statistics** command in the privileged EXEC mode.

**show lisp instance-id** *instance-id* **ipv6 statistics**

### Command Default

None.

### Command Modes

Privileged Exec

### Command History

| Release                     | Modification                 |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

### Usage Guidelines

This command is used to display IPv4 LISP statistics related to packet encapsulations, de-encapsulations, map requests, map replies, map registers, and other LISP-related packets.

The following are sample outputs of the command :

```
device# show lisp instance-id 100 ipv6 statistics
```

# show lisp prefix-list

To display the LISP prefix-list information, use the **show lisp prefix-list** command in the privileged EXEC mode.

**show lisp prefix-list** [*name-prefix-list*]

|                           |                                                                                              |
|---------------------------|----------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>name-prefix-list</i> (Optional) Specifies the prefix-list whose information is displayed. |
|---------------------------|----------------------------------------------------------------------------------------------|

|                        |       |
|------------------------|-------|
| <b>Command Default</b> | None. |
|------------------------|-------|

|                      |                 |
|----------------------|-----------------|
| <b>Command Modes</b> | Privileged Exec |
|----------------------|-----------------|

| Command History | Release                  | Modification                 |
|-----------------|--------------------------|------------------------------|
|                 | Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

|                         |                                                                                 |
|-------------------------|---------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The following is a sample output from the <b>show lisp prefix-list</b> command: |
|-------------------------|---------------------------------------------------------------------------------|

```
device# show lisp prefix-list
Lisp Prefix List information for router lisp 0

Prefix List: set
  Number of entries: 1
  Entries:
  1.2.3.4/16
  Sources: static
```

# show lisp session

To display the current list of reliable transport sessions in the fabric, use the **show lisp session** command in the privileged EXEC mode.

**show lisp session** [**all** | **established**]

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                              |  |  |  |

|                    | Cisco IOS XE Everest 16.6.1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | This command was introduced. |  |  |  |
| Usage Guidelines   | <p>The <b>show lisp session</b> command displays only those sessions that are in Up or Down state. Use the <b>show lisp session all</b> command to see all sessions in any state.</p> <p>The following is a sample output of the command <b>show lisp session</b> on an MSMR:</p> <pre>device# show lisp session Sessions for VRF default, total: 4, established: 2 Peer                               State      Up/Down      In/Out      Users 172.16.1.3:22667                   Up         00:00:52     4/8         2 172.16.1.4:18904                   Up         00:22:15     5/13        1  device# show lisp session all Sessions for VRF default, total: 4, established: 2 Peer                               State      Up/Down      In/Out      Users 172.16.1.3                         Listening   never         0/0         0 172.16.1.3:22667                   Up         00:01:13     4/8         2 172.16.1.4                         Listening   never         0/0         0 172.16.1.4:18904                   Up         00:22:36     5/13        1</pre> |                              |  |  |  |

## use-petr

To configure a router to use an IPv4 or IPv6 Locator/ID Separation Protocol (LISP) Proxy Egress Tunnel Router (PETR), use the **use-petr** command in LISP Instance configuration mode or LISP Instance Service configuration mode. To remove the use of a LISP PETR, use the **no** form of this command.

[no] **use-petr** *locator-address* [**priority** *priority* **weight** *weight*]

|                           |                                 |                                                                                                                               |
|---------------------------|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>locator-address</i>          | The name of locator-set that is set as default.                                                                               |
|                           | <b>priority</b> <i>priority</i> | (Optional) Specifies the priority (value between 0 and 255) assigned to this PETR. A lower value indicates a higher priority. |
|                           | <b>weight</b> <i>weight</i>     | (Optional) Specifies the percentage of traffic to be load-shared (value between 0 and 100).                                   |

**Command Default** The router does not use PETR services.

**Command Modes** LISP Service (router-lisp-service)  
LISP Instance-Service (router-lisp-instance-service)

### Usage Guidelines

Use the **use-petr** command to enable an Ingress Tunnel Router (ITR) or Proxy Ingress Tunnel Router (PITR) to use IPv4 Proxy Egress Tunnel Router (PETR) services. When the use of PETR services is enabled, instead of natively forwarding LISP endpoint identifier (EID) (source) packets destined to non-LISP sites, these packets are LISP-encapsulated and forwarded to the PETR. Upon receiving these packets, the PETR decapsulates them and then forwards them natively toward the non-LISP destination.

Do not use **use-petr** command in Service-Ethernet configuration mode.

PETR services may be necessary in several cases:

1. By default when a LISP site forwards packets to a non-LISP site natively (not LISP encapsulated), the source IP address of the packet is that of an EID. When the provider side of the access network is configured with strict unicast reverse path forwarding (uRPF) or an anti-spoofing access list, it may consider these packets to be spoofed and drop them since EIDs are not advertised in the provider core network. In this case, instead of natively forwarding packets destined to non-LISP sites, the ITR encapsulates these packets using its site locator(s) as the source address and the PETR as the destination address.

#### Note

The use of the **use-petr** command does not change LISP-to-LISP or non-LISP-to-non-LISP forwarding behavior. LISP EID packets destined for LISP sites will follow normal LISP forwarding processes and be sent directly to the destination ETR as normal. Non-LISP-to-non-LISP packets are never candidates for LISP encapsulation and are always forwarded natively according to normal processes.

2. When a LISP IPv6 (EID) site needs to connect to a non-LISP IPv6 site and the ITR locators or some portion of the intermediate network does not support IPv6 (it is IPv4 only), the PETR can be used to traverse (hop over) the address family incompatibility, assuming that the PETR has both IPv4 and IPv6 connectivity. The ITR in this case can LISP-encapsulate the IPv6 EIDs with IPv4 locators destined for the PETR, which de-encapsulates the packets and forwards them natively to the non-LISP IPv6 site over its IPv6 connection. In this case, the use of the PETR effectively allows the LISP site packets to traverse the IPv4 portion of network using the LISP mixed protocol encapsulation support.

## Examples

The following example shows how to configure an ITR to use the PETR with the IPv4 locator of 10.1.1.1. In this case, LISP site IPv4 EIDs destined to non-LISP IPv4 sites are encapsulated in an IPv4 LISP header destined to the PETR located at 10.1.1.1:

```
device(config)# router lisp
device(config-router-lisp)#service ipv4
device(config-router-lisp-serv-ipv4)# use-petr 10.1.1.1
```

The following example configures an ITR to use two PETRs: one has an IPv4 locator of 10.1.1.1 and is configured as the primary PETR (priority 1 weight 100), and the other has an IPv4 locator of 10.1.2.1 and is configured as the secondary PETR (priority 2 weight 100). In this case, LISP site IPv4 EIDs destined to non-LISP IPv4 sites will be encapsulated in an IPv4 LISP header to the primary PETR located at 10.1.1.1 unless it fails, in which case the secondary will be used.

```
Router(config-router-lisp-serv-ipv4)# use-petr 10.1.1.1 priority 1 weight 100
Router(config-router-lisp-serv-ipv4)# use-petr 10.1.2.1 priority 2 weight 100
```

# address (CTS)

To configure the Cisco TrustSec policy-server address, use the **address** command in policy-server configuration mode. To remove the address of the policy server, use the **no** form of this command.

**address** {**domain-name** *name* | **ipv4** *policy-server-address* | **ipv6** *policy-server-address*}  
**no address** {**domain-name** | **ipv4** | **ipv6**}

|                    |                                          |                                                  |
|--------------------|------------------------------------------|--------------------------------------------------|
| Syntax Description | <b>domain-name</b> <i>name</i>           | Specifies the domain name of the policy server.  |
|                    | <b>ipv4</b> <i>policy-server-address</i> | Specifies the IP address of the policy server.   |
|                    | <b>ipv6</b>                              | Specifies the IPv6 address of the policy server. |

**Command Default** Policy server address is not configured.

**Command Modes** Policy-server configuration (config-policy-server)

| Command History | Release                       | Modification                 |
|-----------------|-------------------------------|------------------------------|
|                 | Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

**Usage Guidelines** Configure the policy server name to enter the policy-server configuration mode.

## Examples

The following example shows how configure the domain name of the policy-server:

```
Device# enable
Device# configure terminal
Device(config)# policy-server name ise_server_2
Device(config-policy-server)# address domain-name ISE_domain
```

The following example shows how configure the IP address of the policy-server:

```
Device# enable
Device# configure terminal
Device(config)# cts policy-server name ise_server_2
Device(config-policy-server)# address ipv4 10.1.1.1
```

|------------------|-------------------------------|-------------------------------------------------------------------------------------|
|                  | <b>cts policy-server name</b> | Configures the name of a policy server and enters policy-server configuration mode. |

# clear cts environment-data

To clear Cisco TrustSec environment data, use the **clear cts environment-data** command in privileged EXEC mode.

## clear cts environment-data

This command has no arguments or keywords.

### Command Modes

Privileged EXEC (#)

### Command History

| Release                       | Modification                 |
|-------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

### Examples

The following example shows how to clear environment data:

```
Device# enable
Device# clear cts environment-data
```

### Related Commands

| Command                            | Description                                                          |
|------------------------------------|----------------------------------------------------------------------|
| <b>cts environment-data enable</b> | Enables the download of environment data.                            |
| <b>debug cts environment-data</b>  | Enables the debugging of Cisco TrustSec environment data operations. |
| <b>show cts environment-data</b>   | Displays Cisco TrustSec environment data information.                |

# clear cts policy-server statistics

To clear Cisco TrustSec policy-server statistics, use the **clear cts policy-server statistics** command in privileged EXEC mode.

**clear cts policy-server statistics** {**active** | **all**}

|                           |               |                                                 |
|---------------------------|---------------|-------------------------------------------------|
| <b>Syntax Description</b> | <b>active</b> | Clears statistics of all active policy servers. |
|                           | <b>all</b>    | Clears all policy server statistics.            |

|                      |                     |
|----------------------|---------------------|
| <b>Command Modes</b> | Privileged EXEC (#) |
|----------------------|---------------------|

|                        |                               |                              |
|------------------------|-------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>                | <b>Modification</b>          |
|                        | Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

## Examples

The following example shows how to clear all policy-server statistics:

```
Device# enable
Device# clear cts policy-server statistics all
```

|                         |                               |                                                                                        |
|-------------------------|-------------------------------|----------------------------------------------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>                | <b>Description</b>                                                                     |
|                         | <b>cts policy-server name</b> | Configures a Cisco TrustSec policy server and enters policy-server configuration mode. |

## content-type json

To enable the JavaScript Object Notation (JSON) as the content type, use the **content-type json** command in policy-server configuration mode. To remove the content-type, use the **no** form of this command.

**content-type json**  
**no content-type json**

This command has no arguments or keywords.

|                        |                               |
|------------------------|-------------------------------|
| <b>Command Default</b> | JSON content-type is enabled. |
|------------------------|-------------------------------|

|                      |                                                    |
|----------------------|----------------------------------------------------|
| <b>Command Modes</b> | Policy-server configuration (config-policy-server) |
|----------------------|----------------------------------------------------|

|                        |                               |                              |
|------------------------|-------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>                | <b>Modification</b>          |
|                        | Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

|                         |                                                                                                                                                               |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | JSON is used as the content-type to download Security Group access control lists (SGACLs) and environment data from the Cisco Identity Services Engine (ISE). |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                 |                                                                  |
|-----------------|------------------------------------------------------------------|
| <b>Examples</b> | The following example shows how to enable the JSON content-type: |
|-----------------|------------------------------------------------------------------|

```
Device# enable
Device# configure terminal
Device(config)# policy-server name ise_server_2
Device(config-policy-server)# content-type json
```

|                         |                               |                                                                                     |
|-------------------------|-------------------------------|-------------------------------------------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>                | <b>Description</b>                                                                  |
|                         | <b>cts policy-server name</b> | Configures the name of a policy server and enters policy-server configuration mode. |

# cts authorization list

To specify a list of authentication, authorization, and accounting (AAA) servers to be used by the TrustSec seed device, use the **cts authorization list** command on the Cisco TrustSec seed device in global configuration mode. Use the **no** form of the command to stop using the list during authentication.

**cts authorization list** *server\_list*

**no cts authorization list** *server\_list*

|                           |                                                     |
|---------------------------|-----------------------------------------------------|
| <b>Syntax Description</b> | <i>server_list</i> Cisco TrustSec AAA server group. |
|---------------------------|-----------------------------------------------------|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

## Supported User Roles

Administrator

| Command History | Release                  | Modification                 |
|-----------------|--------------------------|------------------------------|
|                 | Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

|                         |                                                                                                                                                                                          |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | This command is only for the seed device. Non-seed devices obtain the TrustSec AAA server list from their TrustSec authenticator peer as a component of their TrustSec environment data. |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The following example displays an AAA configuration of a TrustSec seed device:

```
Device# cts credentials id Device1 password Cisco123
Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa authentication dot1x default group radius
Device(config)# aaa authorization network MLIST group radius
Device(config)# cts authorization list MLIST
Device(config)# aaa accounting dot1x default start-stop group radius
Device(config)# radius-server host 10.20.3.1 auth-port 1812 acct-port 1813 pac key
AbCe1234
Device(config)# radius-server vsa send authentication
Device(config)# dot1x system-auth-control
Device(config)# exit
```

| <b>Usage Guidelines</b>   | The <b>cts change-password</b> command allows an administrator to change the password used between the local device and the Cisco Secure ACS authentication server, without having to reconfigure the authentication server. |                                                                                                                                         |
|                           | The following example shows how to change the Cisco TrustSec password between a switch and a Cisco Secure ACS:                                                                                                               |                                                                                                                                         |
|                           | Device# <b>cts change-password server 192.168.2.2 88 a-id ffef</b>                                                                                                                                                           |                                                                                                                                         |

# cts credentials

Use the **cts credentials** command in privileged EXEC mode to specify the TrustSec ID and password of the network device. Use the **clear cts credentials** command to delete the credentials.

**cts credentials id** *cts\_id* **password** *cts\_pwd*

|                           |                                                                                                                                                                                                                                                                |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>credentials id</b> <i>cts_id</i> Specifies the Cisco TrustSec device ID for this device to use when authenticating with other Cisco TrustSec devices with EAP-FAST. The <i>cts-id</i> variable has a maximum length of 32 characters and is case sensitive. |
|                           | <b>password</b> <i>cts_pwd</i> Specifies the password for this device to use when authenticating with other Cisco TrustSec devices with EAP-FAST.                                                                                                              |

**Command Default** None

**Command Modes** Privileged EXEC (#)

## Supported User Roles

Administrator

| <b>Command History</b> | <b>Release</b>           | <b>Modification</b>          |
|------------------------|--------------------------|------------------------------|
|                        | Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

**Usage Guidelines** The **cts credentials** command specifies the Cisco TrustSec device ID and password for this device to use when authenticating with other Cisco TrustSec devices with EAP-FAST. The Cisco TrustSec credentials state retrieval is not performed by the nonvolatile generation process (NVGEN) because the Cisco TrustSec credential information is saved in the keystore, and not in the startup configuration. The device can be assigned a Cisco TrustSec identity by the Cisco Secure Access Control Server (ACS), or a new password auto-generated when prompted to do so by the ACS. These credentials are stored in the keystore, eliminating the need to save the running configuration. To display the Cisco TrustSec device ID, use the **show cts credentials** command. The stored password is never displayed.

To change the device ID or the password, reenter the command. To clear the keystore, use the **clear cts credentials** command.

**Note** When the Cisco TrustSec device ID is changed, all Protected Access Credentials (PACs) are flushed from the keystore because PACs are associated with the old device ID and are not valid for a new identity.

The following example shows how to configure the Cisco TrustSec device ID and password:

```
Device# cts credentials id cts1 password password1
```

CTS device ID and password have been inserted in the local keystore. Please make sure that the same ID and password are configured in the server database.

The following example show how to change the Cisco TrustSec device ID and password to cts\_new and password123, respectively:

```
Device# cts credentials id cts_new password password123
A different device ID is being configured.
This may disrupt connectivity on your CTS links.
Are you sure you want to change the Device ID? [confirm] y
```

TS device ID and password have been inserted in the local keystore. Please make sure that the same ID and password are configured in the server database.

The following sample output displays the Cisco TrustSec device ID and password state:

```
Device# show cts credentials
```

```
CTS password is defined in keystore, device-id = cts_new
```

|------------------------------|--------------------------------------------------------------------------|
| <b>clear cts credentials</b> | Clears the Cisco TrustSec device ID and password.                        |
| <b>show cts credentials</b>  | Displays the state of the current Cisco TrustSec device ID and password. |
| <b>show cts keystore</b>     | Displays contents of the hardware and software keystores.                |

## cts environment-data enable

To enable the download of environment data through REST application programming interfaces (APIs), use the **cts environment-data enable** command in global configuration mode. To disable the download of environment data, use the **no** form of this command.

**cts environment-data enable**  
**no cts environment-data enable**

This command has no arguments or keywords.

|                        |                                           |
|------------------------|-------------------------------------------|
| <b>Command Default</b> | Environment data download is not enabled. |
|------------------------|-------------------------------------------|

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |

|-----------------|-------------------------------|------------------------------|
|                 | Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

|                         |                                                                                                                                                                                                                   |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The <b>cts environment-data enable</b> command cannot co-exist with the <b>cts authorization list</b> command. The <b>cts authorization list</b> command enables the download of environment data through RADIUS. |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

If you try to configure RADIUS-based configuration by using the **cts authorization list** command, when the **cts environment-data enable** command is already configured, the following error message is displayed on the console:

```
Error: 'cts policy-server or cts environment-data' related configs are enabled.  
Disable http-based configs, to enable 'cts authorization'
```

|                 |                                                                      |
|-----------------|----------------------------------------------------------------------|
| <b>Examples</b> | The following example shows how to enable environment data download: |
|-----------------|----------------------------------------------------------------------|

```
Device# enable  
Device# configure terminal  
Device(config)# cts environment-data enable
```

|                           | Cisco IOS XE Amsterdam 17.1.1                                                                                                                                                                    | This command was introduced.                                                           |
| <b>Usage Guidelines</b>   | The device ID must be the same one that was used to add the network access device (NAD) on Cisco Identity Services Engine (ISE). This ID is used to send environment data requests to Cisco ISE. |                                                                                        |
| <b>Examples</b>           | <p>The following example shows how to configure the policy-server device ID:</p> <pre>Device# enable Device# configure terminal Device(config)# cts policy-server device-id server1</pre>        |                                                                                        |
| <b>Related Commands</b>   | <b>Command</b>                                                                                                                                                                                   | <b>Description</b>                                                                     |
|                           | <b>cts policy-server name</b>                                                                                                                                                                    | Configures a Cisco TrustSec policy server and enters policy-server configuration mode. |

## cts policy-server name

To configure a Cisco TrustSec policy server and enter policy-server configuration mode, use the **cts policy-server name** command in global configuration mode. To remove the policy server, use the **no** form of this command.

**cts policy-server name** *server-name*  
**no cts policy-server name** *server-name*

|                           |                                                                                                                                                                                                                                 |                                     |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------|

|                           | <b>show cts policy-server</b>                                                                                                                                                                                                   | Displays policy server information. |

# cts policy-server order random

To change the server-selection logic to random, use the **cts policy-server order random** command in global configuration mode. To go back to the default, use the **no** form of this command.

**cts policy-server order random**  
**no cts policy-server order random**

This command has no arguments or keywords.

**Command Default** In-order selection is the default.

**Command Modes** Global configuration (config)

| Command History | Release                       | Modification                 |
|-----------------|-------------------------------|------------------------------|
|                 | Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

**Usage Guidelines** When multiple HTTP policy servers are configured on a device, a single Cisco Identity Services Engine (ISE) instance may get overloaded if the device always selects the first configured server. To avoid this situation, each device randomly selects a server. A random number is generated by the device and based on this number a server is selected. For different devices to generate random numbers, the unique board ID and the Cisco TrustSec process ID of the device is used to initialize the random number generator.

To change the server selection logic to random, use the **cts policy-server order random** command. If this command is not selected, the default in-order selection is retained.

In-order selection is when servers are picked in the order in which they are configured (from the public server list) or downloaded (from the private server list). Once a server is selected, the server is used till it is marked as dead, and then the next server in the list is selected.

## Examples

The following example shows how to change the server selection logic:

```
Device# enable
Device# configure terminal
Device(config)# cts policy-server order random
```

| Related Commands | Command                | Description                                                                            |
|------------------|------------------------|----------------------------------------------------------------------------------------|
|                  | cts policy-server name | Configures a Cisco TrustSec policy server and enters policy-server configuration mode. |

## cts policy-server username

To configure a policy-server username, use the **cts policy-server username** command in global configuration mode. To remove the policy server username, use the **no** form of this command.

**cts policy-server username** *username* **password** {**0** | **6** | **7** *password*} *password*  
**no** cts policy-server username

|                           |                 |                                                                    |
|---------------------------|-----------------|--------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>username</i> | Username to access REST application programming interfaces (APIs). |
|                           | <b>password</b> | Specifies the password to authenticate the user.                   |
|                           | <b>0</b>        | Specifies an unencrypted password.                                 |
|                           | <b>6</b>        | Specifies an encrypted password.                                   |
|                           | <b>7</b>        | Specifies a hidden password.                                       |
|                           | <i>password</i> | Encrypted or unencrypted password.                                 |

**Command Default** User credentials are not configured.

**Command Modes** Global configuration (config)

|                        |                               |                              |
|------------------------|-------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>                | <b>Modification</b>          |
|                        | Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

**Usage Guidelines** You must configure the username and password in Cisco Identity Services Engine (ISE) as the REST API access credentials, before configuring it on the device. See the [Cisco TrustSec HTTP Servers](#) section of the "Cisco TrustSec Policies Configuration" chapter for more information.

### Examples

The following example shows how to configure the policy server credentials:

```
Device# enable
Device# configure terminal
Device(config)# policy-server username user1 password 0 ise-password
```

|                         |                               |                                                                                     |
|-------------------------|-------------------------------|-------------------------------------------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>                | <b>Description</b>                                                                  |
|                         | <b>cts policy-server name</b> | Configures the name of a policy server and enters policy-server configuration mode. |

## cts refresh

To refresh the TrustSec peer authorization policy of all or specific Cisco TrustSec peers, or to refresh the SGACL policies downloaded to the device by the authentication server, use the **cts refresh** command in privileged EXEC mode.

```
cts refresh {peer [peer_id] | sgt [{sgt_number | default | unknown}]}
```

| Syntax Description           | environment-data                                                                                                                                                                      |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                              | Refreshes environment data.                                                                                                                                                           |
| <b>peer</b> <i>Peer-ID</i>   | (Optional) If a peer-id is specified, only policies related to the specified peer connection are refreshed.                                                                           |
| <b>sgt</b> <i>sgt_number</i> | (Optional) Performs an immediate refresh of the SGACL policies from the authentication server.<br><br>If an SGT number is specified, only policies related to that SGT are refreshed. |
| <b>default</b>               | (Optional) Refreshes the default SGACL policy.                                                                                                                                        |
| <b>unknown</b>               | (Optional) Refreshes the unknown SGACL policy.                                                                                                                                        |

**Command Default** None

**Command Modes** Privileged EXEC (#)

### Supported User Roles

Administrator

| Command History | Release                  | Modification                 |
|-----------------|--------------------------|------------------------------|
|                 | Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

**Usage Guidelines** To refresh the Peer Authorization Policy on all TrustSec peers, enter **cts policy refresh** without specifying a peer ID.

The peer authorization policy is initially downloaded from the Cisco ACS at the end of the EAP-FAST NDAC authentication success. The Cisco ACS is configured to refresh the peer authorization policy, but the **cts policy refresh** command can force immediate refresh of the policy before the Cisco ACS timer expires. This command is relevant only to TrustSec devices that can impose Security Group Tags (SGTs) and enforce Security Group Access Control Lists (SGACLs).

The following example shows how to refresh the TrustSec peer authorization policy of all peers:

```
Device# cts policy refresh
Policy refresh in progress
```

The following sample output displays the TrustSec peer authorization policy of all peers:

```
VSS-1# show cts policy peer
```

```
CTS Peer Policy
=====
device-id of the peer that this local device is connected to
Peer name: VSS-2T-1
Peer SGT: 1-02
Trusted Peer: TRUE
Peer Policy Lifetime = 120 secs
Peer Last update time = 12:19:09 UTC Wed Nov 18 2009
Policy expires in 0:00:01:51 (dd:hr:mm:sec)
Policy refreshes in 0:00:01:51 (dd:hr:mm:sec)
Cache data applied = NONE
```

|                         |                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | SAP Pair-wise Master Key key (PMK) refresh ordinarily occurs automatically, triggered by combinations of network events and non-configurable internal timers related to dot1X authentication. The ability to manually refresh encryption keys is often part of network administration security requirements. To manually force a PMK refresh, use the <b>cts rekey</b> command. |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

TrustSec supports a manual configuration mode where dot1X authentication is not required to create link-to-link encryption between switches. In this case, the PMK is manually configured on devices on both ends of the link with the **sap pmk** Cisco TrustSec manual interface configuration command.

The following example shows how to regenerate the PMK on a specified interface:

```
Device# cts rekey interface gigabitEthernet 2/1
```

|                         |                                   |                                                |
|-------------------------|-----------------------------------|------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>                    | <b>Description</b>                             |
|                         | <b>sap mode-list (cts manual)</b> | Configures Cisco TrustSec SAP for manual mode. |

## cts role-based enforcement

To enable role-based access control globally and on specific Layer 3 interfaces using Cisco TrustSec, use the **cts role-based enforcement** command in global configuration mode and interface configuration mode respectively. To disable the enforcement of role-based access control at an interface level, use the **no** form of this command.

**cts role-based enforcement**  
**no cts role-based enforcement**

|                           |                                                                                      |
|---------------------------|--------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | This command has no keywords or arguments.                                           |
| <b>Command Default</b>    | Enforcement of role-based access control at an interface level is disabled globally. |
| <b>Command Modes</b>      | Global configuration (config)<br>Interface configuration (config-if)                 |

| Command History | Release                  | Modification                 |
|-----------------|--------------------------|------------------------------|
|                 | Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

**Usage Guidelines**

The **cts role-based enforcement** command in global configuration mode enables role-based access control globally. Once role-based access control is enabled globally, it is automatically enabled on every Layer 3 interface on the device. To disable role-based access control on specific Layer 3 interfaces, use the **no** form of the command in interface configuration mode. The **cts role-based enforcement** command in interface configuration mode enables enforcement of role-based access control on specific Layer 3 interfaces.

The attribute-based access control list organizes and manages the Cisco TrustSec access control on a network device. The security group access control list (SGACL) is a Layer 3-4 access control list to filter access based on the value of the security group tag (SGT). The filtering usually occurs at an egress port of the Cisco TrustSec domain. The terms role-based access control list (RBACL) and SGACL can be used interchangeably, and they refer to a topology-independent ACL used in an attribute-based access control (ABAC) policy model.

The following example shows how to enable role-based access control on a Gigabit Ethernet interface:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 1/1/3
Device(config-if)# cts role-based enforcement
Device(config-if)# end
```

## cts role-based l2-vrf

To select a virtual routing and forwarding (VRF) instance for Layer 2 VLANs, use the **cts role-based l2-vrf** command in global configuration mode. To remove the configuration, use the **no** form of this command.

```
cts role-based l2-vrf vrf-name vlan-list {all vlan-ID} [{,}] [{-}]
no cts role-based l2-vrf vrf-name vlan-list {all vlan-ID} [{,}] [{-}]
```

### Syntax Description

|                  |                                                               |
|------------------|---------------------------------------------------------------|
| <i>vrf-name</i>  | Name of the VRF instance.                                     |
| <b>vlan-list</b> | Specifies the list of VLANs to be assigned to a VRF instance. |
| <b>all</b>       | Specifies all VLANs.                                          |
| <i>vlan-ID</i>   | VLAN ID. Valid values are from 1 to 4094.                     |
| ,                | (Optional) Specifies another VLAN separated by a comma.       |
| -                | (Optional) Specifies a range of VLANs separated by a hyphen.  |

### Command Default

VRF instances are not selected.

### Command Modes

Global configuration (config)

### Command History

| Release                  | Modification                 |
|--------------------------|------------------------------|
| Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

### Usage Guidelines

The *vlan-list* argument can be a single VLAN ID, a list of comma-separated VLAN IDs, or hyphen-separated VLAN ID ranges.

The **all** keyword is equivalent to the full range of VLANs supported by the network device. The **all** keyword is not preserved in the nonvolatile generation (NVGEN) process.

If the **cts role-based l2-vrf** command is issued more than once for the same VRF, each successive command entered adds the VLAN IDs to the specified VRF.

The VRF assignments configured by the **cts role-based l2-vrf** command are active as long as a VLAN remains a Layer 2 VLAN. The IP-SGT bindings learned while a VRF assignment is active are also added to the Forwarding Information Base (FIB) table associated with the VRF and the IP protocol version. If an Switched Virtual Interface (SVI) becomes active for a VLAN, the VRF-to-VLAN assignment becomes inactive and all bindings learned on the VLAN are moved to the FIB table associated with the VRF of the SVI.

Use the **interface vlan** command to configure an SVI interface, and the **vrf forwarding** command to associate a VRF instance to the interface.

The VRF-to-VLAN assignment is retained even when the assignment becomes inactive. It is reactivated when the SVI is removed or when the SVI IP address is changed. When reactivated, the IP-SGT bindings are moved back from the FIB table associated with the VRF of the SVI to the FIB table associated with the VRF assigned by the **cts role-based l2-vrf** command.

The following example shows how to select a list of VLANS to be assigned to a VRF instance:

```
Device(config)# cts role-based l2-vrf vrf1 vlan-list 20
```

The following example shows how to configure an SVI interface and associate a VRF instance:

```
Device(config)# interface vlan 101
Device(config-if)# vrf forwarding vrf1
```

#### Related Commands

| Command                                | Description                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------|
| <b>interface vlan</b>                  | Configures a VLAN interface.                                                      |
| <b>vrf forwarding</b>                  | Associates a VRF instance or a virtual network with an interface or subinterface. |
| <b>show cts role-based permissions</b> | Displays the SGACL permission list.                                               |

## cts role-based monitor

To enable role-based (security-group) access list monitoring, use the **cts role-based monitor** command in global configuration mode. To remove role-based access list monitoring, use the **no** form of this command.

```
cts role-based monitor {all | permissions {default [{ipv4 | ipv6}] | from {sgt | unknown} to {sgt | unknown} [{ipv4 | ipv6}]}}
no cts role-based monitor {all | permissions {default [{ipv4 | ipv6}] | from {sgt | unknown} to {sgt | unknown} [{ipv4 | ipv6}]}}
```

| Syntax Description |                                                                   |
|--------------------|-------------------------------------------------------------------|
| <b>all</b>         | Monitors permissions for all source tags to all destination tags. |
| <b>permissions</b> | Monitors permissions from a source tags to a destination tags.    |
| <b>default</b>     | Monitors the default permission list.                             |
| <b>ipv4</b>        | (Optional) Specifies the IPv4 protocol.                           |
| <b>ipv6</b>        | (Optional) Specifies the IPv6 protocol.                           |
| <b>from</b>        | Specifies the source group tag for filtered traffic.              |
| <b>sgt</b>         | Security Group Tag (SGT). Valid values are from 2 to 65519.       |
| <b>unknown</b>     | Specifies an unknown source or destination group tag (DST).       |

**Command Default** Role-based access control monitoring is not enabled.

**Command Modes** Global configuration (config)

| Command History | Release                  | Modification                 |
|-----------------|--------------------------|------------------------------|
|                 | Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

**Usage Guidelines** Use the **cts role-based monitor all** command to enable the global monitor mode. If the **cts role-based monitor all** command is configured, the output of the **show cts role-based permissions** command displays monitor mode for all configured policies as true.

The following examples shows how to configure SGACL monitor from a source tag to a destination tag:

```
Device(config)# cts role-based monitor permissions from 10 to 11
```

| Related Commands | Command                                | Description                         |
|------------------|----------------------------------------|-------------------------------------|
|                  | <b>show cts role-based permissions</b> | Displays the SGACL permission list. |

## cts role-based permissions

To enable permissions from a source group to a destination group, use the **cts role-based permissions** command in global configuration mode. To remove the permissions, use the **no** form of this command.

```
cts role-based permissions {default | from {sgt | unknown}to {sgt | unknown}}{rbacl-name | ipv4 | ipv6}
no cts role-based permissions {default | from {sgt | unknown}to {sgt | unknown}}{rbacl-name | ipv4 | ipv6}
```

| Syntax Description |  |                                                                                                                                                                                                                 |
|--------------------|--|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>default</b>     |  | Specifies the default permissions list. Every cell (an SGT pair) for which, security group access control list (SGACL) permission is not configured statically or dynamically falls under the default category. |
| <b>from</b>        |  | Specifies the source group tag of the filtered traffic.                                                                                                                                                         |
| <b>sgt</b>         |  | Security Group Tag (SGT). Valid values are from 2 to 65519.                                                                                                                                                     |
| <b>unknown</b>     |  | Specifies an unknown source or destination group tag.                                                                                                                                                           |
| <b>rbacl-name</b>  |  | Role-based access control list (RBACL) or SGACL name. Up to 16 SGACLs can be specified in the configuration.                                                                                                    |
| <b>ipv4</b>        |  | Specifies the IPv4 protocol.                                                                                                                                                                                    |
| <b>ipv6</b>        |  | Specifies the IPv6 protocol.                                                                                                                                                                                    |

**Command Default** Permissions from a source group to a destination group is not enabled.

**Command Modes** Global configuration (config)

| Command History | Release                  | Modification                 |
|-----------------|--------------------------|------------------------------|
|                 | Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

**Usage Guidelines** Use the **cts role-based permissions** command to define, replace, or delete the list of SGACLs for a given source group tag (SGT), destination group tag (DGT) pair. This policy is in effect as long as there is no dynamic policy for the same DGT or SGT.

The **cts role-based permissions default** command defines, replaces, or deletes the list of SGACLs of the default policy as long as there is no dynamic policy for the same DGT.

The following example shows how to enable permissions for a destination group:

```
Device(config)# cts role-based permissions from 6 to 6 mon_2
```

**Related Commands**

| Command                                | Description                         |
|----------------------------------------|-------------------------------------|
| <b>show cts role-based permissions</b> | Displays the SGACL permission list. |

## cts role-based sgt-caching

To enable Security Group Tag (SGT) caching globally, use the **cts role-based sgt-caching** command in global configuration mode. To remove SGT caching, use the **no** form of this command.

**cts role-based sgt-caching** [vlan-list {vlan-id | all}]  
**no cts role-based sgt-caching** [vlan-list {vlan-id | all}]

|                           |                                                                                                                                                      |                                                                                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>vlan-list</b> <i>vlan-id</i>                                                                                                                      | (Optional) Specifies VLAN IDs. Individual VLAN IDs are separated by commas, and a range of IDs specified with a hyphen. Valid values are from 1 to 4094. |
|                           | <b>all</b>                                                                                                                                           | (Optional) Selects all VLANs.                                                                                                                            |
| <b>Command Default</b>    | SGT caching is not configured.                                                                                                                       |                                                                                                                                                          |
| <b>Command Modes</b>      | Global configuration (config)                                                                                                                        |                                                                                                                                                          |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                       | <b>Modification</b>                                                                                                                                      |
|                           | Cisco IOS XE Fuji 16.9.1                                                                                                                             | This command was introduced.                                                                                                                             |
| <b>Usage Guidelines</b>   | To enable SGT caching on a VLAN, both <b>cts role-based sgt-caching</b> and <b>cts role-based sgt-caching vlan-list</b> commands must be configured. |                                                                                                                                                          |

### Example

The following example shows how to enable SGT caching on a VLAN:

```
Device# configure terminal
Device(config)# cts role-based sgt-caching
Device(config)# cts role-based sgt-caching vlan-list 4
```

## cts role-based sgt-map

To manually map a source IP address to a Security Group Tag (SGT) on either a host or a VRF, use the **cts role-based sgt-map** command in global configuration mode. Use the **no** form of the command to remove the mapping.

```
cts role-based sgt-map {ipv4_netaddress | ipv6_netaddress | ipv4_netaddress/prefix | ipv6_netaddress/prefix}
sgt sgt-number
cts role-based sgt-map host {ipv4_hostaddress | ipv6_hostaddress} sgt sgt-number
cts role-based sgt-map vlan-list [{vlan_ids | all}] sgt sgt-number
cts role-based sgt-map vrf instance_name
{ipv4_netaddress | ipv6_netaddress | ipv4_netaddress/prefix | ipv6_netaddress/prefix | host
{ipv4_hostaddress | ipv6_hostaddress}} sgt sgt-number
no cts role-based sgt-map
```

### Syntax Description

|                                                                      |                                                                                                                                                                                                                                                |
|----------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ipv4_netaddress</b>  <br><b>ipv6_netaddress</b>                   | Specifies the network to be associated with an SGT. Enter IPv4 address in dot decimal notation; IPv6 in colon hexadecimal notation.                                                                                                            |
| <b>ipv4_netaddress/prefix</b>  <br><b>ipv6_netaddress/prefix</b>     | Maps the SGT to all hosts of the specified subnet address (IPv4 or IPv6). IPv4 is specified in dot decimal CIDR notation, IPv6 in colon hexadecimal notation                                                                                   |
| <b>host</b> { <b>ipv4_hostaddress</b>  <br><b>ipv6_hostaddress</b> } | Binds the specified host IP address with the SGT. Enter the IPv4 address in dot decimal notation; IPv6 in colon hexadecimal notation.                                                                                                          |
| <b>vlan-list</b> { <b>vlan_ids</b>   <b>all</b> }                    | Specifies VLAN IDs. <ul style="list-style-type: none"> <li>(Optional) <b>vlan_ids</b>: Individual VLAN IDs are separated by commas, a range of IDs specified with a hyphen.</li> <li>(Optional) <b>all</b>: Specifies all VLAN IDs.</li> </ul> |
| <b>vrf</b> <i>instance_name</i>                                      | Specifies a VRF instance, previously created on the device.                                                                                                                                                                                    |
| <b>sgt</b> <i>sgt-number</i>                                         | Specifies the SGT number from 0 to 65,535.                                                                                                                                                                                                     |

| Cisco IOS XE Fuji<br>16.9.1 | This command was introduced. |

### Usage Guidelines

If you do not have a Cisco Identity Services Engine, Cisco Secure ACS, dynamic Address Resolution Protocol (ARP) inspection, Dynamic Host Control Protocol (DHCP) snooping, or Host Tracking available on your

device to automatically map SGTs to source IP addresses, you can manually map an SGT to the following with the **cts role-based sgt-map** command:

- A single host IPv4 or IPv6 address
- All hosts of an IPv4 or IPv6 network or subnetwork
- VRFs
- Single or multiple VLANs

The **cts role-based sgt-map** command binds the specified SGT with packets that fall within the specified network address.

SXP exports an exhaustive expansion of all possible individual IP–SGT bindings within the specified network or subnetwork. IPv6 bindings and subnet bindings are exported only to SXP listener peers of SXP version 2 or later. The expansion does not include host bindings which are known individually or are configured or learnt from SXP for any nested subnet bindings.

The **cts role-based sgt-map host** command binds the specified SGT with incoming packets when the IP source address is matched by the specified host address. This IP–SGT binding has the lowest priority and is ignored in the presence of any other dynamically discovered bindings from other sources (such as, SXP or locally authenticated hosts). The binding is used locally on the device for SGT imposition and SGACL enforcement. It is exported to SXP peers if it is the only binding known for the specified host IP address.

The **vrf** keyword specifies a virtual routing and forwarding table previously defined with the vrf definition global configuration command. The IP–SGT binding specified with the **cts role-based sgt-map vrf** global configuration command is entered into the IP–SGT table associated with the specified VRF and the IP protocol version which is implied by the type of IP address entered.

The **cts role-based sgt-map vlan-list** command binds an SGT with a specified VLAN or a set of VLANs. The keyword **all** is equivalent to the full range of VLANs supported by the device and is not preserved in the nonvolatile generation (NVGEN) process. The specified SGT is bound to incoming packets received in any of the specified VLANs. The system uses discovery methods such as DHCP and/or ARP snooping (a.k.a. IP device tracking) to discover active hosts in any of the VLANs mapped by this command. Alternatively, the system could map the subnet associated with the SVI of each VLAN to the specified SGT. SXP exports the resulting bindings as appropriate for the type of binding.

## Examples

The following example shows how to manually map a source IP address to an SGT:

```
Device(config)# cts role-based sgt-map 10.10.1.1 sgt 77
```

In the following example, a device binds host IP address 10.1.2.1 to SGT 3 and 10.1.2.2 to SGT 4. These bindings are forwarded by SXP to an SGACL enforcement device.

```
Device(config)# cts role-based sgt-map host 10.1.2.1 sgt 3
Device(config)# cts role-based sgt-map host 10.1.2.2 sgt 4
```

## Related Commands

|------------------------------------|-------------------------------------------------|
| <b>show cts role-based sgt-map</b> | Displays role-based access control information. |

## cts sxp connection peer

To enter the Cisco TrustSec Security Group Tag (SGT) Exchange Protocol (CTS-SXP) peer IP address, to specify if a password is used for the peer connection, to specify the global hold-time period for a listener or speaker device, and to specify if the connection is bidirectional, use the **cts sxp connection peer** command in global configuration mode. To remove these configurations for a peer connection, use the **no** form of this command.

```
cts sxp connection peer ipv4-address {source | password} {default | none} mode {local | peer}
[{{[[{listener | speaker}]] [{hold-time minimum-time maximum-time | vrf vrf-name}]] | both [vrf
vrf-name]]]
```

```
cts sxp connection peer ipv4-address {source | password} {default | none} mode {local | peer}
[{{[[{listener | speaker}]] [{hold-time minimum-time maximum-time | vrf vrf-name}]] | both [vrf
vrf-name]]]
```

### Syntax Description

|                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ipv4-address</i>                                         | SXP peer IPv4 address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>source</b>                                               | Specifies the source IPv4 address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>password</b>                                             | Specifies that an SXP password is used for the peer connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>default</b>                                              | Specifies that the default SXP password is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>none</b>                                                 | Specifies no password is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>mode</b>                                                 | Specifies either the local or peer SXP connection mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>local</b>                                                | Specifies that the SXP connection mode refers to the local device.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>peer</b>                                                 | Specifies that the SXP connection mode refers to the peer device.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>listener</b>                                             | (Optional) Specifies that the device is the listener in the connection.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>speaker</b>                                              | (Optional) Specifies that the device is the speaker in the connection.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>hold-time</b> <i>minimum-time</i><br><i>maximum-time</i> | <p>(Optional) Specifies the hold-time period, in seconds, for the device. The range for minimum and maximum time is from 0 to 65535.</p> <p>A <i>maximum-time</i> value is required only when you use the following keywords: <b>peer speaker</b> and <b>local listener</b>. In other instances, only a <i>minimum-time</i> value is required.</p> <p><b>Note</b> If both minimum and maximum times are required, the <i>maximum-time</i> value must be greater than or equal to the <i>minimum-time</i> value.</p> |
| <b>vrf</b> <i>vrf-name</i>                                  | (Optional) Specifies the virtual routing and forwarding (VRF) instance name to the peer.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>both</b>                                                 | (Optional) Specifies that the device is both the speaker and the listener in the bidirectional SXP connection.                                                                                                                                                                                                                                                                                                                                                                                                      |

**Command Default**

The CTS-SXP peer IP address is not configured and no CTS-SXP peer password is used for the peer connection. The default setting for a CTS-SXP connection password is **none**.

**Command Modes**

Global configuration (config)

**Command History**

| Release                  | Modification                 |
|--------------------------|------------------------------|
| Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

**Usage Guidelines**

When a CTS-SXP connection to a peer is configured with the **cts sxp connection peer** command, only the connection mode can be changed. The **vrf** keyword is optional. If a VRF name is not provided or a VRF name is provided with the **default** keyword, then the connection is set up in the default routing or forwarding domain.

A **hold-time maximum-period** value is required only when you use the following keywords: **peer speaker** and **local listener**. In other instances, only a **hold-time minimum-period** value is required.

**Note**

The *maximum-period* value must be greater than or equal to the *minimum-period* value.

Use the **both** keyword to configure a bidirectional SXP connection. With the support for bidirectional SXP configuration, a peer can act as both a speaker and a listener and propagate SXP bindings in both directions using a single connection.

**Examples**

The following example shows how to enable CTS-SXP and configure the CTS-SXP peer connection on Device\_A, a speaker, for connection to Device\_B, a listener:

```
Device_A> enable
Device_A# configure terminal
Device_A#(config)# cts sxp enable
Device_A#(config)# cts sxp default password Cisco123
Device_A#(config)# cts sxp default source-ip 10.10.1.1
Device_A#(config)# cts sxp connection peer 10.20.2.2 password default mode local speaker
```

The following example shows how to configure the CTS-SXP peer connection on Device\_B, a listener, for connection to Device\_A, a speaker:

```
Device_B> enable
Device_B# configure terminal
Device_B(config)# cts sxp enable
Device_B(config)# cts sxp default password Cisco123
Device_B(config)# cts sxp default source-ip 10.20.2.2
Device_B(config)# cts sxp connection peer 10.10.1.1 password default mode local listener
```

You can also configure both peer and source IP addresses for an SXP connection. The source IP address specified in the **cts sxp connection** command overwrites the default value.

```
Device_A(config)# cts sxp connection peer 51.51.51.1 source 51.51.51.2 password none mode local speaker
```

```
Device_B(config)# cts sxp connection peer 51.51.51.2 source 51.51.51.1 password none mode
local listener
```

The following example shows how to enable bidirectional CTS-SXP and configure the SXP peer connection on Device\_A to connect to Device\_B:

```
Device_A> enable
Device_A# configure terminal
Device_A#(config)# cts sxp enable
Device_A#(config)# cts sxp default password Cisco123
Device_A#(config)# cts sxp default source-ip 10.10.1.1
Device_A#(config)# cts sxp connection peer 10.20.2.2 password default mode local both
```

#### Related Commands

| Command                           | Description                                                                                        |
|-----------------------------------|----------------------------------------------------------------------------------------------------|
| <b>cts sxp default password</b>   | Configures the Cisco TrustSec SXP default password.                                                |
| <b>cts sxp default source-ip</b>  | Configures the Cisco TrustSec SXP source IPv4 address.                                             |
| <b>cts sxp enable</b>             | Enables Cisco TrustSec SXP on a device.                                                            |
| <b>cts sxp log</b>                | Enables logging for IP-to-SGT binding changes.                                                     |
| <b>cts sxp reconciliation</b>     | Changes the Cisco TrustSec SXP reconciliation period.                                              |
| <b>cts sxp retry</b>              | Changes the Cisco TrustSec SXP retry period timer.                                                 |
| <b>cts sxp speaker hold-time</b>  | Configures the global hold-time period of a speaker device in a Cisco TrustSec SGT SXPv4 network.  |
| <b>cts sxp listener hold-time</b> | Configures the global hold-time period of a listener device in a Cisco TrustSec SGT SXPv4 network. |
| <b>show cts sxp</b>               | Displays the status of all Cisco TrustSec SXP configurations.                                      |

## cts sxp default password

To specify the Cisco TrustSec Security Group Tag (SGT) Exchange Protocol (CTS-SXP) default password, use the **cts sxp default password** command in global configuration mode. To remove the CTS-SXP default password, use the **no** form of this command.

**cts sxp default password** {**0** *unencrypted-pwd* | **6** *encrypted-key* | **7** *encrypted-keycleartext-pwd*}  
**no cts sxp default password** {**0** *unencrypted-pwd* | **6** *encrypted-key* | **7** *encrypted-keycleartext-pwd*}

| Syntax Description              |  |                                                                                                                                    |
|---------------------------------|--|------------------------------------------------------------------------------------------------------------------------------------|
| <b>0</b> <i>unencrypted-pwd</i> |  | Specifies that an unencrypted CTS-SXP default password follows. The maximum password length is 32 characters.                      |
| <b>6</b> <i>encrypted-key</i>   |  | Specifies that a 6 encryption type password is used as the CTS-SXP default password. The maximum password length is 32 characters. |
| <b>7</b> <i>encrypted-key</i>   |  | Specifies that a 7 encryption type password is used as the CTS-SXP default password. The maximum password length is 32 characters. |
| <i>cleartext-pwd</i>            |  | Specifies a cleartext CTS-SXP default password. The maximum password length is 32 characters.                                      |

**Command Default** Type **0** (cleartext)

**Command Modes** Global configuration (config)

| Command History | Release                  | Modification                 |
|-----------------|--------------------------|------------------------------|
|                 | Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

**Usage Guidelines** The **cts sxp default password** command sets the CTS-SXP default password to be optionally used for all CTS-SXP connections configured on the device. The CTS-SXP password can be cleartext, or encrypted with the **0**, **7**, **6** encryption type keywords. If the encryption type is 0, then an unencrypted cleartext password follows.

### Examples

The following example shows how to enable CTS-SXP and configure the CTS-SXP peer connection on Device\_A, a speaker, for connection to Device\_B, a listener:

```
Device_A# configure terminal
Device_A#(config)# cts sxp enable
Device_A#(config)# cts sxp default password Cisco123
Device_A#(config)# cts sxp default source-ip 10.10.1.1
Device_A#(config)# cts sxp connection peer 10.20.2.2 password default mode local speaker
```

The following example shows how to configure the CTS-SXP peer connection on Device\_B, a listener, for connection to Device\_A, a speaker:

```
Device_B# configure terminal
```

```

Device_B(config)# cts sxp enable
Device_B(config)# cts sxp default password Cisco123
Device_B(config)# cts sxp default source-ip 10.20.2.2
Device_B(config)# cts sxp connection peer 10.10.1.1 password default mode local listener

```

**Related Commands**

| Command                          | Description                                                                                     |
|----------------------------------|-------------------------------------------------------------------------------------------------|
| <b>cts sxp connection peer</b>   | Enters the CTS-SXP peer IP address and specifies if a password is used for the peer connection. |
| <b>cts sxp default source-ip</b> | Configures the CTS-SXP source IPv4 address.                                                     |
| <b>cts sxp enable</b>            | Enables CTS-SXP on a device.                                                                    |
| <b>cts sxp log</b>               | Enables logging for IP-to-SGT binding changes.                                                  |
| <b>cts sxp reconciliation</b>    | Changes the CTS-SXP reconciliation period.                                                      |
| <b>cts sxp retry</b>             | Changes the CTS-SXP retry period timer.                                                         |
| <b>show cts sxp</b>              | Displays the status of all SXP configurations.                                                  |

## cts sxp default source-ip

To configure the Cisco TrustSec Security Group Tag (SGT) Exchange Protocol (CTS-SXP) source IPv4 address, use the **cts sxp default source-ip** command in global configuration mode. To remove the CTS-SXP default source IP address, use the **no** form of this command.

```
cts sxp default source-ip ipv4-address
no cts sxp default source-ip ipv4-address
```

### Syntax Description

|                   |                                      |
|-------------------|--------------------------------------|
| <i>ip-address</i> | Default source CTS-SXP IPv4 address. |
|-------------------|--------------------------------------|

### Command Default

The CTS-SXP source IP address is not configured.

### Command Modes

Global configuration (config)

### Command History

| Release                  | Modification                 |
|--------------------------|------------------------------|
| Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

### Usage Guidelines

The **cts sxp default source-ip** command sets the default source IP address that CTS-SXP uses for all new TCP connections where a source IP address is not specified. Preexisting TCP connections are not affected when this command is entered. CTS-SXP connections are governed by three timers:

- Retry timer
- Delete Hold Down timer
- Reconciliation timer

### Examples

The following example shows how to enable CTS-SXP and configure the CTS-SXP peer connection on Device\_A, a speaker, for connection to Device\_B, a listener:

```
Device_A# configure terminal
Device_A#(config)# cts sxp enable
Device_A#(config)# cts sxp default password Cisco123
Device_A#(config)# cts sxp default source-ip 10.10.1.1
Device_A#(config)# cts sxp connection peer 10.20.2.2 password default mode local speaker
```

The following example shows how to configure the CTS-SXP peer connection on Device\_B, a listener, for connection to Device\_A, a speaker:

```
Device_B# configure terminal
Device_B#(config)# cts sxp enable
Device_B#(config)# cts sxp default password Cisco123
Device_B#(config)# cts sxp default source-ip 10.20.2.2
Device_B#(config)# cts sxp connection peer 10.10.1.1 password default mode local listener
```

**Related Commands**

| Command                         | Description                                                                                     |
|---------------------------------|-------------------------------------------------------------------------------------------------|
| <b>cts sxp connectionpeer</b>   | Enters the CTS-SXP peer IP address and specifies if a password is used for the peer connection. |
| <b>cts sxp default password</b> | Configures the CTS-SXP default password.                                                        |
| <b>cts sxp enable</b>           | Enables CTS-SXP on a device.                                                                    |
| <b>cts sxp log</b>              | Enables logging for IP-to-SGT binding changes.                                                  |
| <b>cts sxp reconciliation</b>   | Changes the CTS-SXP reconciliation period.                                                      |
| <b>cts sxp retry</b>            | Changes the CTS-SXP retry period timer.                                                         |
| <b>show cts sxp</b>             | Displays the status of all SXP configurations.                                                  |

## cts sxp filter-enable

To enable filtering after creating filter lists and filter groups, use the **cts sxp filter-enable** command in global configuration mode. To disable filtering, use the **no** form of the command.

**cts sxp filter-enable**  
**no cts sxp filter-enable**

### Syntax Description

This command has no keywords or arguments.

### Command Modes

Global configuration (config)

### Command History

| Release                  | Modification                 |
|--------------------------|------------------------------|
| Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

### Usage Guidelines

This command can be used at any time to enable or disable filtering. Configured filter lists and filter groups can be used to implement filtering only after filtering is enabled. The filter action will only filter bindings that are exchanged after filtering is enabled; there won't be any effect on the bindings that were exchanged before filtering was enabled.

### Examples

Device(config)# **cts sxp filter-enable**

### Related Commands

| Command                            | Description                                                                                             |
|------------------------------------|---------------------------------------------------------------------------------------------------------|
| <b>cts sxp filter-list</b>         | Creates a SXP filter list to filter IP-SGT bindings based on IP prefixes, SGT or a combination of both. |
| <b>cts sxp filter-group</b>        | Creates a filter group for grouping a set of peers and applying a filter list to them.                  |
| <b>show cts sxp filter-group</b>   | Displays information about the configured filter groups..                                               |
| <b>show cts sxp filter-list</b>    | Displays information about the configured filter lists.                                                 |
| <b>debug cts sxp filter events</b> | Logs events related to the creation, deletion and update of filter-lists and filter-groups              |

## cts sxp filter-group

To create a filter group for grouping a set of peers and applying a filter list to them, use the **cts sxp filter-group** command in global configuration mode. To delete a filter group, use the **no** form of this command.

**cts sxp filter-group** {**listener** | **speaker**} {*filter-group-name* | **global** *filter-list-name*}

**no cts sxp filter-group** {**listener** | **speaker**} {*filter-group-name* | **global** *filter-list-name*}

### Syntax Description

|                          |                                                 |
|--------------------------|-------------------------------------------------|
| <b>listener</b>          | Creates a filter group for a set of listeners.  |
| <b>speaker</b>           | Creates a filter group for a set of speakers.   |
| <b>global</b>            | Groups all speakers or listeners on the device. |
| <i>filter-group-name</i> | Name of the filter group.                       |
| <i>filter-list-name</i>  | Name of the filter list.                        |

### Command Modes

Global configuration (config)

### Command History

| Release                  | Modification                 |
|--------------------------|------------------------------|
| Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

### Usage Guidelines

Issuing this command, places the device in the filter group configuration mode. From this mode, you can specify the devices to be grouped and apply a filter list to the filter group.

The command format to add devices or peers to the group is as follows:

**peer ipv4** *peer-IP*

In a single command, you can add one peer. To add more peers, repeat the command as many times as required.

The command format to apply a filter list to the group is as follows:

**filter** *filter-list-name*

You cannot specify a peer list for the global listener and global speaker filter-group options because in this case the filter is applied to all SXP connections.

When both the global filter group and peer-based filter groups are applied, the global filter takes priority. If only a global listener or global speaker filter group is configured, then the global filtering takes precedence only in that specific direction. For the other direction, the peer-based filter group is implemented.

### Examples

The following example shows how to create a listener group called **group\_1**, and assign peers and a filter list to this group:

```
Device# configure terminal
Device(config)# cts sxp filter-group listener group_1
Device(config-filter-group)# filter filter_1
```

```
Device(config-filter-group)# peer ipv4 10.0.0.1
Device(config-filter-group)# peer ipv4 10.10.10.1
```

The following example shows how to create a global listener group called **group\_2**:

```
Device# configure terminal
Device(config)# cts sxp filter-group listener global group_2
```

**Related Commands**

|------------------------------------|---------------------------------------------------------------------------------------------------------|
| <b>cts sxp filter-list</b>         | Creates a SXP filter list to filter IP-SGT bindings based on IP prefixes, SGT or a combination of both. |
| <b>cts sxp filter-enable</b>       | Enables filtering.                                                                                      |
| <b>show cts sxp filter-group</b>   | Displays information about the configured filter groups.                                                |
| <b>show cts sxp filter-list</b>    | Displays information about the configured filter lists.                                                 |
| <b>debug cts sxp filter events</b> | Logs events related to the creation, deletion and update of filter-lists and filter-groups              |

## cts sxp filter-list

To create a SXP filter list to hold a set of filter rules for filtering IP-SGT bindings, use the **cts sxp filter-list** command in global configuration mode. To delete a filter list, use the **no** form of the command.

**cts sxp filter-list** *filter-list-name*  
**no cts sxp filter-list** *filter-list-name*

### Syntax Description

|                         |                          |
|-------------------------|--------------------------|
| <i>filter-list-name</i> | Name of the filter-list. |

### Usage Guidelines

Issuing this command, places the device in the filter list configuration mode. From this mode, you can specify rules for the filter lists.

A filter rule can be based on SGT or IP Prefixes or a combination of both SGT and IP Prefixes.

The command format to add rules to the group is as follows:

*sequence-number* **action(permit/deny)** **filter-type(ipv4/ipv6/sgt)** *value/values*

For example, to permit SGT-IP bindings whose SGT value is 20, the rule is as follows:

**30 permit sgt 20**

Note that the sequence number is optional. If you do not specify a sequence number, it is generated by the system. Sequence numbers are automatically incremented by a value of 10 from the last used/configured sequence number. A new rule can be inserted by specifying a sequence number in between two existing rules.

The range of valid SGT values is between 2 and 65519. To provide multiple SGT values in a rule, separate the values using a space. A maximum of 8 SGT values are allowed in a rule.

In a SGT and IP prefix combination rule, if there is a match for the binding in both the parts of the rule, then the action specified in the second part of the rule takes precedence. For example, in the following rule, if the SGT value of the IP prefix 10.0.0.1 is 20, the corresponding binding will be denied even if the first part of the rule permits the binding.

```
Device(config-filter-list)# 10 permit sgt 30 20 deny 10.0.0.1/24
```

Similarly, in the rule below the binding with the sgt value 20 will be permitted even if the sgt of the IP prefix 10.0.0.1 is 20, and the first action does not permit the binding.

```
Device(config-filter-list)# 10 deny 10.0.0.1/24 permit sgt 30 20
```

### Examples

The following example shows how to create a filter list and add some rules to the list:

```
Device# configure terminal
Device(config)# cts sxp filter-list filter_1
Device (config-filter-list)# 10 deny ipv4 10.0.0.1/24 permit sgt 100
Device(config-filter-list)# 20 permit sgt 60 61 62 63
```

**Related Commands**

|------------------------------------|---------------------------------------------------------------------------------------------|
| <b>cts sxp filter-enable</b>       | Enable SXP IP-prefix and SGT-based filtering.                                               |
| <b>cts sxp filter-group</b>        | Creates a filter group for grouping a set of peers and applying a filter list to them.      |
| <b>show cts sxp filter-group</b>   | Displays information about the configured filter groups.                                    |
| <b>show cts sxp filter-list</b>    | Displays information about the configured filter lists.                                     |
| <b>debug cts sxp filter events</b> | Logs events related to the creation, deletion and update of filter-lists and filter-groups. |

## cts sxp log binding-changes

To enable logging for IP-to-Cisco TrustSec Security Group Tag (SGT) Exchange Protocol (CTS-SXP) binding changes, use the **cts sxp log binding-changes** command in global configuration mode. To disable logging, use the **no** form of this command.

**cts sxp log binding-changes**  
**no cts sxp log binding-changes**

### Command Default

Logging is disabled.

### Command Modes

Global configuration (config)

### Command History

|--------------------------|------------------------------|
| Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

### Usage Guidelines

The **cts sxp log binding-changes** command enables logging for IP-to-SGT binding changes. SXP syslogs (sev 5 syslogs) are generated whenever IP address-to-SGT binding occurs (add, delete, change). These changes are learned and propagated on the SXP connection.

|----------------------------------|------------------------------------------------------------------------------------------------|
| <b>cts sxp connectionpeer</b>    | Enters the CTS-SXP peer IP address and specifies if a password is used for the peer connection |
| <b>cts sxp default password</b>  | Configures the CTS-SXP default password.                                                       |
| <b>cts sxp default source-ip</b> | Configures the CTS-SXP source IPv4 address.                                                    |
| <b>cts sxp enable</b>            | Enables CTS-SXP on a device.                                                                   |
| <b>cts sxp reconciliation</b>    | Changes the CTS-SXP reconciliation period.                                                     |
| <b>cts sxp retry</b>             | Changes the CTS-SXP retry period timer.                                                        |
| <b>show cts sxp</b>              | Displays status of all SXP configurations.                                                     |

## cts sxp reconciliation period

To change the Cisco TrustSec Security Group Tag (SGT) Exchange Protocol (CTS-SXP) reconciliation period, use the **cts sxp reconciliation period** command in global configuration mode. To return the CTS-SXP reconciliation period to its default value, use the **no** form of this command.

**cts sxp reconciliation period** *seconds*  
**no cts sxp reconciliation period** *seconds*

| <b>Syntax Description</b>        | <table><tr><td><i>seconds</i></td><td>CTS-SXP reconciliation timer in seconds. The range is from 0 to 64000. The default is 120.</td></tr></table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <i>seconds</i> | CTS-SXP reconciliation timer in seconds. | <b>Usage Guidelines</b>          | After a peer terminates a CTS-SXP connection, an internal delete hold-down timer starts. If the peer reconnects before the delete hold-down timer expires, then the CTS-SXP reconciliation timer starts. While the CTS-SXP reconciliation period timer is active, the CTS-SXP software retains the SGT mapping entries learned from the previous connection and removes invalid entries. Setting the SXP reconciliation period to 0 seconds disables the timer and causes all entries from the previous connection to be removed.                                                                                                                                                                                                                                                      |                |                                                                                            |                                |                                                                                                 |                                 |                                          |                                  |                                             |                       |                              |                    |                                                 |                      |                                         |                     |                                                |

| <b>cts sxp log</b>               | Turns on logging for IP to SGT binding changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                |                                                                                            |                                |                                                                                                 |                                 |                                          |                                  |                                             |                       |                              |                    |                                                 |                      |                                         |                     |                                                |
| <b>cts sxp retry</b>             | Changes the CTS-SXP retry period timer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                |                                                                                            |                                |                                                                                                 |                                 |                                          |                                  |                                             |                       |                              |                    |                                                 |                      |                                         |                     |                                                |
| <b>show cts sxp</b>              | Displays status of all CTS-SXP configurations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                |                                                                                            |                                |                                                                                                 |                                 |                                          |                                  |                                             |                       |                              |                    |                                                 |                      |                                         |                     |                                                |

## cts sxp retry period

To change the Cisco TrustSec Security Group Tag (SGT) Exchange Protocol (CTS-SXP) retry period timer, use the **cts sxp retry period** command in global configuration mode. To return the CTS-SXP retry period timer to its default value, use the **no** form of this command.

**cts sxpretry period** *seconds*  
**no cts sxpretry period** *seconds*

|                           |                                                                                                  |
|---------------------------|--------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>seconds</i> CTS-SXP retry timer in seconds. The range is from 0 to 64000. The default is 120. |
|---------------------------|--------------------------------------------------------------------------------------------------|

**Command Default** 120 seconds (2 minutes)

**Command Modes** Global configuration (config)

| <b>Command History</b> | Release                  | Modification                 |
|------------------------|--------------------------|------------------------------|
|                        | Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

**Usage Guidelines** The retry timer is triggered if there is at least one CTS-SXP connection that is not up. A new CTS-SXP connection is attempted when this timer expires. A zero value results in no retry being attempted.

| <b>Related Commands</b> | Command                          | Description                                                                                     |
|-------------------------|----------------------------------|-------------------------------------------------------------------------------------------------|
|                         | <b>cts sxp connectionpeer</b>    | Enters the CTS-SXP peer IP address and specifies if a password is used for the peer connection. |
|                         | <b>cts sxp default password</b>  | Configures the CTS-SXP default password.                                                        |
|                         | <b>cts sxp default source-ip</b> | Configures the CTS-SXP source IPv4 address.                                                     |
|                         | <b>cts sxp enable</b>            | Enables CTS-SXP on a device.                                                                    |
|                         | <b>cts sxp log</b>               | Enables logging for IP-to-SGT binding changes.                                                  |
|                         | <b>cts sxp reconciliation</b>    | Changes the CTS-SXP reconciliation period.                                                      |
|                         | <b>show cts sxp</b>              | Displays the status of all CTS-SXP configurations.                                              |

# debug cts environment-data

To enable the debugging of Cisco TrustSec environment data operations, use the **debug cts environment-data** command in privileged EXEC mode. To stop the debugging of environment data operations, use the **no** form of this command.

**debug cts environment-data** [{aaa | all | default-epg | default-sg | events | platform | sg-epg}]  
**no debug cts environment-data** [{aaa | all | default-epg | default-sg | events | platform | sg-epg}]

| Syntax Description |                    |                                                                                                     |
|--------------------|--------------------|-----------------------------------------------------------------------------------------------------|
|                    | <b>aaa</b>         | (Optional) Specifies the debugging of authentication, authorization, and accounting (AAA) messages. |
|                    | <b>all</b>         | (Optional) Specifies the debugging of all environment-data messages.                                |
|                    | <b>default-epg</b> | (Optional) Specifies the debugging of default end-point group (EPG) messages.                       |
|                    | <b>default-sg</b>  | (Optional) Specifies the debugging of default server group messages.                                |
|                    | <b>events</b>      | (Optional) Specifies the debugging of environment data events.                                      |
|                    | <b>platform</b>    | (Optional) Specifies the debugging of Security Group Tag (SGT)-EPG platform messages.               |
|                    | <b>sg-epg</b>      | (Optional) Specifies the debugging of SP-EPG mapping.                                               |

|                      |                     |
|----------------------|---------------------|
| <b>Command Modes</b> | Privileged EXEC (#) |
|----------------------|---------------------|

|                        |                               |                              |
|------------------------|-------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>                | <b>Modification</b>          |
|                        | Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

**Examples**

The following example shows how to enable the debugging of environment data events:

```
Device# enable
Device# debug cts environment-data events
```

| Related Commands | Command                            | Description                               |
|------------------|------------------------------------|-------------------------------------------|
|                  | <b>cts environment-data enable</b> | Enables the download of environment data. |
|                  | <b>clear cts environment-data</b>  | Clears environment data.                  |

| Command                   | Description                                           |
|---------------------------|-------------------------------------------------------|
| show cts environment-data | Displays Cisco TrustSec environment data information. |

# debug cts policy-server

To enable Cisco TrustSec policy-server debugging, use the **debug cts policy-server** command in privileged EXEC mode.

**debug cts policy-server** {all | {http | json} {all | error | events}}

| Syntax Description |               |                                   |
|--------------------|---------------|-----------------------------------|
|                    | <b>all</b>    | Enables all policy-server debugs. |
|                    | <b>http</b>   | Enables HTTP client debugs.       |
|                    | <b>json</b>   | Enables JSON parser debugs.       |
|                    | <b>error</b>  | Enables HTTP error debugs.        |
|                    | <b>events</b> | Enables HTTP event debugs.        |

| Command Modes | Privileged EXEC (#) |
|---------------|---------------------|
|---------------|---------------------|

| Command History | Release                       | Modification                 |
|-----------------|-------------------------------|------------------------------|
|                 | Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

## Examples

The following example shows how to enable HTTP client error debugs:

```
Device# enable
Device# debug cts policy-server http error
```

| Related Commands | Command                       | Description                                                                         |
|------------------|-------------------------------|-------------------------------------------------------------------------------------|
|                  | <b>cts policy-server name</b> | Configures the name of a policy server and enters policy-server configuration mode. |
|                  | <b>show cts policy-server</b> | Displays Cisco TrustSec policy-server information.                                  |

## port (CTS)

To configure the policy server port, use the **port** command in policy-server configuration mode. To remove the policy server port, use the **no** form of this command.

**port** *port-number*  
**no port**

|                           |                                                                                                                                                                                                                          |                                                                                     |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>port-number</i> <div>Policy server port number. Valid values are from 1025 to 65535.</div>                                                                                                                            |                                                                                     |
| <b>Command Default</b>    | Default port is 9063.                                                                                                                                                                                                    |                                                                                     |
| <b>Command Modes</b>      | Policy-server configuration (config-policy-server)                                                                                                                                                                       |                                                                                     |

|                           | Cisco IOS XE Amsterdam 17.1.1                                                                                                                                                                                            | This command was introduced.                                                        |
| <b>Usage Guidelines</b>   | Only 9063 is supported as the External RESTful Services (ERS) port.                                                                                                                                                      |                                                                                     |
| <b>Examples</b>           | <p>The following example shows how to configure the policy-server port:</p> <pre>Device# enable Device# configure terminal Device(config)# policy-server name ise_server_2 Device(config-policy-server)# port 9063</pre> |                                                                                     |
| <b>Related Commands</b>   | <b>Command</b>                                                                                                                                                                                                           | <b>Description</b>                                                                  |
|                           | cts policy-server name                                                                                                                                                                                                   | Configures the name of a policy server and enters policy-server configuration mode. |

# propagate sgt (cts manual)

To enable Security Group Tag (SGT) propagation at Layer 2 on Cisco TrustSec Security (CTS) interfaces, use the **propagate sgt** command in interface configuration mode. To disable SGT propagation, use the **no** form of this command.

## propagate sgt

### Syntax Description

This command has no arguments or keywords.

### Command Default

SGT processing propagation is enabled.

### Command Modes

CTS manual interface configuration mode (config-if-cts-manual)

### Command History

| Release                  | Modification                 |
|--------------------------|------------------------------|
| Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

### Usage Guidelines

SGT processing propagation allows a CTS-capable interface to accept and transmit a CTS Meta Data (CMD) based L2 SGT tag. The **no propagate sgt** command can be used to disable SGT propagation on an interface in situations where a peer device is not capable of receiving an SGT, and as a result, the SGT tag cannot be put in the L2 header.

### Examples

The following example shows how to disable SGT propagation on a manually-configured TrustSec-capable interface:

```
Device# configure terminal
Device(config)# interface gigabitethernet 0
Device(config-if)# cts manual
Device(config-if-cts-manual)# no propagate sgt
```

The following example shows that SGT propagation is disabled on Gigabit Ethernet interface 0:

```
Device#show cts interface brief
Global Dot1x feature is Disabled
Interface GigabitEthernet0:
  CTS is enabled, mode:      MANUAL
  IFC state:                 OPEN
  Authentication Status:    NOT APPLICABLE
  Peer identity:             "unknown"
  Peer's advertised capabilities: ""
  Authorization Status:     NOT APPLICABLE
  SAP Status:               NOT APPLICABLE
  Propagate SGT:            Disabled
  Cache Info:
    Cache applied to link : NONE
```

### Related Commands

| <b>show cts interface</b> | Displays Cisco TrustSec states and statistics per interface. |

## retransmit (CTS)

To configure the maximum number of retries from the server, use the **retransmit** command in policy-server configuration mode. To go back to the default, use the **no** form of this command.

**retransmit** *number-of-retries*  
**no retransmit**

|                           |                                                    |                                                          |
|---------------------------|----------------------------------------------------|----------------------------------------------------------|
| <b>Syntax Description</b> | <i>number-of-retries</i>                           | Maximum number of retries. Valid values are from 0 to 5. |
| <b>Command Default</b>    | The default is 4.                                  |                                                          |
| <b>Command Modes</b>      | Policy-server configuration (config-policy-server) |                                                          |
| <b>Command History</b>    | <b>Release</b>                                     | <b>Modification</b>                                      |
|                           | Cisco IOS XE Amsterdam 17.1.1                      | This command was introduced.                             |

### Examples

The following example shows how to change the maximum number of retries:

```
Device# enable
Device# configure terminal
Device(config)# policy-server name ise_server_2
Device(config-policy-server)# retransmit 3
```

|                         |                               |                                                                                     |
|-------------------------|-------------------------------|-------------------------------------------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>                | <b>Description</b>                                                                  |
|                         | <b>cts policy-server name</b> | Configures the name of a policy server and enters policy-server configuration mode. |

## sap mode-list (cts manual)

To select the Security Association Protocol (SAP) authentication and encryption modes (prioritized from highest to lowest) used to negotiate link encryption between two interfaces, use the **sap mode-list** command in CTS dot1x interface configuration mode. To remove a mode-list and revert to the default, use the **no** form of this command.

Use the **sap mode-list** command to manually specify the Pairwise Master Key (PMK) and the Security Association Protocol (SAP) authentication and encryption modes to negotiate MACsec link encryption between two interfaces. Use the **no** form of the command to disable the configuration.

**sap pmk mode-list** {gcm-encrypt | gmac | no-encap | null} [gcm-encrypt | gmac | no-encap | null]  
**no sap pmk mode-list** {gcm-encrypt | gmac | no-encap | null} [gcm-encrypt | gmac | no-encap | null]

### Syntax Description

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>pmk</b> <i>hex_value</i> | Specifies the Hex-data PMK (without leading 0x; enter even number of hex characters, or else the last character is prefixed with 0.). |
| <b>mode-list</b>            | Specifies the list of advertised modes (prioritized from highest to lowest).                                                          |
| <b>gcm-encrypt</b>          | Specifies GMAC authentication, GCM encryption.                                                                                        |
| <b>gmac</b>                 | Specifies GMAC authentication only, no encryption.                                                                                    |
| <b>no-encap</b>             | Specifies no encapsulation.                                                                                                           |
| <b>null</b>                 | Specifies encapsulation present, no authentication, no encryption.                                                                    |

### Command Default

The default encryption is **sap pmk mode-list gcm-encrypt null**. When the peer interface does not support 802.1AE MACsec or 802.REV layer-2 link encryption, the default encryption is **null**.

### Command Modes

CTS manual interface configuration (config-if-cts-manual)

### Command History

| Release                  | Modification                 |
|--------------------------|------------------------------|
| Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

### Usage Guidelines

Use the **sap pmk mode-list** command to specify the authentication and encryption method.

The Security Association Protocol (SAP) is an encryption key derivation and exchange protocol based on a draft version of the 802.11i IEEE protocol. SAP is used to establish and maintain the 802.1AE link-to-link encryption (MACsec) between interfaces that support MACsec.

SAP and the Pairwise Master Key (PMK) can be manually configured between two interfaces with the **sap pmk mode-list** command. When using 802.1X authentication, both sides (supplicant and authenticator) receive the PMK and the MAC address of the peer's port from the Cisco Secure Access Control Server.

If a device is running CTS-aware software but the hardware is not CTS-capable, disallow encapsulation with the **sap mode-list no-encap** command.

## Examples

The following example shows how to configure SAP on a Gigabit Ethernet interface:

```
Device# configure terminal
Device(config)# interface gigabitethernet 2/1
DeviceD(config-if)# cts manual
Device(config-if-cts-manual)# sap pmk FFEED mode-list gcm-encrypt
```

## Related Commands

|-----------------------------------|------------------------------------------------------------------------------------------------------|
| <b>cts manual</b>                 | Enables an interface for CTS.                                                                        |
| <b>propagate sgt (cts manual)</b> | Enables Security Group Tag (SGT) propagation at Layer 2 on Cisco TrustSec Security (CTS) interfaces. |
| <b>show cts interface</b>         | Displays Cisco TrustSec interface configuration statistics.                                          |

# show cts credentials

To display the Cisco TrustSec (CTS) device ID, use the **show cts credentials** command in EXEC or privileged EXEC mode.

## show cts credentials

### Syntax Description

This command has no commands or keywords.

### Command Modes

Privileged EXEC (#) User EXEC (>)

### Command History

| Release                  | Modification                 |
|--------------------------|------------------------------|
| Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

### Examples

The following example displays output:

```
Device# show cts credentials
```

```
CTS password is defined in keystore, device-id = r4
```

### Related Commands

| Command                | Description                             |

| <b>cts credentials</b> | Specifies the TrustSec ID and password. |

## show cts environment-data

To display Cisco TrustSec environment data information, use the **show cts environment-data** command in privileged EXEC mode.

### show cts environment-data

This command has no arguments and keywords.

#### Command Modes

Privileged EXEC (#)

#### Command History

| Release                       | Modification                 |
|-------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

#### Examples

The following is sample output from the **show cts environment-data** command:

```
Device# enable
Device# show cts environment-data

TS Environment Data
=====
Current state = START
Last status = Failed
Environment data is empty
State Machine is running
Retry_timer (60 secs) is running
```

Output fields are self-explanatory.

# show cts interface

To display Cisco TrustSec (CTS) configuration statistics for an interface(s), use the **show cts interface** command in EXEC or privileged EXEC mode.

**show cts interface** [{**GigabitEthernet** *port* | **Vlan** *number* | **brief** | **summary**}]

## Syntax Description

|                |                                                                                                               |
|----------------|---------------------------------------------------------------------------------------------------------------|
| <i>port</i>    | (Optional) Gigabit Ethernet interface number. A verbose status output for this interface is returned.         |
| <i>number</i>  | (Optional) VLAN interface number from 1 to 4095.                                                              |
| <b>brief</b>   | (Optional) Displays abbreviated status for all CTS interfaces.                                                |
| <b>summary</b> | (Optional) Displays a tabular summary of all CTS interfaces with 4 or 5 key status fields for each interface. |

## Command Default

None

## Command Modes

EXEC (>)  
Privileged EXEC (#)

## Command History

| Release                  | Modification                 |
|--------------------------|------------------------------|
| Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

## Usage Guidelines

Use the **show cts interface** command without keywords to display verbose status for all CTS interfaces.

## Examples

The following example displays output without using a keyword (verbose status for all CTS interfaces):

```
Device# show cts interface

Global Dot1x feature is Disabled
Interface GigabitEthernet0/1/0:
  CTS is enabled, mode:    MANUAL
  IFC state:              OPEN
  Interface Active for 00:00:18.232
  Authentication Status:  NOT APPLICABLE
    Peer identity:        "unknown"
    Peer's advertised capabilities: ""
  Authorization Status:   NOT APPLICABLE
  SAP Status:             NOT APPLICABLE
    Configured pairwise ciphers:
      gcm-encrypt
      null

    Replay protection:      enabled
    Replay protection mode: STRICT

    Selected cipher:
```

```

Propagate SGT:          Enabled
Cache Info:
  Cache applied to link : NONE

Statistics:
  authc success:        0
  authc reject:         0
  authc failure:        0
  authc no response:    0
  authc logoff:         0
  sap success:          0
  sap fail:             0
  authz success:        0
  authz fail:           0
  port auth fail:       0
Ingress:
  control frame bypassed: 0
  sap frame bypassed:    0
  esp packets:           0
  unknown sa:            0
  invalid sa:            0
  inverse binding failed: 0
  auth failed:           0
  replay error:          0
Egress:
  control frame bypassed: 0
  esp packets:           0
  sgt filtered:          0
  sap frame bypassed:    0
  unknown sa dropped:    0
  unknown sa bypassed:   0

```

The following example displays output using the **brief** keyword:

```

Device# show cts interface brief

Global Dot1x feature is Disabled
Interface GigabitEthernet0/1/0:
  CTS is enabled, mode:    MANUAL
  IFC state:              OPEN
  Interface Active for 00:00:40.386
  Authentication Status:  NOT APPLICABLE
  Peer identity:          "unknown"
  Peer's advertised capabilities: ""
  Authorization Status:   NOT APPLICABLE
  SAP Status:             NOT APPLICABLE

## Examples

The following is sample output from the **show cts policy-server details all** command:

```
Device# enable
Device# show cts policy-server details all

Server Name      : ise_151
Server Status    : Inactive
  IPv4 Address    : 10.1.1.1
  IPv4 Address    : 10.2.2.2
  IPv4 Address    : 10.2.2.3
  IPv6 Address    : 2001:db8::1
  IPv6 Address    : 2001:db8::3
  Domain-name     : www.cisco.ise.com
  Trustpoint      : trust_ise_151
  Port-num        : 9063
  Retransmit count : 3
  Timeout         : 15
  App Content type : JSON

Server Name      : ise_150
Server Status    : Inactive
  IPv4 Address    : 10.64.69.151
  Trustpoint      : trust_ise_151
  Port-num        : 9063
  Retransmit count : 3
  Timeout         : 15
  App Content type : JSON
```

The following is sample output from the **show cts policy-server statistics all** command:

```
Device# show cts policy-server statistics all
```

```
Server Name : ise_server_1
Server State : ALIVE
Number of Request sent      : 7
Number of Request sent fail : 0
Number of Response received : 4
Number of Response rcv fail : 3
HTTP 200 OK                 : 4
HTTP 400 BadReq             : 0
HTTP 401 Unauthorized Req   : 0
HTTP 403 Req Forbidden      : 0
HTTP 404 NotFound           : 0
HTTP 408 ReqTimeout         : 0
HTTP 415 Unsupported Media  : 0
HTTP 500 ServerErr          : 0
HTTP 501 Req NoSupport      : 0
HTTP 503 Service Unavailable: 0
TCP or TLS handshake error  : 3
HTTP Other Error            : 0
```

The following is sample output from the **show cts policy-server statistics name** command:

```
Device# show cts policy-server statistics name ise_server_1
```

```
Server Name : ise_server_1
Server State : ALIVE
Number of Request sent      : 7
Number of Request sent fail : 0
Number of Response received : 4
Number of Response rcv fail : 3
HTTP 200 OK                 : 4
HTTP 400 BadReq             : 0
HTTP 401 Unauthorized Req   : 0
HTTP 403 Req Forbidden      : 0
HTTP 404 NotFound           : 0
HTTP 408 ReqTimeout         : 0
HTTP 415 Unsupported Media  : 0
HTTP 500 ServerErr          : 0
HTTP 501 Req NoSupport      : 0
HTTP 503 Service Unavailable: 0
TCP or TLS handshake error  : 3
HTTP Other Error            : 0
```

The following table explains the significant fields shown in the display:

**Table 6: show cts policy-server statistics Field Descriptions**

| Field                     | Description                                                                       |
|---------------------------|-----------------------------------------------------------------------------------|
| HTTP 200 OK               | Client request was accepted successfully.                                         |
| HTTP 400 BadReq           | Malformed request, or the request had invalid parameters.                         |
| HTTP 401 Unauthorized Req | Proper credentials (username and password) to access a resource was not provided. |
| HTTP 403 Req Forbidden    | Server refused to honor the client request.                                       |

| Field                      | Description                                                                                       |
|----------------------------|---------------------------------------------------------------------------------------------------|
| HTTP 404 NotFound          | Invalid URL.                                                                                      |
| HTTP 408 ReqTimeout        | Request timed out.                                                                                |
| HTTP 415 UnSupported Media | Server unable to process the requested content-type.                                              |
| HTTP 500 ServerErr         | Internal server error or exception.                                                               |
| TCP or TLS handshake error | IP unreachable or the Transport Layer Security (TLS) handshake failed due to invalid trust-point. |

# show cts role-based counters

To display Security Group access control list (ACL) enforcement statistics, use the **show cts role-based counters** command in user EXEC or privileged EXEC mode.

```
show cts role-based counters [{default [{ipv4 | ipv6}]] [{from {sgt-number | unknown} [{ipv4 | ipv6}
| to | {sgt-number | unknown} ] [{ipv4 | ipv6}]]] [{to {sgt-number | unknown} [{ipv4 | ipv6}]]]
[{ipv4 | ipv6}]
```

| Syntax Description |  |                                                                         |
|--------------------|--|-------------------------------------------------------------------------|
| <b>default</b>     |  | (Optional) Displays information about the default policy counters.      |
| <b>from</b>        |  | (Optional) Displays information about the source security group.        |
| <b>ipv4</b>        |  | (Optional) Displays information about security groups on IPv4 networks. |
| <b>ipv6</b>        |  | (Optional) Displays information about security groups on IPv6 networks. |
| <b>to</b>          |  | (Optional) Displays information about the destination security group.   |
| <i>sgt-number</i>  |  | (Optional) Security Group Tag number. Valid values are from 0 to 65533. |
| <b>unknown</b>     |  | (Optional) Displays information about all source groups.                |

|                      |                                      |

|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | <p>Use the <b>clear cts role-based counters</b> command to reset all or a range of statistics.</p> <p>Specify the source SGT with the <b>from</b> keyword and the destination SGT with the <b>to</b> keyword. All statistics are displayed when both the <b>from</b> and <b>to</b> keywords are omitted.</p> <p>The <b>default</b> keyword displays the statistics of the default unicast policy. When neither <b>ipv4</b> nor <b>ipv6</b> keywords are specified, this command displays only IPv4 counters.</p> <p>In Cisco TrustSec monitor mode, permitted traffic counters are displayed under the SW-Permitt label and the denied traffic counters are displayed under SW-Monitor label.</p> |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Example

The following is sample output from the **show cts role-based counters**

Device# **show cts role-based counters**

```

Role-based IPv4 counters
From    To      SW-Denied  HW-Denied  SW-Permitt  HW-Permitt  SW-Monitor  HW-Monitor
12      24      0          0          0           0           0           0
12      77      0          0          5           0           0           0

```

The table below lists the significant fields shown in the display.

**Table 7: show cts role-based counters Field Descriptions**

| Field      | Description                 |
|------------|-----------------------------|
| From       | Source security group.      |
| To         | Destination security group. |
| SW-Permitt | Permitted traffic counters. |
| SW-Monitor | Denied traffic counters.    |

### Related Commands

| Command                         | Description                                                                                                    |
|---------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>clear role-basedcounters</b> | Resets SGACL statistic counters.                                                                               |
| <b>cts role-based</b>           | Maps IP addresses, Layer 3 interfaces, and VRFs to SGTs. Enables Cisco TrustSec caching and SGACL enforcement. |

# show cts role-based permissions

To display the role-based (security group) access control permission list, use the **show cts role-based permissions** command in privileged EXEC mode.

```
show cts role-based permissions [{default [{details | ipv4 [details] | ipv6 [details]]} | from {sgt | unknown} [{ipv4 | ipv6 | to {sgt | unknown} [{details | ipv4 [details] | ipv6 [details]}]}]} |
ipv4 | ipv6 | platform | to {sgt | unknown} [{ipv4 | ipv6}]]]
```

|                    |                 |                                                                              |
|--------------------|-----------------|------------------------------------------------------------------------------|
| Syntax Description | <b>default</b>  | (Optional) Displays information about the default permission list.           |
|                    | <b>details</b>  | (Optional) Displays attached access control list (ACL) details.              |
|                    | <b>ipv4</b>     | (Optional) Displays information about the IPv4 protocol.                     |
|                    | <b>ipv6</b>     | (Optional) Displays information about the IPv6 protocol.                     |
|                    | <b>from</b>     | (Optional) Displays information about the source group.                      |
|                    | <b>sgt</b>      | (Optional) Security Group Tag. Valid values are from 2 to 65519.             |
|                    | <b>to</b>       | (Optional) Displays information about the destination group.                 |
|                    | <b>unknown</b>  | (Optional) Displays information about unknown source and destination groups. |
|                    | <b>platform</b> | (Optional) Displays information about the platform.                          |

|               |                    |
|---------------|--------------------|
| Command Modes | Privileged EXE (#) |
|---------------|--------------------|

| Command History | Release                  | Modification                 |
|-----------------|--------------------------|------------------------------|
|                 | Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

**Usage Guidelines**

This command displays the content of the SGACL permission matrix. You can specify the source security group tag (SGT) by using the **from** keyword and the destination SGT by using the **to** keyword. When both these keywords are specified RBACLs of a single cell are displayed. An entire column is displayed when only the **to** keyword is used. An entire row is displayed when the **from** keyword is used. The entire permission matrix is displayed when both the **from** and **to** keywords are omitted.

The command output is sorted by destination SGT as a primary key and the source SGT as a secondary key. SGACLs for each cell is displayed in the same order they are defined in the configuration or acquired from Cisco Identity Services Engine (ISE).

The **details** keyword is provided when a single cell is selected by specifying both **from** and **to** keywords. When the **details** keyword is specified the access control entries of SGACLs of a single cell are displayed.

The following is sample output from the **show role-based permissions** command:

```
Device# show cts role-based permissions
```

```

IPv4 Role-based permissions default (monitored):
default_sgac1-02
Permit IP-00
IPv4 Role-based permissions from group 305:sgt to group 306:dgt (monitored):
test_reg_tcp_permit-02
RBACL Monitor All for Dynamic Policies : TRUE
RBACL Monitor All for Configured Policies : FALSE
IPv4 Role-based permissions from group 6:SGT_6 to group 6:SGT_6 (configured):
  mon_1
IPv4 Role-based permissions from group 10 to group 11 (configured):
  mon_2
RBACL Monitor All for Dynamic Policies : FALSE
RBACL Monitor All for Configured Policies : FALSE

```

**Related Commands**

|-----------------------------------|-----------------------------------------------------------------|
| <b>cts role-based permissions</b> | Enables permissions from a source group to a destination group. |
| <b>cts role-based monitor</b>     | Enables role-based access list monitoring.                      |

# show cts server-list

To display the list of HTTP and RADIUS servers available to Cisco TrustSec seed and nonseed devices, use the **show cts server-list** command in user EXEC or privileged EXEC mode.

**show cts server-list**

## Syntax Description

This command has no arguments or keywords.

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                       | Modification                                                                                       |
|-------------------------------|----------------------------------------------------------------------------------------------------|
| Cisco IOS XE Fuji 16.9.1      | This command was introduced.                                                                       |
| Cisco IOS XE Amsterdam 17.1.1 | The output of this command was modified to display the HTTP server address and status information. |

## Usage Guidelines

This command is useful for gathering Cisco TrustSec RADIUS server address and status information.

In Cisco IOS XE Gibraltar 17.1.1 and later releases, the output of this command displays HTTP server address and their status information.

## Examples

*Cisco IOS XE Amsterdam 17.1.1*

The following sample output from the **show cts server-list** command displays HTTP servers and their status information:

```
Device> show cts server-list

HTTP Server-list:
Server Name: Http_Server_1
Server Status: DEAD
  IPv4 Address: 10.78.105.148
  IPv6 Address: Not Supported
  Domain-name: http_server_1.ise.com
  Port: 9063

Server Name: Http_Server_2
Server Status: ALIVE
  IPv4 Address: 10.78.105.149
  IPv6 Address: Not Supported
  Domain-name: http_server_2.ise.com
  Status = ALIVE
```

*Prior to Cisco IOS XE Amsterdam 17.1.1*

The following example displays the Cisco TrustSec RADIUS server list:

```
Device> show cts server-list
```

```

CTS Server Radius Load Balance = DISABLED
Server Group Deadtme = 20 secs (default)
Global Server Liveness Automated Test Deadtme = 20 secs
Global Server Liveness Automated Test Idle Time = 60 mins
Global Server Liveness Automated Test = ENABLED (default)
Preferred list, 1 server(s):
  *Server: 10.0.1.6, port 1812, A-ID 1100E046659D4275B644BF946EFA49CD
    Status = ALIVE
    auto-test = TRUE, idle-time = 60 mins, deadtme = 20 secs
Installed list: ACSServerList1-0001, 1 server(s):
  *Server: 101.0.2.61, port 1812, A-ID 1100E046659D4275B644BF946EFA49CD
    Status = ALIVE
    auto-test = TRUE, idle-time = 60 mins, deadtme = 20 secs

```

### Examples

The following example displays the SXP connections using the **brief** keyword:

```
Device# show cts sxp connection brief
```

```

SXP                : Enabled
Default Password   : Set
Default Source IP  : Not Set
Connection retry open period: 10 secs
Reconcile period: 120 secs
Retry open timer is not running
-----
Peer_IP           Source_IP           Conn Status      Duration
-----
10.10.10.1         10.10.10.2         On               0:00:02:14 (dd:hr:mm:sec)
10.10.2.1          10.10.2.2         On               0:00:02:14 (dd:hr:mm:sec)
Total num of SXP Connections = 2

```

The following example displays the CTS-SXP connections:

```
Device# show cts sxp connections

SXP : Enabled
Default Password : Set
Default Source IP: Not Set
Connection retry open period: 10 secs
Reconcile period: 120 secs
Retry open timer is not running
-----
Peer IP : 10.10.10.1
Source IP : 10.10.10.2
Set up : Peer
Conn status : On
Connection mode : SXP Listener
Connection inst# : 1
TCP conn fd : 1
TCP conn password: not set (using default SXP password)
Duration since last state change: 0:00:01:25 (dd:hr:mm:sec)
-----
Peer IP : 10.10.2.1
Source IP : 10.10.2.2
Set up : Peer
Conn status : On
Connection mode : SXP Listener
TCP conn fd : 2
TCP conn password: not set (using default SXP password)
Duration since last state change: 0:00:01:25 (dd:hr:mm:sec)
Total num of SXP Connections = 2
```

The following example displays the CTS-SXP connections for a bi-directional connection when the device is both the speaker and listener:

```
Device# show cts sxp connections

SXP : Enabled
Highest Version Supported: 4
Default Password : Set
Default Source IP: Not Set
Connection retry open period: 120 secs
Reconcile period: 120 secs
Retry open timer is running
-----
Peer IP : 2.0.0.2
Source IP : 1.0.0.2
Conn status : On (Speaker) :: On (Listener)
Conn version : 4
Local mode : Both
Connection inst# : 1
TCP conn fd : 1(Speaker) 3(Listener)
TCP conn password: default SXP password
Duration since last state change: 1:03:38:03 (dd:hr:mm:sec) :: 0:00:00:46 (dd:hr:mm:sec)
```

The following example displays output from a CTS-SXP listener with a torn down connection to the SXP speaker. Source IP-to-SGT mappings are held for 120 seconds, the default value of the delete hold down timer.

```
Device# show cts sxp connections
```

```

SXP                : Enabled
Default Password   : Set
Default Source IP  : Not Set
Connection retry open period: 10 secs
Reconcile period: 120 secs
Retry open timer is not running
-----
Peer IP            : 10.10.10.1
Source IP          : 10.10.10.2
Set up             : Peer
Conn status        : Delete_Hold_Down
Connection mode     : SXP Listener
Connection inst#    : 1
TCP conn fd        : -1
TCP conn password: not set (using default SXP password)
Delete hold down timer is running
Duration since last state change: 0:00:00:16 (dd:hr:mm:sec)
-----
Peer IP            : 10.10.2.1
Source IP          : 10.10.2.2
Set up             : Peer
Conn status        : On
Connection inst#    : 1
TCP conn fd        : 2
TCP conn password: not set (using default SXP password)
Duration since last state change: 0:00:05:49 (dd:hr:mm:sec)
Total num of SXP Connections = 2

```

|----------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>cts sxp connection peer</b>   | Enters the Cisco TrustSec SXP peer IP address and specifies if a password is used for the peer connection |
| <b>cts sxp default password</b>  | Configures the Cisco TrustSec SXP default password.                                                       |
| <b>cts sxp default source-ip</b> | Configures the Cisco TrustSec SXP source IPv4 address.                                                    |
| <b>cts sxp enable</b>            | Enables Cisco TrustSec SXP on a device.                                                                   |
| <b>cts sxp log</b>               | Enables logging for IP-to-SGT binding changes.                                                            |
| <b>cts sxp reconciliation</b>    | Changes the Cisco TrustSec SXP reconciliation period.                                                     |
| <b>cts sxp retry</b>             | Changes the Cisco TrustSec SXP retry period timer.                                                        |

## timeout (CTS)

To configure the response timeout in seconds, use the **timeout** command in policy-server configuration mode. To go back to the default response timeout, use the **no** form of this command.

**timeout** *seconds*

**no timeout**

|                           |                                                    |                                                    |
|---------------------------|----------------------------------------------------|----------------------------------------------------|
| <b>Syntax Description</b> | <i>seconds</i>                                     | Timeout in seconds. Valid values are from 1 to 60. |
| <b>Command Default</b>    | The default is 5.                                  |                                                    |
| <b>Command Modes</b>      | Policy-server configuration (config-policy-server) |                                                    |
| <b>Command History</b>    | <b>Release</b>                                     | <b>Modification</b>                                |
|                           | Cisco IOS XE Amsterdam 17.1.1                      | This command was introduced.                       |

### Examples

The following example shows how to change the policy-server timeout:

```
Device# enable
Device# configure terminal
Device(config)# policy-server name ise_server_2
Device(config-policy-server)# timeout 8
```

|                         |                               |                                                                                     |
|-------------------------|-------------------------------|-------------------------------------------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>                | <b>Description</b>                                                                  |
|                         | <b>cts policy-server name</b> | Configures the name of a policy server and enters policy-server configuration mode. |

# tls server-trustpoint

Configures the Transport Layer Security (TLS) trustpoint, use the **tls server-trustpoint** command in policy-server configuration mode. To remove the TLS trustpoint, use the **no** form of this command.

**tls server-trustpoint** *name*  
**no** **tls server-trustpoint**

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                              |

| <b>Command Default</b>    | TLS is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                              |
| <b>Command Modes</b>      | Policy-server configuration (config-policy-server)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                              |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>Modification</b>          |
|                           | Cisco IOS XE Amsterdam 17.1.1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | This command was introduced. |
| <b>Usage Guidelines</b>   | <p>TLS is used by a network device to connect to the Cisco Identity Services Engine (ISE). The device uses a make or break approach to the TLS connection establishment, and there is no persistent TLS connection between the device and Cisco ISE. After the TLS connection is established, the device can use this connection to submit multiple REST API calls to specific uniform resource locators (URLs). After all the REST requests are processed, the server terminates the connection through a TCP-FIN message. For new REST API calls, a new connection must be established with the server.</p> <p>If an invalid trustpoint is configured, the TLS handshake will fail and server is marked as dead.</p> |                              |

## Examples

The following example shows how to configure a TLS trustpoint:

```
Device# enable
Device# configure terminal
Device(config)# policy-server name ise_server_2
Device(config-policy-server)# tls server-trustpoint ise_trust
```

|                         |                               |                                                                                     |
|-------------------------|-------------------------------|-------------------------------------------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>                | <b>Description</b>                                                                  |
|                         | <b>cts policy-server name</b> | Configures the name of a policy server and enters policy-server configuration mode. |

# bluetooth pin

To configure a new Bluetooth pin, use the **bluetooth pin** command in interface configuration or global configuration mode.

## **bluetooth pin** *pin*

|                           |            |                                          |
|---------------------------|------------|------------------------------------------|
| <b>Syntax Description</b> | <i>pin</i> | Pairing pin for the Bluetooth interface. |
|                           |            | The pin is a 4-digit number.             |

|                      |                                     |
|----------------------|-------------------------------------|
| <b>Command Modes</b> | Interface configuration (config-if) |
|                      | Global configuration (config)       |

|                        |                                |                              |
|------------------------|--------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>                 | <b>Modification</b>          |
|                        | Cisco IOS XE Gibraltar 16.12.1 | This command was introduced. |

|                         |                                                                                                                                                                                                             |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The <b>bluetooth pin</b> command can be configured either in the interface configuration or global configuration mode. Cisco recommends using the global configuration mode to configure the Bluetooth pin. |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                 |                                                                                                 |
|-----------------|-------------------------------------------------------------------------------------------------|
| <b>Examples</b> | This example shows how to configure a new Bluetooth pin using the <b>bluetooth pin</b> command. |
|-----------------|-------------------------------------------------------------------------------------------------|

```
Device> enable
Device# configure terminal
Device(config)# bluetooth pin 1111
Device(config)#
```

|                         |                                         |                                                    |
|-------------------------|-----------------------------------------|----------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>                          | <b>Description</b>                                 |
|                         | <b>show platform hardware bluetooth</b> | Displays information about the Bluetooth interface |

# clear macro auto configuration

To remove the macro applied configuration from the interfaces, use the **clear macro auto configuration** command.

**Note** Before executing the **clear macro auto configuration** command, you must disable Auto SmartPorts on the switch.

**clear macro auto configuration** {**all** | **interface** [*interface-id*]}

|                           |                                          |                                                              |
|---------------------------|------------------------------------------|--------------------------------------------------------------|
| <b>Syntax Description</b> | <i>all</i>                               | Removes macro applied configuration from all the interfaces. |
|                           | <b>interface</b> [ <i>interface-id</i> ] | Removes macro applied configuration from an interface.       |

**Command Default** This command has no default setting.

**Command Modes** User EXEC (>)

| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|------------------------|------------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Use the command to remove configuration applied by macros from all the interfaces or a particular interface on the switch.

You can verify your settings by entering the **show macro auto interface** command in privileged EXEC mode.

## Example

This example shows how to remove the configuration from all the switch interfaces:

```
Device(config)# clear macro auto configuration all
```

# device classifier

To enable the device classifier, use the **device classifier** command in global configuration mode. Use the **no** form of this command to disable the device classifier.

**device classifier**

**no device classifier**

|                  |                                                                                                                                                                                                                         |                              |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| Command Default  | This command is disabled by default.                                                                                                                                                                                    |                              |
| Command Modes    | Global configuration (config)                                                                                                                                                                                           |                              |
| Command History  | Release                                                                                                                                                                                                                 | Modification                 |
|                  | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                            | This command was introduced. |
| Usage Guidelines | Use the <b>no device classifier</b> command, in global configuration mode, to disable the device classifier. You cannot disable the device classifier while it is being used by features such as Auto SmartPorts (ASP). |                              |

## Example

This example shows how to enable the ASP device classifier on a switch:

```
Device(config)# device classifier
Device(config)# end
```

# debug ilpower

To enable debugging of the power controller and Power over Ethernet (PoE) system, use the **debug ilpower** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

**debug ilpower** {**cdp** | **event** | **ha** | **ipc** | **police** | **port** | **powerman** | **registries** | **scp** | **sense**}  
**no debug ilpower** {**cdp** | **event** | **ha** | **ipc** | **police** | **port** | **powerman** | **registries** | **scp** | **sense**}

## Syntax Description

|                   |                                                                |
|-------------------|----------------------------------------------------------------|
| <b>cdp</b>        | Displays PoE Cisco Discovery Protocol (CDP) debug messages.    |
| <b>event</b>      | Displays PoE event debug messages.                             |
| <b>ha</b>         | Displays PoE high-availability messages.                       |
| <b>ipc</b>        | Displays PoE Inter-Process Communication (IPC) debug messages. |
| <b>police</b>     | Displays PoE police debug messages.                            |
| <b>port</b>       | Displays PoE port manager debug messages.                      |
| <b>powerman</b>   | Displays PoE power management debug messages.                  |
| <b>registries</b> | Displays PoE registries debug messages.                        |
| <b>scp</b>        | Displays PoE SCP debug messages.                               |
| <b>sense</b>      | Displays PoE sense debug messages.                             |

## Command Default

Debugging is disabled.

## Command Modes

Privileged EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

This command is supported only on PoE-capable switches.

When you enable debugging on a switch stack, it is enabled only on the active switch. To enable debugging on a stack member, you can start a session from the active switch by using the **session switch-number** EXEC command. Then enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command stack-member-number LINE** EXEC command on the active switc to enable debugging on a member switch without first starting a session.

# debug interface

To enable debugging of interface-related activities, use the **debug interface** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

**debug interface** {*interface-id* | **counters** {**exceptions** | **protocol memory**} | **null** *interface-number* | **port-channel** *port-channel-number* | **states** | **vlan** *vlan-id*}  
**no debug interface** {*interface-id* | **counters** {**exceptions** | **protocol memory**} | **null** *interface-number* | **port-channel** *port-channel-number* | **states** | **vlan** *vlan-id*}

## Syntax Description

|                                                |                                                                                                                                                                                 |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>interface-id</i>                            | ID of the physical interface. Displays debug messages for the specified physical port, identified by type switch number/module number/port, for example, gigabitethernet 1/0/2. |
| <b>null</b> <i>interface-number</i>            | Displays debug messages for null interfaces. The interface number is always 0.                                                                                                  |
| <b>port-channel</b> <i>port-channel-number</i> | Displays debug messages for the specified EtherChannel port-channel interface. The <i>port-channel-number</i> range is 1 to 48.                                                 |
| <b>vlan</b> <i>vlan-id</i>                     | Displays debug messages for the specified VLAN. The <i>vlan</i> range is 1 to 4094.                                                                                             |
| <b>counters</b>                                | Displays counters debugging information.                                                                                                                                        |
| <b>exceptions</b>                              | Displays debug messages when a recoverable exceptional condition occurs during the computation of the interface packet and data rate statistics.                                |
| <b>protocol memory</b>                         | Displays debug messages for memory operations of protocol counters.                                                                                                             |
| <b>states</b>                                  | Displays intermediary debug messages when an interface's state transitions.                                                                                                     |

## Command Default

Debugging is disabled.

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

If you do not specify a keyword, all debug messages appear.

The **undebg interface** command is the same as the **no debug interface** command.

When you enable debugging on a switch stack, it is enabled only on the active switch. To enable debugging on a stack member, you can start a session from the active switch by using the **session switch-number** EXEC command. Then enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command stack-member-number LINE** EXEC command on the active switch to enable debugging on a member switch without first starting a session.

# debug lldp packets

To enable debugging of Link Layer Discovery Protocol (LLDP) packets, use the **debug lldp packets** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

**debug lldp packets**  
**no debug lldp packets**

|                           |                                           |
|---------------------------|-------------------------------------------|
| <b>Syntax Description</b> | This commnd has no arguments or keywords. |

|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                                                                                     |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The <b>undebg lldp packets</b> command is the same as the <b>no debug lldp packets</b> command.                                                                                                                                     |
|                         | When you enable debugging on a switch stack, it is enabled only on the active switch. To enable debugging on a stack member, you can start a session from the active switch by using the <b>session switch-number</b> EXEC command. |

# debug platform poe

To enable debugging of a Power over Ethernet (PoE) port, use the **debug platform poe** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

**debug platform poe** [{**error** | **info**}] [**switch** *switch-number*]  
**no debug platform poe** [{**error** | **info**}] [**switch** *switch-number*]

## Syntax Description

|                                    |                                                                                                     |
|------------------------------------|-----------------------------------------------------------------------------------------------------|
| <b>error</b>                       | (Optional) Displays PoE-related error debug messages.                                               |
| <b>info</b>                        | (Optional) Displays PoE-related information debug messages.                                         |
| <b>switch</b> <i>switch-number</i> | (Optional) Specifies the stack member. This keyword is supported only on stacking-capable switches. |

## Command Default

Debugging is disabled.

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **undebug platform poe** command is the same as the **no debug platform poe** command.

# debug platform software fed switch active punt packet-capture start

To enable debugging of packets during high CPU utilization, for an active switch, use the **debug platform software fed switch active punt packet-capture start** command in privileged EXEC mode. To disable debugging of packets during high CPU utilization, for an active switch, use the **debug platform software fed switch active punt packet-capture stop** command in privileged EXEC mode.

**debug platform software fed switch active punt packet-capture start**  
**debug platform software fed switch active punt packet-capture stop**

|                    |                       |                                                  |
|--------------------|-----------------------|--------------------------------------------------|
| Syntax Description | <b>switch active</b>  | Displays information about the active switch.    |
|                    | <b>punt</b>           | Specifies the punt information.                  |
|                    | <b>packet-capture</b> | Specifies information about the captured packet. |
|                    | <b>start</b>          | Enables debugging of the active switch.          |
|                    | <b>stop</b>           | Disables debugging of the active switch.         |

|               |                     |
|---------------|---------------------|
| Command Modes | Privileged EXEC (#) |
|---------------|---------------------|

|                 |                                |                              |
|-----------------|--------------------------------|------------------------------|
| Command History | <b>Release</b>                 | <b>Modification</b>          |
|                 | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |

**Usage Guidelines** The **debug platform software fed switch active punt packet-capture start** command starts the debugging of packets during high CPU utilization. The packet capture is stopped when the 4k buffer size is exceeded.

## Examples

The following is a sample output from the **debug platform software fed switch active punt packet-capture start** command:

```
Device# debug platform software fed switch active packet-capture start
Punt packet capturing started.
```

The following is a sample output from the **debug platform software fed switch active punt packet-capture stop** command:

```
Device# debug platform software fed switch active packet-capture stop
Punt packet capturing stopped. Captured 101 packet(s)
```

# duplex

To specify the duplex mode of operation for a port, use the **duplex** command in interface configuration mode. To return to the default value, use the **no** form of this command.

**duplex** {**auto** | **full** | **half**}  
**no duplex** {**auto** | **full** | **half**}

## Syntax Description

- |             |                                                                                                                                                                                          |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>auto</b> | Enables automatic duplex configuration. The port automatically detects whether it should run in full- or half-duplex mode, depending on the attached device mode.                        |
| <b>full</b> | Enables full-duplex mode.                                                                                                                                                                |
| <b>half</b> | Enables half-duplex mode (only for interfaces operating at 10 or 100 Mb/s). You cannot configure half-duplex mode for interfaces operating at 1000 Mb/s, 10,000 Mb/s, 2.5Gb/s, or 5Gb/s. |

## Command Default

The default is **auto** for Gigabit Ethernet ports.

Duplex options are not supported on the 1000BASE-x or 10GBASE-x (where -x is -BX, -CWDM, -LX, -SX, or -ZX) small form-factor pluggable (SFP) modules.

## Command Modes

Interface configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

For Gigabit Ethernet ports, setting the port to **auto** has the same effect as specifying **full** if the attached device does not autonegotiate the duplex parameter.

### Note

Half-duplex mode is supported on Gigabit Ethernet interfaces if the duplex mode is **auto** and the connected device is operating at half duplex. However, you cannot configure these interfaces to operate in half-duplex mode.

Certain ports can be configured to be either full duplex or half duplex. How this command is applied depends on the device to which the switch is attached.

If both ends of the line support autonegotiation, we highly recommend using the default autonegotiation settings. If one interface supports autonegotiation and the other end does not, configure duplex and speed on both interfaces, and use the **auto** setting on the supported side.

If the speed is set to **auto**, the switch negotiates with the device at the other end of the link for the speed setting and then forces the speed setting to the negotiated value. The duplex setting remains as configured on each end of the link, which could result in a duplex setting mismatch.

You can configure the duplex setting when the speed is set to **auto**.

**Caution**

Changing the interface speed and duplex mode configuration might shut down and re-enable the interface during the reconfiguration.

You can verify your setting by entering the **show interfaces** privileged EXEC command.

**Examples**

This example shows how to configure an interface for full-duplex operation:

```
Device(config)# interface gigabitethernet1/0/1  
Devic(config-if)# duplex full
```

## errdisable detect cause

To enable error-disable detection for a specific cause or for all causes, use the **errdisable detect cause** command in global configuration mode. To disable the error-disable detection feature, use the **no** form of this command.

**errdisable detect cause** {all | arp-inspection | bpduguard shutdown vlan | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | link-flap | loopback | pagp-flap | pppoe-ia-rate-limit | psp shutdown vlan | security-violation shutdown vlan | sfp-config-mismatch}  
**no errdisable detect cause** {all | arp-inspection | bpduguard shutdown vlan | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | link-flap | loopback | pagp-flap | pppoe-ia-rate-limit | psp shutdown vlan | security-violation shutdown vlan | sfp-config-mismatch}

| Syntax Description                      |             |                                                                                             |
|-----------------------------------------|-------------|---------------------------------------------------------------------------------------------|
| <b>all</b>                              |             | Enables error detection for all error-disabled causes.                                      |
| <b>arp-inspection</b>                   |             | Enables error detection for dynamic Address Resolution Protocol (ARP) inspection.           |
| <b>bpduguard shutdown vlan</b>          |             | Enables per-VLAN error-disable for BPDU guard.                                              |
| <b>dhcp-rate-limit</b>                  |             | Enables error detection for DHCP snooping.                                                  |
| <b>dtp-flap</b>                         |             | Enables error detection for the Dynamic Trunking Protocol (DTP) flapping.                   |
| <b>gbic-invalid</b>                     |             | Enables error detection for an invalid Gigabit Interface Converter (GBIC) module.           |
|                                         | <b>Note</b> | This error refers to an invalid small form-factor pluggable (SFP) module.                   |
| <b>inline-power</b>                     |             | Enables error detection for the Power over Ethernet (PoE) error-disabled cause.             |
|                                         | <b>Note</b> | This keyword is supported only on switches with PoE ports.                                  |
| <b>link-flap</b>                        |             | Enables error detection for link-state flapping.                                            |
| <b>loopback</b>                         |             | Enables error detection for detected loopbacks.                                             |
| <b>pagp-flap</b>                        |             | Enables error detection for the Port Aggregation Protocol (PAgP) flap error-disabled cause. |
| <b>pppoe-ia-rate-limit</b>              |             | Enables error detection for the PPPoE Intermediate Agent rate-limit error-disabled cause.   |
| <b>psp shutdown vlan</b>                |             | Enables error detection for protocol storm protection (PSP).                                |
| <b>security-violation shutdown vlan</b> |             | Enables voice aware 802.1x security.                                                        |
| <b>sfp-config-mismatch</b>              |             | Enables error detection on an SFP configuration mismatch.                                   |

|                        |                                                                                                                                |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Command Default</b> | Detection is enabled for all causes. All causes, except per-VLAN error disabling, are configured to shut down the entire port. |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------|

|                      |                      |

| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                                           |         |              |                              |                              |

|                         |                                                                                                                                                                                                                                                              |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | <p>A cause (such as a link-flap or dhcp-rate-limit) is the reason for the error-disabled state. When a cause is detected on an interface, the interface is placed in an error-disabled state, an operational state that is similar to a link-down state.</p> |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

When a port is error-disabled, it is effectively shut down, and no traffic is sent or received on the port. For the bridge protocol data unit (BPDU) guard, voice-aware 802.1x security, and port-security features, you can configure the switch to shut down only the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.

If you set a recovery mechanism for the cause by entering the **errdisable recovery** global configuration command, the interface is brought out of the error-disabled state and allowed to retry the operation when all causes have timed out. If you do not set a recovery mechanism, you must enter the **shutdown** and then the **no shutdown** commands to manually recover an interface from the error-disabled state.

For protocol storm protection, excess packets are dropped for a maximum of two virtual ports. Virtual port error disabling using the **psp** keyword is not supported for EtherChannel and Flexlink interfaces.

To verify your settings, enter the **show errdisable detect** privileged EXEC command.

This example shows how to enable error-disabled detection for the link-flap error-disabled cause:

```
Device(config)# errdisable detect cause link-flap
```

This command shows how to globally configure BPDU guard for a per-VLAN error-disabled state:

```
Device(config)# errdisable detect cause bpduguard shutdown vlan
```

This command shows how to globally configure voice-aware 802.1x security for a per-VLAN error-disabled state:

```
Device(config)# errdisable detect cause security-violation shutdown vlan
```

You can verify your setting by entering the **show errdisable detect** privileged EXEC command.

## errdisable recovery cause

To enable the error-disabled mechanism to recover from a specific cause, use the **errdisable recovery cause** command in global configuration mode. To return to the default setting, use the **no** form of this command.

**errdisable recovery cause** {all | arp-inspection | bpduguard | channel-misconfig | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | link-flap | loopback | mac-limit | pagp-flap | port-mode-failure | pppoe-ia-rate-limit | psecure-violation | psp | security-violation | sfp-config-mismatch | storm-control | udld}

**no errdisable recovery cause** {all | arp-inspection | bpduguard | channel-misconfig | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | link-flap | loopback | mac-limit | pagp-flap | port-mode-failure | pppoe-ia-rate-limit | psecure-violation | psp | security-violation | sfp-config-mismatch | storm-control | udld}

### Syntax Description

|                          |                                                                                                                                                                                                                         |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b>               | Enables the timer to recover from all error-disabled causes.                                                                                                                                                            |
| <b>arp-inspection</b>    | Enables the timer to recover from the Address Resolution Protocol (ARP) inspection error-disabled state.                                                                                                                |
| <b>bpduguard</b>         | Enables the timer to recover from the bridge protocol data unit (BPDU) guard error-disabled state.                                                                                                                      |
| <b>channel-misconfig</b> | Enables the timer to recover from the EtherChannel misconfiguration error-disabled state.                                                                                                                               |
| <b>dhcp-rate-limit</b>   | Enables the timer to recover from the DHCP snooping error-disabled state.                                                                                                                                               |
| <b>dtp-flap</b>          | Enables the timer to recover from the Dynamic Trunking Protocol (DTP) flap error-disabled state.                                                                                                                        |
| <b>gbic-invalid</b>      | Enables the timer to recover from an invalid Gigabit Interface Converter (GBIC) module error-disabled state.<br><br><b>Note</b> This error refers to an invalid small form-factor pluggable (SFP) error-disabled state. |
| <b>inline-power</b>      | Enables the timer to recover from the Power over Ethernet (PoE) error-disabled state.<br><br>This keyword is supported only on switches with PoE ports.                                                                 |
| <b>link-flap</b>         | Enables the timer to recover from the link-flap error-disabled state.                                                                                                                                                   |
| <b>loopback</b>          | Enables the timer to recover from a loopback error-disabled state.                                                                                                                                                      |
| <b>mac-limit</b>         | Enables the timer to recover from the mac limit error-disabled state.                                                                                                                                                   |
| <b>pagp-flap</b>         | Enables the timer to recover from the Port Aggregation Protocol (PAgP)-flap error-disabled state.                                                                                                                       |

|                            |                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------|
| <b>port-mode-failure</b>   | Enables the timer to recover from the port mode change failure error-disabled state.             |
| <b>pppoe-ia-rate-limit</b> | Enables the timer to recover from the PPPoE IA rate limit error-disabled state.                  |
| <b>psecure-violation</b>   | Enables the timer to recover from a port security violation disable state.                       |
| <b>psp</b>                 | Enables the timer to recover from the protocol storm protection (PSP) error-disabled state.      |
| <b>security-violation</b>  | Enables the timer to recover from an IEEE 802.1x-violation disabled state.                       |
| <b>sfp-config-mismatch</b> | Enables error detection on an SFP configuration mismatch.                                        |
| <b>storm-control</b>       | Enables the timer to recover from a storm control error.                                         |
| <b>udld</b>                | Enables the timer to recover from the UniDirectional Link Detection (UDLD) error-disabled state. |

**Command Default**

Recovery is disabled for all causes.

**Command Modes**

Global configuration (config)

**Command History**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

A cause (such as all or BPDU guard) is defined as the reason that the error-disabled state occurred. When a cause is detected on an interface, the interface is placed in the error-disabled state, an operational state similar to link-down state.

When a port is error-disabled, it is effectively shut down, and no traffic is sent or received on the port. For the BPDU guard and port-security features, you can configure the switch to shut down only the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.

If you do not enable the recovery for the cause, the interface stays in the error-disabled state until you enter the **shutdown** and the **no shutdown** interface configuration commands. If you enable the recovery for a cause, the interface is brought out of the error-disabled state and allowed to retry the operation again when all the causes have timed out.

Otherwise, you must enter the **shutdown** and then the **no shutdown** commands to manually recover an interface from the error-disabled state.

You can verify your settings by entering the **show errdisable recovery** privileged EXEC command.

**Examples**

This example shows how to enable the recovery timer for the BPDU guard error-disabled cause:

```
Device# Device#configure terminal
Device(config)# errdisable recovery cause bpduguard
```

## errdisable recovery cause

To enable the error-disabled mechanism to recover from a specific cause, use the **errdisable recovery cause** command in global configuration mode. To return to the default setting, use the **no** form of this command.

**errdisable recovery cause** {all | arp-inspection | bpduguard | channel-misconfig | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | link-flap | loopback | mac-limit | pagp-flap | port-mode-failure | pppoe-ia-rate-limit | psecure-violation | psp | security-violation | sfp-config-mismatch | storm-control | udld}

**no errdisable recovery cause** {all | arp-inspection | bpduguard | channel-misconfig | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | link-flap | loopback | mac-limit | pagp-flap | port-mode-failure | pppoe-ia-rate-limit | psecure-violation | psp | security-violation | sfp-config-mismatch | storm-control | udld}

### Syntax Description

|                          |                                                                                                                                                                                                                         |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b>               | Enables the timer to recover from all error-disabled causes.                                                                                                                                                            |
| <b>arp-inspection</b>    | Enables the timer to recover from the Address Resolution Protocol (ARP) inspection error-disabled state.                                                                                                                |
| <b>bpduguard</b>         | Enables the timer to recover from the bridge protocol data unit (BPDU) guard error-disabled state.                                                                                                                      |
| <b>channel-misconfig</b> | Enables the timer to recover from the EtherChannel misconfiguration error-disabled state.                                                                                                                               |
| <b>dhcp-rate-limit</b>   | Enables the timer to recover from the DHCP snooping error-disabled state.                                                                                                                                               |
| <b>dtp-flap</b>          | Enables the timer to recover from the Dynamic Trunking Protocol (DTP) flap error-disabled state.                                                                                                                        |
| <b>gbic-invalid</b>      | Enables the timer to recover from an invalid Gigabit Interface Converter (GBIC) module error-disabled state.<br><br><b>Note</b> This error refers to an invalid small form-factor pluggable (SFP) error-disabled state. |
| <b>inline-power</b>      | Enables the timer to recover from the Power over Ethernet (PoE) error-disabled state.<br><br>This keyword is supported only on switches with PoE ports.                                                                 |
| <b>link-flap</b>         | Enables the timer to recover from the link-flap error-disabled state.                                                                                                                                                   |
| <b>loopback</b>          | Enables the timer to recover from a loopback error-disabled state.                                                                                                                                                      |
| <b>mac-limit</b>         | Enables the timer to recover from the mac limit error-disabled state.                                                                                                                                                   |
| <b>pagp-flap</b>         | Enables the timer to recover from the Port Aggregation Protocol (PAgP)-flap error-disabled state.                                                                                                                       |

|                            |                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------|
| <b>port-mode-failure</b>   | Enables the timer to recover from the port mode change failure error-disabled state.             |
| <b>pppoe-ia-rate-limit</b> | Enables the timer to recover from the PPPoE IA rate limit error-disabled state.                  |
| <b>psecure-violation</b>   | Enables the timer to recover from a port security violation disable state.                       |
| <b>psp</b>                 | Enables the timer to recover from the protocol storm protection (PSP) error-disabled state.      |
| <b>security-violation</b>  | Enables the timer to recover from an IEEE 802.1x-violation disabled state.                       |
| <b>sfp-config-mismatch</b> | Enables error detection on an SFP configuration mismatch.                                        |
| <b>storm-control</b>       | Enables the timer to recover from a storm control error.                                         |
| <b>udld</b>                | Enables the timer to recover from the UniDirectional Link Detection (UDLD) error-disabled state. |

**Command Default**

Recovery is disabled for all causes.

**Command Modes**

Global configuration (config)

**Command History**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

A cause (such as all or BDPU guard) is defined as the reason that the error-disabled state occurred. When a cause is detected on an interface, the interface is placed in the error-disabled state, an operational state similar to link-down state.

When a port is error-disabled, it is effectively shut down, and no traffic is sent or received on the port. For the BDPU guard and port-security features, you can configure the switch to shut down only the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.

If you do not enable the recovery for the cause, the interface stays in the error-disabled state until you enter the **shutdown** and the **no shutdown** interface configuration commands. If you enable the recovery for a cause, the interface is brought out of the error-disabled state and allowed to retry the operation again when all the causes have timed out.

Otherwise, you must enter the **shutdown** and then the **no shutdown** commands to manually recover an interface from the error-disabled state.

You can verify your settings by entering the **show errdisable recovery** privileged EXEC command.

**Examples**

This example shows how to enable the recovery timer for the BDPU guard error-disabled cause:

```
Device# Device#configure terminal
Device(config)# errdisable recovery cause bpduguard
```

# hw-module switch upoe-plus

To enable the 802.3bt mode on the device, use the **hw-module switch upoe-plus** comamnd in the Global Configuration mode. To unconfigure the 802.3bt mode, use the **no** form of the command.

```
hw-module switch switch-number upoe-plus
no hw-module switch switch-number upoe-plus
```

| Command Default  | The device is in 802.3at mode.                                                                                                                                                                                                                                     |                              |

|                  | Cisco IOS XE Gibraltar 16.12.1                                                                                                                                                                                                                                     | This command was introduced. |
| Usage Guidelines | When the device boots up, it is in 802.3at-compliant mode by default. Use the <b>hw-module switchswitch-number upoe-plus</b> command to enable 802.3bt Type 3 mode ton the device. This command causes the device to be power-cycled to enable 802.3bt compliance. |                              |

The following command enables 802.3bt mode on the switch which is the second member of the stack.

```
Device> enable
Device# configure terminal
Device(config)# hw-module switch 2 upoe-plus
!!!WARNING!!!This configuration will power cycle the switch to make it effective. Would you
like to continue y/n?
```

# interface

To configure an interface, use the **interface** command.

**interface** {**Auto-Template** *interface-number* | **FiveGigabitEthernet** *switch-number/slot-number/port-number* | **GigabitEthernet** *switch-number/slot-number/port-number* | **Loopback** *interface-number* **Null** *interface-number* **Port-channel** *interface-number* **TenGigabitEthernet** *switch-number/slot-number/port-number* **TwentyFiveGigE** *switch-number/slot-number/port-number* **TwoGigabitEthernet** *switch-number/slot-number/port-number* **Tunnel** *interface-number* **Vlan** *interface-number* }

| Syntax                                                                      | Description                                                                                                                                                                                                                                                                                                                       |

---

**Usage Guidelines**

You can not use the "no" form of this command.

---

**Examples**

The following example shows how to configure a tunnel interface:

```
Device(config)# interface Tunnel 15  
Device(config-if)#
```

The following example shows how to configure a 25-Gigabit Ethernet interface

```
Device(config)# interface TwentyFiveGigE 1/1/1  
Device(config-if)#
```

The following example shows how to configure a 40-Gigabit Ethernet interface

```
Device(config)# interface FortyGigabitEthernet 1/1/2  
Device(config-if)#
```

# interface range

To configure an interface range, use the **interface range** command.

**interface range** {**Auto-Template** *interface-number* | **FiveGigabitEthernet** *switch-number/slot-number/port-number* | **FortyGigabitEthernet** *switch-number/slot-number/port-number* | **GigabitEthernet** *switch-number/slot-number/port-number* | **Loopback** *interface-number* **Null** *interface-number* **Port-channel** *interface-number* **TenGigabitEthernet** *switch-number/slot-number/port-number* **TwentyFiveGigE** *switch-number/slot-number/port-number* **TwoGigabitEthernet** *switch-number/slot-number/port-number* **Tunnel** *interface-number* **Vlan** *interface-number* }

| Syntax Description                                                       |  |                                                                                                                                                                                                                                                                                                                                          |

Examples

This example shows how you can configure interface range:

```
Device(config)# interface range vlan 1-100
```

# ip mtu

To set the IP maximum transmission unit (MTU) size of routed packets on all routed ports of the switch or switch stack, use the **ip mtu** command in interface configuration mode. To restore the default IP MTU size, use the **no** form of this command.

**ip mtu** *bytes*  
**no ip mtu** *bytes*

|                           |                                                                                              |                              |
|---------------------------|----------------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <i>bytes</i> MTU size, in bytes. The range is from 68 up to the system MTU value (in bytes). |                              |
| <b>Command Default</b>    | The default IP MTU size for frames received and sent on all switch interfaces is 1500 bytes. |                              |
| <b>Command Modes</b>      | Interface configuration (config-if)                                                          |                              |
| <b>Command History</b>    | <b>Release</b>                                                                               | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.5.1a                                                                 | This command was introduced. |

**Usage Guidelines**

The upper limit of the IP value is based on the switch or switch stack configuration and refers to the currently applied system MTU value. For more information about setting the MTU sizes, see the **system mtu** global configuration command.

To return to the default IP MTU setting, you can apply the **default ip mtu** command or the **no ip mtu** command on the interface.

You can verify your setting by entering the **show ip interface** *interface-id* or **show interfaces** *interface-id* privileged EXEC command.

The following example sets the maximum IP packet size for VLAN 200 to 1000 bytes:

```
Device(config)# interface vlan 200
Device(config-if)# ip mtu 1000
```

The following example sets the maximum IP packet size for VLAN 200 to the default setting of 1500 bytes:

```
Device(config)# interface vlan 200
Device(config-if)# default ip mtu
```

This is an example of partial output from the **show ip interface** *interface-id* command. It displays the current IP MTU setting for the interface.

```
Device# show ip interface gigabitethernet4/0/1
GigabitEthernet4/0/1 is up, line protocol is up
  Internet address is 18.0.0.1/24
  Broadcast address is 255.255.255.255
  Address determined by setup command
  MTU is 1500 bytes
  Helper address is not set
```

<output truncated>

# ipv6 mtu

To set the IPv6 maximum transmission unit (MTU) size of routed packets on all routed ports of the switch or switch stack, use the **ipv6 mtu** command in interface configuration mode. To restore the default IPv6 MTU size, use the **no** form of this command.

**ipv6 mtu** *bytes*  
**no ipv6 mtu** *bytes*

|                           |                                                                                                |                              |
|---------------------------|------------------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <i>bytes</i> MTU size, in bytes. The range is from 1280 up to the system MTU value (in bytes). |                              |
| <b>Command Default</b>    | The default IPv6 MTU size for frames received and sent on all switch interfaces is 1500 bytes. |                              |
| <b>Command Modes</b>      | Interface configuration                                                                        |                              |
| <b>Command History</b>    | <b>Release</b>                                                                                 | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.5.1a                                                                   | This command was introduced. |

**Usage Guidelines**

The upper limit of the IPv6 MTU value is based on the switch or switch stack configuration and refers to the currently applied system MTU value. For more information about setting the MTU sizes, see the **system mtu** global configuration command.

To return to the default IPv6 MTU setting, you can apply the **default ipv6 mtu** command or the **no ipv6 mtu** command on the interface.

You can verify your setting by entering the **show ipv6 interface** *interface-id* or **show interface** *interface-id* privileged EXEC command.

The following example sets the maximum IPv6 packet size for an interface to 2000 bytes:

```
Device(config)# interface gigabitethernet4/0/1
Device(config-if)# ipv6 mtu 2000
```

The following example sets the maximum IPv6 packet size for an interface to the default setting of 1500 bytes:

```
Device(config)# interface gigabitethernet4/0/1
Device(config-if)# default ipv6 mtu
```

This is an example of partial output from the **show ipv6 interface** *interface-id* command. It displays the current IPv6 MTU setting for the interface.

```
Device# show ipv6 interface gigabitethernet4/0/1
GigabitEthernet4/0/1 is up, line protocol is up
  Internet address is 18.0.0.1/24
  Broadcast address is 255.255.255.255
  Address determined by setup command
  MTU is 1500 bytes
  Helper address is not set
```

<output truncated>

## lldp (interface configuration)

To enable Link Layer Discovery Protocol (LLDP) on an interface, use the **lldp** command in interface configuration mode. To disable LLDP on an interface, use the **no** form of this command.

**lldp** {**med-tlv-select** *tlv* | **receive** | **tlv-select** **power-management** | **transmit**}  
**no lldp** {**med-tlv-select** *tlv* | **receive** | **tlv-select** **power-management** | **transmit**}

| Syntax Description      |  |                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------|--|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>med-tlv-select</b>   |  | Selects an LLDP Media Endpoint Discovery (MED) time-length-value (TLV) element to send.                                                                                                                                                                                                                                                                                          |
| <i>tlv</i>              |  | String that identifies the TLV element. Valid values are the following: <ul style="list-style-type: none"> <li>• <b>inventory-management</b>— LLDP MED Inventory Management TLV.</li> <li>• <b>location</b>— LLDP MED Location TLV.</li> <li>• <b>network-policy</b>— LLDP MED Network Policy TLV.</li> <li>• <b>power-management</b>— LLDP MED Power Management TLV.</li> </ul> |
| <b>receive</b>          |  | Enables the interface to receive LLDP transmissions.                                                                                                                                                                                                                                                                                                                             |
| <b>tlv-select</b>       |  | Selects the LLDP TLVs to send.                                                                                                                                                                                                                                                                                                                                                   |
| <b>power-management</b> |  | Sends the LLDP Power Management TLV.                                                                                                                                                                                                                                                                                                                                             |
| <b>transmit</b>         |  | Enables LLDP transmission on the interface.                                                                                                                                                                                                                                                                                                                                      |

**Command Default** LLDP is disabled.

**Command Modes** Interface configuration (config-if)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

This command is supported on 802.1 media types.

If the interface is configured as a tunnel port, LLDP is automatically disabled.

The following example shows how to disable LLDP transmission on an interface:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# no lldp transmit
```

The following example shows how to enable LLDP transmission on an interface:

```
Device(config)# interface gigabitethernet1/0/1
```

```
Device(config-if)# lldp transmit
```

# logging event power-inline-status

To enable the logging of Power over Ethernet (PoE) events, use the **logging event power-inline-status** command in interface configuration mode. To disable the logging of PoE status events, use the **no** form of this command.

**logging event power-inline-status**  
**no logging event power-inline-status**

|                           |                                            |
|---------------------------|--------------------------------------------|
| <b>Syntax Description</b> | This command has no arguments or keywords. |
|---------------------------|--------------------------------------------|

|                        |                                   |
|------------------------|-----------------------------------|
| <b>Command Default</b> | Logging of PoE events is enabled. |
|------------------------|-----------------------------------|

|                      |                                     |
|----------------------|-------------------------------------|
| <b>Command Modes</b> | Interface configuration (config-if) |
|----------------------|-------------------------------------|

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                       |
|-------------------------|-----------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The <b>no</b> form of this command does not disable PoE error events. |
|-------------------------|-----------------------------------------------------------------------|

|                 |                                                                   |
|-----------------|-------------------------------------------------------------------|
| <b>Examples</b> | This example shows how to enable logging of PoE events on a port: |
|-----------------|-------------------------------------------------------------------|

```
Device(config-if) # interface gigabitethernet1/0/1  
Device(config-if) # logging event power-inline-status  
Device(config-if) #
```

# macro

To apply a macro to an interface or to apply and debug a macro on an interface, use the **macro** command in interface configuration mode.

**macro** {**apply** | **trace**} *macro-name* [**parameter** {*value*}][**parameter** {*value*}][**parameter** {*value*}]

## Syntax Description

|                               |                                                                                                                                                                                                                                                                         |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>apply</b>                  | Applies a macro to an interface.                                                                                                                                                                                                                                        |
| <b>trace</b>                  | Applies a macro to an interface and then debugs it.                                                                                                                                                                                                                     |
| <i>macro-name</i>             | Specifies the name of the macro.                                                                                                                                                                                                                                        |
| <b>parameter</b> <i>value</i> | (Optional) Specifies unique parameter values that are specific to the interface. You can enter up to three keyword-value pairs. Parameter keyword matching is case sensitive.<br><br>All matching occurrences of the keyword are replaced with the corresponding value. |

## Command Default

This command has no default setting.

## Command Modes

Interface configuration (config-if)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

You can use the **macro apply** *macro-name* command to apply and show the macros running on an interface.

You can use the **macro trace** *macro-name* command to apply and then debug the macro to find any syntax or configuration errors.

If a command fails because of a syntax error or a configuration error when you apply a macro, the macro continues to apply the remaining commands to the interface.

When creating a macro that requires the assignment of unique values, use the **parameter** *value* keywords to designate values specific to the interface.

Keyword matching is case sensitive. All matching occurrences of the keyword are replaced with the corresponding value. Any full match of a keyword, even if it is part of a larger string, is considered a match and is replaced by the corresponding value.

Some macros might contain keywords that require a parameter value. You can use the **macro apply** *macro-name* ? command to display a list of any required values in the macro. If you apply a macro without entering the keyword values, the commands are invalid and are not applied.

There are Cisco-default SmartPorts macros embedded in the switch software. You can display these macros and the commands that they contain by using the **show parser macro** command in user EXEC mode.

Follow these guidelines when you apply a Cisco-default SmartPorts macro on an interface:

- Display all macros on the switch by using the **show parser macro** command in user EXEC mode. Display the contents of a specific macro by using the **show parser macro macro-name** command in user EXEC mode.
- Keywords that begin with \$ mean that a unique parameter value is required. Append the Cisco-default macro with the required values by using the **parameter value** keywords.

The Cisco-default macros use the \$ character to identify required keywords. You can use the \$ character to define keywords when you create a macro.

When you apply a macro to an interface, the macro name is automatically added to the interface. You can display the applied commands and macro names by using the **show running-config interface interface-id** command in user EXEC mode.

A macro applied to an interface range behaves the same way as a macro applied to a single interface. When you use an interface range, the macro is applied sequentially to each interface within the range. If a macro command fails on one interface, it is still applied to the remaining interfaces.

You can delete a macro-applied configuration on an interface by entering the **default interface interface-id** command in interface configuration mode.

### Example

After you use the **macro name** command, in interface configuration mode, you can apply it to an interface. This example shows how to apply a user-created macro called duplex to an interface:

```
Device(config-if)# macro apply duplex
```

To debug a macro, use the **macro trace** command, in interface configuration mode, to find any syntax or configuration errors in the macro as it is applied to an interface.

```
Device(config-if)# macro trace duplex
Applying command...'duplex auto'
%Error Unknown error.
Applying command...'speed nonegotiate'
```

This example shows how to display the Cisco-default cisco-desktop macro and how to apply the macro and set the access VLAN ID to 25 on an interface:

```
Device# show parser macro cisco-desktop
-----
Macro name : cisco-desktop
Macro type : default
# Basic interface - Enable data VLAN only
# Recommended value for access vlan (AVID) should not be 1
switchport access vlan $AVID
switchport mode access
# Enable port security limiting port to a single
# MAC address -- that of desktop
switchport port-security
switchport port-security maximum 1
# Ensure port-security age is greater than one minute
# and use inactivity timer
switchport port-security violation restrict
switchport port-security aging time 2
switchport port-security aging type inactivity
# Configure port as an edge network port
spanning-tree portfast
```

```
spanning-tree bpduguard enable
```

```
-----  
Device#
```

```
Device# configure terminal
```

```
Enter configuration commands, one per line. End with CNTL/Z.
```

```
Device(config)# interface gigabitethernet1/0/4
```

```
Device(config-if)# macro apply cisco-desktop $AVID 25
```

## macro auto

To configure and apply a global macro using the CLI, use the **macro auto** command in privileged EXEC mode.

Use the **no** form of this command to return to the default setting.

**macro auto** {**apply** | **config**} *macro-name*

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                              |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <b>apply</b>                                                                                                                                                                                                                                                                                                                                                                                                                                           | Applies the macro.           |
|                           | <b>config</b>                                                                                                                                                                                                                                                                                                                                                                                                                                          | Enters the macro parameters. |
|                           | <i>macro-name</i>                                                                                                                                                                                                                                                                                                                                                                                                                                      | Specifies the macro name.    |
| <b>Command Default</b>    | No macros are applied to the switch.                                                                                                                                                                                                                                                                                                                                                                                                                   |                              |
| <b>Command Modes</b>      | Privileged EXEC (#)                                                                                                                                                                                                                                                                                                                                                                                                                                    |                              |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                           | This command was introduced. |
| <b>Usage Guidelines</b>   | <p>To remove the macro from the switch, enter the <b>no</b> forms of the macro commands.</p> <p>If you enter the <b>macro auto config macro-name</b> command, you are prompted to enter values for all the macro parameters.</p> <p>Use the exact text string when entering the macro-name. The entries are case sensitive.</p> <p>The user-defined values appear only in the <b>show macro auto</b> or <b>show running-config</b> command output.</p> |                              |

### Example

This example shows how to display global macros:

```
Device# macro auto apply ?
CISCO_SWITCH_AAA_ACCOUNTING      Configure aaa accounting parameters
CISCO_SWITCH_AAA_AUTHENTICATION  Configure aaa authentication parameters
CISCO_SWITCH_AAA_AUTHORIZATION   Configure aaa authorization parameters
CISCO_SWITCH_AUTO_IP_CONFIG      Configure the ip parameters
CISCO_SWITCH_AUTO_PCI_CONFIG     Configure PCI compliant parameters
CISCO_SWITCH_DOMAIN_NAME_CONFIG  Configure domain name
CISCO_SWITCH_ETHERCHANNEL_CONFIG Configure the etherchannel parameters
CISCO_SWITCH_HOSTNAME_CONFIG     Configure hostname
CISCO_SWITCH_HTTP_SERVER_CONFIG  Configure http server
CISCO_SWITCH_LOGGING_SERVER_CONFIG Configure logging server
CISCO_SWITCH_MGMT_VLAN_CONFIG    Configure management vlan parameters
CISCO_SWITCH_NAME_SERVER_CONFIG  Configure name server parameters
CISCO_SWITCH_NTP_SERVER_CONFIG   Configure NTP server
CISCO_SWITCH_RADIUS_SERVER_CONFIG Configure radius server
CISCO_SWITCH_SETUP_SNMP_TRAPS    Configure SNMP trap parameters
CISCO_SWITCH_SETUP_USR_CONFIG    Configure the user parameters
CISCO_SWITCH_SNMP_SOURCE_CONFIG  Configure snmp source interface
```

```

CISCO_SWITCH_TACACS_SERVER_CONFIG    Configure tacacs server
CISCO_SWITCH_USER_PASS_CONFIG        Configure username and password

Device# macro auto config ?
CISCO_SWITCH_AAA_ACCOUNTING           Configure aaa accounting parameters
CISCO_SWITCH_AAA_AUTHENTICATION       Configure aaa authentication parameters
CISCO_SWITCH_AAA_AUTHORIZATION        Configure aaa authorization parameters
CISCO_SWITCH_AUTO_IP_CONFIG           Configure the ip parameters
CISCO_SWITCH_AUTO_PCI_CONFIG          Configure PCI compliant parameters
CISCO_SWITCH_DOMAIN_NAME_CONFIG       Configure domain name
CISCO_SWITCH_ETHERCHANNEL_CONFIG      Configure the etherchannel parameters
CISCO_SWITCH_HOSTNAME_CONFIG          Configure hostname
CISCO_SWITCH_HTTP_SERVER_CONFIG        Configure http server
CISCO_SWITCH_LOGGING_SERVER_CONFIG     Configure logging server
CISCO_SWITCH_MGMT_VLAN_CONFIG          Configure management vlan parameters
CISCO_SWITCH_NAME_SERVER_CONFIG        Configure name server parameters
CISCO_SWITCH_NTP_SERVER_CONFIG         Configure NTP server
CISCO_SWITCH_RADIUS_SERVER_CONFIG      Configure radius server
CISCO_SWITCH_SETUP_SNMP_TRAPS          Configure SNMP trap parameters
CISCO_SWITCH_SETUP_USR_CONFIG          Configure the user parameters
CISCO_SWITCH_SNMP_SOURCE_CONFIG        Configure snmp source interface
CISCO_SWITCH_TACACS_SERVER_CONFIG      Configure tacacs server
CISCO_SWITCH_USER_PASS_CONFIG          Configure username and password

```

This example shows how to display the parameters for a specific macro:

```

Device# macro auto config CISCO_SWITCH_AUTO_IP_CONFIG ?
CISCO_SWITCH_DOMAIN_NAME_CONFIG      domain name parameters
CISCO_SWITCH_LOGGING_SERVER_CONFIG    logging host parameters
CISCO_SWITCH_NAME_SERVER_CONFIG        name server parameters
CISCO_SWITCH_NTP_SERVER_CONFIG         ntp server parameters
LINE                                  Provide parameters of form [Parameters
                                     name=value]

<cr>

```

```

Device# macro auto config CISCO_SWITCH_AUTO_PCI_CONFIG ?
CISCO_SWITCH_AAA_ACCOUNTING           aaa accounting parameters

```

This example shows how to set macro parameters and apply the macro using the CLI:

```
Device# macro auto config CISCO_SWITCH_ETHERCHANNEL_CONFIG
Enter the port channel id[1-48] for 3K & 2350, [1-6] for 2K: 2
Enter the port channel type, Layer:[2-3(L3 not supported on 2K)]: 2
Enter etherchannel mode for the interface[auto/desirable/on/active/passive]: active
Enter the channel protocol[lacp/none]: lacp
Enter the number of interfaces to join the etherchannel[8-PAGP/MODE:ON,16-LACP]: 7
Enter interface name[GigabitEthernet3/0/3]: gigabitethernet1/0/1
Enter interface name[GigabitEthernet3/0/3]: gigabitethernet1/0/2
Enter interface name[GigabitEthernet3/0/3]: gigabitethernet1/0/3
Enter interface name[GigabitEthernet3/0/3]: gigabitethernet1/0/4
Enter interface name[GigabitEthernet3/0/3]: gigabitethernet1/0/5
Enter interface name[GigabitEthernet3/0/3]: gigabitethernet1/0/6
Enter interface name[GigabitEthernet3/0/3]: gigabitethernet1/0/7
Do you want to apply the parameters? [yes/no]: yes
Enter configuration commands, one per line. End with CNTL/Z.
Enter configuration commands, one per line. End with CNTL/Z.
Enter configuration commands, one per line. End with CNTL/Z.
Enter configuration commands, one per line. End with CNTL/Z.
Enter configuration commands, one per line. End with CNTL/Z.
Enter configuration commands, one per line. End with CNTL/Z.
Enter configuration commands, one per line. End with CNTL/Z.
Device# macro auto apply CISCO_SWITCH_ETHERCHANNEL_CONFIG
Enter configuration commands, one per line. End with CNTL/Z.
Device#
```

# macro auto apply (Cisco IOS shell scripting capability)

To configure and apply a global macro using the Cisco IOS shell scripting capability, use the **macro auto apply** command in privileged EXEC mode. Use the **no** form of this command to return to the default setting.

**macro auto apply** *macro-name*

|                    |                                      |                              |
|--------------------|--------------------------------------|------------------------------|
| Syntax Description | <b>apply</b>                         | Applies the macro.           |
|                    | <i>macro-name</i>                    | Specifies the macro name.    |
| Command Default    | No macros are applied to the switch. |                              |
| Command Modes      | Privileged EXEC (#)                  |                              |
| Command History    | <b>Release</b>                       | <b>Modification</b>          |
|                    | Cisco IOS XE Everest 16.5.1a         | This command was introduced. |

**Usage Guidelines**

To remove the macro from the switch, enter the **no** forms of the macro commands.

Use the exact text string when entering the *macro-name*. The entries are case sensitive.

The user-defined values appear only in the **show macro auto** or **show running-config** command output.

You can also use the Cisco IOS shell scripting capability to set the parameters. For examples, see the “Configuring and Applying Global Macros” section in the “Configuring Auto Smartports and Static Smartports Macros” chapter.

## Example

This example shows how to display global macros:

```

Device# macro auto apply ?

CISCO_SWITCH_AAA_ACCOUNTING      Configure aaa accounting parameters
CISCO_SWITCH_AAA_AUTHENTICATION  Configure aaa authentication parameters
CISCO_SWITCH_AAA_AUTHORIZATION   Configure aaa authorization parameters
CISCO_SWITCH_AUTO_IP_CONFIG      Configure the ip parameters
CISCO_SWITCH_AUTO_PCI_CONFIG     Configure PCI compliant parameters
CISCO_SWITCH_DOMAIN_NAME_CONFIG  Configure domain name
CISCO_SWITCH_ETHERCHANNEL_CONFIG Configure the etherchannel parameters
CISCO_SWITCH_HOSTNAME_CONFIG     Configure hostname
CISCO_SWITCH_HTTP_SERVER_CONFIG  Configure http server
CISCO_SWITCH_LOGGING_SERVER_CONFIG Configure logging server
CISCO_SWITCH_MGMT_VLAN_CONFIG    Configure management vlan parameters
CISCO_SWITCH_NAME_SERVER_CONFIG  Configure name server parameters
CISCO_SWITCH_NTP_SERVER_CONFIG   Configure NTP server
CISCO_SWITCH_RADIUS_SERVER_CONFIG Configure radius server
CISCO_SWITCH_SETUP_SNMP_TRAPS    Configure SNMP trap parameters
CISCO_SWITCH_SETUP_USR_CONFIG    Configure the user parameters
CISCO_SWITCH_SNMP_SOURCE_CONFIG  Configure snmp source interface

```

|                                   |                                 |
|-----------------------------------|---------------------------------|
| CISCO_SWITCH_TACACS_SERVER_CONFIG | Configure tacacs server         |
| CISCO_SWITCH_USER_PASS_CONFIG     | Configure username and password |

# macro auto config (Cisco IOS shell scripting capability)

To configure and apply a global macro, use the **macro auto config** command in privileged EXEC mode. Use the **no** form of this command to return to the default setting.

**macro auto config** *macro-name* [*parameter=value* [*parameter=value*]...]

|                    |                                                          |                                                                                                                                                                                     |

|                    | Cisco IOS XE Everest 16.5.1a                             | This command was introduced.                                                                                                                                                        |

**Usage Guidelines**

To remove the macro from the switch, enter the **no** forms of the macro commands.

If you enter the **macro auto config** *macro-name* command, you are prompted to enter values for all the macro parameters.

Use the exact text string when entering the *macro-name* and *parameters*. The entries are case sensitive.

The user-defined values appear only in the **show macro auto** or **show running-config** command output.

You can also use the Cisco IOS shell scripting capability to set the parameters. For examples, see the “Configuring and Applying Global Macros” section in the “Configuring Auto Smartports and Static Smartports Macros” chapter.

## macro auto control

To specify when the switch applies an Auto Smartports macro based on the detection method, device type, or trigger (referred to as event trigger control), use the **macro auto control** command in interface configuration mode. Use the **no** form of this command to disable trigger-to-macro mapping. The switch then does not apply macros based on event triggers.

**macro auto control** {**detection** [**cdp**] [**lldp**] [**mac-address**] | **device** [**ip-camera**] [**media-player**] [**phone**] [**lightweight-ap**] [**access-point**] [**router**] [**switch**] | **trigger** [**last-resort**]}

**no macro auto control** {**detection** [**cdp**] [**lldp**] [**mac-address**] | **device** [**ip-camera**] [**media-player**] [**phone**] [**lightweight-ap**] [**access-point**] [**router**] [**switch**] | **trigger** [**last-resort**]}

| Syntax Description                                                                                                                                                |  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                  | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                              | This command was introduced. |
| Usage Guidelines | <p>If you do not set event triggers, the switch uses the device type as the event trigger. If the switch cannot determine the device type, it uses MAC address groups, MAB messages, 802.1x authentication messages, and LLDP messages in random order.</p> <p>To verify that a macro is applied to an interface, use the <b>show macro auto interface</b> command in user EXEC mode.</p> |                              |

Example

This example shows how to set LLDP messages and MAC address groups as event triggers:

```
Device(config)# interface gigabitethernet 5/0/2
Device(config-if)# macro auto control detection lldp mac-address
Device(config-if)# exit
Device(config)# end
```

This example shows how to set access points, video surveillance cameras, and digital media players as event triggers:

**Note** The switch applies a built-in macro only when it detects an access point, video surveillance camera, or digital media player.

```
Device(config)# interface gigabitethernet 5/0/1
Device(config-if)# macro auto control device access-point ip-camera media-player
Device(config-if)# exit
Device(config)# end
```

# macro auto execute

To replace built-in macro default values and to configure mapping from an event trigger to a built-in or user-defined macro, use the **macro auto execute** command in global configuration mode.

```
macro auto execute event trigger {builtin built-in macro | remote url} {parameter=value} {function contents}
no macro auto execute event trigger {builtin built-in macro | remote url} {parameter=value} {function contents}
```

| Syntax Description   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |              |                              |                              |
| <b>Usage Guidelines</b>      | <p>Use the <b>macro auto execute</b> command to replace the built-in macro default values with values that are specific to your switch.</p> <p>The switch automatically maps from event triggers to built-in macros. The built-in macros are system-defined macros in the software image. You can also create user-defined macros by using the Cisco IOS shell scripting capability.</p> <p>You can create new event triggers by using the <b>shell trigger</b> commands in global configuration mode. Use the <b>show shell triggers</b> command in privileged EXEC to display the contents of the user-defined triggers and macros.</p> <p>You can use the <b>macro auto mac-address-group</b> command in global configuration mode to create event triggers for devices that do not support Cisco Discovery Protocol (CDP) or Link Layer Discovery Protocol (LLDP).</p> |         |              |                              |                              |

You can use the remote macro feature to store macros in a central location for designated network switches to use. You can then maintain and update the macro files for use by multiple switches. Use **remote url** to configure the remote server location and macro path information. There are no specific file extension requirements for saved macro files.

Auto Smartports macros and antimacros (the antimacro is the portion of the applied macro that removes it at link down) have these guidelines and limitations:

- You can delete or change the built-in macros. However, you can override a built-in macro by creating a user-defined macro with the same name. To restore the original built-in macro, delete the user-defined macro.
- If you enable both the **macro auto device** and the **macro auto execute** commands, the parameters specified in the command last executed are applied to the switch. Only one command is active on the switch.
- To avoid system conflicts when macros are applied, remove all port configurations except for 802.1x authentication.
- Do not configure port security when enabling Auto SmartPorts on the switch.
- If the macro conflicts with the original configuration, either the macro does not apply some of the original configuration commands, or the antimacro does not remove them. (The antimacro is the portion of the applied macro that removes the macro at a link-down event.)
- For example, if 802.1x authentication is enabled, you cannot remove the switchport-mode access configuration. Remove the 802.1x authentication before removing the switchport mode configuration.
- A port cannot be a member of an EtherChannel when you apply Auto SmartPorts macros.
- The built-in-macro default data VLAN is VLAN 1. The default voice VLAN is VLAN 2. If your switch uses different access, native, or voice VLANs, use the **macro auto device** or the **macro auto execute** commands to configure the values.
- For 802.1x authentication or MAC authentication bypass (MAB), to detect non-Cisco devices, configure the RADIUS server to support the Cisco attribute-value pair **auto-smart-port=event trigger**
- The switch supports Auto SmartPort macros only on directly connected devices. Multiple device connections, such as hubs, are not supported.
- If authentication is enabled on a port, the switch ignores a MAC address trigger if authentication fails.
- The order of CLI commands within the macro and the corresponding antimacro can be different.

### Example

This example shows how to use two built-in macros for connecting Cisco switches and Cisco IP phones to the switch. This example modifies the default voice VLAN, access VLAN, and native VLAN for the trunk interface:

```
Device(config)# !!! the next command modifies the access and voice vlans
Device(config)# !!! for the built in Cisco IP phone auto smartport macro
Device(config)# macro auto execute CISCO_PHONE_EVENT builtin CISCO_PHONE_AUTO_SMARTPORT
ACCESS_VLAN=10 VOICE_VLAN=20
Device(config)# !!! the next command modifies the Native vlan used for inter switch trunks
```

```

Device(config)# macro auto execute CISCO_SWITCH_EVENT builtin CISCO_SWITCH_AUTO_SMARTPORT
NATIVE_VLAN=10
Device(config)# !!! the next command enables auto smart ports globally
Device(config)# macro auto global processing
Device(config)# exit
Device# !!! here is the running configuration of the interface connected
Device# !!! to another Cisco Switch after the Macro is applied
Device# show running-config interface gigabitethernet1/0/1
Building configuration...

Current configuration : 284 bytes
!
interface GigabitEthernet1/0/1
 switchport trunk encapsulation dot1q
 switchport trunk native vlan 10
 switchport mode trunk
 srr-queue bandwidth share 10 10 60 20
 queue-set 2
 priority-queue out
 mls qos trust cos
 auto qos voip trust
 macro description CISCO_SWITCH_EVENT
end

```

This example shows how to map a user-defined event trigger called media player to a user-defined macro

1. Connect the media player to an 802.1x- or MAB-enabled switch port.
2. On the RADIUS server, set the attribute-value pair to auto-smart-port=DMP\_EVENT
3. On the switch, create the event trigger DMP\_EVENT, and enter the user-defined macro commands.
4. The switch recognizes the attribute-value pair=DMP\_EVENT response from the RADIUS server and applies the macro associated with this event trigger.

```

Device(config)# shell trigger DMP_EVENT mediaplayer
Device(config)# macro auto execute DMP_EVENT {
if [[ $LINKUP == YES ]]; then
conf t
 interface $INTERFACE
  macro description $TRIGGER
  switchport access vlan 1
  switchport mode access
  switchport port-security
  switchport port-security maximum 1
  switchport port-security violation restrict
  switchport port-security aging time 2
  switchport port-security aging type inactivity
  spanning-tree portfast
  spanning-tree bpduguard enable
  exit
fi
if [[ $LINKUP == NO ]]; then
conf t
 interface $INTERFACE
  no macro description $TRIGGER
  no switchport access vlan 1
  if [[ $AUTH_ENABLED == NO ]]; then
    no switchport mode access
  fi
fi
}

```

```

no switchport port-security
no switchport port-security maximum 1
no switchport port-security violation restrict
no switchport port-security aging time 2
no switchport port-security aging type inactivity
no spanning-tree portfast
no spanning-tree bpduguard enable
exit
fi

```

**Table 8: Supported Cisco IOS Shell Keywords**

## macro auto global control

To specify when the switch applies an Auto Smartports macro based on the device type or trigger (referred to as event trigger control), use the **macro auto global control** command in global configuration mode. Use the **no** form of this command to disable trigger-to-macro mapping.

```
macro auto global control {detection [cdp] [lldp] [mac-address] | device [access-point] [ip-camera]
[lightweight-ap] [media-player] [phone] [router] [switch] | trigger [last-resort]}
no macro auto global control {detection [cdp] [lldp] [mac-address] | device [access-point] [ip-camera]
[lightweight-ap] [media-player] [phone] [router] [switch] | trigger [last-resort]}
```

### Syntax Description

**detection** [cdp] [lldp] [mac-address]

detection—Sets one or more of these as an event trigger:

- (Optional) **cdp**—CDP messages
- (Optional) **lldp**—LLDP messages
- (Optional) **mac-address**—User-defined MAC address groups

**device** [access-point] [ip-camera] [lightweight-ap] [media-player] [phone] [router] [switch]

device—Sets one or more of these devices as an event trigger:

- (Optional) **access-point**—Autonomous access point
- (Optional) **ip-camera**—Cisco IP video surveillance camera
- (Optional) **lightweight-ap**—Lightweight access point
- (Optional) **media-player**—Digital media player
- (Optional) **phone**—Cisco IP phone
- (Optional) **router**—Cisco router
- (Optional) **switch**—Cisco switch

**trigger** [last-resort]

trigger—Sets a specific event trigger.

- (Optional) **last-resort**—Last-resort trigger.

### Command Default

The switch uses the device type as the event trigger. If the switch cannot determine the device type, it uses MAC address groups, MAB messages, 802.1x authentication messages, and LLDP messages in random order.

---

**Command Modes** Global configuration (config)

---

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

---

---

**Usage Guidelines**

If you do not set event triggers, the switch uses the device type as the event trigger. If the switch cannot determine the device type, it uses MAC address groups, MAB messages, 802.1x authentication messages, and LLDP messages in random order.

To verify that a macro is applied to a switch, use the **show macro auto global** command in user EXEC mode.

### Example

This example shows how to set CDP messages, LLDP messages and MAC address groups as event triggers:

```
Device(config)# macro auto global control detection cdp lldp mac-address
Device(config)# end
```

This example shows how to set autonomous access points, lightweight access points, and IP phones:

```
Device(config)# macro auto global control device access-point lightweight-ap phone
Device(config)# end
```

# macro auto global processing

To enable Auto SmartPorts macros on the switch, use the **macro auto global processing** command in global configuration mode. Use the **no** form of this command to disable the macros.

**macro auto global processing**

**no macro auto global processing**

## Command Default

Auto Smartports is disabled.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **macro auto global processing** command to globally enable macros on the switch. To disable macros on a specific port, use the **no macro auto processing** command in interface mode.

When using 802.1x or MAB authentication, you need to configure the RADIUS server to support the Cisco attribute-value pair **auto-smart-port=event trigger**. If authentication fails, the macro is not applied. If the 802.1x or MAB authentication fails on the interface, the switch does not use the fallback CDP event trigger.

When CDP-identified devices advertise multiple capabilities, the switch chooses a capability first by switch and then by router.

To verify that a macro is applied to an interface, use the **show macro auto interface** command in privileged EXEC mode.

## Example

This example shows how to enable Auto SmartPorts on the switch and to disable the feature on a specific interface:

```
Device(config)# macro auto global processing
Device(config)# interface gigabitethernet 0/1
Device(config-if)# no macro auto processing
Device(config-if)# exit
Device(config)#
```

## macro auto mac-address-group

To create an event trigger for devices that do not support Cisco Discovery Protocol (CDP) or Link Layer Discover Protocol (LLDP), use the **macro auto mac-address-group** command in global configuration mode. Use the **no** form of this command to delete the group.

**macro auto mac-address-group** *name* {**mac-address list** *list* | **oui** {*list list* | **range** *start-value size* *number*}}

**no macro auto mac-address-group** *name* {**mac-address list** *list* | **oui** {*list list* | **range** *start-value size* *number*}}

|                    |                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                 | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                                                    |
| Usage Guidelines   | Use the <b>macro auto mac-address-group</b> command to create an event trigger for devices that do not support CDP or LLDP. Use the MAC address group as a trigger to map to a built-in or user-defined macro by using the <b>macro auto execute</b> command. At link-up the switch detects the device type and applies the specified macro. |                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                    | The switch supports up to ten MAC address groups. Each group can have up to 32 OUI and 32 MAC configured addresses.                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### Example

This example shows how to create a MAC-address-group event trigger called *address\_trigger* and how to verify your entries:

```
Device(config)# macro auto mac-address-group mac address_trigger
Device(config-addr-grp-mac)# mac-address list 2222.3333.3334 22.33.44 a.b.c
Device(config-addr-grp-mac)# oui list 455555 233244
```

```
Device(config-addr-grp-mac)# oui range 333333 size 2
Device(config-addr-grp-mac)# exit
Device(config)# end
Device# show running configuration
!
!macro auto mac-address-group address_trigger
  oui list 333334
  oui list 333333
  oui list 233244
  oui list 455555
  mac-address list 000A.000B.000C
  mac-address list 0022.0033.0044
  mac-address list 2222.3333.3334
!

<output truncated>
```

# macro auto processing

To enable Auto SmartPorts macros on an interface, use the **macro auto processing** command in interface configuration mode. Use the no form of this command to disable the macros.

**macro auto processing**

**no macro auto processing**

| Command Modes    | Interface configuration (config-if)                                                                                                                                                                                                                                                                      |                              |
| Command History  | Release                                                                                                                                                                                                                                                                                                  | Modification                 |
|                  | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                             | This command was introduced. |
| Usage Guidelines | Use the <b>macro auto processing</b> command, in interface configuration mode, to enable macros on a specific interface. To disable macros on a specific interface, use the no macro auto processing command, in interface configuration mode.                                                           |                              |
|                  | A port cannot be a member of an EtherChannel when you apply Auto SmartPorts macros. If you use EtherChannels, disable Auto SmartPorts on the EtherChannel interface by using the <b>no macro auto processing</b> command. The EtherChannel interface applies the configuration to the member interfaces. |                              |
|                  | To verify that a macro is applied to an interface, use the <b>show macro auto interface</b> command in privileged EXEC mode.                                                                                                                                                                             |                              |

## Example

This example shows how to enable Auto SmartPorts on the switch and to disable the feature on a specific interface:

```
Device(config)# interface gigabitethernet 0/1
Device(config-if)# no macro auto processing
Device(config-if)# exit
Device(config)# macro auto global processing
```

# macro auto sticky

To configure macros to remain active after a link-down event, referred to as macro persistence, use the **macro auto sticky** command in global configuration mode. Use the **no** form of this command to disable the macro persistence.

**macro auto sticky**  
**no macro auto sticky**

|                        |                                |
|------------------------|--------------------------------|
| <b>Command Default</b> | Macro persistence is disabled. |
|------------------------|--------------------------------|

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | Use the <b>macro auto sticky</b> command so that macros remain active after a link-down event. |
|-------------------------|------------------------------------------------------------------------------------------------|

## Example

This example shows how to enable macro persistence on an interface:

```
Device(config)# interface gigabitethernet 5/0/2
Device(config-if)# macro auto port sticky
Device(config-if)# exit
Device(config)# end
```

# macro auto trigger

To enter the configure-macro-trigger mode and define a trigger for a device that has no built-in trigger and associate the trigger with a device or profile, use the **macro auto trigger** command in global configuration mode. To remove the user-defined trigger, use the **no** form of this command.

```
macro auto trigger trigger_name {device | exit | no | profile}
no macro auto trigger trigger_name {device | exit | no | profile}
```

|                    |                     |                                                                            |
|--------------------|---------------------|----------------------------------------------------------------------------|
| Syntax Description | <i>trigger_name</i> | Specifies a trigger to be associated with the device type or profile name. |
|                    | <b>device</b>       | Specifies a device name to map to the named trigger.                       |
|                    | <b>exit</b>         | Exits device group configuration mode.                                     |
|                    | <b>no</b>           | Removes any configured device.                                             |
|                    | <b>profile</b>      | Specifies a profile name to map to the named trigger.                      |

|                 |                                          |
|-----------------|------------------------------------------|
| Command Default | No user-defined triggers are configured. |
|-----------------|------------------------------------------|

|               |                               |
|---------------|-------------------------------|
| Command Modes | Global configuration (config) |
|---------------|-------------------------------|

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

If a device is classified by the Device Classifier, but does not have a built-in trigger defined, use the **macro auto trigger** command, in global configuration mode, to define a trigger based on a device name or a profile name. After you enter the command, the switch is in the configure-macro-trigger mode and the **device**, **exit**, **no**, and **profile** keywords are visible. In this mode, you can provide a device name or a profile name to map to the trigger. It is not necessary to map the trigger to both a device name and a profile name. If you map the trigger to both names, the trigger-to-profile name mapping has preference for macro application.

You must use this command to configure a trigger when you configure a user-defined macro. The trigger name is required for the custom macro configuration.

After the device is profiled, you must add the complete string to the device-group database.

## Example

This example shows how to configure a user-defined trigger for a profile called DMP\_EVENT media player for use with a media player that has no built-in trigger:

```
Device(config)# macro auto trigger DMP
Device(config-macro-trigger) # profile media player-DMP
Device(config-macro-trigger) # exit
```

# macro description

To enter a description about which macros are applied to an interface, use the **macro description** command in interface configuration mode. Use the **no** form of this command to remove the description. This command is mandatory for Auto SmartPorts to work.

**macro description** *text*  
**no macro description** *text*

|                           |                                                                                                                                                                                                                                                                                                                                                 |                                                                                    |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>description</b> <i>text</i>                                                                                                                                                                                                                                                                                                                  | Enters a description about the macros that are applied to the specified interface. |
| <b>Command Default</b>    | This command has no default setting.                                                                                                                                                                                                                                                                                                            |                                                                                    |
| <b>Command Modes</b>      | Interface configuration (config-if)                                                                                                                                                                                                                                                                                                             |                                                                                    |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                                                                                                                                                  | <b>Modification</b>                                                                |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                    | This command was introduced.                                                       |
| <b>Usage Guidelines</b>   | <p>Use the <b>description</b> keyword to associate comment text or the macro name with an interface. When multiple macros are applied on a single interface, the description text is from the last applied macro.</p> <p>You can verify your settings by entering the <b>show parser macro description</b> command in privileged EXEC mode.</p> |                                                                                    |

## Example

This example shows how to add a description to an interface:

```
(config-if)# macro description duplex settings
```

# macro global

To apply a macro to a switch or to apply and debug a macro on a switch, use the **macro global** command in global configuration mode.

**macro global** {**apply** | **trace**} *macro-name* [**parameter** {*value*}] [**parameter** {*value*}] [**parameter** {*value*}]  
parameter

## Syntax Description

|                               |                                                                                                                                                                                                                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>apply</b>                  | Applies a macro to the switch.                                                                                                                                                                                                                                |
| <b>trace</b>                  | Applies a macro to a switch and debugs the macro.                                                                                                                                                                                                             |
| <i>macro-name</i>             | Specifies the name of the macro.                                                                                                                                                                                                                              |
| <b>parameter</b> <i>value</i> | (Optional) Specifies unique parameter values that are specific to the switch. You can enter up to three keyword-value pairs. Parameter keyword matching is case sensitive. All matching occurrences of the keyword are replaced with the corresponding value. |

## Command Default

This command has no default setting.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

### Note

You can delete a global macro-applied configuration on a switch only by entering the no version of each command in the macro.

Use the **macro global apply** *macro-name* command to apply the macro to an interface.

Use the **macro global trace** *macro-name* command to apply and then debug the macro to find any syntax or configuration errors.

If a command fails when you apply a macro because of a syntax error or a configuration error, the macro continues to apply the remaining commands to the switch.

When creating a macro that requires the assignment of unique values, use the **parameter** *value* keywords to designate values specific to the switch.

Keyword matching is case sensitive. All matching occurrences of the keyword are replaced with the corresponding value. Any full match of a keyword, even if it is part of a larger string, is considered a match and is replaced by the corresponding value.

Some macros might contain keywords that require a parameter value. You can use the **macro global apply** *macro-name* ? command to display a list of any required values in the macro. If you apply a macro without entering the keyword values, the commands are invalid and are not applied.

There are Cisco-default Smartports macros embedded in the switch software. You can display these macros and the commands they contain by using the **show parser macro** command in user EXEC mode.

Follow these guidelines when you apply a Cisco-default Smartports macro on a switch:

- Display all macros on the switch by using the **show parser macro** command. Display the contents of a specific macro by using the **show parser macro name macro-name** command.
- Keywords that begin with \$ mean that a unique parameter value is required. Append the Cisco-default macro with the required values by using the **parameter value** keywords.

The Cisco-default macros use the \$ character to help identify required keywords. There is no restriction on using the \$ character to define keywords when you create a macro.

When you apply a macro to a switch, the macro name is automatically added to the switch. You can display the applied commands and macro names by using the **show running-config** command.

### Example

After you have created a new macro by using the **macro auto execute** command, you can apply it to a switch. This example shows how to view the **snmp** macro, how to apply the macro, set the hostname to test-server, and set the IP precedence value to 7:

```
Device# show parser macro name snmp
Macro name : snmp
Macro type : customizable

#enable port security, linkup, and linkdown traps
snmp-server enable traps port-security
snmp-server enable traps linkup
snmp-server enable traps linkdown
#set snmp-server host
snmp-server host ADDRESS
#set SNMP trap notifications precedence
snmp-server ip precedence VALUE

-----
Device(config)# macro global apply snmp ADDRESS test-server VALUE 7
```

To debug a macro, use the **macro global trace** command to find any syntax or configuration errors in the macro when you apply it to a switch. In this example, the **ADDRESS** parameter value was not entered, the **snmp-server host** command failed, and the remainder of the macro is applied to the switch:

```
Device(config)# macro global trace snmp VALUE 7
Applying command...'snmp-server enable traps port-security'
Applying command...'snmp-server enable traps linkup'
Applying command...'snmp-server enable traps linkdown'
Applying command...'snmp-server host'
%Error Unknown error.
Applying command...'snmp-server ip precedence 7'
```

# macro global description

To enter a description about the macros that are applied to a switch, use the **macro global description** command in global configuration mode. Use the **no** form of this command to remove the description.

**macro global description** *text*

**no macro global description** *text*

|                           |                                                                                                                                                                                                                                                                                                                                   |                                                                       |

|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                      | This command was introduced.                                          |
| <b>Usage Guidelines</b>   | <p>Use the <b>description</b> keyword to associate comment text or the macro name with a switch. When multiple macros are applied on a switch, the description text is from the last applied macro.</p> <p>You can verify your settings by entering the <b>show parser macro description</b> command in privileged EXEC mode.</p> |                                                                       |

## Example

This example shows how to add a description to a switch:

```
Device(config)# macro global description udd aggressive mode enabled
```

# mdix auto

To enable the automatic medium-dependent interface crossover (auto-MDIX) feature on the interface, use the **mdix auto** command in interface configuration mode. To disable auto-MDIX, use the **no** form of this command.

**mdix auto**  
**no mdix auto**

|                           |                                            |

|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | <p>When auto-MDIX is enabled, the interface automatically detects the required cable connection type (straight-through or crossover) and configures the connection appropriately.</p> <p>When you enable auto-MDIX on an interface, you must also set the interface speed and duplex to <b>auto</b> so that the feature operates correctly.</p> <p>When auto-MDIX (and autonegotiation of speed and duplex) is enabled on one or both of the connected interfaces, link up occurs, even if the cable type (straight-through or crossover) is incorrect.</p> <p>Auto-MDIX is supported on all 10/100 and 10/100/1000 Mb/s interfaces and on 10/100/1000BASE-TX small form-factor pluggable (SFP) module interfaces. It is not supported on 1000BASE-SX or -LX SFP module interfaces.</p> <p>You can verify the operational state of auto-MDIX on the interface by entering the <b>show controllers ethernet-controller interface-id phy</b> privileged EXEC command.</p> |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

This example shows how to enable auto-MDIX on a port:

```
Device# configure terminal
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# speed auto
Device(config-if)# duplex auto
Device(config-if)# mdix auto
Device(config-if)# end
```

# mode (power-stack configuration)

To configure power stack mode for the power stack, use the **mode** command in power-stack configuration mode. To return to the default settings, use the **no** form of the command.

**mode** {**power-shared** | **redundant**} [**strict**]  
**no mode**

|                    |                     |                                                                                                                                                                                      |
|--------------------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>power-shared</b> | Sets the power stack to operate in power-shared mode. This is the default.                                                                                                           |
|                    | <b>redundant</b>    | Sets the power stack to operate in redundant mode. The largest power supply is removed from the power pool to be used as backup power in case one of the other power supplies fails. |
|                    | <b>strict</b>       | (Optional) Configures the power stack mode to run a strict power budget. The stack power needs cannot exceed the available power.                                                    |

|                 |                                                          |
|-----------------|----------------------------------------------------------|
| Command Default | The default modes are <b>power-shared</b> and nonstrict. |
|-----------------|----------------------------------------------------------|

|               |                                               |
|---------------|-----------------------------------------------|
| Command Modes | Power-stack configuration (config-stackpower) |
|---------------|-----------------------------------------------|

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                  |                                                                                                                                    |
|------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | This command is available only on switch stacks running the IP Base or IP Services feature set.                                    |
|                  | To access power-stack configuration mode, enter the <b>stack-power stack</b> <i>power stack name</i> global configuration command. |

Entering the **no mode** command sets the switch to the defaults of **power-shared** and non-strict mode.

|      |                                                                                                                                                                                                                                                                                              |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Note | For stack power, available power is the total power available for PoE from all power supplies in the power stack, available power is the power allocated to all powered devices connected to PoE ports in the stack, and consumed power is the actual power consumed by the powered devices. |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

In **power-shared** mode, all of the input power can be used for loads, and the total available power appears as one large power supply. The power budget includes all power from all supplies. No power is set aside for power supply failures. If a power supply fails, load shedding (shutting down of powered devices or switches) might occur.

In **redundant** mode, the largest power supply is removed from the power pool to use as backup power in case one of the other power supplies fails. The available power budget is the total power minus the largest power supply. This reduces the available power in the pool for switches and powered devices, but in case of a failure or an extreme power load, there is less chance of having to shut down switches or powered devices.

In **strict** mode, when a power supply fails and the available power drops below the budgeted power, the system balances the budget through load shedding of powered devices, even if the actual power is less than the available power. In nonstrict mode, the power stack can run in an over-allocated state and is stable as long as

the actual power does not exceed the available power. In this mode, a powered device drawing more than normal power could cause the power stack to start shedding loads. This is normally not a problem because most devices do not run at full power. The chances of multiple powered devices in the stack requiring maximum power at the same time is small.

In both strict and nonstrict modes, power is denied when there is no power available in the power budget.

This is an example of setting the power stack mode for the stack named power1 to power-shared with strict power budgeting. All power in the stack is shared, but when the total available power is allotted, no more devices are allowed power.

```
Device(config)# stack-power stack power1  
Device(config-stackpower)# mode power-shared strict  
Device(config-stackpower)# exit
```

This is an example of setting the power stack mode for the stack named power2 to redundant. The largest power supply in the stack is removed from the power pool to provide redundancy in case one of the other supplies fails.

```
Device(config)# stack-power stack power2  
Device(config-stackpower)# mode redundant  
Device(config-stackpower)# exit
```

# network-policy

To apply a network-policy profile to an interface, use the **network-policy** command in interface configuration mode. To remove the policy, use the **no** form of this command.

**network-policy** *profile-number*  
**no network-policy**

## Syntax Description

*profile-number* The network-policy profile number to apply to the interface.

## Command Default

No network-policy profiles are applied.

## Command Modes

Interface configuration (config-if)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **network-policy** *profile number* interface configuration command to apply a profile to an interface.

You cannot apply the **switchport voice vlan** command on an interface if you first configure a network-policy profile on it. However, if **switchport voice vlan** *vlan-id* is already configured on the interface, you can apply a network-policy profile on the interface. The interface then has the voice or voice-signaling VLAN network-policy profile applied.

This example shows how to apply network-policy profile 60 to an interface:

```
Device(config)# interface gigabitethernet1/0/1  
Device(config-if)# network-policy 60
```

## network-policy profile (global configuration)

To create a network-policy profile and to enter network-policy configuration mode, use the **network-policy profile** command in global configuration mode. To delete the policy and to return to global configuration mode, use the **no** form of this command.

**network-policy profile** *profile-number*  
**no network-policy profile** *profile-number*

|                           |                                                                                                                                                                                                                                             |                              |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <i>profile-number</i> Network-policy profile number. The range is 1 to 4294967295.                                                                                                                                                          |                              |
| <b>Command Default</b>    | No network-policy profiles are defined.                                                                                                                                                                                                     |                              |
| <b>Command Modes</b>      | Global configuration (config)                                                                                                                                                                                                               |                              |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                                              | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                | This command was introduced. |
| <b>Usage Guidelines</b>   | Use the <b>network-policy profile</b> global configuration command to create a profile and to enter network-policy profile configuration mode.                                                                                              |                              |
|                           | To return to privileged EXEC mode from the network-policy profile configuration mode, enter the <b>exit</b> command.                                                                                                                        |                              |
|                           | When you are in network-policy profile configuration mode, you can create the profile for voice and voice signaling by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode. |                              |
|                           | These profile attributes are contained in the Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) network-policy time-length-value (TLV).                                                                                   |                              |
|                           | This example shows how to create network-policy profile 60:                                                                                                                                                                                 |                              |
|                           | Device(config)# <b>network-policy profile 60</b><br>Device(config-network-policy)#                                                                                                                                                          |                              |

# platform usb disable

To disable all the USB ports on a device, use the **platform usb disable** command in global configuration mode. To reenable all the USB ports on the device, use the **no platform usb disable** command.

**platform usb disable**  
**no platform usb disable**

|                        |                                           |
|------------------------|-------------------------------------------|
| <b>Command Default</b> | All the USB ports are enabled by default. |
|------------------------|-------------------------------------------|

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |

|                         | <b>show platform usb status</b> | Displays the status of the USB ports on a device. |

# power-priority

To configure Cisco StackPower power-priority values for a switch in a power stack and for its high-priority and low-priority PoE ports, use the **power-priority** command in switch stack-power configuration mode. To return to the default setting, use the **no** form of the command.

```
power-priority {high value | low value | switch value}
no power-priority {high | low | switch}
```

|                    |                     |                                                                                                                                                                                                                                                                |
|--------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>high</b> value   | Sets the power priority for the ports configured as high-priority ports. The range is 1 to 27, with 1 as the highest priority. The <b>high</b> value must be lower than the value set for the low-priority ports and higher than the value set for the switch. |
|                    | <b>low</b> value    | Sets the power priority for the ports configured as low-priority ports. The range is 1 to 27. The <b>low</b> value must be higher than the value set for the high-priority ports and the value set for the switch.                                             |
|                    | <b>switch</b> value | Sets the power priority for the switch. The range is 1 to 27. The <b>switch</b> value must be lower than the values set for the low and high-priority ports.                                                                                                   |

|                 |                                                                                                                                                                                                                                                                                                           |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Command Default | <p>If no values are configured, the power stack randomly determines a default priority.</p> <p>The default ranges are 1 to 9 for switches, 10 to 18 for high-priority ports, 19 to 27 for low-priority ports.</p> <p>On non-PoE switches, the high and low values (for port priority) have no effect.</p> |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|               |                                                 |
|---------------|-------------------------------------------------|
| Command Modes | Switch stack-power configuration (config-stack) |
|---------------|-------------------------------------------------|

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | <p>To access switch stack-power configuration mode, enter the <b>stack-power switch switch-number</b> global configuration command.</p> <p>Cisco StackPower power-priority values determine the order for shutting down switches and ports when power is lost and load shedding must occur. Priority values are from 1 to 27; the highest numbers are shut down first.</p> <p>We recommend that you configure different priority values for each switch and for its high priority ports and low priority ports to limit the number of devices shut down at one time during a loss of power. If you try to configure the same priority value on different switches in a power stack, the configuration is allowed, but you receive a warning message.</p> |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|      |                                                                                                 |
|------|-------------------------------------------------------------------------------------------------|
| Note | This command is available only on switch stacks running the IP Base or IP Services feature set. |
|------|-------------------------------------------------------------------------------------------------|

|          |                                                                                                                                                                      |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Examples | <p>This is an example of setting the power priority for switch 1 in power stack a to 7, for the high-priority ports to 11, and for the low-priority ports to 20.</p> |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|

```
Device(config)# stack-power switch 1  
Device(config-switch-stackpower)# stack-id power_stack_a  
Device(config-switch-stackpower)# power-priority high 11  
Device(config-switch-stackpower)# power-priority low 20  
Device(config-switch-stackpower)# power-priority switch 7  
Device(config-switch-stackpower)# exit
```

# power inline

To configure the power management mode on Power over Ethernet (PoE) ports, use the **power inline** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

**power inline** {**auto** [**max** *max-wattage*] | **never** | **port priority** {**high** | **low**} | **static** [**max** *max-wattage*]}

**no power inline** {**auto** | **never** | **port priority** {**high** | **low**} | **static** [**max** *max-wattage*]}

| Syntax Description     |                                                                                                                                |                                                                                                                                                                                                                       |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                        | <b>auto</b>                                                                                                                    | Enables powered-device detection. If enough power is available, automatically allocates power to the PoE port after device detection. Allocation is first-come, first-serve.                                          |
|                        | <b>max</b> <i>max-wattage</i>                                                                                                  | (Optional) Limits the power allowed on the port. The range is 4000 to 30000 mW. If no value is specified, the maximum is allowed.                                                                                     |
|                        | <b>never</b>                                                                                                                   | Disables device detection, and disables power to the port.                                                                                                                                                            |
|                        | <b>port</b>                                                                                                                    | Configures the power priority of the port. The default priority is low.                                                                                                                                               |
|                        | <b>priority</b> { <b>high</b>   <b>low</b> }                                                                                   | Sets the power priority of the port. In case of a power supply failure, ports configured as low priority are turned off first and ports configured as high priority are turned off last. The default priority is low. |
|                        | <b>static</b>                                                                                                                  | Enables powered-device detection. Pre-allocates (reserves) power for a port before the switch discovers the powered device. This action guarantees that the device connected to the interface receives enough power.  |
| <b>Command Default</b> | <p>The default is <b>auto</b> (enabled).</p> <p>The maximum wattage is 30,000 mW.</p> <p>The default port priority is low.</p> |                                                                                                                                                                                                                       |
| <b>Command Default</b> | Interface configuration (config-if)                                                                                            |                                                                                                                                                                                                                       |

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** This command is supported only on PoE-capable ports. If you enter this command on a port that does not support PoE, this error message appears:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# power inline auto
                        ^
% Invalid input detected at '^' marker.
```

In a switch stack, this command is supported on all ports in the stack that support PoE.

Use the **max max-wattage** option to disallow higher-power powered devices. With this configuration, when the powered device sends Cisco Discovery Protocol (CDP) messages requesting more power than the maximum wattage, the switch removes power from the port. If the powered-device IEEE class maximum is greater than the maximum wattage, the switch does not power the device. The power is reclaimed into the global power budget.

**Note** The switch never powers any class 0 or class 3 device if the **power inline max max-wattage** command is configured for less than 30 W.

If the switch denies power to a powered device (the powered device requests more power through CDP messages or if the IEEE class maximum is greater than the maximum wattage), the PoE port is in a power-deny state. The switch generates a system message, and the Oper column in the **show power inline** privileged EXEC command output shows *power-deny*.

Use the **power inline static max max-wattage** command to give a port high priority. The switch allocates PoE to a port configured in static mode before allocating power to a port configured in auto mode. The switch reserves power for the static port when it is configured rather than upon device discovery. The switch reserves the power on a static port even when there is no connected device and whether or not the port is in a shutdown or in a no shutdown state. The switch allocates the configured maximum wattage to the port, and the amount is never adjusted through the IEEE class or by CDP messages from the powered device. Because power is pre-allocated, any powered device that uses less than or equal to the maximum wattage is guaranteed power when it is connected to a static port. However, if the powered device IEEE class is greater than the maximum wattage, the switch does not supply power to it. If the switch learns through CDP messages that the powered device needs more than the maximum wattage, the powered device is shut down.

If the switch cannot pre-allocate power when a port is in static mode (for example, because the entire power budget is already allocated to other auto or static ports), this message appears: Command rejected: power inline static: pwr not available. The port configuration remains unchanged.

When you configure a port by using the **power inline auto** or the **power inline static** interface configuration command, the port autonegotiates by using the configured speed and duplex settings. This is necessary to determine the power requirements of the connected device (whether or not it is a powered device). After the power requirements have been determined, the switch hardcodes the interface by using the configured speed and duplex settings without resetting the interface.

When you configure a port by using the **power inline never** command, the port reverts to the configured speed and duplex settings.

If a port has a Cisco powered device connected to it, you should not use the **power inline never** command to configure the port. A false link-up can occur, placing the port in an error-disabled state.

Use the **power inline port priority {high | low}** command to configure the power priority of a PoE port. Powered devices connected to ports with low port priority are shut down first in case of a power shortage.

You can verify your settings by entering the **show power inline EXEC** command.

## Examples

This example shows how to enable detection of a powered device and to automatically power a PoE port on a switch:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline auto
```

This example shows how to configure a PoE port on a switch to allow a class 1 or a class 2 powered device:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline auto max 7000
```

This example shows how to disable powered-device detection and to not power a PoE port on a switch:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline never
```

This example shows how to set the priority of a port to high, so that it would be one of the last ports to be shut down in case of power supply failure:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline port priority high
```

# power inline police

To enable policing of real-time power consumption on a powered device, use the **power inline police** command in interface configuration mode. To disable this feature, use the **no** form of this command

**power inline police** [**action** {**errdisable** | **log**}]  
**no power inline police**

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                      |

|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | This command was introduced.                                                                                                                                                                         |
| Usage Guidelines   | This command is supported only on Power over Ethernet (PoE)-capable ports. If you enter this command on a device or port that does not support PoE, an error message appears.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                      |
|                    | In a switch stack, this command is supported on all switches or ports in the stack that support PoE and real-time power-consumption monitoring.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                      |
|                    | When policing of the real-time power consumption is enabled, the device takes action when a powered device consumes more power than the allocated maximum amount.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                      |
|                    | When PoE is enabled, the device senses the real-time power consumption of the powered device. This feature is called <i>power monitoring</i> or <i>power sensing</i> . The device also polices the power usage with the <i>power policing</i> feature.                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                      |
|                    | When power policing is enabled, the device uses one of the these values as the cutoff power on the PoE port in this order:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                      |
|                    | <ol style="list-style-type: none"><li>1. The user-defined power level that limits the power allowed on the port when you enter the <b>power inline auto max max-wattage</b> or the <b>power inline static max max-wattage</b> interface configuration command</li><li>2. The device automatically sets the power usage of the device by using CDP power negotiation or by the IEEE classification and LLPD power negotiation.</li></ol>                                                                                                                                                                                                                       |                                                                                                                                                                                                      |
|                    | If you do not manually configure the cutoff-power value, the device automatically determines it by using CDP power negotiation or the device IEEE classification and LLDP power negotiation. If CDP or LLDP are not enabled, the default value of 30 W is applied. However without CDP or LLDP, the device does not allow devices to consume more than 15.4 W of power because values from 15400 to 30000 mW are only allocated based on CDP or LLDP requests. If a powered device consumes more than 15.4 W without CDP or LLDP negotiation, the device might be in violation of the maximum current <i>I</i> <sub>max</sub> limitation and might experience |                                                                                                                                                                                                      |

an *Icut* fault for drawing more current than the maximum. The port remains in the fault state for a time before attempting to power on again. If the port continuously draws more than 15.4 W, the cycle repeats.

When a powered device connected to a PoE+ port restarts and sends a CDP or LLDP packet with a power TLV, the device locks to the power-negotiation protocol of that first packet and does not respond to power requests from the other protocol. For example, if the device is locked to CDP, it does not provide power to devices that send LLDP requests. If CDP is disabled after the device has locked on it, the device does not respond to LLDP power requests and can no longer power on any accessories. In this case, you should restart the powered device.

If power policing is enabled, the device polices power usage by comparing the real-time power consumption to the maximum power allocated on the PoE port. If the device uses more than the maximum power allocation (or *cutoff power*) on the port, the device either turns power off to the port, or the device generates a syslog message and updates the LEDs (the port LEDs are blinking amber) while still providing power to the device.

- To configure the device to turn off power to the port and put the port in the error-disabled state, use the **power inline police** interface configuration command.
- To configure the device to generate a syslog message while still providing power to the device, use the **power inline police action log** command.

If you do not enter the **action log** keywords, the default action is to shut down the port, turn off power to it, and put the port in the PoE error-disabled state. To configure the PoE port to automatically recover from the error-disabled state, use the **errdisable detect cause inline-power** global configuration command to enable error-disabled detection for the PoE cause and the **errdisable recovery cause inline-power interval interval** global configuration command to enable the recovery timer for the PoE error-disabled cause.

#### Caution

If policing is disabled, no action occurs when the powered device consumes more than the maximum power allocation on the port, which could adversely affect the device.

You can verify your settings by entering the **show power inline police** privileged EXEC command.

#### Examples

This example shows how to enable policing of the power consumption and configuring the device to generate a syslog message on the PoE port on a device:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline police action log
```

# power supply

To configure and manage the internal power supplies on a switch, use the **power supply** command in privileged EXEC mode.

**power supply** *stack-member-number* **slot** {**A** | **B**} {**off** | **on**}

| Syntax Description         |  |                                                                                                                                                                                                                      |
|----------------------------|--|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>stack-member-number</i> |  | Stack member number for which to configure the internal power supplies. The range is 1 to 9, depending on the number of switches in the stack.<br><br>This parameter is available only on stacking-capable switches. |
| <b>slot</b>                |  | Selects the switch power supply to set.                                                                                                                                                                              |
| <b>A</b>                   |  | Selects the power supply in slot A.                                                                                                                                                                                  |
| <b>B</b>                   |  | Selects the power supply in slot B.<br><br><b>Note</b> Power supply slot B is the closest slot to the outer edge of the switch.                                                                                      |
| <b>off</b>                 |  | Sets the switch power supply to off.                                                                                                                                                                                 |
| <b>on</b>                  |  | Sets the switch power supply to on.                                                                                                                                                                                  |

**Command Default** The switch power supply is on.

**Command Modes** Privileged EXEC

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

The **power supply** command applies to a switch or to a switch stack where all switches are the same platform. In a switch stack with the same platform switches, you must specify the stack member before entering the **slot {A | B} off** or **on** keywords.

To return to the default setting, use the **power supply stack-member-number on** command.

You can verify your settings by entering the **show env power** privileged EXEC command.

## Examples

This example shows how to set the power supply in slot A to off:

```
Device> power supply 2 slot A off
Disabling Power supply A may result in a power loss to PoE devices and/or switches ...
Continue? (yes/[no]): yes
Device
Jun 10 04:52:54.389: %PLATFORM_ENV-6-FRU_PS_OIR: FRU Power Supply 1 powered off
Jun 10 04:52:56.717: %PLATFORM_ENV-1-FAN_NOT_PRESENT: Fan is not present
```

This example shows how to set the power supply in slot A to on:

```
Device> power supply 1 slot B on
Jun 10 04:54:39.600: %PLATFORM_ENV-6-FRU_PS_OIR: FRU Power Supply 1 powered on
```

This example shows the output of the show env power command:

```
Device> show env power
SW  PID                Serial#      Status      Sys Pwr  PoE Pwr  Watts
--  -
1A  PWR-1RUC2-640WAC     DCB1705B05B OK          Good     Good     250/390
1B  Not Present
```

# power supply autoLC shutdown

To enable automatic shutdown control on linecards, use the **power supply autoLC shutdown** command in global configuration mode. This command is enabled by default and cannot be disabled. The `AutoLC shutdown cannot be disabled` message will be displayed if you try to disable it.

**power supply autoLC shutdown**  
**no power supply autoLC shutdown**

## Examples

This example shows how to enable automatic shutdown on linecards:

```
Device> enable
Device# configure terminal
Device(config)# power supply autoLC shutdown
```

# shell trigger

To create an event trigger, use the **shell trigger** command in global configuration mode. Use the **no** form of this command to delete the trigger.

**shell trigger** *identifier description*

**no shell trigger** *identifier description*

|                           |                    |                                                                                                        |
|---------------------------|--------------------|--------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>identifier</i>  | Specifies the event trigger identifier. The identifier should have no spaces or hyphens between words. |
|                           | <i>description</i> | Specifies the event trigger description text.                                                          |

|                        |                                                                                                                                                                                                                                                                                  |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Command Default</b> | System-defined event triggers:                                                                                                                                                                                                                                                   |
|                        | <ul style="list-style-type: none"> <li>• CISCO_DMP_EVENT</li> <li>• CISCO_IPVSC_AUTO_EVENT</li> <li>• CISCO_PHONE_EVENT</li> <li>• CISCO_SWITCH_EVENT</li> <li>• CISCO_ROUTER_EVENT</li> <li>• CISCO_WIRELESS_AP_EVENT</li> <li>• CISCO_WIRELESS_LIGHTWEIGHT_AP_EVENT</li> </ul> |

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                              |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | Use this command to create user-defined event triggers for use with the <b>macro auto device</b> and the <b>macro auto execute</b> commands. |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|

To support dynamic device discovery when using IEEE 802.1x authentication, you need to configure the RADIUS authentication server to support the Cisco attribute-value pair: **auto-smart-port=event trigger**.

## Example

This example shows how to create a user-defined event trigger called RADIUS\_MAB\_EVENT:

```
Device(config)# shell trigger RADIUS_MAB_EVENT MAC_AuthBypass Event
Device(config)# end
```

# show beacon all

To display the status of beacon LED on the device, use the **show beacon all** command in privileged EXEC mode.

**show beacon** { **rp** { **active** | **standby** } | **slot** *slot-number* } | **all** }

|                    |                                                                               |                                                                                        |
|--------------------|-------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| Syntax Description | <b>rp</b> { <b>active</b>   <b>standby</b> }                                  | Specifies the active or the standby Switch whose beacon LED status is to be displayed. |
|                    | <b>slot</b> <i>slot-num</i>                                                   | Specifies the slot whose beacon LED status is to be displayed.                         |
|                    | <b>all</b>                                                                    | Displays the status of all beacon LEDs.                                                |
| Command History    | <b>Release</b>                                                                | <b>Modification</b>                                                                    |
|                    | Cisco IOS XE Fuji 16.9.1                                                      | This command was introduced.                                                           |
| Command Default    | This command has no default settings.                                         |                                                                                        |
| Command Modes      | Privileged EXEC (#)                                                           |                                                                                        |
| Usage Guidelines   | Use the command <b>show beacon all</b> to know the status of all beacon LEDs. |                                                                                        |

## Sample output of *show beacon all* command.

```
Device#show beacon all
Switch# Beacon Status
-----
*1 OFF
```

## Sample output of *show beacon rp* command.

```
Device#show beacon rp active
Switch# Beacon Status
-----
*1 OFF
```

```
Device#show beacon slot 1
Switch# Beacon Status
-----
*1 OFF
```

# show device classifier attached

To display the devices connected to a switch and their associated properties, use the **show device classifier attached** command in user EXEC mode.

**show device classifier attached** [{**detail** | **interface** *interface\_id* | **mac-address** *mac\_address*}]

|                           |                                                                                                                                                                                                    |                                                                         |

## Example

This example shows how to use the **show device classifier attached** command with no optional keywords to view the devices connected to the switch:

```

Device# show device classifier attached
MAC_Address      Port_Id      Profile Name
=====
000a.b8c6.1e07   Gi1/0/2      Cisco-Device
001f.9e90.1250   Gi1/0/4      Cisco-AP-Aironet-1130
=====

```

This example shows how to use the **show device classifier attached** command in privileged EXEC mode with the optional **mac-address** keyword to view summary information about the connected device with the specified MAC address:

```

Device# show device classifier attached mac-address 001f.9e90.1250
MAC_Address      Port_Id      Profile Name
=====
001f.9e90.1250   Gi1/0/4      Cisco-AP-Aironet-1130
=====

```

This example shows how to use the **show device classifier attached** command in privileged EXEC mode with the optional **mac-address** and **detail** keywords to view detailed information about the connected device with the specified MAC address:

```

Device# show device classifier attached mac-address 001f.9e90.1250 detail
MAC_Address      Port_Id      Certainty Parent      ProfileType      Profile Name
=====
001f.9e90.1250   Gi1/0/4      40          2          Built-in         Cisco-AP-Aironet-1130
cisco AIR-LAP1131AG-E-K9
=====

```

This example shows how to use the **show device classifier attached** command in privileged EXEC mode with the optional **interface** keyword to view summary information about the device connected to the specified interface:

```

Device# show device classifier attached interface gi 1/0/2
MAC_Address      Port_Id      Profile Name
=====
000a.b8c6.1e07   Gi1/0/2      Cisco-Device
=====

```

This example shows how to use the **show device classifier attached** command in privileged EXEC mode with the optional **interface** and **detail** keywords to view detailed information about the device connected to the specified interface:

```

Device# show device classifier attached interface gi 1/0/2 detail
MAC_Address      Port_Id      Certainty Parent      ProfileType      Profile Name
=====
000a.b8c6.1e07   Gi1/0/2      10          0          Default         Cisco-Device      cisco
WS-C2960-48TT-L
=====

```

# show device classifier clients

To display the clients using the device classifier facility on the switch, use the **show device classifier clients** command in user EXEC mode.

## show device classifier clients

|                  |                                                                                                                                                                                                                                                                         |                              |

| Command History  | Release                                                                                                                                                                                                                                                                 | Modification                 |
|                  | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                            | This command was introduced. |
| Usage Guidelines | Device classifier (DC) is enabled by default when you enable a client application (for example, Auto SmartPorts) that uses its functionality. Use the <b>show device classifier clients</b> command to display the clients that are using the DC feature on the switch. |                              |
|                  | As long as any clients are using the DC, you cannot disable it by using the <b>no device classifier</b> command. If you attempt to disable the DC while a client is using it, an error message appears.                                                                 |                              |

## Example

This example shows how to use the **show device classifier clients** command to view the clients using the DC on the switch:

```
Device# show device classifier clients
Client Name
=====
Auto Smart Ports
```

```
This example shows the error message that appears when you attempt to disable DC while a
client is using it:
Switch(config)# no device classifier
These subsystems should be disabled before disabling Device classifier
Auto Smart Ports

% Error - device classifier is not disabled
```

# show device classifier profile type

To display all the device types recognized by the device classifier, use the **show device classifier profile type** command in user EXEC mode.

**show device classifier profile type** [**table** [{*built-in default*}] | **string** *filter\_string*]

|                           | Privileged EXEC (#)                                                                                                                                                                                                                                                                                  |                                                                            |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                                                                                                       | <b>Modification</b>                                                        |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                         | This command was introduced.                                               |
| <b>Usage Guidelines</b>   | This command displays all the device types recognized by the device classification engine. The number of available device types is the number of profiles stored on the switch. Because the number of profiles can be very large, you can use the <b>filter</b> keyword to limit the command output. |                                                                            |

## Example

This example shows how to use the **show device classifier profile type** command in privileged EXEC mode with no optional keywords to view the devices recognized by the device classifier:

```
Device# show device classifier profile type table
  Valid      Type      Profile Name      min Conf      ID
=====
Valid      Default      Apple-Device      10            0
Valid      Default      Aruba-Device      10            1
Valid      Default      Avaya-Device      10            2

# show env

To display fan, temperature, and power information, use the **show env** command in EXEC mode.

**show env** {**all** | **fan** | **power** [{**all** | **switch** [*stack-member-number*]}] | **stack** [*stack-member-number*] | **temperature** [*status*]}

## Syntax Description

|                            |                                                                                                                                                                                                                   |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b>                 | Displays the fan and temperature environmental status and the status of the internal power supplies.                                                                                                              |
| <b>fan</b>                 | Displays the switch fan status.                                                                                                                                                                                   |
| <b>power</b>               | Displays the internal power status of the active switch.                                                                                                                                                          |
| <b>all</b>                 | (Optional) Displays the status of all the internal power supplies in a standalone switch when the command is entered on the switch, or in all the stack members when the command is entered on the active switch. |
| <b>switch</b>              | (Optional) Displays the status of the internal power supplies for each switch in the stack or for the specified switch.<br><br>This keyword is available only on stacking-capable switches.                       |
| <i>stack-member-number</i> | (Optional) Number of the stack member for which to display the status of the internal power supplies or the environmental status.<br><br>The range is 1 to 9.                                                     |
| <b>stack</b>               | Displays all environmental status for each switch in the stack or for the specified switch.<br><br>This keyword is available only on stacking-capable switches.                                                   |
| <b>temperature</b>         | Displays the switch temperature status.                                                                                                                                                                           |
| <b>status</b>              | (Optional) Displays the switch internal temperature (not the external temperature) and the threshold values.                                                                                                      |

## Command Default

None

## Command Modes

User EXEC (>)  
  
Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **show env** EXEC command to display the information for the switch being accessed—a standalone switch or the active switch. Use this command with the **stack** and **switch** keywords to display all information for the stack or for the specified stack member.

If you enter the **show env temperature status** command, the command output shows the switch temperature state and the threshold level.

You can also use the **show env temperature** command to display the switch temperature status. The command output shows the green and yellow states as *OK* and the red state as *FAULTY*. If you enter the **show env all** command, the command output is the same as the **show env temperature status** command output.

## Examples

This is an example of output from the **show env all** command:

```
Device>show env all
Switch 1 FAN 1 is OK
Switch 1 FAN 2 is OK
Switch 1 FAN 3 is OK
FAN PS-1 is NOT PRESENT
FAN PS-2 is OK
Switch 1: SYSTEM TEMPERATURE is OK
Inlet Temperature Value: 25 Degree Celsius
Temperature State: GREEN
Yellow Threshold : 46 Degree Celsius
Red Threshold    : 56 Degree Celsius

Hotspot Temperature Value: 35 Degree Celsius
Temperature State: GREEN
Yellow Threshold : 105 Degree Celsius
Red Threshold    : 125 Degree Celsius
```

| SW | PID           | Serial#     | Status         | Sys Pwr | PoE Pwr | Watts |
|----|---------------|-------------|----------------|---------|---------|-------|
| 1A | Unknown       | Unknown     | No Input Power | Bad     | Bad     | 235   |
| 1B | PWR-C1-350WAC | DCB2137H04P | OK             | Good    | Good    | 350   |

```
Device# show env fan
Switch 1 FAN 1 is OK
Switch 1 FAN 2 is OK
Switch 1 FAN 3 is OK
FAN PS-1 is NOT PRESENT
FAN PS-2 is OK
```

This is an example of output from the **show env power** command:

```
Device>show env power
```

| SW | PID           | Serial#     | Status         | Sys Pwr | PoE Pwr | Watts |
|----|---------------|-------------|----------------|---------|---------|-------|
| 1A | Unknown       | Unknown     | No Input Power | Bad     | Bad     | 235   |
| 1B | PWR-C1-350WAC | DCB2137H04P | OK             | Good    | Good    | 350   |

```
> show env stack
SWITCH: 1
Switch 1 FAN 1 is OK
Switch 1 FAN 2 is OK
Switch 1 FAN 3 is OK
FAN PS-1 is NOT PRESENT
FAN PS-2 is OK
Switch 1: SYSTEM TEMPERATURE is OK
Inlet Temperature Value: 25 Degree Celsius
Temperature State: GREEN
Yellow Threshold : 46 Degree Celsius
Red Threshold    : 56 Degree Celsius

Hotspot Temperature Value: 35 Degree Celsius
```

```
Temperature State: GREEN
Yellow Threshold : 105 Degree Celsius
Red Threshold    : 125 Degree Celsius
```

This example shows how to display the temperature value, state, and the threshold values on a stack.

```
# show env stack
System Temperature Value: 41 Degree Celsius
System Temperature State: GREEN
Yellow Threshold : 66 Degree Celsius
Red Threshold    : 76 Degree Celsius
```

This example shows the output of **show env temperature** command

```
Device> show env temperature
Switch 1: SYSTEM TEMPERATURE is OK
Inlet Temperature Value: 25 Degree Celsius
Temperature State: GREEN
Yellow Threshold : 46 Degree Celsius
Red Threshold    : 56 Degree Celsius

Hotspot Temperature Value: 35 Degree Celsius
Temperature State: GREEN
Yellow Threshold : 105 Degree Celsius
Red Threshold    : 125 Degree Celsius
```

**Table 10: States in the show env temperature status Command Output**

| State  | Description                                                                                                             |
|--------|-------------------------------------------------------------------------------------------------------------------------|
| Green  | The switch temperature is in the <i>normal</i> operating range.                                                         |
| Yellow | The temperature is in the <i>warning</i> range. You should check the external temperature around the switch.            |
| Red    | The temperature is in the <i>critical</i> range. The switch might not run properly if the temperature is in this range. |

# show errdisable detect

To display error-disabled detection status, use the **show errdisable detect** command in EXEC mode.

## show errdisable detect

|                    |                                                                                                                                                                                                                                                                                                                                      |                              |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| Syntax Description | This command has no arguments or keywords.                                                                                                                                                                                                                                                                                           |                              |

| Usage Guidelines                                                                  | A gbic-invalid error-disable reason refers to an invalid small form-factor pluggable (SFP) module interface. |                                                                     |
|  |                                                                                                              |                                                                     |
|                                                                                   | Note                                                                                                         | Though visible in the output, the unicast-flood field is not valid. |

# show ip interface

To display the usability status of interfaces configured for IP, use the **show ip interface** command in privileged EXEC mode.

**show ip interface** [*type number*] [**brief**]

|                    |               |                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <i>type</i>   | (Optional) Interface type.                                                                                                                                                                                                                                                                                                                                        |
|                    | <i>number</i> | (Optional) Interface number.                                                                                                                                                                                                                                                                                                                                      |
|                    | <b>brief</b>  | (Optional) Displays a summary of the usability status information for each interface.                                                                                                                                                                                                                                                                             |
|                    | <b>Note</b>   | The output of the <b>show ip interface brief</b> command displays information of all the available interfaces whether or not the corresponding network module for these interfaces are connected. These interfaces can be configured if the network module is connected. Run the <b>show interface status</b> command to see which network modules are connected. |

**Command Default** The full usability status is displayed for all interfaces configured for IP.

**Command Modes** Privileged EXEC (#)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The Cisco IOS software automatically enters a directly connected route in the routing table if the interface is usable (which means that it can send and receive packets). If an interface is not usable, the directly connected routing entry is removed from the routing table. Removing the entry lets the software use dynamic routing protocols to determine backup routes to the network, if any.

If the interface can provide two-way communication, the line protocol is marked "up." If the interface hardware is usable, the interface is marked "up."

If you specify an optional interface type, information for that specific interface is displayed. If you specify no optional arguments, information on all the interfaces is displayed.

When an asynchronous interface is encapsulated with PPP or Serial Line Internet Protocol (SLIP), IP fast switching is enabled. A **show ip interface** command on an asynchronous interface encapsulated with PPP or SLIP displays a message indicating that IP fast switching is enabled.

You can use the **show ip interface brief** command to display a summary of the device interfaces. This command displays the IP address, the interface status, and other information.

The **show ip interface brief** command does not display any information related to Unicast RPF.

**Examples** The following example shows interface information on Gigabit Ethernet interface 1/0/1:

```
Device# show ip interface gigabitethernet 1/0/1

GigabitEthernet1/0/1 is up, line protocol is up
```

```
Internet address is 10.1.1.1/16
Broadcast address is 255.255.255.255
Address determined by setup command
MTU is 1500 bytes
Helper address is not set
Directed broadcast forwarding is disabled
Outgoing access list is not set
Inbound access list is not set
Proxy ARP is enabled
Local Proxy ARP is disabled
Security level is default
Split horizon is enabled
ICMP redirects are always sent
ICMP unreachable are always sent
ICMP mask replies are never sent
IP fast switching is enabled
IP fast switching on the same interface is disabled
IP Flow switching is disabled
IP CEF switching is enabled
IP Feature Fast switching turbo vector
IP VPN Flow CEF switching turbo vector
IP multicast fast switching is enabled
IP multicast distributed fast switching is disabled
IP route-cache flags are Fast, CEF
Router Discovery is disabled
IP output packet accounting is disabled
IP access violation accounting is disabled
TCP/IP header compression is disabled
RTP/IP header compression is disabled
Policy routing is enabled, using route map PBR
Network address translation is disabled
BGP Policy Mapping is disabled
IP Multi-Processor Forwarding is enabled
  IP Input features, "PBR",
    are not supported by MPF and are IGNORED
  IP Output features, "NetFlow",
    are not supported by MPF and are IGNORED
```

The following example shows how to display the usability status for a specific VLAN:

```
Device# show ip interface vlan 1

Vlan1 is up, line protocol is up
  Internet address is 10.0.0.4/24
  Broadcast address is 255.255.255.255
Address determined by non-volatile memory
MTU is 1500 bytes
Helper address is not set
Directed broadcast forwarding is disabled
Outgoing access list is not set
Inbound access list is not set
Proxy ARP is enabled
Local Proxy ARP is disabled
Security level is default
Split horizon is enabled
ICMP redirects are always sent
ICMP unreachable are always sent
ICMP mask replies are never sent
IP fast switching is enabled
IP fast switching on the same interface is disabled
IP Flow switching is disabled
IP CEF switching is enabled
IP Fast switching turbo vector
```

```

IP Normal CEF switching turbo vector
IP multicast fast switching is enabled
IP multicast distributed fast switching is disabled
IP route-cache flags are Fast, CEF
Router Discovery is disabled
IP output packet accounting is disabled
IP access violation accounting is disabled
TCP/IP header compression is disabled
RTP/IP header compression is disabled
Probe proxy name replies are disabled
Policy routing is disabled
Network address translation is disabled
WCCP Redirect outbound is disabled
WCCP Redirect inbound is disabled
WCCP Redirect exclude is disabled
BGP Policy Mapping is disabled
Sampled Netflow is disabled
IP multicast multilayer switching is disabled
Netflow Data Export (hardware) is enabled

```

The table below describes the significant fields shown in the display.

**Table 11: show ip interface Field Descriptions**

| Field                         | Description                                                                                                                 |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Broadcast address is          | Broadcast address.                                                                                                          |
| Peer address is               | Peer address.                                                                                                               |
| MTU is                        | MTU value set on the interface, in bytes.                                                                                   |
| Helper address                | Helper address, if one is set.                                                                                              |
| Directed broadcast forwarding | Shows whether directed broadcast forwarding is enabled.                                                                     |
| Outgoing access list          | Shows whether the interface has an outgoing access list set.                                                                |
| Inbound access list           | Shows whether the interface has an incoming access list set.                                                                |
| Proxy ARP                     | Shows whether Proxy Address Resolution Protocol (ARP) is enabled for the interface.                                         |
| Security level                | IP Security Option (IPSO) security level set for this interface.                                                            |
| Split horizon                 | Shows whether split horizon is enabled.                                                                                     |
| ICMP redirects                | Shows whether redirect messages will be sent on this interface.                                                             |
| ICMP unreachable              | Shows whether unreachable messages will be sent on this interface.                                                          |
| ICMP mask replies             | Shows whether mask replies will be sent on this interface.                                                                  |
| IP fast switching             | Shows whether fast switching is enabled for this interface. It is generally enabled on serial interfaces, such as this one. |
| IP Flow switching             | Shows whether Flow switching is enabled for this interface.                                                                 |

| Field                                     | Description                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP CEF switching                          | Shows whether Cisco Express Forwarding switching is enabled for the interface.                                                                                                                                                                                                                                                                                       |
| IP multicast fast switching               | Shows whether multicast fast switching is enabled for the interface.                                                                                                                                                                                                                                                                                                 |
| IP route-cache flags are Fast             | Shows whether NetFlow is enabled on an interface. Displays "Flow init" to specify that NetFlow is enabled on the interface. Displays "Ingress Flow" to specify that NetFlow is enabled on a subinterface using the <b>ip flow ingress</b> command. Shows "Flow" to specify that NetFlow is enabled on a main interface using the <b>ip route-cache flow</b> command. |
| Router Discovery                          | Shows whether the discovery process is enabled for this interface. It is generally disabled on serial interfaces.                                                                                                                                                                                                                                                    |
| IP output packet accounting               | Shows whether IP accounting is enabled for this interface and what the threshold (maximum number of entries) is.                                                                                                                                                                                                                                                     |
| TCP/IP header compression                 | Shows whether compression is enabled.                                                                                                                                                                                                                                                                                                                                |
| WCCP Redirect outbound is disabled        | Shows the status of whether packets received on an interface are redirected to a cache engine. Displays "enabled" or "disabled."                                                                                                                                                                                                                                     |
| WCCP Redirect exclude is disabled         | Shows the status of whether packets targeted for an interface will be excluded from being redirected to a cache engine. Displays "enabled" or "disabled."                                                                                                                                                                                                            |
| Netflow Data Export (hardware) is enabled | NetFlow Data Expert (NDE) hardware flow status on the interface.                                                                                                                                                                                                                                                                                                     |

The following example shows how to display a summary of the usability status information for each interface:

Device# **show ip interface brief**

```

Interface          IP-Address      OK? Method Status          Protocol
Vlan1              unassigned     YES NVRAM    administratively down down
GigabitEthernet0/0 unassigned     YES NVRAM    down            down
GigabitEthernet1/0/1 unassigned     YES NVRAM    down            down
GigabitEthernet1/0/2 unassigned     YES unset   down            down
GigabitEthernet1/0/3 unassigned     YES unset   down            down
GigabitEthernet1/0/4 unassigned     YES unset   down            down
GigabitEthernet1/0/5 unassigned     YES unset   down            down
GigabitEthernet1/0/6 unassigned     YES unset   down            down
GigabitEthernet1/0/7 unassigned     YES unset   down            down

```

**Table 12: show ip interface brief Field Descriptions**

| Field     | Description        |
|-----------|--------------------|
| Interface | Type of interface. |

| Field      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP-Address | IP address assigned to the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| OK?        | "Yes" means that the IP Address is valid. "No" means that the IP Address is not valid.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Method     | <p>The Method field has the following possible values:</p> <ul style="list-style-type: none"> <li>• RARP or SLARP: Reverse Address Resolution Protocol (RARP) or Serial Line Address Resolution Protocol (SLARP) request.</li> <li>• BOOTP: Bootstrap protocol.</li> <li>• TFTP: Configuration file obtained from the TFTP server.</li> <li>• manual: Manually changed by the command-line interface.</li> <li>• NVRAM: Configuration file in NVRAM.</li> <li>• IPCP: <b>ip address negotiated</b> command.</li> <li>• DHCP: <b>ip address dhcp</b> command.</li> <li>• unset: Unset.</li> <li>• other: Unknown.</li> </ul> |
| Status     | <p>Shows the status of the interface. Valid values and their meanings are:</p> <ul style="list-style-type: none"> <li>• up: Interface is up.</li> <li>• down: Interface is down.</li> <li>• administratively down: Interface is administratively down.</li> </ul>                                                                                                                                                                                                                                                                                                                                                           |
| Protocol   | Shows the operational status of the routing protocol on this interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Related Commands**

| Command                      | Description                                                                                                  |
|------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>ip interface</b>          | Configures a virtual gateway IP interface on a Secure Socket Layer Virtual Private Network (SSL VPN) gateway |
| <b>show interface status</b> | Displays the status of the interface.                                                                        |

# show interfaces

To display the administrative and operational status of all interfaces or for a specified interface, use the **show interfaces** command in the EXEC mode.

```
show interfaces [{ interface-id | vlan vlan-id }] [{ accounting | capabilities [ module number ] | description | etherchannel | flowcontrol | link [ module number ] | private-vlan mapping | pruning | stats | status [{ err-disabled | inactive }] | trunk }]
```

| Syntax Description                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>interface-id</i>                 | (Optional) ID of the interface. Valid interfaces include physical ports (including type, stack member for stacking-capable switches, module, and port number) and port channels.<br><br>The port channel range is 1 to 128.                                                                                                                                                                                                                                                |
| <b>vlan</b> <i>vlan-id</i>          | (Optional) VLAN identification. The range is 1 to 4094.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>accounting</b>                   | (Optional) Displays accounting information on the interface, including active protocols and input and output packets and octets.<br><br><b>Note</b> The display shows only packets processed in software; hardware-switched packets do not appear.                                                                                                                                                                                                                         |
| <b>capabilities</b>                 | (Optional) Displays the capabilities of all interfaces or the specified interface, including the features and options that you can configure on the interface. Though visible in the command line help, this option is not available for VLAN IDs.                                                                                                                                                                                                                         |
| <b>module</b> <i>number</i>         | (Optional) Displays capabilities of all interfaces on the switch or specified stack member.<br><br>The range is 1 to 9.<br><br>This option is not available if you entered a specific interface ID.                                                                                                                                                                                                                                                                        |
| <b>description</b>                  | (Optional) Displays the administrative status and description set for interfaces.<br><br><b>Note</b> The output of the <b>show interfaces description</b> command displays information of all the available interfaces whether or not the corresponding network module for these interfaces are connected. These interfaces can be configured if the network module is connected. Run the <b>show interface status</b> command to see which network modules are connected. |
| <b>etherchannel</b>                 | (Optional) Displays interface EtherChannel information.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>flowcontrol</b>                  | (Optional) Displays interface flow control information.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>link</b> [ <i>modulenumber</i> ] | (Optional) Displays the up time and down time of the interface.                                                                                                                                                                                                                                                                                                                                                                                                            |

|                             |                                                                                                                                                                                            |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>private-vlan mapping</b> | (Optional) Displays private-VLAN mapping information for the VLAN switch virtual interfaces (SVIs). This keyword is not available if the switch is running the LAN base feature set.       |
| <b>pruning</b>              | (Optional) Displays trunk VTP pruning information for the interface.                                                                                                                       |
| <b>stats</b>                | (Optional) Displays the input and output packets by switching the path for the interface.                                                                                                  |
| <b>status</b>               | (Optional) Displays the status of the interface. A status of unsupported in the Type field means that a non-Cisco small form-factor pluggable (SFP) module is inserted in the module slot. |
| <b>err-disabled</b>         | (Optional) Displays interfaces in an error-disabled state.                                                                                                                                 |
| <b>inactive</b>             | (Optional) Displays interfaces in an inactive state.                                                                                                                                       |
| <b>trunk</b>                | (Optional) Displays interface trunk information. If you do not specify an interface, only information for active trunking ports appears.                                                   |

**Note**

Though visible in the command-line help strings, the **crb**, **fair-queue**, **irb**, **mac-accounting**, **precedence**, **random-detect**, **rate-limit**, and **shape** keywords are not supported.

**Command Default**

None

**Command Modes**

Privileged EXEC (#)

**Command History**

| Release                        | Modification                            |
|--------------------------------|-----------------------------------------|
| Cisco IOS XE Everest 16.5.1a   | This command was introduced.            |
| Cisco IOS XE Gibraltar 16.12.1 | The <b>link</b> keyword was introduced. |

**Usage Guidelines**

The **show interfaces capabilities** command with different keywords has these results:

- Use the **show interface capabilities module** *number* command to display the capabilities of all interfaces on that switch in the stack. If there is no switch with that module number in the stack, there is no output.
- Use the **show interfaces** *interface-id* **capabilities** to display the capabilities of the specified interface.
- Use the **show interfaces capabilities** (with no module number or interface ID) to display the capabilities of all interfaces in the stack.

**Note** The field **Last Input** displayed in the command output indicates the number of hours, minutes, and seconds since the last packet was successfully received by an interface and processed by the CPU on the device. This information can be used to know when a dead interface failed.

**Last Input** is not updated by fast-switched traffic.

The field **output** displayed in the command output indicates the number of hours, minutes, and seconds since the last packet was successfully transmitted by the interface. The information provided by this field can be useful for knowing when a dead interface failed.

The **show interfaces link** command with different keywords has these results:

- Use the **show interface link module *number*** command to display the up time and down time of all interfaces on that switch in the stack. If there is no switch with that module number in the stack, there is no output.

**Note** On a standalone switch, the **module *number*** refers to the slot number.

- Use the **show interfaces *interface-id* link** to display the up time and down time of the specified interface.
- Use the **show interfaces link** (with no module number or interface ID) to display the up time and down time of all interfaces in the stack.
- If the interface is up, the up time displays the time (hours, minutes, and seconds) and the down time displays 00:00:00.
- If the interface is down, only the down time displays the time (hours, minutes, and seconds).

## Examples

This is an example of output from the **show interfaces** command for an interface on stack member 3:

```
Device# show interfaces gigabitethernet3/0/2

GigabitEthernet3/0/2 is down, line protocol is down (notconnect)
  Hardware is Gigabit Ethernet, address is 2037.064d.4381 (bia 2037.064d.4381)
  MTU 1500 bytes, BW 1000000 Kbit/sec, DLY 10 usec,
    reliability 255/255, txload 1/255, rxload 1/255
  Encapsulation ARPA, loopback not set
  Keepalive set (10 sec)
  Auto-duplex, Auto-speed, media type is 10/100/1000BaseTX
  input flow-control is off, output flow-control is unsupported
  ARP type: ARPA, ARP Timeout 04:00:00
  Last input never, output never, output hang never
  Last clearing of "show interface" counters never
  Input queue: 0/2000/0/0 (size/max/drops/flushes); Total output drops: 0
  Queueing strategy: fifo
  Output queue: 0/40 (size/max)
  5 minute input rate 0 bits/sec, 0 packets/sec
  5 minute output rate 0 bits/sec, 0 packets/sec
    0 packets input, 0 bytes, 0 no buffer
    Received 0 broadcasts (0 multicasts)
    0 runts, 0 giants, 0 throttles
    0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
    0 watchdog, 0 multicast, 0 pause input
```

```

0 input packets with dribble condition detected
0 packets output, 0 bytes, 0 underruns
0 output errors, 0 collisions, 1 interface resets
0 unknown protocol drops
0 babbles, 0 late collision, 0 deferred
0 lost carrier, 0 no carrier, 0 pause output
0 output buffer failures, 0 output buffers swapped out

```

Device# **show interfaces accounting**

```

          Protocol    Pkts In   Chars In   Pkts Out   Chars Out
No traffic sent or received on this interface.
GigabitEthernet1/0/2
          Protocol    Pkts In   Chars In   Pkts Out   Chars Out
No traffic sent or received on this interface.

```

<output truncated>

This is an example of output from the **show interfaces interface description** command when the interface has been described as *Connects to Marketing* by using the **description** interface configuration command:

Device# **show interfaces gigabitethernet1/0/2 description**

```

Interface           Status      Protocol Description
Gi1/0/2             up         down     Connects to Marketing

```

Device# **show interfaces etherchannel**

```

----
Port-channel34:
Age of the Port-channel   = 28d:18h:51m:46s
Logical slot/port        = 12/34          Number of ports = 0
GC                        = 0x00000000    HotStandBy port = null
Passive port list        =
Port state                = Port-channel L3-Ag Ag-Not-Inuse
Protocol                  = -
Port security             = Disabled

```

This is an example of output from the **show interfaces interface-id pruning** command when pruning is enabled in the VTP domain:

Device# **show interfaces gigabitethernet1/0/2 pruning**

```

Port      Vlans pruned for lack of request by neighbor
Gi1/0/2   3,4

Port      Vlans traffic requested of neighbor

```

Gi1/0/2 1-3

This is an example of output from the **show interfaces stats** command for a specified VLAN interface:

Device# **show interfaces vlan 1 stats**

|                |         |           |          |           |
|----------------|---------|-----------|----------|-----------|
| Switching path | Pkts In | Chars In  | Pkts Out | Chars Out |
| Processor      | 1165354 | 136205310 | 570800   | 91731594  |
| Route cache    | 0       | 0         | 0        | 0         |
| Total          | 1165354 | 136205310 | 570800   | 91731594  |

This is an example of output from the **show interfaces status err-disabled** command. It displays the status of interfaces in the error-disabled state:

Device# **show interfaces status err-disabled**

| Port    | Name | Status       | Reason       |
|---------|------|--------------|--------------|
| Gi1/0/2 |      | err-disabled | gbic-invalid |
| Gi2/0/3 |      | err-disabled | dtp-flap     |

This is an example of output from the **show interfaces interface-id pruning** command:

Device# **show interfaces gigabitethernet1/0/2 pruning**

Port Vlans pruned for lack of request by neighbor

Device# **show interfaces gigabitethernet1/0/1 trunk**

| Port    | Mode | Encapsulation | Status | Native vlan |
|---------|------|---------------|--------|-------------|
| Gi1/0/1 | on   | 802.1q        | other  | 10          |

  

| Port    | Vlans allowed on trunk |
|---------|------------------------|
| Gi1/0/1 | none                   |

  

| Port    | Vlans allowed and active in management domain |
|---------|-----------------------------------------------|
| Gi1/0/1 | none                                          |

  

| Port    | Vlans in spanning tree forwarding state and not pruned |
|---------|--------------------------------------------------------|
| Gi1/0/1 | none                                                   |

This is an example of output from the **show interfaces description** command:

Device# **show interfaces description**

| Interface | Status     | Protocol Description |
|-----------|------------|----------------------|
| Vl1       | admin down | down                 |

```

# show interfaces counters

To display various counters for the switch or for a specific interface, use the **show interfaces counters** command in privileged EXEC mode.

**show interfaces** [*interface-id*] **counters** [{**errors** | **etherchannel** | **module** *member-number* | **protocol status** | **trunk**}]

| Syntax Description                 |                                                                                                                                                              |  |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <i>interface-id</i>                | (Optional) ID of the physical interface, including type, stack member (stacking-capable switches only) module, and port number.                              |  |
| <b>errors</b>                      | (Optional) Displays error counters.                                                                                                                          |  |
| <b>etherchannel</b>                | (Optional) Displays EtherChannel counters, including octets, broadcast packets, multicast packets, and unicast packets received and sent.                    |  |
| <b>module</b> <i>member-number</i> | (Optional) Displays counters for the specified member.<br>The range is 1 to 9.                                                                               |  |
|                                    | <b>Note</b> In this command, the <b>module</b> keyword refers to the stack member number. The module number that is part of the interface ID is always zero. |  |
| <b>protocol status</b>             | (Optional) Displays the status of protocols enabled on interfaces.                                                                                           |  |
| <b>trunk</b>                       | (Optional) Displays trunk counters.                                                                                                                          |  |

**Note** Though visible in the command-line help string, the **vlan** *vlan-id* keyword is not supported.

| <b>Command Default</b>       | None                                                                                                                                                  |         |              |                              |                              |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|------------------------------|
| <b>Command Modes</b>         | Privileged EXEC (#)                                                                                                                                   |         |              |                              |                              |
| <b>Command History</b>       | <table> <tr> <th>Release</th><th>Modification</th></tr> <tr> <td>Cisco IOS XE Everest 16.5.1a</td><td>This command was introduced.</td></tr> </table> | Release | Modification | Cisco IOS XE Everest 16.5.1a | This command was introduced. |
| Release                      | Modification                                                                                                                                          |         |              |                              |                              |
| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                          |         |              |                              |                              |

**Usage Guidelines** If you do not enter any keywords, all counters for all interfaces are included.

This is an example of partial output from the **show interfaces counters** command. It displays all counters for the switch.

```
Device# show interfaces counters
Port          InOctets    InUcastPkts  InMcastPkts  InBcastPkts
Gi1/0/1              0              0              0              0
Gi1/0/2              0              0              0              0
Gi1/0/3          95285341         43115         1178430         1950
Gi1/0/4              0              0              0              0
```

<output truncated>

This is an example of partial output from the **show interfaces counters module** command for module 2. It displays all counters for the specified switch in the module.

```
Device# show interfaces counters module 2
Port          InOctets    InUcastPkts  InMcastPkts  InBcastPkts
Gi1/0/1        520          2             0             0
Gi1/0/2        520          2             0             0
Gi1/0/3        520          2             0             0
Gi1/0/4        520          2             0             0
```

<output truncated>

This is an example of partial output from the **show interfaces counters protocol status** command for all interfaces:

```
Device# show interfaces counters protocol status
Protocols allocated:
Vlan1: Other, IP
Vlan20: Other, IP, ARP
Vlan30: Other, IP, ARP
Vlan40: Other, IP, ARP
Vlan50: Other, IP, ARP
Vlan60: Other, IP, ARP
Vlan70: Other, IP, ARP
Vlan80: Other, IP, ARP
Vlan90: Other, IP, ARP
Vlan900: Other, IP, ARP
Vlan3000: Other, IP
Vlan3500: Other, IP
GigabitEthernet1/0/1: Other, IP, ARP, CDP
GigabitEthernet1/0/2: Other, IP
GigabitEthernet1/0/3: Other, IP
GigabitEthernet1/0/4: Other, IP
GigabitEthernet1/0/5: Other, IP
GigabitEthernet1/0/6: Other, IP
GigabitEthernet1/0/7: Other, IP
GigabitEthernet1/0/8: Other, IP
GigabitEthernet1/0/9: Other, IP
GigabitEthernet1/0/10: Other, IP, CDP
```

<output truncated>

This is an example of output from the **show interfaces counters trunk** command. It displays trunk counters for all interfaces.

```
Device# show interfaces counters trunk
Port          TrunkFramesTx  TrunkFramesRx  WrongEncap
Gi1/0/1        0              0              0
Gi1/0/2        0              0              0
Gi1/0/3       80678          0              0
Gi1/0/4       82320          0              0
Gi1/0/5        0              0              0
```

<output truncated>

# show interfaces switchport

To display the administrative and operational status of a switching (nonrouting) port, including port blocking and port protection settings, use the **show interfaces switchport** command in privileged EXEC mode.

**show interfaces** [*interface-id*] **switchport** [{*module number*}]

| <b>Syntax Description</b>    | <p><i>interface-id</i> (Optional) ID of the interface. Valid interfaces include physical ports (including type, stack member for stacking-capable switches, module, and port number) and port channels. The port channel range is 1 to 48.</p> <p><b>module number</b> (Optional) Displays switchport configuration of all interfaces on the switch or specified stack member.</p> <p>The range is 1 to 9.</p> <p>This option is not available if you entered a specific interface ID.</p> |         |              |                              |                              |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|------------------------------|
| <b>Command Default</b>       | None                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |              |                              |                              |

| Release                      | Modification                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |              |                              |                              |
| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |              |                              |                              |
| <b>Usage Guidelines</b>      | <p>Use the <b>show interface switchport module number</b> command to display the switch port characteristics of all interfaces on that switch in the stack. If there is no switch with that module number in the stack, there is no output.</p>                                                                                                                                                                                                                                            |         |              |                              |                              |

This is an example of output from the **show interfaces switchport** command for a port. The table that follows describes the fields in the display.

```
Device# show interfaces gigabitethernet1/0/1 switchport
Name: Gi1/0/1
Switchport: Enabled
Administrative Mode: trunk
Operational Mode: down
Administrative Trunking Encapsulation: dot1q
Negotiation of Trunking: On
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 10 (VLAN0010)
Administrative Native VLAN tagging: enabled
Voice VLAN: none
Administrative private-vlan host-association: none
Administrative private-vlan mapping: none
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk Native VLAN tagging: enabled
Administrative private-vlan trunk encapsulation: dot1q
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk associations: none
Administrative private-vlan trunk mappings: none
Operational private-vlan: none
Trunking VLANs Enabled: 11-20
```

## show interfaces switchport

```

Pruning VLANs Enabled: 2-1001
Capture Mode Disabled
Capture VLANs Allowed: ALL

Protected: false
Unknown unicast blocked: disabled
Unknown multicast blocked: disabled
Appliance trust: none

```

| Trunking Native Mode VLAN<br>Trunking VLANs Enabled<br>Trunking VLANs Active                           | Lists the VLAN ID of the trunk that is in native mode. Lists the allowed VLANs on the trunk. Lists the active VLANs on the trunk. |
| Pruning VLANs Enabled                                                                                  | Lists the VLANs that are pruning-eligible.                                                                                        |
| Protected                                                                                              | Displays whether or not protected port is enabled (True) or disabled (False) on the interface.                                    |
| Unknown unicast blocked<br>Unknown multicast blocked                                                   | Displays whether or not unknown multicast and unknown unicast traffic is blocked on the interface.                                |
| Voice VLAN                                                                                             | Displays the VLAN ID on which voice VLAN is enabled.                                                                              |
| Appliance trust                                                                                        | Displays the class of service (CoS) setting of the data packets of the IP phone.                                                  |

# show interfaces transceiver

To display the physical properties of a small form-factor pluggable (SFP) module interface, use the **show interfaces transceiver** command in EXEC mode.

**show interfaces** [*interface-id*] **transceiver** [{**detail** | **module number** | **properties** | **supported-list** | **threshold-table**}]

| Syntax Description     |                                                                                                                                                                                                      |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>interface-id</i>    | (Optional) ID of the physical interface, including type, stack member (stacking-capable switches only) module, and port number.                                                                      |
| <b>detail</b>          | (Optional) Displays calibration properties, including high and low numbers and any alarm information for any Digital Optical Monitoring (DoM)-capable transceiver if one is installed in the switch. |
| <b>module number</b>   | (Optional) Limits display to interfaces on module on the switch.<br>This option is not available if you entered a specific interface ID.                                                             |
| <b>properties</b>      | (Optional) Displays speed, duplex, and inline power settings on an interface.                                                                                                                        |
| <b>supported-list</b>  | (Optional) Lists all supported transceivers.                                                                                                                                                         |
| <b>threshold-table</b> | (Optional) Displays alarm and warning threshold table.                                                                                                                                               |

| Command Modes | User EXEC (>)<br>Privileged EXEC (#) |
|---------------|--------------------------------------|
|---------------|--------------------------------------|

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

This is an example of output from the **show interfaces interface-id transceiver properties** command:

```
Device# show interfaces transceiver
```

```
If device is externally calibrated, only calibrated values are printed.
++ : high alarm, + : high warning, - : low warning, -- : low alarm.
NA or N/A: not applicable, Tx: transmit, Rx: receive.
mA: milliamperes, dBm: decibels (milliwatts).
```

| Port    | Temperature<br>(Celsius) | Voltage<br>(Volts) | Current<br>(mA) | Optical<br>Tx Power<br>(dBm) | Optical<br>Rx Power<br>(dBm) |
|---------|--------------------------|--------------------|-----------------|------------------------------|------------------------------|
| Gi5/1/2 | 42.9                     | 3.28               | 22.1            | -5.4                         | -8.1                         |
| Te5/1/3 | 32.0                     | 3.28               | 19.8            | 2.4                          | -4.2                         |

```
Device# show interfaces gigabitethernet1/1/1 transceiver properties
Name : Gi1/1/1
Administrative Speed: auto
```

## show interfaces transceiver

```

Operational Speed: auto
Administrative Duplex: auto
Administrative Power Inline: enable
Operational Duplex: auto
Administrative Auto-MDIX: off
Operational Auto-MDIX: off

```

This is an example of output from the **show interfaces interface-id transceiver detail** command:

Device# **show interfaces gigabitethernet1/1/1 transceiver detail**

```

ITU Channel not available (Wavelength not available),
Transceiver is internally calibrated.
mA:milliamperes, dBm:decibels (milliwatts), N/A:not applicable.
++:high alarm, +:high warning, -:low warning, -- :low alarm.
A2D readouts (if they differ), are reported in parentheses.
The threshold values are uncalibrated.

```

| <b>fru</b>    | (Optional) Retrieves information about all Field Replaceable Units (FRUs) installed in the Cisco networking device.                                                                                                                                                                            |
| <b>oid</b>    | (Optional) Retrieves information about the vendor specific hardware registration identifier referred to as object identifier (OID).<br><br>The OID identifies the MIB object's location in the MIB hierarchy, and provides a means of accessing the MIB object in a network of managed devices |
| <b>raw</b>    | (Optional) Retrieves information about all Cisco products referred to as entities installed in the Cisco networking device, even if the entities do not have a product ID (PID) value, a unique device identifier (UDI), or other physical identification.                                     |
| <i>entity</i> | (Optional) Name of a Cisco entity (for example, chassis, backplane, module, or slot). A quoted string may be used to display very specific UDI information; for example "sfslot 1" will display the UDI information for slot 1 of an entity named sfslot.                                      |

## Command Modes

Privileged EXEC (#)

## Command History

| Release                     | Modification                                                            |
|-----------------------------|-------------------------------------------------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced.                                            |
| Cisco IOS XE Everest 16.6.3 | This command was enhanced to display the serial number for the chassis. |

## Usage Guidelines

The **show inventory** command retrieves and displays inventory information about each Cisco product in the form of a UDI. The UDI is a combination of three separate data elements: a product identifier (PID), a version identifier (VID), and the serial number (SN).

The PID is the name by which the product can be ordered; it has been historically called the "Product Name" or "Part Number." This is the identifier that one would use to order an exact replacement part.

The VID is the version of the product. Whenever a product has been revised, the VID will be incremented. The VID is incremented according to a rigorous process derived from Telcordia GR-209-CORE, an industry guideline that governs product change notices.

The SN is the vendor-unique serialization of the product. Each manufactured product will carry a unique serial number assigned at the factory, which cannot be changed in the field. This is the means by which to identify an individual, specific instance of a product.

The UDI refers to each product as an entity. Some entities, such as a chassis, will have subentities like slots. Each entity will display on a separate line in a logically ordered presentation that is arranged hierarchically by Cisco entities.

Use the **show inventory** command without options to display a list of Cisco entities installed in the networking device that are assigned a PID.

The following is sample output from the **show inventory** command:

```
Device#show inventory
NAME: "c93xx Stack", DESCR: "c93xx Stack"
PID: C9300-48UXM      , VID: P2B  , SN: FCW2117G00C

NAME: "Switch 2", DESCR: "C9300-48UXM"
PID: C9300-48UXM      , VID: P2B  , SN: FCW2117G00C

NAME: "Switch 2 - Power Supply A", DESCR: "Switch 2 - Power Supply A"
PID: PWR-C1-1100WAC   , VID: V02  , SN: LIT211227NZ

NAME: "Switch 2 FRU Uplink Module 1", DESCR: "8x10G Uplink Module"
PID: C3850-NM-8-10G   , VID: V01  , SN: FOC20153M58

NAME: "Te2/1/1", DESCR: "SFP-10GBase-CX1"
PID: SFP-H10GB-CU2M    , VID: V02  , SN: TED2132H0SU

NAME: "Te2/1/3", DESCR: "SFP-10GBase-CX1"
PID: SFP-H10GB-CU2M    , VID: V02  , SN: TED2132H0A8

NAME: "Te2/1/5", DESCR: "SFP-10GBase-CX1"
PID: SFP-H10GB-CU2M    , VID: V02  , SN: TED2132H1G8

NAME: "usbflash1", DESCR: "usbflash1"
PID: SSD-120G          , VID: STP21460FNA, SN: V01
```

**Table 13: show inventory Field Descriptions**

| Field | Description                                                                                                                                                                                                        |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME  | Physical name (text string) assigned to the Cisco entity. For example, console or a simple component number (port or module number), such as “1,” depending on the physical component naming syntax of the device. |
| DESCR | Physical description of the Cisco entity that characterizes the object. The physical description includes the hardware serial number and the hardware revision.                                                    |
| PID   | Entity product identifier. Equivalent to the entPhysicalModelName MIB variable in RFC 2737.                                                                                                                        |
| VID   | Entity version identifier. Equivalent to the entPhysicalHardwareRev MIB variable in RFC 2737.                                                                                                                      |
| SN    | Entity serial number. Equivalent to the entPhysicalSerialNum MIB variable in RFC 2737.                                                                                                                             |

For diagnostic purposes, the **show inventory** command can be used with the **raw** keyword to display every RFC 2737 entity including those without a PID, UDI, or other physical identification.

**Note**

The **raw** keyword option is primarily intended for troubleshooting problems with the **show inventory** command itself.

Enter the **show inventory** command with an *entity* argument value to display the UDI information for a specific type of Cisco entity installed in the networking device. In this example, a list of Cisco entities that match the sfslot argument string is displayed.

```
Device#show inventory "c93xx Stack"
NAME: "c93xx Stack", DESCR: "c93xx Stack"
PID: C9300-48UXM      , VID: P2B  , SN: FCW2117G00C

NAME: "Switch 2", DESCR: "C9300-48UXM"
PID: C9300-48UXM      , VID: P2B  , SN: FCW2117G00C

NAME: "Switch 2 - Power Supply A", DESCR: "Switch 2 - Power Supply A"
PID: PWR-C1-1100WAC   , VID: V02  , SN: LIT211227NZ

NAME: "Switch 2 FRU Uplink Module 1", DESCR: "8x10G Uplink Module"
PID: C3850-NM-8-10G   , VID: V01  , SN: FOC20153M58

NAME: "Te2/1/1", DESCR: "SFP-10GBase-CX1"
PID: SFP-H10GB-CU2M   , VID: V02  , SN: TED2132H0SU

NAME: "Te2/1/3", DESCR: "SFP-10GBase-CX1"
PID: SFP-H10GB-CU2M   , VID: V02  , SN: TED2132H0A8

NAME: "Te2/1/5", DESCR: "SFP-10GBase-CX1"
PID: SFP-H10GB-CU2M   , VID: V02  , SN: TED2132H1G8

NAME: "usbflash1", DESCR: "usbflash1"
PID: SSD-120G         , VID: STP21460FNA, SN: V01
```

You can request even more specific UDI information with the *entity* argument value enclosed in quotation marks.

# show macro auto

To display Auto Smartports macro information, use the **show macro auto** command in user EXEC mode.

```
show macro auto {address-group address-group-name | device [access-point] [ip-camera]
[lightweight-ap] [media-player] [phone] [router] [switch] | global [event_trigger] | interface
[interface_id]}
```

|                    |                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|---------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | address-group [address-group-name]                                                          | Displays address-group information.<br><br>(Optional) <i>address-group-name</i> —Displays information for the specified address group.                                                                                                                                                                                                                                                                                                                                                                                                     |

| Command History    | Release                                                                                     | Modification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                    | Cisco IOS XE Everest 16.5.1a                                                                | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Usage Guidelines

Use this command to display the Auto SmartPorts information for the switch. Use the **show macro auto device** command to display the configurable parameters for a device.

## Example

This example shows how to use the **show macro auto device** to view the configuration on the switch:

```
Device# show macro auto device
Device:lightweight-ap
Default Macro:CISCO_LWAP_AUTO_SMARTPORT
Current Macro:CISCO_LWAP_AUTO_SMARTPORT
Configurable Parameters:ACCESS_VLAN
Defaults Parameters:ACCESS_VLAN=1
Current Parameters:ACCESS_VLAN=1

Device:access-point
Default Macro:CISCO_AP_AUTO_SMARTPORT
Current Macro:CISCO_AP_AUTO_SMARTPORT
Configurable Parameters:NATIVE_VLAN
Defaults Parameters:NATIVE_VLAN=1
Current Parameters:NATIVE_VLAN=1

Device:phone
Default Macro:CISCO_PHONE_AUTO_SMARTPORT
Current Macro:CISCO_PHONE_AUTO_SMARTPORT
Configurable Parameters:ACCESS_VLAN VOICE_VLAN
Defaults Parameters:ACCESS_VLAN=1 VOICE_VLAN=2
Current Parameters:ACCESS_VLAN=1 VOICE_VLAN=2

Device:router
Default Macro:CISCO_ROUTER_AUTO_SMARTPORT
Current Macro:CISCO_ROUTER_AUTO_SMARTPORT
Configurable Parameters:NATIVE_VLAN
Defaults Parameters:NATIVE_VLAN=1
Current Parameters:NATIVE_VLAN=1

Device:switch
Default Macro:CISCO_SWITCH_AUTO_SMARTPORT
Current Macro:CISCO_SWITCH_AUTO_SMARTPORT
Configurable Parameters:NATIVE_VLAN
Defaults Parameters:NATIVE_VLAN=1
Current Parameters:NATIVE_VLAN=1

Device:ip-camera
Default Macro:CISCO_IP_CAMERA_AUTO_SMARTPORT
Current Macro:CISCO_IP_CAMERA_AUTO_SMARTPORT
Configurable Parameters:ACCESS_VLAN
Defaults Parameters:ACCESS_VLAN=1
Current Parameters:ACCESS_VLAN=1

Device:media-player
Default Macro:CISCO_DMP_AUTO_SMARTPORT
Current Macro:CISCO_DMP_AUTO_SMARTPORT
Configurable Parameters:ACCESS_VLAN
Defaults Parameters:ACCESS_VLAN=1
Current Parameters:ACCESS_VLAN=1
```

This example shows how to use the **show macro auto address-group name** command to view the TEST3 address group configuration on the switch:

```
Device# show macro auto address-group TEST3MAC Address Group Configuration:
```

show macro auto

| Group   | Name    | OUI | MAC ADDRESS    |
|---------|---------|-----|----------------|
| -----   |         |     |                |
| TEST3   | 2233.33 |     | 0022.0022.0022 |
| 2233.34 |         |     |                |

# show memory platform

To display memory statistics of a platform, use the **show memory platform** command in privileged EXEC mode.

**show memory platform** [{**compressed-swap** | **information** | **page-merging**}]

|                           |                                                                                         |
|---------------------------|-----------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>compressed-swap</b> (Optional) Displays platform memory compressed-swap information. |
|                           | <b>information</b> (Optional) Displays general information about the platform.          |
|                           | <b>page-merging</b> (Optional) Displays platform memory page-merging information.       |

**Command Modes** Privileged EXEC (#)

| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|------------------------|------------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Free memory is accurately computed and displayed in the Free Memory field of the command output.

## Examples

The following is sample output from the **show memory platform** command:

```
Switch# show memory platform

  Interface:
    none
Network Policy Profile 30
  voice vlan 30 cos 5
  Interface:
    none
Network Policy Profile 36
  voice vlan 4 cos 3
  Interface:
    Interface_id
  
```

# show parser macro

To display the parameters for all configured macros or for one macro on the switch, use the **show parser macro** command in user EXEC mode.

**show parser macro** {**brief** | **description** [**interface** *interface-id*] | **name** *macro-name*}

|                    |                                                             |                                                                                        |
|--------------------|-------------------------------------------------------------|----------------------------------------------------------------------------------------|
| Syntax Description | <b>brief</b>                                                | (Optional) Displays the name of each macro.                                            |
|                    | <b>description</b> [ <b>interface</b> <i>interface-id</i> ] | (Optional) Displays all macro descriptions or the description of a specific interface. |
|                    | <b>name</b> <i>macro-name</i>                               | (Optional) Displays information about a single macro identified by the macro name.     |
| Command Modes      | User EXEC (>)                                               |                                                                                        |
|                    | Privileged EXEC (#)                                         |                                                                                        |
| Command History    | <b>Release</b>                                              | <b>Modification</b>                                                                    |
|                    | Cisco IOS XE Everest 16.5.1a                                | This command was introduced.                                                           |

## Example

This is a partial output example from the **show parser macro** command. The output for the Cisco-default macros varies depending on the switch platform and the software image running on the switch:

```

Device# show parser macro
Total number of macros = 6
-----
Macro name : cisco-global
Macro type : default global
# Enable dynamic port error recovery for link state
# failures
errdisable recovery cause link-flap
errdisable recovery interval 60

<output truncated>

-----
Macro name : cisco-desktop
Macro type : default interface
# macro keywords $AVID
# Basic interface - Enable data VLAN only
# Recommended value for access vlan (AVID) should not be 1
switchport access vlan $AVID
switchport mode access

<output truncated>

-----
Macro name : cisco-phone

```

```
Macro type : default interface
# Cisco IP phone + desktop template
# macro keywords $AVID $VVID
# VoIP enabled interface - Enable data VLAN
# and voice VLAN (VVID)
# Recommended value for access vlan (AVID) should not be 1
switchport access vlan $AVID
switchport mode access
```

<output truncated>

```
-----
Macro name : cisco-switch
Macro type : default interface
# macro keywords $NVID
# Access Uplink to Distribution
# Do not apply to EtherChannel/Port Group
# Define unique Native VLAN on trunk ports
# Recommended value for native vlan (NVID) should not be 1
switchport trunk native vlan $NVID
```

<output truncated>

```
-----
Macro name : cisco-router
Macro type : default interface
# macro keywords $NVID
# Access Uplink to Distribution
# Define unique Native VLAN on trunk ports
# Recommended value for native vlan (NVID) should not be 1
switchport trunk native vlan $NVID
```

<output truncated>

```
-----
Macro name : snmp
Macro type : customizable

#enable port security, linkup, and linkdown traps
snmp-server enable traps port-security
snmp-server enable traps linkup
snmp-server enable traps linkdown
#set snmp-server host
snmp-server host ADDRESS
#set SNMP trap notifications precedence
snmp-server ip precedence VALUE
```

This example shows the output from the **show parser macro name** command:

```
Device# show parser macro name standard-switch10
Macro name : standard-switch10
Macro type : customizable
macro description standard-switch10
# Trust QoS settings on VOIP packets
auto qos voip trust
# Allow port channels to be automatically formed
channel-protocol pagp
```

This example shows the output from the **show parser macro brief** command:

```
Device# show parser macro brief
  default global      : cisco-global
  default interface: cisco-desktop
  default interface: cisco-phone
  default interface: cisco-switch
  default interface: cisco-router
  customizable       : snmp
```

This example shows the output from the **show parser macro description** command:

```
Device# show parser macro description
Global Macro(s): cisco-global
Interface      Macro Description(s)
-----
Gig1/0/1       standard-switch10
Gig1/0/2       this is test macro
-----
```

This example shows the output from the **show parser macro description interface** command:

```
Device# show parser macro description interface gigabitethernet1/0/2
Interface      Macro Description
-----
Gig1/0/2       this is test macro
-----
```

# show platform hardware bluetooth

To display information about Bluetooth interface, use the **show platform hardware bluetooth** command in privileged EXEC mode.

## show platform hardware bluetooth

### Command Default

None

### Command Modes

Privileged EXEC (#)

### Command History

| Release                        | Modification                 |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.12.1 | This command was introduced. |

### Usage Guidelines

The **show platform hardware bluetooth** command is to be used when an external USB Bluetooth dongle is connected on the device.

### Examples

This example shows how to display the information of the Bluetooth interface using the **show platform hardware bluetooth** command.

```
Device> enable
Device# show platform hardware bluetooth
Controller: 0:1a:7d:da:71:13
Type: Primary
Bus: USB
State: DOWN
Name:
HCI Version:
```

# show platform hardware fed switch forward

To display device-specific hardware information, use the **show platform hardware fed switch** *switch\_number* command.

This topic elaborates only the forwarding-specific options, that is, the options available with the **show platform hardware fed switch** {*switch\_num* | **active** | **standby** } **forward summary** command.

The output of the **show platform hardware fed switch** *switch\_number* **forward summary** displays all the details about the forwarding decision taken for the packet.

**show platform hardware fed switch** {*switch\_num* | **active** | **standby**} **forward summary**

|                    |                                                                      |                                                                                                                                                                                                                                                                   |
|--------------------|----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>switch</b> { <i>switch_num</i>   <b>active</b>   <b>standby</b> } | The switch for which you want to display information. You have the following options :                                                                                                                                                                            |
|                    |                                                                      | <ul style="list-style-type: none"> <li>• <i>switch_num</i>—ID of the switch.</li> <li>• <b>active</b>—Displays information relating to the active switch.</li> <li>• <b>standby</b>—Displays information relating to the standby switch, if available.</li> </ul> |
|                    | <b>forward summary</b>                                               | Displays packet forwarding information.                                                                                                                                                                                                                           |
|                    | <b>Note</b>                                                          | Support for the keyword <b>summary</b> has been discontinued in the Cisco IOS XE Everest 16.6.1 release and later releases.                                                                                                                                       |

|                 | Cisco IOS XE Everest 16.5.1a                   | This command was introduced.                             |
|                 | Cisco IOS XE Everest 16.6.1 and later releases | Support for the keyword <b>summary</b> was discontinued. |

**Usage Guidelines** Do not use this command unless a technical support representative asks you to. Use this command only when you are working directly with a technical support representative while troubleshooting a problem.

Fields displayed in the command output are explained below.

- Station Index : The Station Index is the result of the layer 2 lookup and points to a station descriptor which provides the following:
  - Destination Index : Determines the egress port(s) to which the packets should be sent to. Global Port Number(GPN) can be used as the destination index. A destination index with 15 down to 12 bits set indicates the GPN to be used. For example, destination index - 0xF04E corresponds to GPN - 78 (0x4e).
  - Rewrite Index : Determines what needs to be done with the packets. For layer 2 switching, this is typically a bridging action

- Flexible Lookup Pipeline Stages(FPS) : Indicates the forwarding decision that was taken for the packet - routing or bridging
- Replication Bit Map : Determines if the packets should be sent to CPU or stack
  - Local Data Copy = 1
  - Remote Data copy = 0
  - Local CPU Copy = 0
  - Remote CPU Copy = 0

### Example

This is an example of output from the **show platform hardware fed switch** {*switch\_num* | **active** | **standby** } **forward summary** command.

```

# show platform hardware fed switch forward interface

To debug forwarding information and to trace the packet path in the hardware forwarding plane, use the **show platform hardware fed switch *switch\_number* forward interface** command. This command simulates a user-defined packet and retrieves the forwarding information from the hardware forwarding plane. A packet is generated on the ingress port based on the packet parameters that you have specified in this command. You can also provide a complete packet from the captured packets stored in a PCAP file.

This topic elaborates only the interface forwarding-specific options, that is, the options available with the **show platform hardware fed switch {*switch\_num* | **active** | **standby**} forward interface** command.

**show platform hardware fed switch** {*switch\_num* | **active** | **standby**} **forward interface** *interface-type interface-number* **source-mac-address** *destination-mac-address* {*protocol-number* | **arp** | **cos** | **ipv4** | **ipv6** | **mpls**}

**show platform hardware fed switch** {*switch\_num* | **active** | **standby**} **forward interface** *interface-type interface-number* **pcap** *pcap-file-name* **number** *packet-number* **data**

**show platform hardware fed switch** {*switch\_num* | **active** | **standby**} **forward interface** *interface-type interface-number* **vlan** *vlan-id* **source-mac-address** *destination-mac-address* {*protocol-number* | **arp** | **cos** | **ipv4** | **ipv6** | **mpls**}

## Syntax Description

|                                                                      |                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>switch</b> { <i>switch_num</i>   <b>active</b>   <b>standby</b> } | The switch on which packet tracing has to be scheduled. The input port should be available on this switch. You have the following options :                                                                                                                                                                              |
|                                                                      | <ul style="list-style-type: none"> <li>• <i>switch_num</i>—ID of the switch on which the ingress port is present.</li> <li>• <b>active</b>—indicates the active switch on which the the ingress port is present.</li> <li>• <b>standby</b>—indicates the standby switch on which the ingress port is present.</li> </ul> |
|                                                                      | <b>Note</b> This keyword is not supported.                                                                                                                                                                                                                                                                               |
| <b>interface</b> <i>interface-type interface-number</i>              | The input interface on which packet trace is simulated.                                                                                                                                                                                                                                                                  |
| <i>source-mac-address</i>                                            | The source MAC address of the packet you want to simulate.                                                                                                                                                                                                                                                               |
| <i>destination-mac-address</i>                                       | The MAC address of the destination interface in hexadecimal format.                                                                                                                                                                                                                                                      |
| <i>protocol-number</i>                                               | The number assigned to any L3 protocol.                                                                                                                                                                                                                                                                                  |
| <b>arp</b>                                                           | The Address Resolution Protocol (ARP) parameters.                                                                                                                                                                                                                                                                        |
| <b>ipv4</b>                                                          | The IPv4 packet parameters.                                                                                                                                                                                                                                                                                              |
| <b>ipv6</b>                                                          | The IPv6 packet parameters.                                                                                                                                                                                                                                                                                              |
| <b>mpls</b>                                                          | The Multiprotocol Label Switching (MPLS) label parameters.                                                                                                                                                                                                                                                               |

|                                    |                                                                                                     |
|------------------------------------|-----------------------------------------------------------------------------------------------------|
| <b>cos</b>                         | The class of service (CoS) number from 0 to 7 to set priority.                                      |
| <b>pcap</b> <i>pcap-file-name</i>  | Name of the pcap file in internal flash (flash:).<br>Ensure that the file already exists in flash:. |
| <b>number</b> <i>packet-number</i> | Specifies the packet number in the pcap file.                                                       |
| <b>vlan</b> <i>vlan-id</i>         | VLAN id of the dot1q header in the simulated packet. The range is 1 to 4096.                        |

|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Cisco IOS XE Everest 16.5.1a   | This command was introduced.                                                                                    |
| Cisco IOS XE Fuji 16.9.1       | The command was enhanced to support MPLS/ARP/VxLAN packet parameters and trace packets captured in a PCAP file. |
| Cisco IOS XE Gibraltar 16.10.1 | The command was enhanced to support data capture across a stack.                                                |

**Usage Guidelines**

Do not use this command unless a technical support representative asks you to. Use this command only when you are working directly with a technical support representative while troubleshooting a problem.

This command supports the following packet types:

- Non-IP packets with any L3 protocol
- ARP packets
- IPv4 packets with any L4 protocol
- IPv4 packets with TCP/UDP/IGMP/ICMP/SCTP payload
- VxLAN packets
- MPLS packets with up to 3 Labels and meta data
- MPLS packets with IPv4/IPv6 payload
- IPv6 packets with TCP/UDP/IGMP/ICMP/SCTP payload

In a stack environment, you can trace packets across the stack irrespective of the number of stack members and topology. The **show platform hardware fed switch** *switch-number* **forward interface** *interface-type interface-number* command consolidates packet-forwarding information of all the stack members on the ingress switch. To achieve this, ensure that the switch number specified in the *switch\_num* and *interface-number* arguments are of the input switch and that the number matches.

To trace any particular packet from the captured packets stored in a PCAP file, use the **show platform hardware fed switch forward interface** *interface-type interface-number* **pcap** *pcap-file-name* **number** *packet-number* **data** command.

### Example

This is an example of output from the **show platform hardware fed switch** { *switch\_num* | **active** | **standby** } **forward interface** command.

```
Device#show platform hardware fed switch active forward interface gigabitEthernet 1/0/35
0000.0022.0055 0000.0055.0066 ipv4 44.44.0.2 55.55.0.2 udp 1222 3333
```

Show forward is running in the background. After completion, syslog will be generated.

```
*Sep 24 05:57:36.614: %SHFWD-6-PACKET_TRACE_DONE: Switch 1 R0/0: fed: Packet Trace Complete:
  Execute (show platform hardware fed switch <> forward last summary|detail)
*Sep 24 05:57:36.614: %SHFWD-6-PACKET_TRACE_FLOW_ID: Switch 1 R0/0: fed: Packet Trace Flow
id is 150323855361
```

| Command                          | Description                                                                                                                                                                                                |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>monitor capture interface</b> | Configures monitor capture points specifying an attachment point and the packet flow direction.                                                                                                            |
| <b>monitor capture start</b>     | Starts the capture of packet data at a traffic trace point into a buffer.                                                                                                                                  |
| <b>monitor capture stop</b>      | Stops the capture of packet data at a traffic trace point.                                                                                                                                                 |
| <b>monitor capture export</b>    | Saves the captured packets in the buffer.<br><br>Use this command to export the monitor capture buffer to a pcap file in flash: that you can use as an input in the <b>show forward</b> with <b>pcap</b> . |

# show platform hardware fed switch forward last summary

To display a summary of packet tracing data from a switch or switches in a stack, use the **show platform hardware fed switch *switch\_number* forward last summary** command.

The output of the **show platform hardware fed switch *switch\_number* forward last summary** command displays all the details about the forwarding decision taken for the packet from the last time the **show forward** command was run.

**show platform hardware fed switch {*switch\_number* | active | standby} forward last summary**

|                    |                                                                         |                                                                                                                                                                                                                                                                                                                          |
|--------------------|-------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>switch</b> { <i>switch_number</i>   <b>active</b>   <b>standby</b> } | The switch on which you want to schedule a packet capture for a port. You have the following options :                                                                                                                                                                                                                   |
|                    |                                                                         | <ul style="list-style-type: none"> <li>• <i>switch_num</i>—ID of the switch on which the ingress port is present.</li> <li>• <b>active</b>—indicates the active switch on which the the ingress port is present.</li> <li>• <b>standby</b>—indicates the standby switch on which the ingress port is present.</li> </ul> |
|                    | <b>Note</b>                                                             | This keyword is not supported.                                                                                                                                                                                                                                                                                           |

|                             |                                         |
|-----------------------------|-----------------------------------------|
| <b>forward last summary</b> | Displays packet forwarding information. |
|-----------------------------|-----------------------------------------|

|                 | Cisco IOS XE Everest 16.5.1a                   | This command was introduced.                                                                                                            |
|                 | Cisco IOS XE Everest 16.6.1 and later releases | Support for the keyword <b>summary</b> was discontinued.                                                                                |
|                 | Cisco IOS XE Fuji 16.9.1                       | Support for keywords <b>last</b> and <b>summary</b> is introduced.                                                                      |
|                 | Cisco IOS XE Gibraltar 16.10.1                 | The output of the command was enhanced to display the details about all the copies of the packets and the corresponding outgoing ports. |

**Usage Guidelines**

Do not use this command unless a technical support representative asks you to. Use this command only when you are working directly with a technical support representative while troubleshooting a problem.

With Cisco IOS XE Gibraltar 16.10.1, **show platform hardware fed switch forward last summary** command is enhanced to:

- Inject the debug packets from the CPU to simulate the incoming port and packets

- ### Example

[illegible]

show platform hardware fed switch forward last summary

```

        Local Port Number      : 22
        Asic Port Number       : 21
        Asic Instance          : 0
        Unique RI               : 2
        Rewrite Type            : 1          [L2_BRIDGE]
        Mapped Rewrite Type     : 1          [L2_BRIDGE]
        Vlan                    : 20
        Mapped Vlan ID          : 6
    Port : GigabitEthernet2/0/1
        Global Port Number      : 97
        Local Port Number       : 1
        Asic Port Number        : 0
        Asic Instance           : 1
        Unique RI               : 2
        Rewrite Type            : 1          [L2_BRIDGE]
        Mapped Rewrite Type     : 1          [L2_BRIDGE]
        Vlan                    : 20
        Mapped Vlan ID          : 6

# show platform hardware fed switch fwd-asic counters tla

To display the register information of a counter from the forwarding ASIC, use the **show platform hardware fed switch fwd-asic counters tla** command in the Privileged EXEC mode.

**show platform hardware fed switch** {*switch\_num* | **active** | **standby**} **fwd-asic counters tla**  
*tla\_counter*{**detail** | **drop** | **statistics**} [**asic** *asic\_num*] **output** *location:filename*

---

## Syntax Description

|                                                                      |                                                                                        |
|----------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>switch</b> { <i>switch_num</i>   <b>active</b>   <b>standby</b> } | The switch for which you want to display information. You have the following options : |
| }                                                                    |                                                                                        |

- *switch\_num*: ID of the switch.
- **active**: Displays information relating to the active switch.
- **standby**: Displays information relating to the standby switch, if available.

---

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Release                       | Modification                                                                                                                                                                                                             |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cisco IOS XE Everest 16.5.1a  | This command was introduced.                                                                                                                                                                                             |
| Cisco IOS XE Amsterdam 17.3.1 | The command output was modified to be presented in a readable tabular format. The size of the output file was also reduced by not printing fields that had zero values.<br><br>The <b>change</b> keyword was deprecated. |

**Usage Guidelines**

Do not use this command unless a technical support representative asks you to. Use this command only when you are working directly with a technical support representative while troubleshooting a problem.

**Note**

Some TLAs may not have any registers to display as part of **drop** or **statistics** options because of the lack of these drop or statistics registers for them. In such a case, a message, `No <detail|drop|statistics> counters to display for tla <TLA_NAME>` is displayed and no output file is generated.

**Example**

This is an example output from the **show platform hardware fed active fwd-asic counters tla aqm** command.

```
Device#show platform hardware fed active fwd-asic counters tla aqm detail output flash:aqm
command to get counters for tla AQM succeeded
Device#
Device# more flash:aqm
```

|-------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The output of this command displays the used memory, which is total memory minus the accurate free memory. |
|-------------------------|------------------------------------------------------------------------------------------------------------|

## Example

The following is sample output from the **show platform resources** command:

```
Switch# show platform resources
```

```
**State Acronym: H - Healthy, W - Warning, C - Critical
```

| Resource<br>State      | Usage        | Max    | Warning | Critical |
|------------------------|--------------|--------|---------|----------|
| Control Processor<br>H | 7.20%        | 100%   | 90%     | 95%      |
| DRAM<br>H              | 2701MB (69%) | 3883MB | 90%     | 95%      |

# show platform software audit

To display the SE Linux Audit logs, use the **show platform software audit** command in privileged EXEC mode.

**show platform software audit** {all | summary | [switch {switch-number | active | standby}] {0 | F0 | R0 | {FP | RP} {active}}}

| Syntax Description   |  |                                                                     |
|----------------------|--|---------------------------------------------------------------------|
| <b>all</b>           |  | Shows the audit log from all the slots.                             |
| <b>summary</b>       |  | Shows the audit log summary count from all the slots.               |
| <b>switch</b>        |  | Shows the audit logs for a slot on a specific switch.               |
| <i>switch-number</i> |  | Selects the switch with the specified switch number.                |
| <b>switch active</b> |  | Selects the active instance of the switch.                          |
| <b>standby</b>       |  | Selects the standby instance of the switch.                         |
| <b>0</b>             |  | Shows the audit log for the SPA-Inter-Processor slot 0.             |
| <b>F0</b>            |  | Shows the audit log for the Embedded-Service-Processor slot 0.      |
| <b>R0</b>            |  | Shows the audit log for the Route-Processor slot 0.                 |
| <b>FP active</b>     |  | Shows the audit log for the active Embedded-Service-Processor slot. |
| <b>RP active</b>     |  | Shows the audit log for the active Route-Processor slot.            |

**Command Modes** Privileged EXEC (#)

| Command History | Release                        | Modification                 |
|-----------------|--------------------------------|------------------------------|
|                 | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |

**Usage Guidelines** This command was introduced in the Cisco IOS XE Gibraltar 16.10.1 as a part of the SELinux Permissive Mode feature. The **show platform software audit** command displays the system logs containing the access violation events.

In Cisco IOS XE Gibraltar 16.10.1, operation in a permissive mode is available - with the intent of confining specific components (process or application) of the IOS-XE platform. In the permissive mode, access violation events are detected and system logs are generated, but the event or operation itself is not blocked. The solution operates mainly in an access violation detection mode.

The following is a sample output of the **show software platform software audit summary** command:

```
Device# show platform software audit summary
```

```
=====
AUDIT LOG ON switch 1
-----
AVC Denial count: 58
=====
```

The following is a sample output of the **show software platform software audit all** command:

```
Device# show platform software audit all
```

```

The table below describes the significant fields shown in the display.

**Table 15: show platform software fed switch active punt cpuq rates Field Descriptions**

| Field      | Description                                                                           |
|------------|---------------------------------------------------------------------------------------|
| Queue Name | Name of the queue.                                                                    |
| Rx         | The rate at which the packets are received per second in 10s, 1 minute and 5 minutes. |
| Drop       | The rate at which the packets are dropped per second in 10s, 1 minute and 5 minutes.  |

# show platform software fed switch punt packet-capture display

To display packet capture information during high CPU utilization, use the **show platform software fed switch active punt packet-capture display** command in privileged EXEC mode.

**show platform software fed switch active punt packet-capture display { detailed | hexdump }**

|                    |                                                                         |                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|-------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>switch</b> { <i>switch-number</i>   <b>active</b>   <b>standby</b> } | Displays information about a switch. You have the following options: <ul style="list-style-type: none"> <li><b>active</b>—Displays information relating to the active switch.</li> <li><b>standby</b>—Displays information relating to the standby switch, if available.</li> </ul> <p><b>Note</b> The <b>standby</b> keyword is not supported.</p> |
|                    | <b>punt</b>                                                             | Specifies punt information.                                                                                                                                                                                                                                                                                                                         |
|                    | <b>packet-capture display</b>                                           | Specifies information about the captured packet.                                                                                                                                                                                                                                                                                                    |
|                    | <b>detailed</b>                                                         | Specifies detailed information about the captured packet.                                                                                                                                                                                                                                                                                           |
|                    | <b>hex-dump</b>                                                         | Specifies information about the captured packet, in hex format.                                                                                                                                                                                                                                                                                     |

# show platform software fed switch punt rates interfaces

To display the overall statistics of punt rate for all the interfaces, use the **show platform software fed switch punt rates interfaces** command in privileged EXEC mode.

```
show platform software fed switch {switch-number | active | standby} punt rates
interfaces[interface-id]
```

|                    |                                          |                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | switch{switch-number   active   standby} | Displays information about the switch. You have the following options: <ul style="list-style-type: none"> <li>switch-number.</li> <li>active —Displays information relating to the active switch.</li> <li>standby—Displays information relating to the standby switch, if available.</li> </ul> <p><b>Note</b> This keyword is not supported.</p> |
|                    | punt                                     | Specifies the punt informtion.                                                                                                                                                                                                                                                                                                                     |
|                    | rates                                    | Specifies the rate at which the packets are punted.                                                                                                                                                                                                                                                                                                |
|                    | interfaces[interface-id]                 | (Optional) Displays the overall statistics for an interface and also the per-queue configuration for the interface at an interval of 10 seconds.                                                                                                                                                                                                   |

Command Modes Privileged EXEC (#)

| Command History | Release                        | Modification                 |
|-----------------|--------------------------------|------------------------------|
|                 | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |

Usage Guidelines The output displays the punt rates in packets per second at intervals of 10 seconds, 1 minute and 5 minutes.

## Example

The following is sample output from the **show platform software fed switch active punt rates interfaces** command for all the interfaces.

```
Device#show plataform software fed switch active punt rates interfaces

Punt Rate on Interfaces Statistics

Packets per second averaged over 10 seconds, 1 min and 5 mins

=====

Interface Name          | IF_ID | Rx  | Rx  | Rx  | Drop | Drop | Drop
                        |       | 10s | 1min | 5min | 10s  | 1min | 5min
```

```
=====
Vlan3                                0x00000034    1000    1000    520        0        0        0
-----
```

The table below describes the significant fields shown in the display.

**Table 16: show platform software fed switch active punt rates interfaces Field Descriptions**

| Field          | Description                                                                           |
|----------------|---------------------------------------------------------------------------------------|
| Interface Name | Name of the physical interface.                                                       |
| IF_ID          | ID of the physical interface.                                                         |
| Rx             | The per second rate at which the packets are received in 10s, 1 minute and 5 minutes. |
| Drop           | The per second rate at which the packets are dropped in 10s, 1 minute and 5 minutes.  |

The following is sample output from the **show platform software fed switch active punt rates interfaces interface-id** command for a specific interface.

```
Device#show platform software fed switch active punt rates interfaces 0x31
Punt Rate on Single Interfaces Statistics
```

```
Interface : Port-channel1 [if_id: 0x31]
```

```

Received                               Dropped

The table below describes the significant fields shown in the display.

**Table 17: show platform software fed switch punt rates interfaces interface-id Field Descriptions**

| Field      | Description                                        |
|------------|----------------------------------------------------|
| Queue Name | Name of the queue.                                 |
| Recv Total | Total number of packets received.                  |
| Recv Rate  | Per second rate at which the packets are received. |
| Drop Total | Total number of packets dropped.                   |
| Drop Rate  | Per second rate at which the packets are dropped.  |

# show platform software ilpower

To display the inline power details of all the PoE ports on the device, use the **show platform software ilpower** command in privileged EXEC mode.

**show platform software ilpower** { **details** | **port** { *GigabitEthernet interface-number* } | **system** *slot-number* }

|                           |                                                |                                                                 |
|---------------------------|------------------------------------------------|-----------------------------------------------------------------|
| <b>Syntax Description</b> | <b>details</b>                                 | Displays inline power details for all the interfaces.           |
|                           | <b>port</b>                                    | Displays inline power port configuration.                       |
|                           | <b>GigabitEthernet</b> <i>interface-number</i> | The GigabitEthernet interface number. Values range from 0 to 9. |
|                           | <b>system</b> <i>slot-number</i>               | Displays inline power system configuration.                     |

|                           | Cisco IOS XE Everest 16.5.1a                   | The command was introduced.                                     |

## Examples

The following is sample output from the **show platform software ilpower details** command:

```
Device# show platform software ilpower details
ILP Port Configuration for interface Gi1/0/1
  Initialization Done:    Yes
  ILP Supported:         Yes
  ILP Enabled:           Yes
  POST:                  Yes
  Detect On:              No
  Powered Device Detected                No
  Powered Device Class Done              No
  Cisco Powered Device:                  No
  Power is On:                          No
  Power Denied:                         No
  Powered Device Type:                   Null
  Powerd Device Class:                   Null
  Power State:                          NULL
  Current State:                        NGWC_ILP_DETECTING_S
  Previous State:                       NGWC_ILP_SHUT_OFF_S
  Requested Power in milli watts:        0
  Short Circuit Detected:                 0
  Short Circuit Count:                   0
  Cisco Powerd Device Detect Count: 0
  Spare Pair mode:                       0
    IEEE Detect:                         Stopped
    IEEE Short:                         Stopped
    Link Down:                          Stopped
  Voltage sense:                        Stopped
  Spare Pair Architecture:                1
  Signal Pair Power allocation in milli watts: 0
  Spare Pair Power On:                   0
  Powered Device power state:             0
  Timer:
```

```
Power Good:          Stopped
Power Denied:        Stopped
Cisco Powered Device Detect:  Stopped
```

# show platform software memory

To display memory information for a specified switch, use the **show platform software memory** command in privileged EXEC mode.

**show platform software memory** [{**chunk** | **database** | **messaging**}] *process slot*

| Syntax Description        |                  |                                                                             |
|---------------------------|------------------|-----------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>chunk</b>     | (Optional) Displays chunk memory information for the specified process.     |
|                           | <b>database</b>  | (Optional) Displays database memory information for the specified process.  |

*process*

---

Level that is being set. Options include:

- **bt-logger**—The Binary-Tracing Logger process.
- **btrace-manager**—The Btrace Manager process.
- **chassis-manager**—The Chassis Manager process.
- **cli-agent**—The CLI Agent process.
- **cmm**—The CMM process.
- **dbm**—The Database Manager process.
- **dmiauthd**—The DMI Authentication Daemon process.
- **emd**—The Environmental Monitoring process.
- **fed**—The Forwarding Engine Driver process.
- **forwarding-manager**—The Forwarding Manager process.
- **geo**—The Geo Manager process.
- **gnmi**—The GNMI process.
- **host-manager**—The Host Manager process.
- **interface-manager**—The Interface Manager process.
- **iomd**—The Input/Output Module daemon (IOMd) process.
- **ios**—The IOS process.
- **iox-manager**—The IOx Manager process.
- **license-manager**—The License Manager process.
- **logger**—The Logging Manager process.
- **mdt-pubd**—The Model Defined Telemetry Publisher process.
- **ndbman**—The Netconf DataBase Manager process.
- **nesd**—The Network Element Synchronizer Daemon process.
- **nginx**—The Nginx Webserver process.
- **nif\_mgr**—The NIF Manager process.
- **platform-mgr**—The Platform Manager process.
- **pluggable-services**—The Pluggable Services process.
- **replication-mgr**—The Replication Manager process.
- **shell-manager**—The Shell Manager process.
- **sif**—The Stack Interface (SIF) Manager process.
- **smd**—The Session Manager process.
- **stack-mgr**—The Stack Manager process.

- **syncfd**—The SyncmDaemon process.
- **table-manager**—The Table Manager Server.
- **thread-test**—The Multithread Manager process.
- **virt-manager**—The Virtualization Manager process.

The following table describes the significant fields shown in the display.

**Table 18: show platform software memory brief Field Descriptions**

| Field     | Description                                   |
|-----------|-----------------------------------------------|
| module    | Name of submodule.                            |
| allocated | Memory, allocated in bytes.                   |
| requested | Number of bytes requested by application.     |
| allocs    | Number of discrete allocation event attempts. |
| frees     | Number of free events.                        |

# show platform software process list

To display the list of running processes on a platform, use the **show platform software process list** command in privileged EXEC mode.

**show platform software process list switch** {*switch-number* | **active** | **standby**} {**0** | **F0** | **R0**} [**{name** *process-name* | **process-id** *process-ID* | **sort** **memory** | **summary**}]

| Syntax Description                  |                                                                                                        |
|-------------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>switch</b> <i>switch-number</i>  | Displays information about the switch. Valid values for <i>switch-number</i> argument are from 0 to 9. |
| <b>active</b>                       | Displays information about the active instance of the switch.                                          |
| <b>standby</b>                      | Displays information about the standby instance of the switch.                                         |
| <b>0</b>                            | Displays information about the shared port adapters (SPA) Interface Processor slot 0.                  |
| <b>F0</b>                           | Displays information about the Embedded Service Processor (ESP) slot 0.                                |
| <b>R0</b>                           | Displays information about the Route Processor (RP) slot 0.                                            |
| <b>name</b> <i>process-name</i>     | (Optional) Displays information about the specified process. Enter the process name.                   |
| <b>process-id</b> <i>process-ID</i> | (Optional) Displays information about the specified process ID. Enter the process ID.                  |
| <b>sort</b>                         | (Optional) Displays information sorted according to processes.                                         |
| <b>memory</b>                       | (Optional) Displays information sorted according to memory.                                            |
| <b>summary</b>                      | (Optional) Displays a summary of the process memory of the host device.                                |

The table below describes the significant fields shown in the displays.

**Table 19: show platform software process list Field Descriptions**

| Field    | Description                                                                                                                     |
|----------|---------------------------------------------------------------------------------------------------------------------------------|
| Name     | Displays the command name associated with the process. Different threads in the same process may have different command values. |
| Pid      | Displays the process ID that is used by the operating system to identify and keep track of the processes.                       |
| PPid     | Displays process ID of the parent process.                                                                                      |
| Group Id | Displays the group ID                                                                                                           |

| Field    | Description                                                                                                                                                                                                                                        |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status   | Displays the process status in human readable form.                                                                                                                                                                                                |
| Priority | Displays the negated scheduling priority.                                                                                                                                                                                                          |
| Size     | <p>Prior to Cisco IOS XE Gibraltar 16.10.1:<br/>Displays Virtual Memory size.</p> <p>From Cisco IOS XE Gibraltar 16.10.1 onwards:<br/>Displays the Resident Set Size (RSS) that shows how much memory is allocated to that process in the RAM.</p> |

# show platform software process memory

To display the amount of memory used by each system process, use the **show platform software process memory** command in privileged EXEC mode.

## show platform process memory

**switch** { *switch-number* | **active** | **standby** } { **0** | **F0** | **FP** | **R0** } { **all** [ **sorted** | **virtual** [ **sorted** ] ] | **name** *process-name* { **maps** | **smaps** [ **summary** ] } | **process-id** *process-id* { **maps** | **smaps** [ **summary** ] } }

| Syntax Description                  |                                |                                                                     |
|-------------------------------------|--------------------------------|---------------------------------------------------------------------|
| <b>switch</b> <i>switch-number</i>  |                                | Displays information about the switch. Enter the switch number.     |
| <b>active</b>                       |                                | Specifies the active instance of the device.                        |
| <b>standby</b>                      |                                | Specifies the standby instance of the device.                       |
| <b>0</b>                            |                                | Specifies the Shared Port Adapter (SPA) Interface Processor slot 0. |
| <b>F0</b>                           |                                | Specifies the Embedded Service Processor (ESP) slot 0.              |
| <b>FP</b>                           |                                | Specifies the Embedded Service Processor (ESP).                     |
| <b>R0</b>                           |                                | Specifies the Route Processor (RP) slot 0.                          |
| <b>all</b>                          |                                | Lists all processes.                                                |
| <b>sorted</b>                       |                                | (Optional) Sorts the output based on Resident Set Size (RSS).       |
| <b>virtual</b>                      |                                | (Optional) Specifies virtual memory.                                |
| <b>name</b> <i>process-name</i>     |                                | Specifies a process name.                                           |
| <b>maps</b>                         |                                | Specifies the memory maps of a process.                             |
| <b>smaps summary</b>                |                                | Specifies the smaps summary of a process.                           |
| <b>process-id</b> <i>process-id</i> |                                | Specifies a process identifier.                                     |
| Command History                     | Release                        | Modification                                                        |
|                                     | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced.                                        |

**Command Modes** Privileged EXEC(#)

## Examples:

The following is a sample output from the **show platform software process memory active R0 all** command:

Device# show platform software process memory switch active R0 all

The table below describes the significant fields shown in the displays.

*Table 20: show platform software process memory Field Descriptions*

| Field   | Description                                                                                                                                                     |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PID     | Displays the process ID that is used by the operating system to identify and keep track of the processes.                                                       |
| RSS     | Displays the Resident Set Size (in kilobytes (KB)) that shows how much memory is allocated to that process in the RAM.                                          |
| PSS     | Displays the Proportional Set Size of a process. This is the count of pages it has in memory, where each page is divided by the number of processes sharing it. |
| Heap    | Displays where all user-allocated memory is located.                                                                                                            |
| Shared  | Shared clean + Shared dirty                                                                                                                                     |
| Private | Private clean + Private dirty                                                                                                                                   |
| Name    | Displays the command name associated with the process. Different threads in the same process may have different command values.                                 |

# show platform software process slot switch

To display platform software process switch information, use the **show platform software process slot switch** command in privileged EXEC mode.

**show platform software process slot switch** {*switch-number* | **active** | **standby**} {**0** | **F0** | **R0**} **monitor** [{*cycles no-of-times* [{*interval delay* [{*lines number*]}]}]]

|                           |                           |                                                                                                                      |
|---------------------------|---------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>switch-number</i>      | Switch number.                                                                                                       |
|                           | <b>active</b>             | Specifies the active instance.                                                                                       |
|                           | <b>standby</b>            | Specifies the standby instance.                                                                                      |
|                           | <b>0</b>                  | Specifies the shared port adapter (SPA) interface processor slot 0.                                                  |
|                           | <b>F0</b>                 | Specifies the Embedded Service Processor (ESP) slot 0.                                                               |
|                           | <b>R0</b>                 | Specifies the Route Processor (RP) slot 0.                                                                           |
|                           | <b>monitor</b>            | Monitors the running processes.                                                                                      |
|                           | <i>cycles no-of-times</i> | (Optional) Sets the number of times to run monitor command. Valid values are from 1 to 4294967295. The default is 5. |
|                           | <i>interval delay</i>     | (Optional) Sets a delay after each . Valid values are from 0 to 300. The default is 3.                               |
|                           | <i>lines number</i>       | (Optional) Sets the number of lines of output displayed. Valid values are from 0 to 512. The default is 0.           |

|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

The output of the **show platform software process slot switch** and **show processes cpu platform monitor location** commands display the output of the Linux **top** command. The output of these commands display Free memory and Used memory as displayed by the Linux **top** command. The values displayed for the Free memory and Used memory by these commands do not match the values displayed by the output of other platform-memory related CLIs.

## Examples

The following is sample output from the **show platform software process slot monitor** command:

```
Switch# show platform software process slot switch active R0 monitor
```

**show platform software process slot switch**

```

# show platform software thread list

To display the list of threads on a platform, use the **show platform software thread list** command in privileged EXEC mode.

**show platform software thread list switch** { *switch-number* | **active** | **standby** } { **0** | **F0** | **FP** | **active** | **R0** } **pname** { **cdman** | **vidman** | **all** } **tname** { **main** | **pktio** | **rt** | **all** }

|                    |                                    |                                                                                                            |
|--------------------|------------------------------------|------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>switch</b> <i>switch-number</i> | Displays information about the switch. Enter the switch number.                                            |
|                    | <b>active</b>                      | Specifies the active instance of the device.                                                               |
|                    | <b>standby</b>                     | Specifies standby instance of the device.                                                                  |
|                    | <b>0</b>                           | Specifies the Shared Port Adapter (SPA) Interface Processor slot 0.                                        |
|                    | <b>F0</b>                          | Specifies the Embedded Service Processor (ESP) slot 0.                                                     |
|                    | <b>FP active</b>                   | Specifies the active instance of Embedded Service Processor (ESP).                                         |
|                    | <b>R0</b>                          | Specifies the Route Processor (RP) slot 0.                                                                 |
|                    | <b>pname</b>                       | Specifies a process name. The possible values are <b>cdman</b> , <b>vidman</b> , and <b>all</b> .          |
|                    | <b>tname</b>                       | Specifies a thread name. The possible values are <b>main</b> , <b>pktio</b> , <b>rt</b> , and <b>all</b> . |
| Command History    | <b>Release</b>                     | <b>Modification</b>                                                                                        |
|                    | Cisco IOS XE Gibraltar 16.10.1     | This command was introduced.                                                                               |
| Command Modes      | Privileged EXEC(#)                 |                                                                                                            |

## Examples:

The following is sample output from the **show platform software thread list switch active R0 pname cdman tname all** command:

```
Device# show platform software thread list switch active R0 pname cdman tname all

Name      Tid    PPid  Group Id  Core    Vcswch  Nvcswch  Status    Priority
TIME+    Size
-----
cdman     8407   7295   8407      1        0        0    S          20
12309   36976
```

The table below describes the significant fields shown in the displays.

**Table 21: show platform software thread list Field Descriptions**

| Field    | Description                                                                                                                     |
|----------|---------------------------------------------------------------------------------------------------------------------------------|
| Name     | Displays the command name associated with the process. Different threads in the same process may have different command values. |
| Tid      | Displays the process ID.                                                                                                        |
| PPid     | Displays the process ID of the parent process.                                                                                  |
| Group Id | Displays the group ID.                                                                                                          |
| Core     | Displays processor information.                                                                                                 |
| Veswch   | Displays the number of voluntary context switches.                                                                              |
| Nveswch  | Displays the number of non-voluntary context switches.                                                                          |
| Status   | Displays the process status in human readable form.                                                                             |
| Priority | Displays the negated scheduling priority.                                                                                       |
| TIME+    | Displays the time since the start of the process.                                                                               |
| Size     | Displays the Resident Set Size (in kilobytes (KB)) that shows how much memory is allocated to that process in the RAM.          |

# show platform usb status

To display the status of the USB ports on a device, use the **show platform usb status** command in Privileged EXEC mode.

**show platform usb status**

| Command Modes   | Privileged EXEC (#)           |                              |
|-----------------|-------------------------------|------------------------------|
| Command History | Release                       | Modification                 |
|                 | Cisco IOS XE Bengaluru 17.5.1 | This command was introduced. |

**Examples** The following is a sample output of the **show platform usb status** command:

```
Device> enable
Device# show platform usb status
USB Disabled
```

# show processes cpu platform

To display information about the CPU utilization of the IOS-XE processes, use the **show processes cpu platform** command in privileged EXEC mode.

**show processes cpu platform** [ [ **sorted** [ **1min** | **5min** | **5sec** ] ] **location**  
**switch** { *switch-number* | **active** | **standby** } { **F0** | **FP active** | **R0** | **RP active** }

|                           |                                       |                                                                                   |
|---------------------------|---------------------------------------|-----------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>sorted</b>                         | (Optional) Displays output sorted based on percentage of CPU usage on a platform. |
|                           | <b>1min</b>                           | (Optional) Sorts based on 1 minute intervals.                                     |
|                           | <b>5min</b>                           | (Optional) Sorts based on 5 minute intervals.                                     |
|                           | <b>5sec</b>                           | (Optional) Sorts based on 5 second intervals.                                     |
|                           | <b>location</b>                       | Specifies the Field Replaceable Unit (FRU) location.                              |
|                           | <b>switch</b><br><i>switch-number</i> | Displays information about the switch. Enter the switch number.                   |
|                           | <b>active</b>                         | Specifies the active instance of the device.                                      |
|                           | <b>standby</b>                        | Specifies the standby instance of the device.                                     |
|                           | <b>F0</b>                             | Specifies the Embedded Service Processor (ESP) slot 0.                            |
|                           | <b>FP active</b>                      | Specifies active instances on the Embedded Service Processor (ESP).               |
|                           | <b>R0</b>                             | Specifies the Route Processor (RP) slot 0.                                        |
|                           | <b>RP active</b>                      | Specifies active instances on the Route Processor (RP).                           |
|                           |                                       |                                                                                   |
| <b>Command History</b>    | <b>Release</b>                        | <b>Modification</b>                                                               |
|                           | Cisco IOS XE Gibraltar 16.10.1        | This command was introduced.                                                      |
| <b>Command Modes</b>      | Privileged EXEC (#)                   |                                                                                   |

## Examples:

The following is sample output from the **show processes cpu platform** command:

Device# **show processes cpu platform**

```

CPU utilization for five seconds: 1%, one minute: 3%, five minutes: 2%

**Usage Guidelines** The output of the **show platform software process slot switch** and **show processes cpu platform monitor location** commands display the output of the Linux **top** command. The output of these commands display Free memory and Used memory as displayed by the Linux **top** command. The values displayed for the Free memory and Used memory by these commands do not match the values displayed by the output of other platform-memory related CLIs.

## Examples

The following is sample output from the **show processes cpu monitor location switch active R0** command:

```
Switch# show processes cpu platform monitor location switch active R0

# show processes memory

To display the amount of memory used by each system process, use the **show processes memory** command in privileged EXEC mode.

**show processes memory** [{ *process-id* | **sorted** [{ **allocated** | **getbufs** | **holding** }]]

## Syntax Description

|                   |                                                                                                                                                                                           |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>process-id</i> | (Optional) Process ID (PID) of a specific process. When you specify a process ID, only details for the specified process will be shown.                                                   |
| <b>sorted</b>     | (Optional) Displays memory data sorted by the Allocated, Get Buffers, or Holding column. If the <b>sorted</b> keyword is used by itself, data is sorted by the Holding column by default. |
| <b>allocated</b>  | (Optional) Displays memory data sorted by the Allocated column.                                                                                                                           |
| <b>getbufs</b>    | (Optional) Displays memory data sorted by the Getbufs (Get Buffers) column.                                                                                                               |
| <b>holding</b>    | (Optional) Displays memory data sorted by the Holding column. This keyword is the default.                                                                                                |

| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **show processes memory** command and the **show processes memory sorted** command displays a summary of total, used, and free memory, followed by a list of processes and their memory impact.

If the standard **show processes memory process-id** command is used, processes are sorted by their PID. If the **show processes memory sorted** command is used, the default sorting is by the Holding value.

### Note

Holding memory of a particular process can be allocated by other processes also, and so it can be greater than the allocated memory.

The following is sample output from the **show processes memory** command:

Device# **show processes memory**

```

Processor Pool Total: 25954228 Used: 8368640 Free: 17585588
PID TTY Allocated Freed Holding Getbufs Retbufs Process
0 0 8629528 689900 6751716 0 0 *Init*
0 0 24048 12928 24048 0 0 *Sched*
0 0 260 328 68 350080 0 *Dead*
1 0 0 0 12928 0 0 Chunk Manager

```

The table below describes the significant fields shown in the display.

**Table 22: show processes memory Field Descriptions**

| Field                | Description                                                                                                                             |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Processor Pool Total | Total amount of memory, in kilobytes (KB), held for the Processor memory pool.                                                          |
| Used                 | Total amount of used memory, in KB, in the Processor memory pool.                                                                       |
| Free                 | Total amount of free memory, in KB, in the Processor memory pool.                                                                       |
| PID                  | Process ID.                                                                                                                             |
| TTY                  | Terminal that controls the process.                                                                                                     |
| Allocated            | Bytes of memory allocated by the process.                                                                                               |
| Freed                | Bytes of memory freed by the process, regardless of who originally allocated it.                                                        |
| Holding              | Amount of memory, in KB, currently allocated to the process. This includes memory allocated by the process and assigned to the process. |
| Getbufs              | Number of times the process has requested a packet buffer.                                                                              |
| Retbufs              | Number of times the process has relinquished a packet buffer.                                                                           |
| Process              | Process name.                                                                                                                           |
| *Init*               | System initialization process.                                                                                                          |
| *Sched*              | The scheduler process.                                                                                                                  |
| *Dead*               | Processes as a group that are now dead.                                                                                                 |
| <value> Total        | Total amount of memory, in KB, held by all processes (sum of the “Holding” column).                                                     |

The following is sample output from the **show processes memory** command when the **sorted** keyword is used. In this case, the output is sorted by the Holding column, from largest to smallest.

Device# **show processes memory sorted**

```

Processor Pool Total:  25954228 Used:    8371280 Free:    17582948

|-----------------------|--------------------------------------------------------------------------|
| <b>show memory</b>    | Displays statistics about memory, including memory-free pool statistics. |
| <b>show processes</b> | Displays information about the active processes.                         |

## show processes memory platform

To display memory usage for each Cisco IOS XE process, use the **show processes memory platform** command in privileged EXEC mode.

**show processes memory platform** [ [ **detailed** { **name** *process-name* | **process-id** *process-ID* } [ **location** | **maps** [ **location** ] | **smaps** [ **location** ] ] | **location** | **sorted** [ **location** ] ] **switch** { *switch-number* | **active** | **standby** } { **0** | **F0** | **R0** } | **accounting** ]

### Syntax Description

|                                     |                                                                                                                 |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>accounting</b>                   | (Optional) Displays the top memory allocators for each Cisco IOS XE process.                                    |
| <b>detailed</b>                     | (Optional) Displays detailed memory information for a specified Cisco IOS XE process.                           |
| <b>name</b> <i>process-name</i>     | (Optional) Displays the Cisco IOS XE process name. Enter the process name.                                      |
| <b>process-id</b> <i>process-ID</i> | (Optional) Displays the Cisco IOS XE process ID. Enter the process ID.                                          |
| <b>location</b>                     | (Optional) Displays information about the Field Replaceable Unit (FRU) location.                                |
| <b>maps</b>                         | (Optional) Displays memory maps of a process.                                                                   |
| <b>smaps</b>                        | (Optional) Displays static memory maps of a process.                                                            |
| <b>sorted</b>                       | (Optional) Displays the sorted output based on the Resident Set Size (RSS) memory used by Cisco IOS XE process. |
| <b>switch</b> <i>switch-number</i>  | Displays information about the device.                                                                          |
| <b>active</b>                       | Displays information about the active instance of the device.                                                   |
| <b>standby</b>                      | Displays information about the standby instance of the device.                                                  |
| <b>0</b>                            | Displays information about Shared Port Adapter (SPA)-Inter-Processor slot 0.                                    |
| <b>F0</b>                           | Displays information about Embedded Service Processor (ESP) slot 0.                                             |
| <b>R0</b>                           | Displays information about Route Processor (RP) slot 0.                                                         |

# show processes platform

To display information about the IOS-XE processes running on a platform, use the **show processes platform** command in privileged EXEC mode.

**show processes platform** [**detailed name** *process-name*] [**location** **switch** { *switch-number* | **active** | **standby** } { **0** | **F0** | **FP active** | **R0** } ]

|                                    |                                                                           |
|------------------------------------|---------------------------------------------------------------------------|
| <b>detailed</b>                    | (Optional) Displays detailed information of the specified IOS-XE process. |
| <b>name</b> <i>process-name</i>    | (Optional) Specifies the process name.                                    |
| <b>location</b>                    | (Optional) Specifies the Field Replaceable Unit (FRU) location.           |
| <b>switch</b> <i>switch-number</i> | (Optional) Displays information about the switch.                         |
| <b>active</b>                      | (Optional) Specifies the active instance of the device.                   |
| <b>standby</b>                     | (Optional) Specifies standby instance of the device.                      |
| <b>0</b>                           | Specifies the Shared Port Adapter (SPA) Interface Processor slot 0.       |
| <b>F0</b>                          | Specifies the Embedded Service Processor (ESP) slot 0.                    |
| <b>FP active</b>                   | Specifies the active instance in the Embedded Service Processor (ESP).    |
| <b>R0</b>                          | Specifies the Route Processor (RP) slot 0.                                |

## Command History

| Release                        | Modification                 |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |

## Command Modes

Privileged EXEC(#)

### Examples:

The following is sample output from the **show processes platform** command:

Device# **show processes platform**

CPU utilization for five seconds: 1%, one minute: 2%, five minutes: 1%

| Pid | PPid | Status | Size | Name         |

The table below describes the significant fields shown in the displays.

**Table 23: show processes platform Field Descriptions**

| Field | Description              |
|-------|--------------------------|
| Pid   | Displays the process ID. |

| Field  | Description                                                                                                                     |
|--------|---------------------------------------------------------------------------------------------------------------------------------|
| PPid   | Displays the process ID of the parent process.                                                                                  |
| Status | Displays the process status in human readable form.                                                                             |
| Size   | Displays the Resident Set Size (in kilobytes (KB)) that shows how much memory is allocated to that process in the RAM.          |
| Name   | Displays the command name associated with the process. Different threads in the same process may have different command values. |

# show power inline

To display the Power over Ethernet (PoE) status for the specified PoE port, the specified stack member, or for all PoE ports in the switch stack, use the **show power inline** command in EXEC mode.

**show power inline** [{**police** | **priority**}] [{*interface-id* | **module** *stack-member-number*}] [**detail**]

|                           |                                          |                                                                                                                                                                       |
|---------------------------|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>police</b>                            | (Optional) Displays the power policing information about real-time power consumption.                                                                                 |
|                           | <b>priority</b>                          | (Optional) Displays the power inline port priority for each port.                                                                                                     |
|                           | <i>interface-id</i>                      | (Optional) ID of the physical interface.                                                                                                                              |
|                           | <b>module</b> <i>stack-member-number</i> | (Optional) Limits the display to ports on the specified stack member.<br><br>The range is 1 to 9.<br><br>This keyword is supported only on stacking-capable switches. |
|                           | <b>detail</b>                            | (Optional) Displays detailed output of the interface or module.                                                                                                       |

|                      |                     |
|----------------------|---------------------|
| <b>Command Modes</b> | User EXEC (>)       |
|                      | Privileged EXEC (#) |

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

This is an example of output from the **show power inline** command. The table that follows describes the output fields.

```
Device> show power inline
Module   Available      Used      Remaining
         (Watts)        (Watts)   (Watts)
-----
1         n/a            n/a       n/a
2         n/a            n/a       n/a
3        1440.0       15.4      1424.6
4         720.0         6.3       713.7
Interface Admin  Oper      Power    Device
         (Watts)
-----
Gi3/0/1   auto   off       0.0      n/a
Gi3/0/2   auto   off       0.0      n/a
Gi3/0/3   auto   off       0.0      n/a
Gi3/0/4   auto   off       0.0      n/a
Gi3/0/5   auto   off       0.0      n/a
Gi3/0/6   auto   off       0.0      n/a
Gi3/0/7   auto   off       0.0      n/a
Gi3/0/8   auto   off       0.0      n/a
```

## show power inline

```

Gi3/0/9   auto   off      0.0    n/a                n/a    30.0
Gi3/0/10  auto   off      0.0    n/a                n/a    30.0
Gi3/0/11  auto   off      0.0    n/a                n/a    30.0
Gi3/0/12  auto   off      0.0    n/a                n/a    30.0
<output truncated>

```

This is an example of output from the **show power inline interface-id** command on a switch port:

```

Device> show power inline gigabitethernet1/0/1
Interface Admin Oper      Power  Device      Class Max
              (Watts)
-----
Gi1/0/1   auto   off      0.0    n/a          n/a    30.0

```

This is an example of output from the **show power inline module switch-number** command on stack member 3. The table that follows describes the output fields.

```

Device> show power inline module 3
Module      Available      Used      Remaining
              (Watts)      (Watts)      (Watts)
-----
3           865.0       864.0       1.0
Interface Admin Oper      Power  Device      Class Max
              (Watts)
-----
Gi3/0/1   auto   power-deny  4.0    n/a          n/a    15.4
Gi3/0/2   auto   off         0.0    n/a          n/a    15.4
Gi3/0/3   auto   off         0.0    n/a          n/a    15.4
Gi3/0/4   auto   off         0.0    n/a          n/a    15.4
Gi3/0/5   auto   off         0.0    n/a          n/a    15.4
Gi3/0/6   auto   off         0.0    n/a          n/a    15.4
Gi3/0/7   auto   off         0.0    n/a          n/a    15.4
Gi3/0/8   auto   off         0.0    n/a          n/a    15.4
Gi3/0/9   auto   off         0.0    n/a          n/a    15.4
Gi3/0/10  auto   off         0.0    n/a          n/a    15.4
<output truncated>

```

**Table 24: show power inline Field Descriptions**

| Field     | Description                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------|
| Available | The total amount of configured power <sup>1</sup> on the PoE switch in watts (W).                                    |
| Used      | The amount of configured power that is allocated to PoE ports in watts.                                              |
| Remaining | The amount of configured power in watts that is not allocated to ports in the system. (Available – Used = Remaining) |
| Admin     | Administration mode: auto, off, static.                                                                              |

| Field            | Description                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Oper             | Operating mode: <ul style="list-style-type: none"> <li>• on—The powered device is detected, and power is applied.</li> <li>• off—No PoE is applied.</li> <li>• faulty—Device detection or a powered device is in a faulty state.</li> <li>• power-deny—A powered device is detected, but no PoE is available, or the maximum wattage exceeds the detected powered-device maximum.</li> </ul> |
| Power            | The maximum amount of power that is allocated to the powered device in watts. This value is the same as the value in the <i>Cutoff Power</i> field in the <b>show power inline police</b> command output.                                                                                                                                                                                    |
| Device           | The device type detected: n/a, unknown, Cisco powered-device, IEEE powered-device, or the name from CDP.                                                                                                                                                                                                                                                                                     |
| Class            | The IEEE classification: n/a or a value from 0 to 4.                                                                                                                                                                                                                                                                                                                                         |
| Max              | The maximum amount of power allocated to the powered device in watts.                                                                                                                                                                                                                                                                                                                        |
| AdminPowerMax    | The maximum amount power allocated to the powered device in watts when the switch polices the real-time power consumption. This value is the same as the <i>Max</i> field value.                                                                                                                                                                                                             |
| AdminConsumption | The power consumption of the powered device in watts when the switch polices the real-time power consumption. If policing is disabled, this value is the same as the <i>AdminPowerMax</i> field value.                                                                                                                                                                                       |

<sup>1</sup> The configured power is the power that you manually specify or that the switch specifies by using CDP power negotiation or the IEEE classification, which is different than the real-time power that is monitored with the power sensing feature.

This is an example of output from the **show power inline police** command on a stacking-capable switch:

```
Device> show power inline police
Module   Available   Used   Remaining
         (Watts)    (Watts) (Watts)
-----
1         370.0      0.0    370.0
3         865.0     864.0    1.0

Interface Admin Oper   Admin   Oper   Cutoff Oper
          State State   Police Police Power  Power
-----
Gi1/0/1   auto  off    none    n/a    n/a    0.0
Gi1/0/2   auto  off    log     n/a    5.4    0.0
Gi1/0/3   auto  off    errdisable n/a    5.4    0.0
Gi1/0/4   off   off    none    n/a    n/a    0.0
Gi1/0/5   off   off    log     n/a    5.4    0.0
Gi1/0/6   off   off    errdisable n/a    5.4    0.0
Gi1/0/7   auto  off    none    n/a    n/a    0.0
Gi1/0/8   auto  off    log     n/a    5.4    0.0
Gi1/0/9   auto  on     none    n/a    n/a    5.1
Gi1/0/10  auto  on     log     ok     5.4    4.2
Gi1/0/11  auto  on     log     log    5.4    5.9
Gi1/0/12  auto  on     errdisable ok     5.4    4.2
```

```

Gi1/0/13 auto errdisable errdisable n/a 5.4 0.0
<output truncated>

```

In the previous example:

- The Gi1/0/1 port is shut down, and policing is not configured.
- The Gi1/0/2 port is shut down, but policing is enabled with a policing action to generate a syslog message.
- The Gi1/0/3 port is shut down, but policing is enabled with a policing action is to shut down the port.
- Device detection is disabled on the Gi1/0/4 port, power is not applied to the port, and policing is disabled.
- Device detection is disabled on the Gi1/0/5 port, and power is not applied to the port, but policing is enabled with a policing action to generate a syslog message.
- Device detection is disabled on the Gi1/0/6 port, and power is not applied to the port, but policing is enabled with a policing action to shut down the port.
- The Gi1/0/7 port is up, and policing is disabled, but the switch does not apply power to the connected device.
- The Gi1/0/8 port is up, and policing is enabled with a policing action to generate a syslog message, but the switch does not apply power to the powered device.
- The Gi1/0/9 port is up and connected to a powered device, and policing is disabled.
- The Gi1/0/10 port is up and connected to a powered device, and policing is enabled with a policing action to generate a syslog message. The policing action does not take effect because the real-time power consumption is less than the cutoff value.
- The Gi1/0/11 port is up and connected to a powered device, and policing is enabled with a policing action to generate a syslog message.
- The Gi1/0/12 port is up and connected to a powered device, and policing is enabled with a policing action to shut down the port. The policing action does not take effect because the real-time power consumption is less than the cutoff value.
- The Gi1/0/13 port is up and connected to a powered device, and policing is enabled with a policing action to shut down the port.

This is an example of output from the **show power inline police interface-id** command on a standalone switch. The table that follows describes the output fields.

```

Device> show power inline police gigabitethernet1/0/1
Interface Admin Oper Admin Oper Cutoff Oper
          State State Police Police Power Power
-----
Gi1/0/1 auto off none n/a n/a 0.0

```

Table 25: show power inline police Field Descriptions

| Field        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Available    | The total amount of configured power <sup>2</sup> on the switch in watts (W).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Used         | The amount of configured power allocated to PoE ports in watts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Remaining    | The amount of configured power in watts that is not allocated to ports in the system. (Available – Used = Remaining)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Admin State  | Administration mode: auto, off, static.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Oper State   | <p>Operating mode:</p> <p><b>Note</b> The operating mode is the current PoE state for the specified PoE port, the specified stack member, or for all PoE ports on the switch.</p> <ul style="list-style-type: none"> <li>errdisable—Policing is enabled.</li> <li>faulty—Device detection on a powered device is in a faulty state.</li> <li>off—No PoE is applied.</li> <li>on—The powered device is detected, and power is applied.</li> <li>power-deny—A powered device is detected, but no PoE is available, or the real-time power consumption exceeds the maximum power allocation.</li> </ul> |
| Admin Police | <p>Status of the real-time power-consumption policing feature:</p> <ul style="list-style-type: none"> <li>errdisable—Policing is enabled, and the switch shuts down the port when the real-time power consumption exceeds the maximum power allocation</li> <li>.</li> <li>log—Policing is enabled, and the switch generates a syslog message when the real-time power consumption exceeds the maximum power allocation.</li> <li>none—Policing is disabled.</li> </ul>                                                                                                                              |
| Oper Police  | <p>Policing status:</p> <ul style="list-style-type: none"> <li>errdisable—The real-time power consumption exceeds the maximum power allocation, and the switch shuts down the PoE port.</li> <li>log—The real-time power consumption exceeds the maximum power allocation, and the switch generates a syslog message.</li> <li>n</li> <li>/a—Device detection is disabled, power is not applied to the PoE port, or no policing action is configured.</li> <li>ok—Real-time power consumption is less than the maximum power allocation.</li> </ul>                                                  |
| Cutoff Power | The maximum power allocated on the port. When the real-time power consumption is greater than this value, the switch takes the configured policing action.                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Field      | Description                                            |
|------------|--------------------------------------------------------|
| Oper Power | The real-time power consumption of the powered device. |

- <sup>2</sup> The configured power is the power that you manually specify or that the switch specifies by using CDP power negotiation or the IEEE classification, which is different than the real-time power that is monitored with the power sensing feature.

This is an example of output from the **show power inline priority** command on a standalone switch.

```
Device> show power inline priority
Interface  Admin  Oper      Priority
          State  State
-----  -
Gi1/0/1    auto   off       low
Gi1/0/2    auto   off       low
Gi1/0/3    auto   off       low
Gi1/0/4    auto   off       low
Gi1/0/5    auto   off       low
Gi1/0/6    auto   off       low
Gi1/0/7    auto   off       low
Gi1/0/8    auto   off       low
Gi1/0/9    auto   off       low
```

# show stack-power

To display information about StackPower stacks or switches in a power stack, use the **show stack-power** command in EXEC mode.

**Note** Cisco Catalyst 9300L Series Switches do not support this command.

```
{show stack-power [{budgeting | detail | load-shedding | neighbors}] [order power-stack-name] |
[{stack-name [stack-id] | switch [switch-id]}]}
```

## Syntax Description

|                                      |                                                                                                                                                                                                 |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>budgeting</b>                     | (Optional) Displays the stack power budget table.                                                                                                                                               |
| <b>detail</b>                        | (Optional) Displays the stack power stack details.                                                                                                                                              |
| <b>load-shedding</b>                 | (Optional) Displays the stack power load shedding table.                                                                                                                                        |
| <b>neighbors</b>                     | (Optional) Displays the stack power neighbor table.                                                                                                                                             |
| <b>order</b> <i>power-stack-name</i> | (Optional) Displays the load shedding priority for a power stack.<br><b>Note</b> This keyword is available only after the <b>load-shedding</b> keyword.                                         |
| <b>stack-name</b>                    | (Optional) Displays budget table, details, or neighbors for all power stacks or the specified power stack.<br><b>Note</b> This keyword is not available after the <b>load-shedding</b> keyword. |
| <i>stack-id</i>                      | (Optional) Power stack ID for the power stack. The stack ID must be 31 characters or less.                                                                                                      |
| <b>switch</b>                        | (Optional) Displays budget table, details, load-shedding, or neighbors for all switches or the specified switch.                                                                                |
| <i>switch-id</i>                     | (Optional) Switch ID for the switch. The switch number is from 1 to 9.                                                                                                                          |

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

This command is available only on switch stacks running the IP Base or IP Services image.

If a switch is shut down because of load shedding, the output of the **show stack-power** command still includes the MAC address of the shutdown neighbor switch. The command output shows the stack power topology even if there is not enough power to power a switch.

## Examples

This is an example of output from the **show stack-power** command:

```
Device# show stack-power
Power Stack      Stack  Stack  Total  Rsvd  Alloc  Unused  Num  Num
Name            Mode   Topolgy Pwr (W) Pwr (W) Pwr (W) Pwr (W) SW  PS
-----
Powerstack-1     SP-PS  Stndaln 350    150   200    0       1   1
```

This is an example of output from the **show stack-power budgeting** command:

```
Device# show stack-power budgeting
Power Stack      Stack  Stack  Total  Rsvd  Alloc  Unused  Num  Num
Name            Mode   Topolgy Pwr (W) Pwr (W) Pwr (W) Pwr (W) SW  PS
-----
Powerstack-1     SP-PS  Stndaln 350    150   200    0       1   1

      Power Stack      PS-A  PS-B  Power  Alloc  Avail  Consumd Pwr
SW  Name              (W)   (W)   Budgt (W) Power (W) Pwr (W) Sys/PoE (W)
--  -----
1   Powerstack-1      350   0     200    200    0      60   /0
--  -----

Totals:                200    0      60   /0
```

# show shell

To display shell information, use the **show shell** command in user EXEC mode.

**show shell** [{**environment** | **functions** [{**brief** *shell\_function*}] | **triggers**}]

|                           |                                                                   |                                                                                                                                                                                                  |
|---------------------------|-------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>environment</b>                                                | (Optional) Displays shell environment information.                                                                                                                                               |
|                           | <b>functions</b> [ <b>brief</b>   <i>shell_function</i> ]         | (Optional) Displays macro information. <ul style="list-style-type: none"> <li>• <b>brief</b>—Names of the shell functions.</li> <li>• <i>shell_function</i>—Name of a shell function.</li> </ul> |
|                           | <b>triggers</b>                                                   | (Optional) Displays event trigger information.                                                                                                                                                   |
| <b>Command Modes</b>      | User EXEC (>)                                                     |                                                                                                                                                                                                  |

|                           | Cisco IOS XE Everest 16.5.1a                                      | This command was introduced.                                                                                                                                                                     |
| <b>Usage Guidelines</b>   | Use this command to display the shell information for the switch. |                                                                                                                                                                                                  |

## Example

This example shows how to use the **show shell triggers** command to view the event triggers in the switch software:

```
Device# term shell
Device# show shell triggers
User defined triggers
-----
Built-in triggers
-----
Trigger Id: CISCO_CUSTOM_EVENT
Trigger description: Custom macroevent to apply user defined configuration
Trigger environment: User can define the macro
Trigger mapping function: CISCO_CUSTOM_AUTOSMARTPORT

Trigger Id: CISCO_DMP_EVENT
Trigger description: Digital media-player device event to apply port configuration
Trigger environment: Parameters that can be set in the shell - $ACCESS_VLAN=(1)
The value in the parenthesis is a default value
Trigger mapping function: CISCO_DMP_AUTO_SMARTPORT

Trigger Id: CISCO_IPVSC_EVENT
Trigger description: IP-camera device event to apply port configuration
Trigger environment: Parameters that can be set in the shell - $ACCESS_VLAN=(1)
The value in parenthesis is a default value
Trigger mapping function: CISCO_IP_CAMERA_AUTO_SMARTPORT
```

```

Trigger Id: CISCO_LAST_RESORT_EVENT
Trigger description: Last resortevent to apply port configuration
Trigger environment: Parameters that can be set in the shell - $ACCESS_VLAN=(1)
The value in the parenthesis is a default value
Trigger mapping function: CISCO_LAST_RESORT_SMARTPORT

```

```

Trigger Id: CISCO_PHONE_EVENT
Trigger description: IP-phone device event to apply port configuration
Trigger environment: Parameters that can be set in the shell - $ACCESS_VLAN=(1)
and $VOICE_VLAN=(2), The value in the parenthesis is a default value
Trigger mapping function: CISCO_PHONE_AUTO_SMARTPORT

```

```

Trigger Id: CISCO_ROUTER_EVENT
Trigger description: Router device event to apply port configuration
Trigger environment: Parameters that can be set in the shell - $NATIVE_VLAN=(1)
The value in the parenthesis is a default value
Trigger mapping function: CISCO_ROUTER_AUTO_SMARTPORT

```

```

Trigger Id: CISCO_SWITCH_ETHERCHANNEL_CONFIG
Trigger description: etherchannel parameter
Trigger environment: $INTERFACE_LIST=(), $PORT-CHANNEL_ID=(),
                    $SEC_MODE=(), $SEC_PROTOCOLTYPE=(),
                    PORT-CHANNEL_TYPE=()
Trigger mapping function: CISCO_ETHERCHANNEL_AUTOSMARTPORT

```

```

Trigger Id: CISCO_SWITCH_EVENT
Trigger description: Switch device event to apply port configuration
Trigger environment: Parameters that can be set in the shell - $NATIVE_VLAN=(1)
The value in the parenthesis is a default value
Trigger mapping function: CISCO_SWITCH_AUTO_SMARTPORT

```

```

Trigger Id: CISCO_WIRELESS_AP_EVENT
Trigger description: Autonomous ap device event to apply port configuration
Trigger environment: Parameters that can be set in the shell - $NATIVE_VLAN=(1)
The value in the parenthesis is a default value
Trigger mapping function: CISCO_AP_AUTO_SMARTPORT

```

```

Trigger Id: CISCO_WIRELESS_LIGHTWEIGHT_AP_EVENT
Trigger description: Lightweight-ap device event to apply port configuration
Trigger environment: Parameters that can be set in the shell - $ACCESS_VLAN=(1)
The value in the parenthesis is a default value
Trigger mapping function: CISCO_LWAP_AUTO_SMARTPORT

```

```

Trigger Id: word
Trigger description: word
Trigger environment:
Trigger mapping function:

```

This example shows how to use the **show shell functions** command to view the built-in macros in the switch software:

```

Device# show shell functions
#User defined functions:

#Built-in functions:
function CISCO_AP_AUTO_SMARTPORT () {
    if [[ $LINKUP == YES ]]; then
        conf t
            interface $INTERFACE
                macro description $TRIGGER
                switchport trunk encapsulation dot1q
                switchport trunk native vlan $NATIVE_VLAN
                switchport trunk allowed vlan ALL
    fi
}

```

```

        switchport mode trunk
        switchport nonegotiate
        auto qos voip trust
        mls qos trust cos
        if [[ $LIMIT == 0 ]]; then
            default srr-queue bandwidth limit
        else
            srr-queue bandwidth limit $LIMIT
        fi
        if [[ $SW_POE == YES ]]; then
            if [[ $AP125X == AP125X ]]; then
                macro description AP125X
                macro auto port sticky
                power inline port maximum 20000
            fi
        fi
        exit
    end
fi
if [[ $LINKUP == NO ]]; then
    conf t
        interface $INTERFACE
            no macro description
            no switchport nonegotiate
            no switchport trunk native vlan $NATIVE_VLAN
            no switchport trunk allowed vlan ALL
            no auto qos voip trust
            no mls qos trust cos
            default srr-queue bandwidth limit
            if [[ $AUTH_ENABLED == NO ]]; then
                no switchport mode
                no switchport trunk encapsulation
            fi
            if [[ $STICKY == YES ]]; then
                if [[ $SW_POE == YES ]]; then
                    if [[ $AP125X == AP125X ]]; then
                        no macro auto port sticky
                        no power inline port maximum
                    fi
                fi
            fi
        exit
    end
fi
}
<output truncated>

```

# show system mtu

To display the global maximum transmission unit (MTU) or maximum packet size set for the switch, use the **show system mtu** command in privileged EXEC mode.

**show system mtu**

| Syntax Description | This command has no arguments or keywords.                                                                                                         |                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| Command Default    | None                                                                                                                                               |                              |
| Command Modes      | Privileged EXEC (#)                                                                                                                                |                              |
| Command History    | Release                                                                                                                                            | Modification                 |
|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                       | This command was introduced. |
| Usage Guidelines   | For information about the MTU values and the stack configurations that affect the MTU values, see the <b>system mtu</b> command.                   |                              |
| Examples           | <p>This is an example of output from the <b>show system mtu</b> command:</p> <pre>Device# show system mtu Global Ethernet MTU is 1500 bytes.</pre> |                              |

# show tech-support

To automatically run **show** commands that display system information, use the **show tech-support** command in the privilege EXEC mode.

## show tech-support

| <b>ipmulticast</b> | (Optional) Displays IP multicast related information.                                                                                                                                                                                                                                                                               |
| <b>ipsec</b>       | (Optional) Displays IPSEC related information.                                                                                                                                                                                                                                                                                      |
| <b>mfib</b>        | (Optional) Displays MFIB related information.                                                                                                                                                                                                                                                                                       |
| <b>nat</b>         | (Optional) Displays NAT related information.                                                                                                                                                                                                                                                                                        |
| <b>nbar</b>        | (Optional) Displays NBAR related information.                                                                                                                                                                                                                                                                                       |
| <b>onep</b>        | (Optional) Displays ONEP related information.                                                                                                                                                                                                                                                                                       |
| <b>ospf</b>        | (Optional) Displays OSPF related information.                                                                                                                                                                                                                                                                                       |
| <b>page</b>        | (Optional) Displays the command output on a single page at a time. Use the Return key to display the next line of output or use the space bar to display the next page of information. If not used, the output scrolls (that is, it does not stop for page breaks).<br><br>Press the <b>Ctrl-C</b> keys to stop the command output. |
| <b>password</b>    | (Optional) Leaves passwords and other security information in the output. If not used, passwords and other security-sensitive information in the output are replaced with the label "<removed>".                                                                                                                                    |
| <b>rsvp</b>        | (Optional) Displays IP RSVP related information.                                                                                                                                                                                                                                                                                    |
| <b>subscriber</b>  | (Optional) Displays subscriber related information.                                                                                                                                                                                                                                                                                 |
| <b>vrrp</b>        | (Optional) Displays VRRP related information.                                                                                                                                                                                                                                                                                       |
| <b>wccp</b>        | (Optional) Displays WCCP related information.                                                                                                                                                                                                                                                                                       |

**Command Modes** Privileged EXEC (#)

| Command History | Release                      | Modification                  |
|-----------------|------------------------------|-------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was implemented. |

**Usage Guidelines**

The output from the **show tech-support** command is very long. To better manage this output, you can redirect the output to a file (for example, **show tech-support > filename** ) in the local writable storage file system or the remote file system. Redirecting the output to a file also makes sending the output to your Cisco Technical Assistance Center (TAC) representative easier.

You can use one of the following redirection methods:

- **> filename** - Redirects the output to a file.
- **>> filename** - Redirects the output to a file in append mode.

# show tech-support bgp

To automatically run show commands that display BGP related system information, use the **show tech-support bgp** command in the privileged EXEC mode.

```
show tech-support bgp [address-family {all | ipv4 [flowspec | multicast | unicast | [mdt
| mvpn] {all | vrf vrf-instance-name} ] | ipv6 [flowspec | multicast | mvpn {all | vrf
vrf-instance-name} | unicast] | l2vpn [evpn | vpls] | link-state [link-state] | [nsap |
rtfilter] [unicast] | [vpn4 | vpn6] [flowspec | multicast | unicast] {all | vrf
vrf-instance-name} } ] [detail]
```

| Syntax Description        |  |                                                                                                      |
|---------------------------|--|------------------------------------------------------------------------------------------------------|
| <b>address-family</b>     |  | (Optional) Displays the output for a specified address family.                                       |
| <b>address-family all</b> |  | (Optional) Displays the output for all address families.                                             |
| <b>ipv4</b>               |  | (Optional) Displays the output for IPv4 address family.                                              |
| <b>ipv6</b>               |  | (Optional) Displays the output for IPv6 address family.                                              |
| <b>l2vpn</b>              |  | (Optional) Displays the output for L2VPN address family.                                             |
| <b>link-state</b>         |  | (Optional) Displays the output for Link State address family.                                        |
| <b>nsap</b>               |  | (Optional) Displays the output for NSAP address family.                                              |
| <b>rtfilter</b>           |  | (Optional) Displays the output for RT Filter address family.                                         |
| <b>vpn4</b>               |  | (Optional) Displays the output for VPNv4 address family.                                             |
| <b>vpn6</b>               |  | (Optional) Displays the output for VPNv6 address family.                                             |
| <b>flowspec</b>           |  | (Optional) Displays the flowspec related information for an address family.                          |
| <b>multicast</b>          |  | (Optional) Displays the multicast related information for an address family.                         |
| <b>unicast</b>            |  | (Optional) Displays the unicast related information for an address family.                           |
| <b>mdt</b>                |  | (Optional) Displays the Multicast Distribution Tree (MDT) related information for an address family. |

|                          |                                                                                                        |
|--------------------------|--------------------------------------------------------------------------------------------------------|
| <b>mvpn</b>              | (Optional) Displays the Multicast VPN (MVPN) related information for an address family.                |
| <b>vrf</b>               | Displays the information for a VPN Routing/Forwarding instance.                                        |
| <b>evpn</b>              | (Optional) Displays the Ethernet VPN (EVPN) related information for an address family.                 |
| <b>vpls</b>              | (Optional) Displays the Virtual Private LAN Services (VPLS) related information for an address family. |
| <i>vrf-instance-name</i> | Specifies the name of the VPN Routing/Forwarding instance.                                             |
| <b>all</b>               | Displays the information about all VPN NLRIs.                                                          |
| <b>detail</b>            | (Optional) Displays the detailed routes information.                                                   |

**Usage Guidelines**

The **show tech-support bgp** command is used to display the outputs of various BGP show commands and log them to the show-tech file. The output from the **show tech-support bgp** command is very long. To better manage this output, you can redirect the output to a file (for example, **show tech-support > filename**) in the local writable storage file system or the remote file system. Redirecting the output to a file also makes sending the output to your Cisco Technical Assistance Center (TAC) representative easier.

You can use one of the following redirection methods:

- **> filename** - Redirects the output to a file.
- **>> filename** - Redirects the output to a file in append mode.

The following **show** commands run automatically when the **show tech-support bgp** command is used:

- **show clock**
- **show version**
- **show running-config**
- **show process cpu sorted**
- **show process cpu history**
- **show process memory sorted**

The following **show** commands for a specific address family run automatically when the **show tech-support bgp address-family address-family-name address-family-modifier** command is used:

- **show bgp** *address-family-name address-family-modifier* **summary**
- **show bgp** *address-family-name address-family-modifier* **detail**
- **show bgp** *address-family-name address-family-modifier* **internal**
- **show bgp** *address-family-name address-family-modifier* **neighbors**
- **show bgp** *address-family-name address-family-modifier* **update-group**
- **show bgp** *address-family-name address-family-modifier* **replication**
- **show bgp** *address-family-name address-family-modifier* **community**
- **show bgp** *address-family-name address-family-modifier* **dampening dampened-paths**
- **show bgp** *address-family-name address-family-modifier* **dampening flap-statistics**
- **show bgp** *address-family-name address-family-modifier* **dampening parameters**
- **show bgp** *address-family-name address-family-modifier* **injected-paths**
- **show bgp** *address-family-name address-family-modifier* **cluster-ids**
- **show bgp** *address-family-name address-family-modifier* **cluster-ids internal**
- **show bgp** *address-family-name address-family-modifier* **peer-group**
- **show bgp** *address-family-name address-family-modifier* **pending-prefixes**
- **show bgp** *address-family-name address-family-modifier* **rib-failure**

In addition to the above commands, the following segment routing specific **show** commands also run when the **show tech-support bgp** command is used:

- **show bgp all binding-sid**
- **show segment-routing client**
- **show segment-routing mpls state**
- **show segment-routing mpls gb**
- **show segment-routing mpls connected-prefix-sid-map protocol ipv4**
- **show segment-routing mpls connected-prefix-sid-map protocol backup ipv4**
- **show mpls traffic-eng tunnel auto-tunnel client bgp**

# show tech-support diagnostic

To display diagnostic information for technical support, use the **show tech-support diagnostic** command in privileged EXEC mode.

## show tech-support diagnostic

### Syntax Description

This command has no arguments or keywords.

### Command Modes

Privileged EXEC (#)

### Command History

| Release                        | Modification                 |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |

### Usage Guidelines

The output of this command is very long. To better manage this output, you can redirect the output to a file (for example, **show tech-support diagnostic > flash:filename** ) in the local writable storage file system or remote file system.

#### Note

For devices that support stacking, this command is executed on every switch that is up. For devices that do not support stacking, this command is executed only on the active switch.

The output of this command displays the output of the following commands:

- **show clock**
- **show version**
- **show running-config**
- **show inventory**
- **show diagnostic bootup level**
- **show diagnostic status**
- **show diagnostic content switch all**
- **show diagnostic result switch all detail**
- **show diagnostic schedule switch all**
- **show diagnostic post**
- **show diagnostic description switch [switch number] test all**
- **show logging onboard switch [switch number] clilog detail**
- **show logging onboard switch [switch number] counter detail**
- **show logging onboard switch [switch number] environment detail**
- **show logging onboard switch [switch number] message detail**

- show logging onboard switch [switch number] poe detail
- show logging onboard switch [switch number] status
- show logging onboard switch [switch number] temperature detail
- show logging onboard switch [switch number] uptime detail
- show logging onboard switch [switch number] voltage detail

## Examples

The following is a sample output from the **show tech-support diagnostic** command:

```
Device# show tech-support diagnostic
.
.
.
----- show diagnostic status -----

<BU> - Bootup Diagnostics, <HM> - Health Monitoring Diagnostics,
<OD> - OnDemand Diagnostics, <SCH> - Scheduled Diagnostics

=====

# show tech-support poe

To display the output of all the PoE-related troubleshooting commands, use the **show tech-support poe** command in privileged EXEC mode. This command displays the output of the following commands:

- **show clock**
- **show version**
- **show running-config**
- **show log**
- **show interface**
- **show interface status**
- **show controllers ethernet-controller**
- **show controllers power inline**
- **show cdp neighbors detail**
- **show llpd neighbors detail**
- **show post**
- **show platform software ilpower details**
- **show platform software ilpower system** *switch-id*
- **show power inline**
- **show power inline** *interface-id* **detail**
- **show power inline police**
- **show power inline priority**
- **show platform software trace message platform-mgr switch** *switch-number* *R0*
- **show platform software trace message fed switch** *switch-number*
- **show platform hardware fed switch** *switch-number* **fwd-asic register read** *register-name* *pimdeviceid*
- **show platform frontend-controller manager 0** *switch-number*
- **show platform frontend-controller subordinate 0** *switch-number*
- **show platform frontend-controller version 0** *switch-number*
- **show stack-power budgeting**
- **show stack-power detail**

----- show interface -----
```

```

Vlan1 is administratively down, line protocol is down , Autostate Enabled

  Hardware is Ethernet SVI, address is f8b7.e24f.37c7 (bia f8b7.e24f.37c7)

  MTU 1500 bytes, BW 1000000 Kbit/sec, DLY 10 usec,

    reliability 255/255, txload 1/255, rxload 1/255

  Encapsulation ARPA, loopback not set

  Keepalive not supported

  ARP type: ARPA, ARP Timeout 04:00:00

  Last input never, output never, output hang never

```

```

Last clearing of "show interface" counters never

Input queue: 0/375/0/0 (size/max/drops/flushes); Total output drops: 0

Queueing strategy: fifo

Output queue: 0/40 (size/max)

5 minute input rate 0 bits/sec, 0 packets/sec

5 minute output rate 0 bits/sec, 0 packets/sec

    0 packets input, 0 bytes, 0 no buffer

    Received 0 broadcasts (0 IP multicasts)

    0 runts, 0 giants, 0 throttles

    0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored

    0 packets output, 0 bytes, 0 underruns

    0 output errors, 1 interface resets

    0 unknown protocol drops

    0 output buffer failures, 0 output buffers swapped out
GigabitEthernet0/0 is up, line protocol is up

Hardware is RP management port, address is f8b7.e24f.3780 (bia f8b7.e24f.3780)

Internet address is 10.8.40.172/16

MTU 1500 bytes, BW 100000 Kbit/sec, DLY 100 usec,

    reliability 255/255, txload 1/255, rxload 1/255

Encapsulation ARPA, loopback not set

Keepalive set (10 sec)

Full Duplex, 100Mbps, link type is auto, media type is RJ45

output flow-control is unsupported, input flow-control is unsupported

ARP type: ARPA, ARP Timeout 04:00:00

Last input 00:00:00, output 00:01:47, output hang never

Last clearing of "show interface" counters never

Input queue: 0/75/2531/0 (size/max/drops/flushes); Total output drops: 0

Queueing strategy: fifo

Output queue: 0/40 (size/max)

5 minute input rate 5000 bits/sec, 3 packets/sec

5 minute output rate 0 bits/sec, 0 packets/sec

    1636640 packets input, 321164654 bytes, 0 no buffer

```

```
Received 0 broadcasts (0 IP multicasts)

0 runts, 0 giants, 0 throttles

0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored

0 watchdog, 0 multicast, 0 pause input

7641 packets output, 2207212 bytes, 0 underruns

0 output errors, 0 collisions, 0 interface resets

1414 unknown protocol drops

0 babbles, 0 late collision, 0 deferred

0 lost carrier, 0 no carrier, 0 pause output

0 output buffer failures, 0 output buffers swapped out

0 carrier transitions

FiveGigabitEthernet1/0/1 is down, line protocol is down (notconnect)

Hardware is Five Gigabit Ethernet, address is f8b7.e24f.3781 (bia f8b7.e24f.3781)

MTU 1500 bytes, BW 5000000 Kbit/sec, DLY 10 usec,

    reliability 255/255, txload 1/255, rxload 1/255

Encapsulation ARPA, loopback not set

Keepalive set (10 sec)

Auto-duplex, Auto-speed, media type is 100/1000/2.5G/5GBaseTX

input flow-control is on, output flow-control is unsupported

ARP type: ARPA, ARP Timeout 04:00:00

Last input never, output never, output hang never

Last clearing of "show interface" counters never

Input queue: 0/2000/0/0 (size/max/drops/flushes); Total output drops: 0

Queueing strategy: fifo

Interface: Gi9/0/16
Inline Power Mode: auto
Operational status: off
Device Detected: no
Device Type: n/a
IEEE Class: n/a
Discovery mechanism used/configured: Ieee and Cisco
Police: off

Power Allocated
Admin Value: 60.0
Power drawn from the source: 0.0
Power available to the device: 0.0

Actual consumption
Measured at the port: 0.0
Maximum Power drawn by the device since powered on: 0.0

Absent Counter: 0
Over Current Counter: 0
Short Current Counter: 0

```

```

Mosfet Counter: 0
Invalid Signature Counter: 0
Power Denied Counter: 0

```

```

Power Negotiation Used: None
LLDP Power Negotiation --Sent to PD--      --Rcvd from PD--
Power Type:          -                      -
Power Source:        -                      -
Power Priority:       -                      -
Requested Power(W):  -                      -
Allocated Power(W):  -                      -

```

```

Four-Pair PoE Supported: Yes
Spare Pair Power Enabled: No
Four-Pair PD Architecture: N/A

# speed

To specify the speed of a port, use the **speed** command in interface configuration mode. To return to the default value, use the **no** form of this command.

## Note

Available configuration options depend on the switch model and transceiver module installed. Options include 10, 100, 1000, 2500, 5000, 10000, 25000, 40000, 100000

```
speed {10 | 100 | 1000 | 2500 | 5000 | auto [{10 | 100 | 1000 | 2500 | 5000}]} | nonegotiate}
no speed
```

## Syntax Description

|                    |                                                                                                                                                                                                                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>10</b>          | Specifies that the port runs at 10 Mbps.                                                                                                                                                                                                                                                      |
| <b>100</b>         | Specifies that the port runs at 100 Mbps.                                                                                                                                                                                                                                                     |
| <b>1000</b>        | Specifies that the port runs at 1000 Mbps. This option is valid and visible only on 10/100/1000 Mb/s ports.                                                                                                                                                                                   |
| <b>2500</b>        | Specifies that the port runs at 2500 Mbps. This option is valid and visible only on multi-Gigabit-supported Ethernet ports.                                                                                                                                                                   |
| <b>5000</b>        | Specifies that the port runs at 5000 Mbps. This option is valid and visible only on multi-Gigabit-supported Ethernet ports.                                                                                                                                                                   |
| <b>auto</b>        | Detects the speed at which the port should run, automatically, based on the port at the other end of the link. If you use the <b>10</b> , <b>100</b> , <b>1000</b> , <b>2500</b> , or <b>5000</b> keyword with the <b>auto</b> keyword, the port autonegotiates only at the specified speeds. |
| <b>nonegotiate</b> | Disables autonegotiation, and the port runs at 1000 Mbps.                                                                                                                                                                                                                                     |

## Command Default

The default is **auto**.

## Command Modes

Interface configuration (config-if)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

You cannot configure speed on 10-Gigabit Ethernet ports.

Except for the 1000BASE-T small form-factor pluggable (SFP) modules, you can configure the speed to not negotiate (**nonegotiate**) when an SFP module port is connected to a device that does not support autonegotiation.

The keywords, **2500** and **5000** are visible only on multi-Gigabit (m-Gig) Ethernet supporting devices.

If the speed is set to **auto**, the switch negotiates with the device at the other end of the link for the speed setting, and then forces the speed setting to the negotiated value. The duplex setting remains configured on each end of the link, which might result in a duplex setting mismatch.

If both ends of the line support autonegotiation, we highly recommend the default autonegotiation settings. If one interface supports autonegotiation and the other end does not, use the auto setting on the supported side, but set the duplex and speed on the other side.

**Caution**

Changing the interface speed and duplex mode configuration might shut down and re-enable the interface during the reconfiguration.

For guidelines on setting the switch speed and duplex parameters, see the “Configuring Interface Characteristics” chapter in the software configuration guide for this release.

Verify your settings using the **show interfaces** privileged EXEC command.

**Examples**

The following example shows how to set speed on a port to 100 Mbps:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# speed 100
```

The following example shows how to set a port to autonegotiate at only 10 Mbps:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# speed auto 10
```

The following example shows how to set a port to autonegotiate at only 10 or 100 Mbps:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# speed auto 10 100
```

# stack-power

To configure StackPower parameters for the power stack or for a switch in the power stack, use the **stack power** command in global configuration mode. To return to the default setting, use the **no** form of the command,

## Note

Cisco Catalyst 9300L Series Switches do not support this command.

**stack-power** {**stack** *power-stack-name* | **switch** *stack-member-number*}  
**no stack-power** {**stack** *power-stack-name* | **switch** *stack-member-number*}

## Syntax Description

|                                          |                                                                                                                                                                          |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>stack</b> <i>power-stack-name</i>     | Specifies the name of the power stack. The name can be up to 31 characters. Entering these keywords followed by a carriage return enters power stack configuration mode. |
| <b>switch</b> <i>stack-member-number</i> | Specifies the switch number in the stack (1 to 4) to enter switch stack-power configuration mode for the switch.                                                         |

## Command Default

There is no default.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

When you enter the **stack-power stack** *power stack name* command, you enter power stack configuration mode, and these commands are available:

- **default**—Returns a command to its default setting.
- **exit**—Exits ARP access-list configuration mode.
- **mode**—Sets the power mode for the power stack. See the **mode** command.
- **no**—Negates a command or returns to default settings.

If you enter the **stack-power switch** *switch-number* command with a switch number that is not participating in StackPower, you receive an error message.

When you enter the **stack-power switch** *switch-number* command with the number of a switch participating in StackPower, you enter switch stack power configuration mode, and these commands are available:

- **default**—Returns a command to its default setting.
- **exit**—Exits switch stack power configuration mode.
- **no**—Negates a command or returns to default settings.
- **power-priority**—Sets the power priority for the switch and the switch ports. See the **power-priority** command.

- **stack-id** *name*—Enters the name of the power stack to which the switch belongs. If you do not enter the power stack-ID, the switch does not inherit the stack parameters. The name can be up to 31 characters.
- **standalone**—Forces the switch to operate in standalone power mode. This mode shuts down both stack power ports.

## Examples

This example removes switch 2, which is connected to the power stack, from the power pool and shutting down both power ports:

```
Device(config)# stack-power switch 2  
Device(config-switch-stackpower)# standalone  
Device(config-switch-stackpower)# exit
```

# switchport block

To prevent unknown multicast or unicast packets from being forwarded, use the **switchport block** command in interface configuration mode. To allow forwarding unknown multicast or unicast packets, use the **no** form of this command.

**switchport block** {multicast | unicast}  
**no switchport block** {multicast | unicast}

## Syntax Description

**multicast** Specifies that unknown multicast traffic should be blocked.

**Note** Only pure Layer 2 multicast traffic is blocked. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.

**unicast** Specifies that unknown unicast traffic should be blocked.

## Command Default

Unknown multicast and unicast traffic is not blocked.

## Command Modes

Interface configuration (config-if)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

By default, all traffic with unknown MAC addresses is sent to all ports. You can block unknown multicast or unicast traffic on protected or nonprotected ports. If unknown multicast or unicast traffic is not blocked on a protected port, there could be security issues.

With multicast traffic, the port blocking feature blocks only pure Layer 2 packets. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.

Blocking unknown multicast or unicast traffic is not automatically enabled on protected ports; you must explicitly configure it.

For more information about blocking packets, see the software configuration guide for this release.

This example shows how to block unknown unicast traffic on an interface:

```
Device(config-if)# switchport block unicast
```

You can verify your setting by entering the **show interfaces interface-id switchport** privileged EXEC command.

## system mtu

To set the global maximum packet size or MTU size for switched packets on Gigabit Ethernet and 10-Gigabit Ethernet ports, use the **system mtu** command in global configuration mode. To restore the global MTU value to its default value, use the **no** form of this command.

**system mtu** *bytes*  
**no system mtu**

|                           |                                                                                                                                                                                                                                                                                                                                                        |                              |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <i>bytes</i> The global MTU size in bytes. The range is 1500 to 9198 bytes; the default is 1500 bytes.                                                                                                                                                                                                                                                 |                              |
| <b>Command Default</b>    | The default MTU size for all ports is 1500 bytes.                                                                                                                                                                                                                                                                                                      |                              |
| <b>Command Modes</b>      | Global configuration (config)                                                                                                                                                                                                                                                                                                                          |                              |

Note: this is the Ethernet payload size, not the total Ethernet frame size, which includes the Ethernet header/trailer and possibly other tags, such as ISL or 802.1q tags.</pre> |                              |

## voice-signaling vlan (network-policy configuration)

To create a network-policy profile for the voice-signaling application type, use the **voice-signaling vlan** command in network-policy configuration mode. To delete the policy, use the **no** form of this command.

**voice-signaling vlan** {*vlan-id* [{**cos** *cos-value* | **dscp** *dscp-value*}] | **dot1p** [{**cos** *l2-priority* | **dscp** *dscp*}] | **none** | **untagged**}

| Syntax Description            |                                                                                                                                            |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan-id</i>                | (Optional) The VLAN for voice traffic. The range is 1 to 4094.                                                                             |
| <b>cos</b> <i>cos-value</i>   | (Optional) Specifies the Layer 2 priority class of service (CoS) for the configured VLAN. The range is 0 to 7; the default is 5.           |
| <b>dscp</b> <i>dscp-value</i> | (Optional) Specifies the differentiated services code point (DSCP) value for the configured VLAN. The range is 0 to 63; the default is 46. |
| <b>dot1p</b>                  | (Optional) Configures the phone to use IEEE 802.1p priority tagging and to use VLAN 0 (the native VLAN).                                   |
| <b>none</b>                   | (Optional) Does not instruct the Cisco IP phone about the voice VLAN. The phone uses the configuration from the phone key pad.             |
| <b>untagged</b>               | (Optional) Configures the phone to send untagged voice traffic. This is the default for the phone.                                         |

| Command Default | No network-policy profiles for the voice-signaling application type are defined.<br>The default CoS value is 5.<br>The default DSCP value is 46.<br>The default tagging mode is untagged. |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Command Modes | Network-policy profile configuration |
|---------------|--------------------------------------|
|---------------|--------------------------------------|

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

| Usage Guidelines | <p>Use the <b>network-policy profile</b> global configuration command to create a profile and to enter network-policy profile configuration mode.</p> <p>The voice-signaling application type is for network topologies that require a different policy for voice signaling than for voice media. This application type should not be advertised if all of the same network policies apply as those advertised in the voice policy TLV.</p> <p>When you are in network-policy profile configuration mode, you can create the profile for voice-signaling by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode.</p> <p>These profile attributes are contained in the Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) network-policy time-length-value (TLV).</p> |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To return to privileged EXEC mode from the network-policy profile configuration mode, enter the **exit** command.

This example shows how to configure voice-signaling for VLAN 200 with a priority 2 CoS:

```
(config) # network-policy profile 1  
(config-network-policy) # voice-signaling vlan 200 cos 2
```

This example shows how to configure voice-signaling for VLAN 400 with a DSCP value of 45:

```
(config) # network-policy profile 1  
(config-network-policy) # voice-signaling vlan 400 dscp 45
```

This example shows how to configure voice-signaling for the native VLAN with priority tagging:

```
(config-network-policy) # voice-signaling vlan dot1p cos 4
```

## voice vlan (network-policy configuration)

To create a network-policy profile for the voice application type, use the **voice vlan** command in network-policy configuration mode. To delete the policy, use the **no** form of this command.

**voice vlan** {*vlan-id* [{**cos** *cos-value* | **dscp** *dscp-value*}] | **dot1p** [{**cos** *l2-priority* | **dscp** *dscp*}] | **none** | **untagged**}

| Syntax Description            |                                                                                                                                            |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan-id</i>                | (Optional) The VLAN for voice traffic. The range is 1 to 4094.                                                                             |
| <b>cos</b> <i>cos-value</i>   | (Optional) Specifies the Layer 2 priority class of service (CoS) for the configured VLAN. The range is 0 to 7; the default is 5.           |
| <b>dscp</b> <i>dscp-value</i> | (Optional) Specifies the differentiated services code point (DSCP) value for the configured VLAN. The range is 0 to 63; the default is 46. |
| <b>dot1p</b>                  | (Optional) Configures the phone to use IEEE 802.1p priority tagging and to use VLAN 0 (the native VLAN).                                   |
| <b>none</b>                   | (Optional) Does not instruct the Cisco IP phone about the voice VLAN. The phone uses the configuration from the phone key pad.             |
| <b>untagged</b>               | (Optional) Configures the phone to send untagged voice traffic. This is the default for the phone.                                         |

| Command Default | No network-policy profiles for the voice application type are defined.<br>The default CoS value is 5.<br>The default DSCP value is 46.<br>The default tagging mode is untagged. |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Command Modes | Network-policy profile configuration |
|---------------|--------------------------------------|
|---------------|--------------------------------------|

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

| Usage Guidelines | <p>Use the <b>network-policy profile</b> global configuration command to create a profile and to enter network-policy profile configuration mode.</p> <p>The voice application type is for dedicated IP telephones and similar devices that support interactive voice services. These devices are typically deployed on a separate VLAN for ease of deployment and enhanced security through isolation from data applications.</p> <p>When you are in network-policy profile configuration mode, you can create the profile for voice by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode.</p> <p>These profile attributes are contained in the Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) network-policy time-length-value (TLV).</p> |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To return to privileged EXEC mode from the network-policy profile configuration mode, enter the **exit** command.

This example shows how to configure the voice application type for VLAN 100 with a priority 4 CoS:

```
(config) # network-policy profile 1  
(config-network-policy) # voice vlan 100 cos 4
```

This example shows how to configure the voice application type for VLAN 100 with a DSCP value of 34:

```
(config) # network-policy profile 1  
(config-network-policy) # voice vlan 100 dscp 34
```

This example shows how to configure the voice application type for the native VLAN with priority tagging:

```
(config-network-policy) # voice vlan dot1p cos 4
```

# clear ip nhrp

To clear all dynamic entries from the Next Hop Resolution Protocol (NHRP) cache, use the **clear ip nhrp** command in user EXEC or privileged EXEC mode.

**clear ip nhrp** [{vrf {vrf-name | global}}] [{dest-ip-address [{dest-mask}] | tunnel number | counters [{interface tunnel number}] | stats [{tunnel number [{vrf {vrf-name | global}}]}]]]

## Syntax Description

|                        |                                                                                                                                   |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf</b>             | (Optional) Deletes entries from the NHRP cache for the specified virtual routing and forwarding (VRF) instance.                   |
| <i>vrf-name</i>        | (Optional) Name of the VRF address family to which the command is applied.                                                        |
| <b>global</b>          | (Optional) Specifies the global VRF instance.                                                                                     |
| <i>dest-ip-address</i> | (Optional) Destination IP address. Specifying this argument clears NHRP mapping entries for the specified destination IP address. |
| <i>dest-mask</i>       | (Optional) Destination network mask.                                                                                              |
| <b>counters</b>        | (Optional) Clears the NHRP counters.                                                                                              |
| <b>interface</b>       | (Optional) Clears the NHRP mapping entries for all interfaces.                                                                    |
| <b>tunnel number</b>   | (Optional) Removes the specified interface from the NHRP cache.                                                                   |
| <b>stats</b>           | (Optional) Clears all IPv4 statistic information for all interfaces.                                                              |

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                    | Modification                 |
|----------------------------|------------------------------|
| Cisco IOS XE Denali 16.5.1 | This command was introduced. |

## Usage Guidelines

The **clear ip nhrp** command does not clear any static (configured) IP-to-NBMA address mappings from the NHRP cache.

## Examples

The following example shows how to clear all dynamic entries from the NHRP cache for an interface:

```
Switch# clear ip nhrp
```

## Related Commands

| Command             | Description                        |
|---------------------|------------------------------------|
| <b>show ip nhrp</b> | Displays NHRP mapping information. |

# clear ipv6 access-list

To reset the IPv6 access list match counters, use the **clear ipv6 access-list** command in privileged EXEC mode.

**clear ipv6 access-list** [*access-list-name*]

## Syntax Description

|                         |                                                                                                                                                         |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>access-list-name</i> | (Optional) Name of the IPv6 access list for which to clear the match counters. Names cannot contain a space or quotation mark, or begin with a numeric. |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Default

No reset is initiated.

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **clear ipv6 access-list** command is similar to the **clear ip access-list counters** command, except that it is IPv6-specific.

The **clear ipv6 access-list** command used without the *access-list-name* argument resets the match counters for all IPv6 access lists configured on the router.

This command resets the IPv6 global ACL hardware counters.

## Examples

The following example resets the match counters for the IPv6 access list named marketing:

```
# clear ipv6 access-list marketing
```

## Related Commands

| Command                      | Description                                                                 |
|------------------------------|-----------------------------------------------------------------------------|
| <b>hardware statistics</b>   | Enables the collection of hardware statistics.                              |
| <b>ipv6 access-list</b>      | Defines an IPv6 access list and enters IPv6 access list configuration mode. |
| <b>show ipv6 access-list</b> | Displays the contents of all current IPv6 access lists.                     |

# clear ipv6 dhcp

To clear IPv6 Dynamic Host Configuration Protocol (DHCP) information, use the **clear ipv6 dhcp** command in privileged EXEC mode:

**clear ipv6 dhcp**

## Syntax Description

This command has no arguments or keywords.

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **clear ipv6 dhcp** command deletes DHCP for IPv6 information.

## Examples

The following example :

```
# clear ipv6 dhcp
```

# clear ipv6 dhcp binding

To delete automatic client bindings from the Dynamic Host Configuration Protocol (DHCP) for IPv6 server binding table, use the **clear ipv6 dhcp binding** command in privileged EXEC mode.

**clear ipv6 dhcp binding** [*ipv6-address*] [**vrf** *vrf-name*]

## Syntax Description

|                            |                                                                                                                                                                                                     |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ipv6-address</i>        | (Optional) The address of a DHCP for IPv6 client.<br><br>This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons. |
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.                                                                                                                          |

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **clear ipv6 dhcp binding** command is used as a server function.

A binding table entry on the DHCP for IPv6 server is automatically:

- Created whenever a prefix is delegated to a client from the configuration pool.
- Updated when the client renews, rebinds, or confirms the prefix delegation.
- Deleted when the client releases all the prefixes in the binding voluntarily, all prefixes' valid lifetimes have expired, or an administrator runs the **clear ipv6 dhcp binding** command.

If the **clear ipv6 dhcp binding** command is used with the optional *ipv6-address* argument specified, only the binding for the specified client is deleted. If the **clear ipv6 dhcp binding** command is used without the *ipv6-address* argument, then all automatic client bindings are deleted from the DHCP for IPv6 binding table. If the optional **vrf** *vrf-name* keyword and argument combination is used, only the bindings for the specified VRF are cleared.

## Examples

The following example deletes all automatic client bindings from the DHCP for IPv6 server binding table:

```
# clear ipv6 dhcp binding
```

## Related Commands

| Command                       | Description                                                                     |
|-------------------------------|---------------------------------------------------------------------------------|
| <b>show ipv6 dhcp binding</b> | Displays automatic client bindings from the DHCP for IPv6 server binding table. |

# clear ipv6 dhcp client

To restart the Dynamic Host Configuration Protocol (DHCP) for IPv6 client on an interface, use the **clear ipv6 dhcp client** command in privileged EXEC mode.

**clear ipv6 dhcp client** *interface-type interface-number*

## Syntax Description

*interface-type interface-number*

Interface type and number. For more information, use the question mark (?) online help function.

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **clear ipv6 dhcp client** command restarts the DHCP for IPv6 client on specified interface after first releasing and unconfiguring previously acquired prefixes and other configuration options (for example, Domain Name System [DNS] servers).

## Examples

The following example restarts the DHCP for IPv6 client for Ethernet interface 1/0:

```
# clear ipv6 dhcp client Ethernet 1/0
```

## Related Commands

| Command                         | Description                                   |
|---------------------------------|-----------------------------------------------|
| <b>show ipv6 dhcp interface</b> | Displays DHCP for IPv6 interface information. |

# clear ipv6 dhcp conflict

To clear an address conflict from the Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server database, use the **clear ipv6 dhcp conflict** command in privileged EXEC mode.

**clear ipv6 dhcp conflict** *{\*ipv6-address | vrf vrf-name}*

## Syntax Description

|                            |                                                                     |
|----------------------------|---------------------------------------------------------------------|
| <b>*</b>                   | Clears all address conflicts.                                       |
| <i>ipv6-address</i>        | Clears the host IPv6 address that contains the conflicting address. |
| <b>vrf</b> <i>vrf-name</i> | Specifies a virtual routing and forwarding (VRF) name.              |

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

When you configure the DHCPv6 server to detect conflicts, it uses ping. The client uses neighbor discovery to detect clients and reports to the server through a DECLINE message. If an address conflict is detected, the address is removed from the pool, and the address is not assigned until the administrator removes the address from the conflict list.

If you use the asterisk (\*) character as the address parameter, DHCP clears all conflicts.

If the **vrf** *vrf-name* keyword and argument are specified, only the address conflicts that belong to the specified VRF will be cleared.

## Examples

The following example shows how to clear all address conflicts from the DHCPv6 server database:

```
# clear ipv6 dhcp conflict *
```

## Related Commands

| Command                        | Description                                                                                   |
|--------------------------------|-----------------------------------------------------------------------------------------------|
| <b>show ipv6 dhcp conflict</b> | Displays address conflicts found by a DHCPv6 server when addresses are offered to the client. |

# clear ipv6 dhcp relay binding

To clear an IPv6 address or IPv6 prefix of a Dynamic Host Configuration Protocol (DHCP) for IPv6 relay binding, use the **clear ipv6 dhcp relay binding** command in privileged EXEC mode.

```
clear ipv6 dhcp relay binding {vrf vrf-name} { *ipv6-addressipv6-prefix }
```

```
clear ipv6 dhcp relay binding {vrf vrf-name} { * ipv6-prefix }
```

## Syntax Description

|                            |                                                                 |
|----------------------------|-----------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i> | Specifies a virtual routing and forwarding (VRF) configuration. |
| <b>*</b>                   | Clears all DHCPv6 relay bindings.                               |
| <i>ipv6-address</i>        | DHCPv6 address.                                                 |
| <i>ipv6-prefix</i>         | IPv6 prefix.                                                    |

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **clear ipv6 dhcp relay binding** command deletes a specific IPv6 address or IPv6 prefix of a DHCP for IPv6 relay binding. If no relay client is specified, no binding is deleted.

## Examples

The following example shows how to clear the binding for a client with a specified IPv6 address:

```
# clear ipv6 dhcp relay binding 2001:0DB8:3333:4::5
```

The following example shows how to clear the binding for a client with the VRF name vrf1 and a specified prefix on a Cisco uBR10012 universal broadband device:

```
# clear ipv6 dhcp relay binding vrf vrf1 2001:DB8:0:1::/64
```

## Related Commands

| Command                             | Description                                                     |
|-------------------------------------|-----------------------------------------------------------------|
| <b>show ipv6 dhcp relay binding</b> | Displays DHCPv6 IANA and DHCPv6 IAPD bindings on a relay agent. |

## clear ipv6 eigrp

To delete entries from Enhanced Interior Gateway Routing Protocol (EIGRP) for IPv6 routing tables, use the **clear ipv6 eigrp** command in privileged EXEC mode.

**clear ipv6 eigrp** [*as-number*] [**neighbor** [{*ipv6-address* | *interface-type interface-number*}]]

### Syntax Description

|                         |                                                         |
|-------------------------|---------------------------------------------------------|
| <i>as-number</i>        | (Optional) Autonomous system number.                    |
| <b>neighbor</b>         | (Optional) Deletes neighbor router entries.             |
| <i>ipv6-address</i>     | (Optional) IPv6 address of a neighboring router.        |
| <i>interface-type</i>   | (Optional) The interface type of the neighbor router.   |
| <i>interface-number</i> | (Optional) The interface number of the neighbor router. |

### Command Modes

Privileged EXEC (#)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Use the **clear ipv6 eigrp** command without any arguments or keywords to clear all EIGRP for IPv6 routing table entries. Use the *as-number* argument to clear routing table entries on a specified process, and use the **neighbor***ipv6-address* keyword and argument, or the *interface-type**interface-number* argument, to remove a specific neighbor from the neighbor table.

### Examples

The following example removes the neighbor whose IPv6 address is 3FEE:12E1:2AC1:EA32:

```
# clear ipv6 eigrp neighbor 3FEE:12E1:2AC1:EA32
```

# clear ipv6 mfib counters

To reset all active Multicast Forwarding Information Base (MFIB) traffic counters, use the **clear ipv6 mfib counters** command in privileged EXEC mode.

**clear ipv6 mfib** [**vrf** *vrf-name*] **counters** [{*group-name* | *group-address* [{*source-address* | *source-name*}]}]

## Syntax Description

|                                            |                                                                            |
|--------------------------------------------|----------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i>                 | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |
| <i>group-name</i>   <i>group-address</i>   | (Optional) IPv6 address or name of the multicast group.                    |
| <i>source-address</i>   <i>source-name</i> | (Optional) IPv6 address or name of the source.                             |

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

After you enable the **clear ipv6 mfib counters** command, you can determine if additional traffic is forwarded by using one of the following show commands that display traffic counters:

- **show ipv6 mfib**
- **show ipv6 mfib active**
- **show ipv6 mfib count**
- **show ipv6 mfib interface**
- **show ipv6 mfib summary**

## Examples

The following example clears and resets all MFIB traffic counters:

```
# clear ipv6 mfib counters
```

# clear ipv6 mld counters

To clear the Multicast Listener Discovery (MLD) interface counters, use the **clear ipv6 mld counters** command in privileged EXEC mode.

**clear ipv6 mld** [**vrf** *vrf-name*] **counters** [*interface-type*]

## Syntax Description

|                            |                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.                       |
| <i>interface-type</i>      | (Optional) Interface type. For more information, use the question mark (?) online help function. |

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **clear ipv6 mld counters** command to clear the MLD counters, which keep track of the number of joins and leaves received. If you omit the optional *interface-type* argument, the **clear ipv6 mld counters** command clears the counters on all interfaces.

## Examples

The following example clears the counters for Ethernet interface 1/0:

```
# clear ipv6 mld counters Ethernet1/0
```

## Related Commands

| Command                        | Description                                                |
|--------------------------------|------------------------------------------------------------|
| <b>show ipv6 mld interface</b> | Displays multicast-related information about an interface. |

# clear ipv6 mld traffic

To reset the Multicast Listener Discovery (MLD) traffic counters, use the **clear ipv6 mld traffic** command in privileged EXEC mode.

**clear ipv6 mld** [**vrf vrf-name**] **traffic**

## Syntax Description

|                     |                                                                            |
|---------------------|----------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |
|---------------------|----------------------------------------------------------------------------|

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Using the **clear ipv6 mld traffic** command will reset all MLD traffic counters.

## Examples

The following example resets the MLD traffic counters:

```
# clear ipv6 mld traffic
```

| Command                      | Description                        |
|------------------------------|------------------------------------|
| <b>show ipv6 mld traffic</b> | Displays the MLD traffic counters. |

# clear ipv6 mtu

To clear the maximum transmission unit (MTU) cache of messages, use the **clear ipv6 mtu** command in privileged EXEC mode.

**clear ipv6 mtu**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Messages are not cleared from the MTU cache.

**Command Modes** Privileged EXEC (#)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** If a router is flooded with ICMPv6 toobig messages, the router is forced to create an unlimited number of entries in the MTU cache until all available memory is consumed. Use the **clear ipv6 mtu** command to clear messages from the MTU cache.

**Examples** The following example clears the MTU cache of messages:

```
# clear ipv6 mtu
```

| Related Commands | Command      | Description                                                                      |
|------------------|--------------|----------------------------------------------------------------------------------|
|                  | ipv6 flowset | Configures flow-label marking in 1280-byte or larger packets sent by the router. |

# clear ipv6 multicast aaa authorization

To clear authorization parameters that restrict user access to an IPv6 multicast network, use the **clear ipv6 multicast aaa authorization** command in privileged EXEC mode.

**clear ipv6 multicast aaa authorization** [*interface-type interface-number*]

## Syntax Description

*interface-type interface-number*

Interface type and number. For more information, use the question mark (?) online help function.

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Using the **clear ipv6 multicast aaa authorization** command without the optional *interface-type* and *interface-number* arguments will clear all authorization parameters on a network.

## Examples

The following example clears all configured authorization parameters on an IPv6 network:

```
# clear ipv6 multicast aaa authorization FastEthernet 1/0
```

## Related Commands

| Command                                    | Description                                                             |
|--------------------------------------------|-------------------------------------------------------------------------|
| <b>aaa authorization multicast default</b> | Sets parameters that restrict user access to an IPv6 multicast network. |

# clear ipv6 nd destination

To clear IPv6 host-mode destination cache entries, use the **clear ipv6 nd destination** command in privileged EXEC mode.

**clear ipv6 nd destination**[*vrf vrf-name*]

## Syntax Description

|                            |                                                                            |
|----------------------------|----------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |
|----------------------------|----------------------------------------------------------------------------|

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **clear ipv6 nd destination** command clears IPv6 host-mode destination cache entries. If the **vrf** *vrf-name* keyword and argument pair is used, then only information about the specified VRF is cleared.

## Examples

The following example shows how to clear IPv6 host-mode destination cache entries:

```
# clear ipv6 nd destination
```

## Related Commands

| Command                         | Description                                        |
|---------------------------------|----------------------------------------------------|
| <b>ipv6 nd host mode strict</b> | Enables the conformant, or strict, IPv6 host mode. |

# clear ipv6 nd on-link prefix

To clear on-link prefixes learned through router advertisements (RAs), use the **clear ipv6 nd on-link prefix** command in privileged EXEC mode.

**clear ipv6 nd on-link prefix**[vrf *vrf-name*]

|                           |                                                                                                       |

# clear ipv6 nd router

To clear neighbor discovery (ND) device entries learned through router advertisements (RAs), use the **clear ipv6 nd router** command in privileged EXEC mode.

**clear ipv6 nd router**[*vrf vrf-name*]

## Syntax Description

|                            |                                                                            |
|----------------------------|----------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |
|----------------------------|----------------------------------------------------------------------------|

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **clear ipv6 nd router** command to clear ND device entries learned through RAs. If the **vrf vrf-name** keyword and argument pair is used, then only information about the specified VRF is cleared.

## Examples

The following example shows how to clear neighbor discovery ND device entries learned through RAs:

```
# clear ipv6 nd router
```

## Related Commands

| Command                         | Description                                        |
|---------------------------------|----------------------------------------------------|
| <b>ipv6 nd host mode strict</b> | Enables the conformant, or strict, IPv6 host mode. |

# clear ipv6 neighbors

To delete all entries in the IPv6 neighbor discovery cache, except static entries and ND cache entries on non-virtual routing and forwarding (VRF) interfaces, use the **clear ipv6 neighbors** command in privileged EXEC mode.

```
clear ipv6 neighbors [{interface type number[ipv6 ipv6-address] | statistics | vrf table-name
[ipv6-address | statistics]}]
```

**clear ipv6 neighbors**

| Syntax Description                  |  |                                                                                                                         |
|-------------------------------------|--|-------------------------------------------------------------------------------------------------------------------------|
| <b>interface</b> <i>type number</i> |  | (Optional) Clears the IPv6 neighbor discovery cache in the specified interface.                                         |
| <b>ipv6</b> <i>ipv6-address</i>     |  | (Optional) Clears the IPv6 neighbor discovery cache that matches the specified IPv6 address on the specified interface. |
| <b>statistics</b>                   |  | (Optional) Clears the IPv6 neighbor discovery entry cache.                                                              |
| <b>vrf</b>                          |  | (Optional) Clears entries for a virtual private network (VPN) routing or forwarding instance.                           |
| <i>table-name</i>                   |  | (Optional) Table name or identifier. The value range is from 0x0 to 0xFFFFFFFF (0 to 65535 in decimal).                 |

**Command Modes** Privileged EXEC (#)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **clear ipv6 neighbor** command clears ND cache entries. If the command is issued without the **vrf** keyword, then the command clears ND cache entries on interfaces associated with the default routing table (e.g., those interfaces that do not have a **vrf forwarding** statement). If the command is issued with the **vrf** keyword, then it clears ND cache entries on interfaces associated with the specified VRF.

## Examples

The following example deletes all entries, except static entries and ND cache entries on non-VRF interfaces, in the neighbor discovery cache:

```
# clear ipv6 neighbors
```

The following example clears all IPv6 neighbor discovery cache entries, except static entries and ND cache entries on non-VRF interfaces, on Ethernet interface 0/0:

```
# clear ipv6 neighbors interface Ethernet 0/0
```

The following example clears a neighbor discovery cache entry for 2001:0DB8:1::1 on Ethernet interface 0/0:

```
# clear ipv6 neighbors interface Ethernet0/0 ipv6 2001:0DB8:1::1
```

In the following example, interface Ethernet 0/0 is associated with the VRF named red. Interfaces Ethernet 1/0 and Ethernet 2/0 are associated with the default routing table (because they are not associated with a VRF). Therefore, the **clear ipv6 neighbor** command will clear ND cache entries on interfaces Ethernet 1/0 and Ethernet 2/0 only. In order to clear ND cache entries on interface Ethernet 0/0, the user must issue the **clear ipv6 neighbor vrf red** command.

```
interface ethernet0/0
  vrf forward red
  ipv6 address 2001:db8:1::1/64

interface ethernet1/0
  ipv6 address 2001:db8:2::1/64

interface ethernet2/0
  ipv6 address 2001:db8:3::1/64
```

#### Related Commands

| Command                    | Description                                                     |
|----------------------------|-----------------------------------------------------------------|
| <b>ipv6 neighbor</b>       | Configures a static entry in the IPv6 neighbor discovery cache. |
| <b>show ipv6 neighbors</b> | Displays IPv6 neighbor discovery cache information.             |

# clear ipv6 nhrp

To clear all dynamic entries from the Next Hop Resolution Protocol (NHRP) cache, use the **clear ipv6 nhrp** command in privileged EXEC mode.

**clear ipv6 nhrp** [{*ipv6-address* | **counters**}]

## Syntax Description

|                     |                                               |
|---------------------|-----------------------------------------------|
| <i>ipv6-address</i> | (Optional) The IPv6 network to delete.        |
| <b>counters</b>     | (Optional) Specifies NHRP counters to delete. |

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

This command does not clear any static (configured) IPv6-to-nonbroadcast multiaccess (NBMA) address mappings from the NHRP cache.

## Examples

The following example shows how to clear all dynamic entries from the NHRP cache for the interface:

```
# clear ipv6 nhrp
```

## Related Commands

| Command               | Description              |
|-----------------------|--------------------------|
| <b>show ipv6 nhrp</b> | Displays the NHRP cache. |

# clear ipv6 ospf

To clear the Open Shortest Path First (OSPF) state based on the OSPF routing process ID, use the **clear ipv6 ospf** command in privileged EXEC mode.

**clear ipv6 ospf** [*process-id*] {**process** | **force-spf** | **redistribution**}

## Syntax Description

|                       |                                                                                                                                                                                                  |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>process-id</i>     | (Optional) Internal identification. It is locally assigned and can be any positive integer. The number used here is the number assigned administratively when enabling the OSPF routing process. |
| <b>process</b>        | Restarts the OSPF process.                                                                                                                                                                       |
| <b>force-spf</b>      | Starts the shortest path first (SPF) algorithm without first clearing the OSPF database.                                                                                                         |
| <b>redistribution</b> | Clears OSPF route redistribution.                                                                                                                                                                |

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

When the **process** keyword is used with the **clear ipv6 ospf** command, the OSPF database is cleared and repopulated, and then the shortest path first (SPF) algorithm is performed. When the **force-spf** keyword is used with the **clear ipv6 ospf** command, the OSPF database is not cleared before the SPF algorithm is performed.

Use the *process-id* option to clear only one OSPF process. If the *process-id* option is not specified, all OSPF processes are cleared.

## Examples

The following example starts the SPF algorithm without clearing the OSPF database:

```
# clear ipv6 ospf force-spf
```

# clear ipv6 ospf counters

To clear the Open Shortest Path First (OSPF) state based on the OSPF routing process ID, use the **clear ipv6 ospf** command in privileged EXEC mode.

**clear ipv6 ospf** [*process-id*] **counters** [**neighbor** [{*neighbor-interface* *neighbor-id*}]]

| Syntax Description        |  |                                                                                                                                                                                                  |
|---------------------------|--|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>process-id</i>         |  | (Optional) Internal identification. It is locally assigned and can be any positive integer. The number used here is the number assigned administratively when enabling the OSPF routing process. |
| <b>neighbor</b>           |  | (Optional) Neighbor statistics per interface or neighbor ID.                                                                                                                                     |
| <i>neighbor-interface</i> |  | (Optional) Neighbor interface.                                                                                                                                                                   |
| <i>neighbor-id</i>        |  | (Optional) IPv6 or IP address of the neighbor.                                                                                                                                                   |

**Command Modes** Privileged EXEC (#)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Use the **neighbor neighbor-interface** option to clear counters for all neighbors on a specified interface. If the **neighbor neighbor-interface** option is not used, all OSPF counters are cleared.

Use the **neighbor neighbor-id** option to clear counters at a specified neighbor. If the **neighbor neighbor-id** option is not used, all OSPF counters are cleared.

## Examples

The following example provides detailed information on a neighbor router:

```
# show ipv6 ospf neighbor detail
Neighbor 10.0.0.1
  In the area 1 via interface Serial19/0
  Neighbor:interface-id 21, link-local address FE80::A8BB:CCFF:FE00:6F00
  Neighbor priority is 1, State is FULL, 6 state changes
  Options is 0x194AE05
  Dead timer due in 00:00:37
  Neighbor is up for 00:00:15
  Index 1/1/1, retransmission queue length 0, number of retransmission 1
  First 0x0(0)/0x0(0)/0x0(0) Next 0x0(0)/0x0(0)/0x0(0)
  Last retransmission scan length is 1, maximum is 1
  Last retransmission scan time is 0 msec, maximum is 0 msec
```

The following example clears all neighbors on the specified interface:

```
# clear ipv6 ospf counters neighbor s19/0
```

The following example now shows that there have been 0 state changes since the **clear ipv6 ospf counters neighbor s19/0** command was used:

## # show ipv6 ospf neighbor detail

```

Neighbor 10.0.0.1
  In the area 1 via interface Serial19/0
  Neighbor:interface-id 21, link-local address FE80::A8BB:CCFF:FE00:6F00
  Neighbor priority is 1, State is FULL, 0 state changes
  Options is 0x194AE05
  Dead timer due in 00:00:39
  Neighbor is up for 00:00:43
  Index 1/1/1, retransmission queue length 0, number of retransmission 1
  First 0x0(0)/0x0(0)/0x0(0) Next 0x0(0)/0x0(0)/0x0(0)
  Last retransmission scan length is 1, maximum is 1
  Last retransmission scan time is 0 msec, maximum is 0 msec

```

|--------------------------------|--------------------------------------------------------------|
| <b>show ipv6 ospf neighbor</b> | Displays OSPF neighbor information on a per-interface basis. |

# clear ipv6 ospf events

To clear the Open Shortest Path First (OSPF) for IPv6 event log content based on the OSPF routing process ID, use the **clear ipv6 ospf events** command in privileged EXEC mode.

**clear ipv6 ospf** [*process-id*] **events**

## Syntax Description

|                   |                                                                                                                                                                                                  |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>process-id</i> | (Optional) Internal identification. It is locally assigned and can be any positive integer. The number used here is the number assigned administratively when enabling the OSPF routing process. |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the optional *process-id* argument to clear the IPv6 event log content of a specified OSPF routing process. If the *process-id* argument is not used, all event log content is cleared.

## Examples

The following example enables the clearing of OSPF for IPv6 event log content for routing process 1:

```
# clear ipv6 ospf 1 events
```

# clear ipv6 pim reset

To delete all entries from the topology table and reset the Multicast Routing Information Base (MRIB) connection, use the **clear ipv6 pim reset** command in privileged EXEC mode.

**clear ipv6 pim** [*vrf vrf-name*] **reset**

## Syntax Description

|                            |                                                                            |
|----------------------------|----------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |
|----------------------------|----------------------------------------------------------------------------|

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Using the **clear ipv6 pim reset** command breaks the PIM-MRIB connection, clears the topology table, and then reestablishes the PIM-MRIB connection. This procedure forces MRIB resynchronization.

### Caution

Use the **clear ipv6 pim reset** command with caution, as it clears all PIM protocol information from the PIM topology table. Use of the **clear ipv6 pim reset** command should be reserved for situations where PIM and MRIB communication are malfunctioning.

## Examples

The following example deletes all entries from the topology table and resets the MRIB connection:

```
# clear ipv6 pim reset
```

# clear ipv6 pim topology

To clear the Protocol Independent Multicast (PIM) topology table, use the **clear ipv6 pim topology** command in privileged EXEC mode.

**clear ipv6 pim** [**vrf** *vrf-name*] **topology** [{*group-name**group-address*}]

|                           |                                                                                                                                                                                                                                       |                                                                            |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>vrf</b> <i>vrf-name</i>                                                                                                                                                                                                            | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |
|                           | <i>group-name</i>   <i>group-address</i>                                                                                                                                                                                              | (Optional) IPv6 address or name of the multicast group.                    |
| <b>Command Default</b>    | When the command is used with no arguments, all group entries located in the PIM topology table are cleared of PIM protocol information.                                                                                              |                                                                            |
| <b>Command Modes</b>      | Privileged EXEC (#)                                                                                                                                                                                                                   |                                                                            |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                                        | <b>Modification</b>                                                        |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                          | This command was introduced.                                               |
| <b>Usage Guidelines</b>   | This command clears PIM protocol information from all group entries located in the PIM topology table. Information obtained from the MRIB table is retained. If a multicast group is specified, only those group entries are cleared. |                                                                            |
| <b>Examples</b>           | The following example clears all group entries located in the PIM topology table:<br><br><pre># clear ipv6 pim topology</pre>                                                                                                         |                                                                            |

# clear ipv6 pim traffic

To clear the Protocol Independent Multicast (PIM) traffic counters, use the **clear ipv6 pim traffic** command in privileged EXEC mode.

**clear ipv6 pim** [**vrf vrf-name**] **traffic**

## Syntax Description

|                     |                                                                            |
|---------------------|----------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |
|---------------------|----------------------------------------------------------------------------|

## Command Default

When the command is used with no arguments, all traffic counters are cleared.

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

This command clears PIM traffic counters. If the **vrf vrf-name** keyword and argument are used, only those counters are cleared.

## Examples

The following example clears all PIM traffic counter:

```
# clear ipv6 pim traffic
```

# clear ipv6 prefix-list

To reset the hit count of the IPv6 prefix list entries, use the **clear ipv6 prefix-list** command in privileged EXEC mode.

**clear ipv6 prefix-list** [*prefix-list-name*] [*ipv6-prefix/prefix-length*]

|                           |                         |                                                                                                                                                                                                                                           |
|---------------------------|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>prefix-list-name</i> | (Optional) The name of the prefix list from which the hit count is to be cleared.                                                                                                                                                         |
|                           | <i>ipv6-prefix</i>      | (Optional) The IPv6 network from which the hit count is to be cleared.<br><br>This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.                  |
|                           | <i>/ prefix-length</i>  | (Optional) The length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value. |

**Command Default** The hit count is automatically cleared for all IPv6 prefix lists.

**Command Modes** Privileged EXEC (#)

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **clear ipv6 prefix-list** command is similar to the **clear ip prefix-list** command, except that it is IPv6-specific.

The hit count is a value indicating the number of matches to a specific prefix list entry.

## Examples

The following example clears the hit count from the prefix list entries for the prefix list named `first_list` that match the network mask `2001:0DB8::/35`.

```
# clear ipv6 prefix-list first_list 2001:0DB8::/35
```

|                         |                                         |                                                                                |
|-------------------------|-----------------------------------------|--------------------------------------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>                          | <b>Description</b>                                                             |
|                         | <b>ipv6 prefix-list</b>                 | Creates an entry in an IPv6 prefix list.                                       |
|                         | <b>ipv6 prefix-list sequence-number</b> | Enables the generation of sequence numbers for entries in an IPv6 prefix list. |
|                         | <b>show ipv6 prefix-list</b>            | Displays information about an IPv6 prefix list or prefix list entries.         |

# clear ipv6 rip

To delete routes from the IPv6 Routing Information Protocol (RIP) routing table, use the **clear ipv6 rip** command in privileged EXEC mode.

**clear ipv6 rip** [*name*][*vrf vrf-name*]

**clear ipv6 rip** [*name*]

## Syntax Description

|                            |                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------|
| <i>name</i>                | (Optional) Name of an IPv6 RIP process.                                                          |
| <b>vrf</b> <i>vrf-name</i> | (Optional) Clears information about the specified Virtual Routing and Forwarding (VRF) instance. |

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

When the *name* argument is specified, only routes for the specified IPv6 RIP process are deleted from the IPv6 RIP routing table. If no *name* argument is specified, all IPv6 RIP routes are deleted.

Use the **show ipv6 rip** command to display IPv6 RIP routes.

Use the **clear ipv6 rip name vrf vrf-name** command to delete the specified VRF instances for the specified IPv6 RIP process.

## Examples

The following example deletes all the IPv6 routes for the RIP process called one:

```
# clear ipv6 rip one
```

The following example deletes the IPv6 VRF instance, called vrf1 for the RIP process, called one:

```
# clear ipv6 rip one vrf vrf1
```

```
*Mar 15 12:36:17.022: RIPng: Deleting 2001:DB8::/32
*Mar 15 12:36:17.022: [Exec]IPv6RT[vrf1]: rip <name>, Delete all next-hops for 2001:DB8::1
*Mar 15 12:36:17.022: [Exec]IPv6RT[vrf1]: rip <name>, Delete 2001:DB8::1 from table
*Mar 15 12:36:17.022: [IPv6 RIB Event Handler]IPv6RT[<red>]: Event: 2001:DB8::1, Del, owner
rip, previous None
```

## Related Commands

| <b>debug ipv6 rip</b>           | Displays the current contents of the IPv6 RIP routing table. |
| <b>ipv6 rip vrf-mode enable</b> | Enables VRF-aware support for IPv6 RIP.                      |
| <b>show ipv6 rip</b>            | Displays the current content of the IPv6 RIP routing table.  |

# clear ipv6 route

To delete routes from the IPv6 routing table, use the **clear ipv6 route** command in privileged EXEC mode.

**{clear ipv6 route {ipv6-addressipv6-prefix/prefix-length} | \*}**

## Syntax Description

|                        |                                                                                                                                                                                                                                |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ipv6-address</i>    | The address of the IPv6 network to delete from the table.<br><br>This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.                    |
| <i>ipv6-prefix</i>     | The IPv6 network number to delete from the table.<br><br>This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.                            |
| <i>/ prefix-length</i> | The length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value. |
| <i>*</i>               | Clears all IPv6 routes.                                                                                                                                                                                                        |

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **clear ipv6 route** command is similar to the **clear ip route** command, except that it is IPv6-specific.

When the *ipv6-address* or *ipv6-prefix/ prefix-length* argument is specified, only that route is deleted from the IPv6 routing table. When the **\*** keyword is specified, all routes are deleted from the routing table (the per-destination maximum transmission unit [MTU] cache is also cleared).

## Examples

The following example deletes the IPv6 network 2001:0DB8::/35:

```
# clear ipv6 route 2001:0DB8::/35
```

## Related Commands

| Command                | Description                                              |
|------------------------|----------------------------------------------------------|
| <b>ipv6 route</b>      | Establishes static IPv6 routes.                          |
| <b>show ipv6 route</b> | Displays the current contents of the IPv6 routing table. |

# clear ipv6 spd

To clear the most recent Selective Packet Discard (SPD) state transition, use the **clear ipv6 spd** command in privileged EXEC mode.

**clear ipv6 spd**

## Syntax Description

This command has no arguments or keywords.

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **clear ipv6 spd** command removes the most recent SPD state transition and any trend historical data.

## Examples

The following example shows how to clear the most recent SPD state transition:

```
# clear ipv6 spd
```

# debug nhrp

To enable Next Hop Resolution Protocol (NHRP) debugging, use the **debug nhrp** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

**debug nhrp** [{**attribute** | **cache** | **condition** {**interface** **tunnel** *number* | **peer** {**nbma** {*ipv4-nbma-address* *nbma-name* *ipv6-nbma-address*} } | **unmatched** | **vrf** *vrf-name*} | **detail** | **error** | **extension** | **group** | **packet** | **rate**}]

**no debug nhrp** [{**attribute** | **cache** | **condition** {**interface** **tunnel** *number* | **peer** {**nbma** {*ipv4-nbma-address* *nbma-name* *ipv6-nbma-address*} } | **unmatched** | **vrf** *vrf-name*} | **detail** | **error** | **extension** | **group** | **packet** | **rate**}]

## Syntax Description

|                                       |                                                                                               |
|---------------------------------------|-----------------------------------------------------------------------------------------------|
| <b>attribute</b>                      | (Optional) Enables NHRP attribute debugging operations.                                       |
| <b>cache</b>                          | (Optional) Enables NHRP cache debugging operations.                                           |
| <b>condition</b>                      | (Optional) Enables NHRP conditional debugging operations.                                     |
| <b>interface tunnel</b> <i>number</i> | (Optional) Enables debugging operations for the tunnel interface.                             |
| <b>nbma</b>                           | (Optional) Enables debugging operations for the non-broadcast multiple access (NBMA) network. |
| <i>ipv4-nbma-address</i>              | (Optional) Enables debugging operations based on the IPv4 address of the NBMA network.        |
| <i>nbma-name</i>                      | (Optional) NBMA network name.                                                                 |
| <i>IPv6-address</i>                   | (Optional) Enables debugging operations based on the IPv6 address of the NBMA network.        |
| <b>vrf</b> <i>vrf-name</i>            | (Optional) Enables debugging operations for the virtual routing and forwarding instance.      |
| <b>detail</b>                         | (Optional) Displays detailed logs of NHRP debugs.                                             |
| <b>error</b>                          | (Optional) Enables NHRP error debugging operations.                                           |
| <b>extension</b>                      | (Optional) Enables NHRP extension processing debugging operations.                            |
| <b>group</b>                          | (Optional) Enables NHRP group debugging operations.                                           |
| <b>packet</b>                         | (Optional) Enables NHRP activity debugging.                                                   |
| <b>rate</b>                           | (Optional) Enables NHRP rate limiting.                                                        |
| <b>routing</b>                        | (Optional) Enables NHRP routing debugging operations.                                         |

## Command Default

NHRP debugging is not enabled.

## Command Modes

Privileged EXEC (#)

**Command History**

| Release                    | Modification                 |
|----------------------------|------------------------------|
| Cisco IOS XE Denali 16.5.1 | This command was introduced. |

**Usage Guidelines**

Use the **debug nhrp detail** command to view the NHRP attribute logs.

The **Virtual-Access number** keyword-argument pair is visible only if the virtual access interface is available on the device.

**Examples**

The following sample output from the **debug nhrp** command displays NHRP debugging output for IPv4:

```
Switch# debug nhrp
```

```
Aug 9 13:13:41.486: NHRP: Attempting to send packet via DEST 10.1.1.99
Aug 9 13:13:41.486: NHRP: Encapsulation succeeded. Tunnel IP addr 10.11.11.99
Aug 9 13:13:41.486: NHRP: Send Registration Request via Tunnel0 vrf 0, packet size: 105
Aug 9 13:13:41.486:      src: 10.1.1.11, dst: 10.1.1.99
Aug 9 13:13:41.486: NHRP: 105 bytes out Tunnel0
Aug 9 13:13:41.486: NHRP: Receive Registration Reply via Tunnel0 vrf 0, packet size: 125
Aug 9 13:13:41.486: NHRP: netid_in = 0, to_us = 1
```

**Related Commands**

| Command             | Description                        |

| <b>show ip nhrp</b> | Displays NHRP mapping information. |

# fhrp delay

To specify the delay period for the initialization of First Hop Redundancy Protocol (FHRP) clients, use the **fhrp delay** command in interface configuration mode. To remove the delay period specified, use the **no** form of this command.

**fhrp delay** {[**minimum**] [**reload**] *seconds*}  
**no fhrp delay** {[**minimum**] [**reload**] *seconds*}

|                           |                |                                                                              |
|---------------------------|----------------|------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>minimum</b> | (Optional) Configures the delay period after an interface becomes available. |
|                           | <b>reload</b>  | (Optional) Configures the delay period after the device reloads.             |
|                           | <i>seconds</i> | Delay period in seconds. The range is from 0 to 3600.                        |

**Command Default** None

**Command Modes** Interface configuration (config-if)

**Examples** This example shows how to specify the delay period for the initialization of FHRP clients:

```
Device(config-if)# fhrp delay minimum 90
```

|                         |                  |                                                            |

| <b>Related Commands</b> | <b>Command</b>   | <b>Description</b>                                         |
|                         | <b>show fhrp</b> | Displays First Hop Redundancy Protocol (FHRP) information. |

## fhrp version vrrp v3

To enable Virtual Router Redundancy Protocol version 3 (VRRPv3) and Virtual Router Redundancy Service (VRRS) configuration on a device, use the **fhrp version vrrp v3** command in global configuration mode. To disable the ability to configure VRRPv3 and VRRS on a device, use the **no** form of this command.

**fhrp version vrrp v3**  
**no fhrp version vrrp v3**

|                           |                                                                |
|---------------------------|----------------------------------------------------------------|
| <b>Syntax Description</b> | This command has no keywords or arguments.                     |
| <b>Command Default</b>    | VRRPv3 and VRRS configuration on a device is not enabled.      |
| <b>Command Modes</b>      | Global configuration (config)                                  |
| <b>Usage Guidelines</b>   | When VRRPv3 is in use, VRRP version 2 (VRRPv2) is unavailable. |

### Examples

In the following example, a tracking process is configured to track the state of an IPv6 object using a VRRPv3 group. VRRP on GigabitEthernet interface 0/0/0 then registers with the tracking process to be informed of any changes to the IPv6 object on the VRRPv3 group. If the IPv6 object state on serial interface VRRPv3 goes down, then the priority of the VRRP group is reduced by 20:

```
Device(config)# fhrp version vrrp v3
Device(config)# interface GigabitEthernet 0/0/0
Device(config-if)# vrrp 1 address-family ipv6
Device(config-if-vrrp)# track 1 decrement 20
```

|---------------------|-------------------------------------------------------|
| <b>track (VRRP)</b> | Enables an object to be tracked using a VRRPv3 group. |

# ip address dhcp

To acquire an IP address on an interface from the DHCP, use the **ip address dhcp** command in interface configuration mode. To remove any address that was acquired, use the **no** form of this command.

**ip address dhcp** [**client-id** *interface-type number*] [**hostname** *hostname*]  
**no ip address dhcp** [**client-id** *interface-type number*] [**hostname** *hostname*]

## Syntax Description

|                       |                                                                                                                                                                                                                                      |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>client-id</b>      | (Optional) Specifies the client identifier. By default, the client identifier is an ASCII value. The <b>client-id interface-type number</b> option sets the client identifier to the hexadecimal MAC address of the named interface. |
| <i>interface-type</i> | (Optional) Interface type. For more information, use the question mark (?) online help function.                                                                                                                                     |
| <i>number</i>         | (Optional) Interface or subinterface number. For more information about the numbering syntax for your networking device, use the question mark (?) online help function.                                                             |
| <b>hostname</b>       | (Optional) Specifies the hostname.                                                                                                                                                                                                   |
| <i>hostname</i>       | (Optional) Name of the host to be placed in the DHCP option 12 field. This name need not be the same as the hostname entered in global configuration mode.                                                                           |

## Command Default

The hostname is the globally configured hostname of the device. The client identifier is an ASCII value.

## Command Modes

Interface configuration (config-if)

## Usage Guidelines

The **ip address dhcp** command allows any interface to dynamically learn its IP address by using the DHCP protocol. It is especially useful on Ethernet interfaces that dynamically connect to an Internet service provider (ISP). Once assigned a dynamic address, the interface can be used with the Port Address Translation (PAT) of Cisco IOS Network Address Translation (NAT) to provide Internet access to a privately addressed network attached to the device.

The **ip address dhcp** command also works with ATM point-to-point interfaces and will accept any encapsulation type. However, for ATM multipoint interfaces you must specify Inverse ARP via the **protocol ip inarp** interface configuration command and use only the aa15snap encapsulation type.

Some ISPs require that the DHCPDISCOVER message have a specific hostname and client identifier that is the MAC address of the interface. The most typical usage of the **ip address dhcp client-id interface-type number hostname hostname** command is when *interface-type* is the Ethernet interface where the command is configured and *interface-type number* is the hostname provided by the ISP.

A client identifier (DHCP option 61) can be a hexadecimal or an ASCII value. By default, the client identifier is an ASCII value. The **client-id interface-type number** option overrides the default and forces the use of the hexadecimal MAC address of the named interface.

If a Cisco device is configured to obtain its IP address from a DHCP server, it sends a DHCPDISCOVER message to provide information about itself to the DHCP server on the network.

If you use the **ip address dhcp** command with or without any of the optional keywords, the DHCP option 12 field (hostname option) is included in the DISCOVER message. By default, the hostname specified in option 12 will be the globally configured hostname of the device. However, you can use the **ip address dhcp hostname**

`hostname` command to place a different name in the DHCP option 12 field than the globally configured hostname of the device.

The **no ip address dhcp** command removes any IP address that was acquired, thus sending a DHCPRELEASE message.

You might need to experiment with different configurations to determine the one required by your DHCP server. The table below shows the possible configuration methods and the information placed in the DISCOVER message for each method.

**Table 26: Configuration Method and Resulting Contents of the DISCOVER Message**

| Configuration Method                                                 | Contents of DISCOVER Messages                                                                                                                                                                                                         |
|----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip address dhcp</b>                                               | The DISCOVER message contains “cisco- <i>mac-address</i> -Eth1” in the client ID field. The <i>mac-address</i> is the MAC address of the Ethernet 1 interface and contains the default hostname of the device in the option 12 field. |
| <b>ip address dhcp hostname</b><br><i>hostname</i>                   | The DISCOVER message contains “cisco- <i>mac-address</i> -Eth1” in the client ID field. The <i>mac-address</i> is the MAC address of the Ethernet 1 interface, and contains <i>hostname</i> in the option 12 field.                   |
| <b>ip address dhcp client-id ethernet 1</b>                          | The DISCOVER message contains the MAC address of the Ethernet 1 interface in the client ID field and contains the default hostname of the device in the option 12 field.                                                              |
| <b>ip address dhcp client-id ethernet 1 hostname</b> <i>hostname</i> | The DISCOVER message contains the MAC address of the Ethernet 1 interface in the client ID field and contains <i>hostname</i> in the option 12 field.                                                                                 |

## Examples

In the examples that follow, the command **ip address dhcp** is entered for Ethernet interface 1. The DISCOVER message sent by a device configured as shown in the following example would contain “cisco- *mac-address* -Eth1” in the client-ID field, and the value abc in the option 12 field.

```
hostname abc
!
interface GigabitEthernet 1/0/1
 ip address dhcp
```

The DISCOVER message sent by a device configured as shown in the following example would contain “cisco- *mac-address* -Eth1” in the client-ID field, and the value def in the option 12 field.

```
hostname abc
!
interface GigabitEthernet 1/0/1
 ip address dhcp hostname def
```

The DISCOVER message sent by a device configured as shown in the following example would contain the MAC address of Ethernet interface 1 in the client-id field, and the value abc in the option 12 field.

```
hostname abc
!
```

```
interface Ethernet 1
 ip address dhcp client-id GigabitEthernet 1/0/1
```

The DISCOVER message sent by a device configured as shown in the following example would contain the MAC address of Ethernet interface 1 in the client-id field, and the value def in the option 12 field.

```
hostname abc
!
interface Ethernet 1
 ip address dhcp client-id GigabitEthernet 1/0/1 hostname def
```

**Related Commands**

| Command             | Description                                                                                        |
|---------------------|----------------------------------------------------------------------------------------------------|
| <b>ip dhcp pool</b> | Configures a DHCP address pool on a Cisco IOS DHCP server and enters DHCP pool configuration mode. |

## ip address pool (DHCP)

To enable the IP address of an interface to be automatically configured when a Dynamic Host Configuration Protocol (DHCP) pool is populated with a subnet from IP Control Protocol (IPCP) negotiation, use the **ip address pool** command in interface configuration mode. To disable autoconfiguring of the IP address of the interface, use the **no** form of this command.

**ip address pool** *name*

**no ip address pool**

### Syntax Description

|             |                                                                                                                                       |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <i>name</i> | Name of the DHCP pool. The IP address of the interface will be automatically configured from the DHCP pool specified in <i>name</i> . |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------|

### Command Default

IP address pooling is disabled.

### Command Modes

Interface configuration

### Usage Guidelines

Use this command to automatically configure the IP address of a LAN interface when there are DHCP clients on the attached LAN that should be serviced by the DHCP pool on the device. The DHCP pool obtains its subnet dynamically through IPCP subnet negotiation.

### Examples

The following example specifies that the IP address of GigabitEthernet interface 1/0/1 will be automatically configured from the address pool named abc:

```
ip dhcp pool abc
  import all
  origin ipcp
!
interface GigabitEthernet 1/0/1
  ip address pool abc
```

| <b>show ip interface</b> | Displays the usability status of interfaces configured for IP. |

# ip address

To set a primary or secondary IP address for an interface, use the **ip address** command in interface configuration mode. To remove an IP address or disable IP processing, use the no form of this command.

**ip address** *ip-address mask* [**secondary** [**vrf** *vrf-name*]]  
**no ip address** *ip-address mask* [**secondary** [**vrf** *vrf-name*]]

## Syntax Description

|                   |                                                                                                                                                                                                                                                                                                                         |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip-address</i> | IP address.                                                                                                                                                                                                                                                                                                             |
| <i>mask</i>       | Mask for the associated IP subnet.                                                                                                                                                                                                                                                                                      |
| <b>secondary</b>  | (Optional) Specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.<br><br><b>Note</b> If the secondary address is used for a VRF table configuration with the <b>vrf</b> keyword, the <b>vrf</b> keyword must be specified also. |
| <b>vrf</b>        | (Optional) Name of the VRF table. The <i>vrf-name</i> argument specifies the VRF name of the ingress interface.                                                                                                                                                                                                         |

## Command Default

No IP address is defined for the interface.

## Command Modes

Interface configuration (config-if)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

An interface can have one primary IP address and multiple secondary IP addresses. Packets generated by the Cisco IOS software always use the primary IP address. Therefore, all devices and access servers on a segment should share the same primary network number.

Hosts can determine subnet masks using the Internet Control Message Protocol (ICMP) mask request message. Devices respond to this request with an ICMP mask reply message.

You can disable IP processing on a particular interface by removing its IP address with the **no ip address** command. If the software detects another host using one of its IP addresses, it will print an error message on the console.

The optional **secondary** keyword allows you to specify an unlimited number of secondary addresses. Secondary addresses are treated like primary addresses, except the system never generates datagrams other than routing updates with secondary source addresses. IP broadcasts and Address Resolution Protocol (ARP) requests are handled properly, as are interface routes in the IP routing table.

Secondary IP addresses can be used in a variety of situations. The following are the most common applications:

- There may not be enough host addresses for a particular network segment. For example, your subnetting allows up to 254 hosts per logical subnet, but on one physical subnet you need 300 host addresses. Using

secondary IP addresses on the devices or access servers allows you to have two logical subnets using one physical subnet.

- Many older networks were built using Level 2 bridges. The judicious use of secondary addresses can aid in the transition to a subnetted, device-based network. Devices on an older, bridged segment can be easily made aware that many subnets are on that segment.
- Two subnets of a single network might otherwise be separated by another network. This situation is not permitted when subnets are in use. In these instances, the first network is *extended*, or layered on top of the second network using secondary addresses.

#### Note

- If any device on a network segment uses a secondary address, all other devices on that same segment must also use a secondary address from the same network or subnet. Inconsistent use of secondary addresses on a network segment can very quickly cause routing loops.
- When you are routing using the Open Shortest Path First (OSPF) algorithm, ensure that all secondary addresses of an interface fall into the same OSPF area as the primary addresses.
- If you configure a secondary IP address, you must disable sending ICMP redirect messages by entering the **no ip redirects** command, to avoid high CPU utilization.

#### Examples

In the following example, 192.108.1.27 is the primary address and 192.31.7.17 is the secondary address for GigabitEthernet interface 1/0/1:

```
Device> enable
Device# configure terminal
Device(config)# interface GigabitEthernet 1/0/1
Device(config-if)# ip address 192.108.1.27 255.255.255.0
Device(config-if)# ip address 192.31.7.17 255.255.255.0 secondary
```

#### Related Commands

| Command                      | Description                                                                                                           |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>match ip route-source</b> | Specifies a source IP address to match to required route maps that have been set up based on VRF connected routes.    |
| <b>route-map</b>             | Defines the conditions for redistributing routes from one routing protocol into another, or to enable policy routing. |
| <b>set vrf</b>               | Enables VPN VRF selection within a route map for policy-based routing VRF selection.                                  |
| <b>show ip arp</b>           | Displays the ARP cache, in which SLIP addresses appear as permanent ARP table entries.                                |
| <b>show ip interface</b>     | Displays the usability status of interfaces configured for IP.                                                        |
| <b>show route-map</b>        | Displays static and dynamic route maps.                                                                               |

## ip nhrp map

To statically configure the IP-to-nonbroadcast multiaccess (NBMA) address mapping of IP destinations connected to an NBMA network, use the **ip nhrp map** interface configuration command. To remove the static entry from Next Hop Resolution Protocol (NHRP) cache, use the **no** form of this command.

```
ip nhrp map {ip-address [nbma-ip-address][dest-mask][nbma-ipv6-address] | multicast
{nbma-ip-address nbma-ipv6-address | dynamic}}
no ip nhrp map {ip-address [nbma-ip-address][dest-mask][nbma-ipv6-address] | multicast
{nbma-ip-address nbma-ipv6-address | dynamic}}
```

### Syntax Description

|                          |                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip-address</i>        | IP address of the destinations reachable through the Nonbroadcast multiaccess (NBMA) network. This address is mapped to the NBMA address.                                                                                                                                                                                                        |
| <i>nbma-ip-address</i>   | NBMA IP address.                                                                                                                                                                                                                                                                                                                                 |
| <i>dest-mask</i>         | Destination network address for which a mask is required.                                                                                                                                                                                                                                                                                        |
| <i>nbma-ipv6-address</i> | NBMA IPv6 address.                                                                                                                                                                                                                                                                                                                               |
| <b>dynamic</b>           | Dynamically learns destinations from client registrations on hub.                                                                                                                                                                                                                                                                                |
| <b>multicast</b>         | NBMA address that is directly reachable through the NBMA network. The address format varies depending on the medium you are using. For example, ATM has a Network Service Access Point (NSAP) address, Ethernet has a MAC address, and Switched Multimegabit Data Service (SMDS) has an E.164 address. This address is mapped to the IP address. |

### Command Default

No static IP-to-NBMA cache entries exist.

### Command Modes

Interface configuration (config-if)

### Command History

| Release | Modification                 |
|---------|------------------------------|
|         | This command was introduced. |

### Usage Guidelines

You will probably need to configure at least one static mapping in order to reach the next-hop server. Repeat this command to statically configure multiple IP-to-NBMA address mappings.

### Examples

In the following example, this station in a multipoint tunnel network is statically configured to be served by two next-hop servers 10.0.0.1 and 10.0.1.3. The NBMA address for 10.0.0.1 is statically configured to be 192.0.0.1 and the NBMA address for 10.0.1.3 is 192.2.7.8.

```
Device(config)# interface tunnel 0
Device(config-if)# ip nhrp nhs 10.0.0.1
Device(config-if)# ip nhrp nhs 10.0.1.3
Device(config-if)# ip nhrp map 10.0.0.1 192.0.0.1
Device(config-if)# ip nhrp map 10.0.1.3 192.2.7.8
```

## Examples

In the following example, if a packet is sent to 10.255.255.255, it is replicated to destinations 10.0.0.1 and 10.0.0.2. Addresses 10.0.0.1 and 10.0.0.2 are the IP addresses of two other routers that are part of the tunnel network, but those addresses are their addresses in the underlying network, not the tunnel network. They would have tunnel addresses that are in network 10.0.0.0.

```
Device(config)# interface tunnel 0
Device(config-if)# ip address 10.0.0.3 255.0.0.0
Device(config-if)# ip nhrp map multicast 10.0.0.1
Device(config-if)# ip nhrp map multicast 10.0.0.2
```

## Related Commands

| Command              | Description                                     |
|----------------------|-------------------------------------------------|
| <b>clear ip nhrp</b> | Clears all dynamic entries from the NHRP cache. |

# ip nhrp map multicast

To configure nonbroadcast multiaccess (NBMA) addresses used as destinations for broadcast or multicast packets to be sent over a tunnel network, use the **ip nhrp map multicast** command in interface configuration mode. To remove the destinations, use the **no** form of this command.

**ip nhrp map multicast** {*ip-nbma-address* *ipv6-nbma-address* | **dynamic**}  
**no ip nhrp map multicast** {*ip-nbma-address* *ipv6-nbma-address* | **dynamic**}

|                           |                          |                                                                                                                                         |
|---------------------------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>ip-nbma-address</i>   | NBMA address that is directly reachable through the NBMA network. The address format varies depending on the medium that you are using. |
|                           | <i>ipv6-nbma-address</i> | IPv6 NBMA address.                                                                                                                      |
|                           | <b>dynamic</b>           | Dynamically learns destinations from client registrations on the hub.                                                                   |

**Command Default** No NBMA addresses are configured as destinations for broadcast or multicast packets.

**Command Modes** Interface configuration (config-if)

|                        |                            |                              |
|------------------------|----------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>             | <b>Modification</b>          |
|                        | Cisco IOS XE Denali 16.5.1 | This command was introduced. |

**Usage Guidelines** This command applies only to tunnel interfaces. This command is useful for supporting broadcasts over a tunnel network when the underlying network does not support IP multicast. If the underlying network does support IP multicast, you should use the **tunnel destination** command to configure a multicast destination for transmission of tunnel broadcasts or multicasts.

When multiple NBMA addresses are configured, the system replicates the broadcast packet for each address.

## Examples

In the following example, if a packet is sent to 10.255.255.255, it is replicated to destinations 10.0.0.1 and 10.0.0.2:

```
Switch(config)# interface tunnel 0
Switch(config-if)# ip address 10.0.0.3 255.0.0.0
Switch(config-if)# ip nhrp map multicast 10.0.0.1
Switch(config-if)# ip nhrp map multicast 10.0.0.2
```

|                         |                           |                                                                  |
|-------------------------|---------------------------|------------------------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>            | <b>Description</b>                                               |
|                         | <b>debug nhrp</b>         | Enables NHRP debugging.                                          |
|                         | <b>interface</b>          | Configures an interface and enters interface configuration mode. |
|                         | <b>tunnel destination</b> | Specifies the destination for a tunnel interface.                |

## ip nhrp network-id

To enable the Next Hop Resolution Protocol (NHRP) on an interface, use the **ip nhrp network-id** command in interface configuration mode. To disable NHRP on the interface, use the **no** form of this command.

**ip nhrp network-id** *number*  
**no ip nhrp network-id** [*number*]

### Syntax Description

|               |                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------|
| <i>number</i> | Globally unique, 32-bit network identifier from a nonbroadcast multiaccess (NBMA) network. The range is from 1 to 4294967295. |
|---------------|-------------------------------------------------------------------------------------------------------------------------------|

### Command Default

NHRP is disabled on the interface.

### Command Modes

Interface configuration (config-if)

### Command History

| Release | Modification                 |
|---------|------------------------------|
|         | This command was introduced. |

### Usage Guidelines

In general, all NHRP stations within one logical NBMA network must be configured with the same network identifier.

### Examples

The following example enables NHRP on the interface:

```
Device(config-if)# ip nhrp network-id 1
```

## ip nhrp nhs

To specify the address of one or more Next Hop Resolution Protocol (NHRP) servers, use the **ip nhrp nhs** command in interface configuration mode. To remove the address, use the **no** form of this command.

**ip nhrp nhs** {*nhs-address* [**nbma** {*nbma-address**FQDN-string*}] [**multicast**] [**priority** *value*] [**cluster** *value*]|**cluster** *value* **max-connections** *value*|**dynamic** **nbma** {*nbma-address**FQDN-string*} [**multicast**] [**priority** *value*] [**cluster** *value*]}

**no ip nhrp nhs** {*nhs-address* [**nbma** {*nbma-address**FQDN-string*}] [**multicast**] [**priority** *value*] [**cluster** *value*]|**cluster** *value* **max-connections** *value*|**dynamic** **nbma** {*nbma-address**FQDN-string*} [**multicast**] [**priority** *value*] [**cluster** *value*]}

### Syntax Description

|                                     |                                                                                                                                                                                           |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>nhs-address</i>                  | Address of the next-hop server being specified.                                                                                                                                           |
| <i>net-address</i>                  | (Optional) IP address of a network served by the next-hop server.                                                                                                                         |
| <i>netmask</i>                      | (Optional) IP network mask to be associated with the IP address. The IP address is logically ANDed with the mask.                                                                         |
| <b>nbma</b>                         | (Optional) Specifies the nonbroadcast multiple access (NBMA) address or FQDN.                                                                                                             |
| <i>nbma-address</i>                 | NBMA address.                                                                                                                                                                             |
| <i>FQDN-string</i>                  | Next hop server (NHS) fully qualified domain name (FQDN) string.                                                                                                                          |
| <b>multicast</b>                    | (Optional) Specifies to use NBMA mapping for broadcasts and multicasts.                                                                                                                   |
| <b>priority</b> <i>value</i>        | (Optional) Assigns a priority to hubs to control the order in which spokes select hubs to establish tunnels. The range is from 0 to 255; 0 is the highest and 255 is the lowest priority. |
| <b>cluster</b> <i>value</i>         | (Optional) Specifies NHS groups. The range is from 0 to 10; 0 is the highest and 10 is the lowest. The default value is 0.                                                                |
| <b>max-connections</b> <i>value</i> | Specifies the number of NHS elements from each NHS group that needs to be active. The range is from 0 to 255.                                                                             |
| <b>dynamic</b>                      | Configures the spoke to learn the NHS protocol address dynamically.                                                                                                                       |

### Command Default

No next-hop servers are explicitly configured, so normal network layer routing decisions are used to forward NHRP traffic.

### Command Modes

Interface configuration (config-if)

### Command History

| Release | Modification                 |
|---------|------------------------------|
|         | This command was introduced. |

### Usage Guidelines

Use the **ip nhrp nhs** command to specify the address of a next hop server and the networks it serves. Normally, NHRP consults the network layer forwarding table to determine how to forward NHRP packets. When next

hop servers are configured, these next hop addresses override the forwarding path that would otherwise be used for NHRP traffic.

When the **ip nhrp nhs dynamic** command is configured on a DMVPN tunnel and the **shut** command is issued to the tunnel interface, the crypto socket does not receive shut message, thereby not bringing up a DMVPN session with the hub.

For any next hop server that is configured, you can specify multiple networks by repeating this command with the same *nhs-address* argument, but with different IP network addresses.

## Examples

The following example shows how to register a hub to a spoke using NBMA and FQDN:

```
Device# configure terminal
Device(config)# interface tunnel 1
Device(config-if)# ip nhrp nhs 192.0.2.1 nbma examplehub.example1.com
```

The following example shows how to configure the desired **max-connections** value:

```
Device# configure terminal
Device(config)# interface tunnel 1
Device(config-if)# ip nhrp nhs cluster 5 max-connections 100
```

The following example shows how to configure NHS priority and group values:

```
Device# configure terminal
Device(config)# interface tunnel 1
Device(config-if)# ip nhrp nhs 192.0.2.1 priority 1 cluster 2
```

|---------------------|-------------------------------------------------------------------------------------------------------|
| <b>ip nhrp map</b>  | Statically configures the IP-to-NBMA address mapping of IP destinations connected to an NBMA network. |
| <b>show ip nhrp</b> | Displays NHRP mapping information.                                                                    |

# ipv6 access-list

To define an IPv6 access list and to place the device in IPv6 access list configuration mode, use the **ipv6 access-list** command in global configuration mode. To remove the access list, use the **no** form of this command.

**ipv6 access-list** *access-list-name*  
**no ipv6 access-list** *access-list-name*

## Syntax Description

|                         |                                                                                                        |
|-------------------------|--------------------------------------------------------------------------------------------------------|
| <i>access-list-name</i> | Name of the IPv6 access list. Names cannot contain a space or quotation mark, or begin with a numeric. |
|-------------------------|--------------------------------------------------------------------------------------------------------|

## Command Default

No IPv6 access list is defined.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **ipv6 access-list** command is similar to the **ip access-list** command, except that it is IPv6-specific.

The standard IPv6 ACL functionality supports --in addition to traffic filtering based on source and destination addresses--filtering of traffic based on IPv6 option headers and optional, upper-layer protocol type information for finer granularity of control (functionality similar to extended ACLs in IPv4). IPv6 ACLs are defined by using the **ipv6 access-list** command in global configuration mode and their permit and deny conditions are set by using the **deny** and **permit** commands in IPv6 access list configuration mode. Configuring the **ipv6 access-list** command places the device in IPv6 access list configuration mode--the device prompt changes to Device(config-ipv6-acl)#. From IPv6 access list configuration mode, permit and deny conditions can be set for the defined IPv6 ACL.

### Note

IPv6 ACLs are defined by a unique name (IPv6 does not support numbered ACLs). An IPv4 ACL and an IPv6 ACL cannot share the same name.

For backward compatibility, the **ipv6 access-list** command with the **deny** and **permit** keywords in global configuration mode is still supported; however, an IPv6 ACL defined with deny and permit conditions in global configuration mode is translated to IPv6 access list configuration mode.

Refer to the deny (IPv6) and permit (IPv6) commands for more information on filtering IPv6 traffic based on IPv6 option headers and optional, upper-layer protocol type information. See the "Examples" section for an example of a translated IPv6 ACL configuration.

**Note** Every IPv6 ACL has implicit **permit icmp any any nd-na**, **permit icmp any any nd-ns**, and **deny ipv6 any any** statements as its last match conditions. (The former two match conditions allow for ICMPv6 neighbor discovery.) An IPv6 ACL must contain at least one entry for the implicit **deny ipv6 any any** statement to take effect. The IPv6 neighbor discovery process makes use of the IPv6 network layer service; therefore, by default, IPv6 ACLs implicitly allow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, makes use of a separate data link layer protocol; therefore, by default, IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface.

**Note** IPv6 prefix lists, not access lists, should be used for filtering routing protocol prefixes.

Use the **ipv6 traffic-filter** interface configuration command with the *access-list-name* argument to apply an IPv6 ACL to an IPv6 interface. Use the **ipv6 access-class** line configuration command with the *access-list-name* argument to apply an IPv6 ACL to incoming and outgoing IPv6 virtual terminal connections to and from the device.

**Note** An IPv6 ACL applied to an interface with the **ipv6 traffic-filter** command filters traffic that is forwarded, not originated, by the device.

**Note** When using this command to modify an ACL that is already associated with a bootstrap router (BSR) candidate rendezvous point (RP) (see the **ipv6 pim bsr candidate rp** command) or a static RP (see the **ipv6 pim rp-address** command), any added address ranges that overlap the PIM SSM group address range (FF3x::/96) are ignored. A warning message is generated and the overlapping address ranges are added to the ACL, but they have no effect on the operation of the configured BSR candidate RP or static RP commands.

Duplicate remark statements can no longer be configured from the IPv6 access control list. Because each remark statement is a separate entity, each one is required to be unique.

## Examples

The following example is from a device running Cisco IOS Release 12.0(23)S or later releases. The example configures the IPv6 ACL list named list1 and places the device in IPv6 access list configuration mode.

```
Device(config)# ipv6 access-list list1
Device(config-ipv6-acl)#
```

The following example is from a device running Cisco IOS Release 12.2(2)T or later releases, 12.0(21)ST, or 12.0(22)S. The example configures the IPv6 ACL named list2 and applies the ACL to outbound traffic on Ethernet interface 0. Specifically, the first ACL entry keeps all packets from the network FEC0:0:0:2::/64 (packets that have the site-local prefix FEC0:0:0:2 as the first 64 bits of their source IPv6 address) from exiting out of Ethernet interface 0. The second entry in the ACL permits all other traffic to exit out of Ethernet interface 0. The second entry is necessary because an implicit deny all condition is at the end of each IPv6 ACL.

```

Device(config)# ipv6 access-list list2 deny FEC0:0:0:2::/64 any
Device(config)# ipv6 access-list list2 permit any any
Device(config)# interface ethernet 0
Device(config-if)# ipv6 traffic-filter list2 out

```

If the same configuration was entered on a device running Cisco IOS Release 12.0(23)S or later releases, the configuration would be translated into IPv6 access list configuration mode as follows:

```

ipv6 access-list list2
  deny FEC0:0:0:2::/64 any
  permit ipv6 any any
interface ethernet 0
  ipv6 traffic-filter list2 out

```

**Note** IPv6 is automatically configured as the protocol type in **permit any any** and **deny any any** statements that are translated from global configuration mode to IPv6 access list configuration mode.

**Note** IPv6 ACLs defined on a device running Cisco IOS Release 12.2(2)T or later releases, 12.0(21)ST, or 12.0(22)S that rely on the implicit deny condition or specify a **deny any any** statement to filter traffic should contain **permit** statements for link-local and multicast addresses to avoid the filtering of protocol packets (for example, packets associated with the neighbor discovery protocol). Additionally, IPv6 ACLs that use **deny** statements to filter traffic should use a **permit any any** statement as the last statement in the list.

**Note** An IPv6 device will not forward to another network an IPv6 packet that has a link-local address as either its source or destination address (and the source interface for the packet is different from the destination interface for the packet).

#### Related Commands

| Command                          | Description                                                                                    |
|----------------------------------|------------------------------------------------------------------------------------------------|
| <b>deny (IPv6)</b>               | Sets deny conditions for an IPv6 access list.                                                  |
| <b>ipv6 access-class</b>         | Filters incoming and outgoing connections to and from the device based on an IPv6 access list. |
| <b>ipv6 pim bsr candidate rp</b> | Configures the candidate RP to send PIM RP advertisements to the BSR.                          |
| <b>ipv6 pim rp-address</b>       | Configure the address of a PIM RP for a particular group range.                                |
| <b>ipv6 traffic-filter</b>       | Filters incoming or outgoing IPv6 traffic on an interface.                                     |
| <b>permit (IPv6)</b>             | Sets permit conditions for an IPv6 access list.                                                |
| <b>show ipv6 access-list</b>     | Displays the contents of all current IPv6 access lists.                                        |

# ipv6 address-validate

To enable IPv6 address validation, use the **ipv6 address-validate** in global configuration mode. To disable IPv6 address validation, use the **no** form of this command.

**ipv6 address-validate**  
**no ipv6 address-validate**

**Command Default** This command is enabled by default.

**Command Modes** Global configuration (config)

| Command History | Release                        | Modification                 |
|-----------------|--------------------------------|------------------------------|
|                 | Cisco IOS XE Gibraltar 16.11.1 | This command was introduced. |

**Usage Guidelines** The **ipv6 address-validate** command is used to validate whether the interface identifiers in an assigned IPv6 address are a part of the reserved IPv6 interface identifiers range, as specified in RFC5453. If the interface identifiers of the assigned IPv6 address are a part of the reserved range, a new IPv6 address is assigned.

Only auto-configured addresses or addresses configured by DHCPv6 are validated.

**Note** The **no ipv6-address validate** command disables the IPv6 address validation and allows assigning of IPv6 addresses with interface identifiers that are a part of the reserved IPv6 interface identifiers range. We do not recommend the use of this command.

You must enter a minimum of eight characters of the **ipv6-address validate** command if you're using CLI help (?) for completing the syntax of this command. If you enter less than eight characters the command will conflict with the **no ipv6 address** command in interface configuration mode.

## Examples

The following example shows how to re-enable IPv6 address validation if it is disabled using the no ipv6-address validate command:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 address-validate
```

# ipv6 cef

To enable Cisco Express Forwarding for IPv6, use the **ipv6 cef** command in global configuration mode. To disable Cisco Express Forwarding for IPv6, use the **no** form of this command.

**ipv6 cef**  
**no ipv6 cef**

|                           |                                                           |
|---------------------------|-----------------------------------------------------------|
| <b>Syntax Description</b> | This command has no arguments or keywords.                |
| <b>Command Default</b>    | Cisco Express Forwarding for IPv6 is disabled by default. |
| <b>Command Modes</b>      | Global configuration (config)                             |

| <b>Command History</b> | Release                      | Modification                 |
|------------------------|------------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **ipv6 cef** command is similar to the **ip cef** command, except that it is IPv6-specific.

The **ipv6 cef** command is not available on the Cisco 12000 series Internet routers because this distributed platform operates only in distributed Cisco Express Forwarding for IPv6 mode.

**Note** The **ipv6 cef** command is not supported in interface configuration mode.

**Note** Some distributed architecture platforms support both Cisco Express Forwarding for IPv6 and distributed Cisco Express Forwarding for IPv6. When Cisco Express Forwarding for IPv6 is configured on distributed platforms, Cisco Express Forwarding switching is performed by the Route Processor (RP).

**Note** You must enable Cisco Express Forwarding for IPv4 by using the **ip cef** global configuration command before enabling Cisco Express Forwarding for IPv6 by using the **ipv6 cef** global configuration command.

Cisco Express Forwarding for IPv6 is advanced Layer 3 IP switching technology that functions the same and offer the same benefits as Cisco Express Forwarding for IPv4. Cisco Express Forwarding for IPv6 optimizes network performance and scalability for networks with dynamic, topologically dispersed traffic patterns, such as those associated with web-based applications and interactive sessions.

## Examples

The following example enables standard Cisco Express Forwarding for IPv4 operation and then standard Cisco Express Forwarding for IPv6 operation globally on the .

```
(config) # ip cef
(config) # ipv6 cef
```

| <b>show cef</b>             | Displays which packets the line cards dropped or displays which packets were not express-forwarded.             |
| <b>show ipv6 cef</b>        | Displays entries in the IPv6 FIB.                                                                               |

## ipv6 cef accounting

To enable Cisco Express Forwarding for IPv6 and distributed Cisco Express Forwarding for IPv6 network accounting, use the **ipv6 cef accounting** command in global configuration mode or interface configuration mode. To disable Cisco Express Forwarding for IPv6 network accounting, use the **no** form of this command.

**ipv6 cef accounting** *accounting-types*  
**no ipv6 cef accounting** *accounting-types*

### Specific Cisco Express Forwarding Accounting Information Through Interface Configuration Mode

**ipv6 cef accounting non-recursive** {external | internal}  
**no ipv6 cef accounting non-recursive** {external | internal}

#### Syntax Description

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>non-recursive</b>    | Enables accounting through nonrecursive prefixes.<br><br>This keyword is optional when used in global configuration mode after another keyword is entered. See the <i>accounting-types</i> argument.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>external</b>         | Counts input traffic in the nonrecursive external bin.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>internal</b>         | Counts input traffic in the nonrecursive internal bin.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

#### Command Default

Cisco Express Forwarding for IPv6 network accounting is disabled by default.

#### Command Modes

Global configuration (config)  
Interface configuration (config-if)

#### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

#### Usage Guidelines

The **ipv6 cef accounting** command is similar to the **ip cef accounting** command, except that it is IPv6-specific. Configuring Cisco Express Forwarding for IPv6 network accounting enables you to collect statistics on Cisco Express Forwarding for IPv6 traffic patterns in your network.

When you enable network accounting for Cisco Express Forwarding for IPv6 by using the **ipv6 cef accounting** command in global configuration mode, accounting information is collected at the Route Processor (RP) when Cisco Express Forwarding for IPv6 mode is enabled and at the line cards when distributed Cisco Express Forwarding for IPv6 mode is enabled. You can then display the collected accounting information using the **show ipv6 cef** EXEC command.

For prefixes with directly connected next hops, the **non-recursive** keyword enables express forwarding of the collection of packets and bytes through a prefix. This keyword is optional when this command is used in global configuration mode after you enter another keyword on the **ipv6 cef accounting** command.

This command in interface configuration mode must be used in conjunction with the global configuration command. The interface configuration command allows a user to specify two different bins (internal or external) for the accumulation of statistics. The internal bin is used by default. The statistics are displayed through the **show ipv6 cef detail** command.

Per-destination load balancing uses a series of 16 hash buckets into which the set of available paths are distributed. A hash function operating on certain properties of the packet is applied to select a bucket that contains a path to use. The source and destination IP addresses are the properties used to select the bucket for per-destination load balancing. Use the **load-balance-hash** keyword with the **ipv6 cef accounting** command to enable per-hash-bucket counters. Enter the **show ipv6 cef prefix internal** command to display the per-hash-bucket counters.

## Examples

The following example enables the collection of Cisco Express Forwarding for IPv6 accounting information for prefixes with directly connected next hops:

```
(config) # ipv6 cef accounting non-recursive
```

## Related Commands

| Command                  | Description                                                                       |
|--------------------------|-----------------------------------------------------------------------------------|
| <b>ip cef accounting</b> | Enable Cisco Express Forwarding network accounting (for IPv4).                    |
| <b>show cef</b>          | Displays information about packets <b>forwarded by Cisco Express Forwarding</b> . |
| <b>show ipv6 cef</b>     | Displays entries in the IPv6 FIB.                                                 |

# ipv6 cef distributed

To enable distributed Cisco Express Forwarding for IPv6, use the **ipv6 cef distributed** command in global configuration mode. To disable Cisco Express Forwarding for IPv6, use the **no** form of this command.

**ipv6 cef distributed**  
**no ipv6 cef distributed**

## Syntax Description

This command has no arguments or keywords.

## Command Default

Distributed Cisco Express Forwarding for IPv6 is disabled by default.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **ipv6 cef distributed** command is similar to the **ip cef distributed** command, except that it is IPv6-specific.

Enabling distributed Cisco Express Forwarding for IPv6 globally on the router by using the **ipv6 cef distributed** in global configuration mode distributes the Cisco Express Forwarding processing of IPv6 packets from the Route Processor (RP) to the line cards of distributed architecture platforms.

### Note

To forward distributed Cisco Express Forwarding for IPv6 traffic on the router, configure the forwarding of IPv6 unicast datagrams globally on your router by using the **ipv6 unicast-routing** global configuration command, and configure an IPv6 address and IPv6 processing on an interface by using the **ipv6 address** interface configuration command.

### Note

You must enable distributed Cisco Express Forwarding for IPv4 by using the **ip cef distributed** global configuration command before enabling distributed Cisco Express Forwarding for IPv6 by using the **ipv6 cef distributed** global configuration command.

Cisco Express Forwarding is advanced Layer 3 IP switching technology. Cisco Express Forwarding optimizes network performance and scalability for networks with dynamic, topologically dispersed traffic patterns, such as those associated with web-based applications and interactive sessions.

## Examples

The following example enables distributed Cisco Express Forwarding for IPv6 operation:

```
(config)# ipv6 cef distributed
```

**Related Commands**

| Command               | Description                                                     |
|-----------------------|-----------------------------------------------------------------|
| <b>ip route-cache</b> | Controls the use of high-speed switching caches for IP routing. |
| <b>show ipv6 cef</b>  | Displays entries in the IPv6 FIB.                               |

# ipv6 cef load-sharing algorithm

To select a Cisco Express Forwarding load-balancing algorithm for IPv6, use the **ipv6 cef load-sharing algorithm** command in global configuration mode. To return to the default universal load-balancing algorithm, use the **no** form of this command.

**ipv6 cef load-sharing algorithm** {**original** | **universal** [*id*]}  
**no ipv6 cef load-sharing algorithm**

## Syntax Description

|                  |                                                                                                                 |
|------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>original</b>  | Sets the load-balancing algorithm to the original algorithm based on a source and destination hash.             |
| <b>universal</b> | Sets the load-balancing algorithm to the universal algorithm that uses a source and destination and an ID hash. |
| <i>id</i>        | (Optional) Fixed identifier in hexadecimal format.                                                              |

## Command Default

The universal load-balancing algorithm is selected by default. If you do not configure the fixed identifier for a load-balancing algorithm, the device automatically generates a unique ID.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **ipv6 cef load-sharing algorithm** command is similar to the **ip cef load-sharing algorithm** command, except that it is IPv6-specific.

When the Cisco Express Forwarding for IPv6 load-balancing algorithm is set to universal mode, each device on the network can make a different load-sharing decision for each source-destination address pair.

## Examples

The following example shows how to enable the Cisco Express Forwarding original load-balancing algorithm for IPv6:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 cef load-sharing algorithm original
```

## Related Commands

| Command                              | Description                                                             |
|--------------------------------------|-------------------------------------------------------------------------|
| <b>ip cef load-sharing algorithm</b> | Selects a Cisco Express Forwarding load-balancing algorithm (for IPv4). |

# ipv6 cef optimize neighbor resolution

To configure address resolution optimization from Cisco Express Forwarding for IPv6 for directly connected neighbors, use the **ipv6 cef optimize neighbor resolution** command in global configuration mode. To disable address resolution optimization from Cisco Express Forwarding for IPv6 for directly connected neighbors, use the **no** form of this command.

**ipv6 cef optimize neighbor resolution**  
**no ipv6 cef optimize neighbor resolution**

## Syntax Description

This command has no arguments or keywords.

## Command Default

If this command is not configured, Cisco Express Forwarding for IPv6 does not optimize the address resolution of directly connected neighbors.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **ipv6 cef optimize neighbor resolution** command is very similar to the **ip cef optimize neighbor resolution** command, except that it is IPv6-specific.

Use this command to trigger Layer 2 address resolution of neighbors directly from Cisco Express Forwarding for IPv6.

## Examples

The following example shows how to optimize address resolution from Cisco Express Forwarding for IPv6 for directly connected neighbors:

```
(config)# ipv6 cef optimize neighbor resolution
```

## Related Commands

| Command                                    | Description                                                                                                         |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>ip cef optimize neighbor resolution</b> | Configures address resolution optimization from Cisco Express Forwarding for IPv4 for directly connected neighbors. |

# ipv6 destination-guard policy

To define a destination guard policy, use the **ipv6 destination-guard policy** command in global configuration mode. To remove the destination guard policy, use the **no** form of this command.

**ipv6 destination-guard policy** [*policy-name*]  
**no ipv6 destination-guard policy** [*policy-name*]

## Syntax Description

|                    |                                                  |
|--------------------|--------------------------------------------------|
| <i>policy-name</i> | (Optional) Name of the destination guard policy. |
|--------------------|--------------------------------------------------|

## Command Default

No destination guard policy is defined.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

This command enters destination-guard configuration mode. The destination guard policies can be used to filter IPv6 traffic based on the destination address to block data traffic from an unknown source.

## Examples

The following example shows how to define the name of a destination guard policy:

```
(config)#ipv6 destination-guard policy policy1
```

## Related Commands

| Command                                   | Description                             |
|-------------------------------------------|-----------------------------------------|
| <b>show ipv6 destination-guard policy</b> | Displays destination guard information. |

## ipv6 dhcp-relay bulk-lease

To configure bulk lease query parameters, use the **ipv6 dhcp-relay bulk-lease** command in global configuration mode. To remove the bulk-lease query configuration, use the **no** form of this command.

**ipv6 dhcp-relay bulk-lease** {**data-timeout** *seconds* | **retry** *number*} [**disable**]  
**no ipv6 dhcp-relay bulk-lease** [**disable**]

### Syntax Description

|                     |                                                                                     |
|---------------------|-------------------------------------------------------------------------------------|
| <b>data-timeout</b> | (Optional) Bulk lease query data transfer timeout.                                  |
| <i>seconds</i>      | (Optional) The range is from 60 seconds to 600 seconds. The default is 300 seconds. |
| <b>retry</b>        | (Optional) Sets the bulk lease query retries.                                       |
| <i>number</i>       | (Optional) The range is from 0 to 5. The default is 5.                              |
| <b>disable</b>      | (Optional) Disables the DHCPv6 bulk lease query feature.                            |

### Command Default

Bulk lease query is enabled automatically when the DHCP for IPv6 (DHCPv6) relay agent feature is enabled.

### Command Modes

Global configuration (config)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Use the **ipv6 dhcp-relay bulk-lease** command in global configuration mode to configure bulk lease query parameters, such as data transfer timeout and bulk-lease TCP connection retries.

The DHCPv6 bulk lease query feature is enabled automatically when the DHCPv6 relay agent is enabled. The DHCPv6 bulk lease query feature itself cannot be enabled using this command. To disable this feature, use the **ipv6 dhcp-relay bulk-lease** command with the **disable** keyword.

### Examples

The following example shows how to set the bulk lease query data transfer timeout to 60 seconds:

```
(config) # ipv6 dhcp-relay bulk-lease data-timeout 60
```

## ipv6 dhcp-relay option vpn

To enable the DHCP for IPv6 relay VRF-aware feature, use the `ipv6 dhcp-relay option vpn` command in global configuration mode. To disable the feature, use the **no** form of this command.

**ipv6 dhcp-relay option vpn**  
**no ipv6 dhcp-relay option vpn**

### Syntax Description

This command has no arguments or keywords.

### Command Default

The DHCP for IPv6 relay VRF-aware feature is not enabled on the device.

### Command Modes

Global configuration (config)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

The **ipv6 dhcp-relay option vpn** command allows the DHCPv6 relay VRF-aware feature to be enabled globally on the device. If the **ipv6 dhcp relay option vpn** command is enabled on a specified interface, it overrides the global **ipv6 dhcp-relay option vpn** command.

### Examples

The following example enables the DHCPv6 relay VRF-aware feature globally on the device:

```
(config)# ipv6 dhcp-relay option vpn
```

### Related Commands

| Command                           | Description                                                 |
|-----------------------------------|-------------------------------------------------------------|
| <b>ipv6 dhcp relay option vpn</b> | Enables the DHCPv6 relay VRF-aware feature on an interface. |

# ipv6 dhcp-relay source-interface

To configure an interface to use as the source when relaying messages, use the **ipv6 dhcp-relay source-interface** command in global configuration mode. To remove the interface from use as the source, use the no form of this command.

**ipv6 dhcp-relay source-interface** *interface-type interface-number*  
**no ipv6 dhcp-relay source-interface** *interface-type interface-number*

## Syntax Description

*interface-type*  
*interface-number*

(Optional) Interface type and number that specifies output interface for a destination. If this argument is configured, client messages are forwarded to the destination address through the link to which the output interface is connected.

## Command Default

The address of the server-facing interface is used as the IPv6 relay source.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

If the configured interface is shut down, or if all of its IPv6 addresses are removed, the relay will revert to its standard behavior.

The interface configuration (using the **ipv6 dhcp relay source-interface** command in interface configuration mode) takes precedence over the global configuration if both have been configured.

## Examples

The following example configures the Loopback 0 interface to be used as the relay source:

```
(config) # ipv6 dhcp-relay source-interface loopback 0
```

## Related Commands

| Command                                 | Description                                    |
|-----------------------------------------|------------------------------------------------|
| <b>ipv6 dhcp relay source-interface</b> | Enables DHCP for IPv6 service on an interface. |

# ipv6 dhcp binding track ppp

To configure Dynamic Host Configuration Protocol (DHCP) for IPv6 to release any bindings associated with a PPP connection when that connection closes, use the **ipv6 dhcp binding track ppp** command in global configuration mode. To return to the default behavior, use the **no** form of this command.

**ipv6 dhcp binding track ppp**  
**no ipv6 dhcp binding track ppp**

## Syntax Description

This command has no arguments or keywords.

## Command Default

When a PPP connection closes, the DHCP bindings associated with that connection are not released.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **ipv6 dhcp binding track ppp** command configures DHCP for IPv6 to automatically release any bindings associated with a PPP connection when that connection is closed. The bindings are released automatically to accommodate subsequent new registrations by providing sufficient resource.

### Note

In IPv6 broadband deployment using DHCPv6, you must enable release of prefix bindings associated with a PPP virtual interface using this command. This ensures that DHCPv6 bindings are tracked together with PPP sessions, and in the event of DHCP REBIND failure, the client initiates DHCPv6 negotiation again.

A binding table entry on the DHCP for IPv6 server is automatically:

- Created whenever a prefix is delegated to a client from the configuration pool.
- Updated when the client renews, rebinds, or confirms the prefix delegation.
- Deleted when the client releases all the prefixes in the binding voluntarily, all prefixes' valid lifetimes have expired, or an administrator clears the binding.

## Examples

The following example shows how to release the prefix bindings associated with the PPP:

```
(config)# ipv6 dhcp binding track ppp
```

## ipv6 dhcp database

To configure a Dynamic Host Configuration Protocol (DHCP) for IPv6 binding database agent, use the **ipv6 dhcp database** command in global configuration mode. To delete the database agent, use the **no** form of this command.

```
ipv6 dhcp database agent [ write-delay seconds ] abort [ timeout seconds ]
no ipv6 dhcp database agent
```

### Syntax Description

|                                   |                                                                                                                                            |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <i>agent</i>                      | A flash, local bootflash, compact flash, NVRAM, FTP, TFTP, or Remote Copy Protocol (RCP) uniform resource locator.                         |
| <b>write-delay</b> <i>seconds</i> | (Optional) How often (in seconds) DHCP for IPv6 sends database updates. The default is 300 seconds. The minimum write delay is 60 seconds. |
| <b>timeout</b> <i>seconds</i>     | (Optional) How long, in seconds, the router waits for a database transfer.                                                                 |

### Command Default

Write-delay default is 300 seconds. Timeout default is 300 seconds.

### Command Modes

Global configuration (config)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

The **ipv6 dhcp database** command specifies DHCP for IPv6 binding database agent parameters. The user may configure multiple database agents.

A binding table entry is automatically created whenever a prefix is delegated to a client from the configuration pool, updated when the client renews, rebinds, or confirms the prefix delegation, and deleted when the client releases all the prefixes in the binding voluntarily, all prefixes' valid lifetimes have expired, or administrators enable the clear ipv6 dhcp binding command. These bindings are maintained in RAM and can be saved to permanent storage using the *agent* argument so that the information about configuration such as prefixes assigned to clients is not lost after a system reload or power down. The bindings are stored as text records for easy maintenance.

Each permanent storage to which the binding database is saved is called the database agent. A database agent can be a remote host such as an FTP server or a local file system such as NVRAM.

The **write-delay** keyword specifies how often, in seconds, that DHCP sends database updates. By default, DHCP for IPv6 server waits 300 seconds before sending any database changes.

The **timeout** keyword specifies how long, in seconds, the router waits for a database transfer. Infinity is defined as 0 seconds, and transfers that exceed the timeout period are canceled. By default, the DHCP for IPv6 server waits 300 seconds before canceling a database transfer. When the system is going to reload, there is no transfer timeout so that the binding table can be stored completely.

### Examples

The following example specifies DHCP for IPv6 binding database agent parameters and stores binding entries in TFTP:

```
(config)# ipv6 dhcp database tftp://10.0.0.1/dhcp-binding
```

The following example specifies DHCP for IPv6 binding database agent parameters and stores binding entries in bootflash:

```
(config)# ipv6 dhcp database bootflash
```

## ipv6 dhcp iana-route-add

To add routes for individually assigned IPv6 addresses on a relay or server, use the **ipv6 dhcp iana-route-add** command in global configuration mode. To disable route addition for individually assigned IPv6 addresses on a relay or server, use the **no** form of the command.

**ipv6 dhcp iana-route-add**

**no ipv6 dhcp iana-route-add**

---

**Syntax Description**

This command has no arguments or keywords.

---

**Command Default**

Route addition for individually assigned IPv6 addresses on a relay or server is disabled by default.

---

**Command Modes**

Global configuration (config)

---

**Command History**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

---

**Usage Guidelines**

The **ipv6 dhcp iana-route-add** command is disabled by default and has to be enabled if route addition is required. Route addition for Internet Assigned Numbers Authority (IANA) is possible if the client is connected to the relay or server through unnumbered interfaces, and if route addition is enabled with the help of this command.

---

**Examples**

The following example shows how to enable route addition for individually assigned IPv6 addresses:

```
Device(config)# ipv6 dhcp iana-route-add
```

# ipv6 dhcp iapd-route-add

To enable route addition by Dynamic Host Configuration Protocol for IPv6 (DHCPv6) relay and server for the delegated prefix, use the **ipv6 dhcp iapd-route-add** command in global configuration mode. To disable route addition, use the **no** form of the command.

**ipv6 dhcp iapd-route-add**  
**no ipv6 dhcp iapd-route-add**

|                           |                                                                              |
|---------------------------|------------------------------------------------------------------------------|
| <b>Syntax Description</b> | This command has no arguments or keywords.                                   |
| <b>Command Default</b>    | DHCPv6 relay and DHCPv6 server add routes for delegated prefixes by default. |
| <b>Command Modes</b>      | Global configuration (config)                                                |

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                                                                                                                                                               |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The DHCPv6 relay and the DHCPv6 server add routes for delegated prefixes by default. The presence of this command on a device does not mean that routes will be added on that device. When you configure the command, routes for delegated prefixes will only be added on the first Layer 3 relay and server. |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                 |                                                                                                             |
|-----------------|-------------------------------------------------------------------------------------------------------------|
| <b>Examples</b> | The following example shows how to enable the DHCPv6 relay and server to add routes for a delegated prefix: |
|-----------------|-------------------------------------------------------------------------------------------------------------|

```
Device(config)# ipv6 dhcp iapd-route-add
```

# ipv6 dhcp-ldra

To enable Lightweight DHCPv6 Relay Agent (LDRA) functionality on an access node, use the **ipv6 dhcp-ldra** command in global configuration mode. To disable the LDRA functionality, use the **no** form of this command.

**ipv6 dhcp-ldra {enable | disable}**  
**no ipv6 dhcp-ldra {enable | disable}**

## Syntax Description

**enable** Enables LDRA functionality on an access node.

**disable** Disables LDRA functionality on an access node.

## Command Default

By default, LDRA functionality is not enabled on an access node.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

You must configure the LDRA functionality globally using the **ipv6 dhcp-ldra** command before configuring it on a VLAN or an access node (such as a Digital Subscriber Link Access Multiplexer [DSLAM] or an Ethernet switch) interface.

## Example

The following example shows how to enable the LDRA functionality:

```
(config)# ipv6 dhcp-ldra enable
(config)# exit
```

### Note

In the above example, Device denotes an access node.

## Related Commands

| Command                             | Description                                 |
|-------------------------------------|---------------------------------------------|
| <b>ipv6 dhcp ldra attach-policy</b> | Enables LDRA functionality on a VLAN.       |
| <b>ipv6 dhcp-ldra attach-policy</b> | Enables LDRA functionality on an interface. |

# ipv6 dhcp ping packets

To specify the number of packets a Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server sends to a pool address as part of a ping operation, use the **ipv6 dhcp ping packets** command in global configuration mode. To prevent the server from pinging pool addresses, use the **no** form of this command.

**ipv6 dhcp ping packets** *number*  
**ipv6 dhcp ping packets**

## Syntax Description

|               |                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>number</i> | The number of ping packets sent before the address is assigned to a requesting client. The valid range is from 0 to 10. |
|---------------|-------------------------------------------------------------------------------------------------------------------------|

## Command Default

No ping packets are sent before the address is assigned to a requesting client.

## Command Modes

Global configuration (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The DHCPv6 server pings a pool address before assigning the address to a requesting client. If the ping is unanswered, the server assumes, with a high probability, that the address is not in use and assigns the address to the requesting client.

Setting the *number* argument to 0 turns off the DHCPv6 server ping operation

## Examples

The following example specifies four ping attempts by the DHCPv6 server before further ping attempts stop:

```
(config)# ipv6 dhcp ping packets 4
```

## Related Commands

| Command                         | Description                                                                                               |
|---------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>clear ipv6 dhcp conflict</b> | Clears an address conflict from the DHCPv6 server database.                                               |
| <b>show ipv6 dhcp conflict</b>  | Displays address conflicts found by a DHCPv6 server, or reported through a DECLINE message from a client. |

## ipv6 dhcp pool

To configure a Dynamic Host Configuration Protocol (DHCP) for IPv6 server configuration information pool and enter DHCP for IPv6 pool configuration mode, use the **ipv6 dhcp pool** command in global configuration mode. To delete a DHCP for IPv6 pool, use the **no** form of this command.

**ipv6 dhcp pool** *poolname*  
**no ipv6 dhcp pool** *poolname*

### Syntax Description

|                 |                                                                                                                                        |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <i>poolname</i> | User-defined name for the local prefix pool. The pool name can be a symbolic string (such as "Engineering") or an integer (such as 0). |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------|

### Command Default

DHCP for IPv6 pools are not configured.

### Command Modes

Global configuration (config)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Use the **ipv6 dhcp pool** command to create a DHCP for IPv6 server configuration information pool. When the **ipv6 dhcp pool** command is enabled, the configuration mode changes to DHCP for IPv6 pool configuration mode. In this mode, the administrator can configure pool parameters, such as prefixes to be delegated and Domain Name System (DNS) servers, using the following commands:

- **address prefix** *IPv6-prefix* [**lifetime** {*valid-lifetime preferred-lifetime* | **infinite**}] sets an address prefix for address assignment. This address must be in hexadecimal, using 16-bit values between colons.
- **link-address** *IPv6-prefix* sets a link-address IPv6 prefix. When an address on the incoming interface or a link-address in the packet matches the specified IPv6-prefix, the server uses the configuration information pool. This address must be in hexadecimal, using 16-bit values between colons.
- **vendor-specific** *vendor-id* enables DHCPv6 vendor-specific configuration mode. Specify a vendor identification number. This number is the vendor IANA Private Enterprise Number. The range is 1 to 4294967295. The following configuration command is available:
  - **suboption** *number* sets vendor-specific suboption number. The range is 1 to 65535. You can enter an IPv6 address, ASCII text, or a hex string as defined by the suboption parameters.

#### Note

The **hex** value used under the **suboption** keyword allows users to enter only hex digits (0-f). Entering an invalid **hex** value does not delete the previous configuration.

Once the DHCP for IPv6 configuration information pool has been created, use the **ipv6 dhcp server** command to associate the pool with a server on an interface. If you do not configure an information pool, you need to use the **ipv6 dhcp server interface** configuration command to enable the DHCPv6 server function on an interface.

When you associate a DHCPv6 pool with an interface, only that pool services requests on the associated interface. The pool also services other interfaces. If you do not associate a DHCPv6 pool with an interface, it can service requests on any interface.

Not using any IPv6 address prefix means that the pool returns only configured options.

The **link-address** command allows matching a link-address without necessarily allocating an address. You can match the pool from multiple relays by using multiple link-address configuration commands inside a pool.

Since a longest match is performed on either the address pool information or the link information, you can configure one pool to allocate addresses and another pool on a subprefix that returns only configured options.

## Examples

The following example specifies a DHCP for IPv6 configuration information pool named cisco1 and places the router in DHCP for IPv6 pool configuration mode:

```
(config)# ipv6 dhcp pool cisco1
(config-dhcpv6)#
```

The following example shows how to configure an IPv6 address prefix for the IPv6 configuration pool cisco1:

```
(config-dhcpv6)# address prefix 2001:1000::0/64
(config-dhcpv6)# end
```

The following example shows how to configure a pool named engineering with three link-address prefixes and an IPv6 address prefix:

```
# configure terminal
(config)# ipv6 dhcp pool engineering
(config-dhcpv6)# link-address 2001:1001::0/64 (config-dhcpv6)# link-address
2001:1002::0/64 (config-dhcpv6)# link-address 2001:2000::0/48 (config-dhcpv6)# address prefix
2001:1003::0/64
(config-dhcpv6)# end
```

The following example shows how to configure a pool named 350 with vendor-specific options:

```
# configure terminal
(config)# ipv6 dhcp pool 350
(config-dhcpv6)# vendor-specific 9
(config-dhcpv6-vs)# suboption 1 address 1000:235D::1 (config-dhcpv6-vs)# suboption 2 ascii
"IP-Phone"
(config-dhcpv6-vs)# end
```

## Related Commands

|----------------------------|--------------------------------------------------------|
| <b>ipv6 dhcp server</b>    | Enables DHCP for IPv6 service on an interface.         |
| <b>show ipv6 dhcp pool</b> | Displays DHCP for IPv6 configuration pool information. |

# ipv6 dhcp server vrf enable

To enable the DHCP for IPv6 server VRF-aware feature, use the **ipv6 dhcp server vrf enable** command in global configuration mode. To disable the feature, use the **no** form of this command.

**ipv6 dhcp server vrf enable**  
**no ipv6 dhcp server vrf enable**

---

**Syntax Description** This command has no arguments or keywords.

---

**Command Default** The DHCPv6 server VRF-aware feature is not enabled.

---

**Command Modes** Global configuration (config)

---

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

---

**Usage Guidelines** The **ipv6 dhcp server option vpn** command allows the DHCPv6 server VRF-aware feature to be enabled globally on a device.

---

**Examples** The following example enables the DHCPv6 server VRF-aware feature globally on a device:

```
(config) # ipv6 dhcp server option vpn
```

# ipv6 flow monitor

This command activates a previously created flow monitor by assigning it to the interface to analyze incoming or outgoing traffic.

To activate a previously created flow monitor, use the **ipv6 flow monitor** command. To de-activate a flow monitor, use the **no** form of the command.

**ipv6 flow monitor** *ipv6-monitor-name* [**sampler** *ipv6-sampler-name*] {**input** | **output**}  
**no ipv6 flow monitor** *ipv6-monitor-name* [**sampler** *ipv6-sampler-name*] {**input** | **output**}

## Syntax Description

|                                         |                                                                                                                       |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>ipv6-monitor-name</i>                | Activates a previously created flow monitor by assigning it to the interface to analyze incoming or outgoing traffic. |
| <b>sampler</b> <i>ipv6-sampler-name</i> | Applies the flow monitor sampler.                                                                                     |
| <b>input</b>                            | Applies the flow monitor on input traffic.                                                                            |
| <b>output</b>                           | Applies the flow monitor on output traffic.                                                                           |

## Command Default

IPv6 flow monitor is not activated until it is assigned to an interface.

## Command Modes

Interface configuration (config-if)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

You cannot attach a NetFlow monitor to a port channel interface. If both service module interfaces are part of an EtherChannel, you should attach the monitor to both physical interfaces.

This example shows how to apply a flow monitor to an interface:

```
(config)# interface gigabitethernet 1/1/2
(config-if)# ip flow monitor FLOW-MONITOR-1 input
(config-if)# ip flow monitor FLOW-MONITOR-2 output
(config-if)# end
```

# ipv6 general-prefix

To define an IPv6 general prefix, use the **ipv6 general-prefix** command in global configuration mode. To remove the IPv6 general prefix, use the **no** form of this command.

**ipv6 general-prefix** *prefix-name* {*ipv6-prefix/prefix-length* | **6to4** *interface-type interface-number* | **6rd** *interface-type interface-number*}

**no ipv6 general-prefix** *prefix-name*

## Syntax Description

|                                        |                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>prefix-name</i>                     | The name assigned to the prefix.                                                                                                                                                                                                                                                                                                                        |

| <b>6rd</b>                             | Allows configuration of a general prefix computed from an interface used for IPv6 rapid deployment (6RD) tunneling.                                                                                                                                                                                                                                     |

## Command Default

No general prefix is defined.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **ipv6 general-prefix** command to define an IPv6 general prefix.

A general prefix holds a short prefix, based on which a number of longer, more specific, prefixes can be defined. When the general prefix is changed, all of the more specific prefixes based on it will change, too. This function greatly simplifies network renumbering and allows for automated prefix definition.

More specific prefixes, based on a general prefix, can be used when configuring IPv6 on an interface.

When defining a general prefix based on an interface used for 6to4 tunneling, the general prefix will be of the form 2002:a.b.c.d::/48, where "a.b.c.d" is the IPv4 address of the interface referenced.

## Examples

The following example manually defines an IPv6 general prefix named my-prefix:

```
(config)# ipv6 general-prefix my-prefix 2001:DB8:2222::/48
```

The following example defines an IPv6 general prefix named my-prefix based on a 6to4 interface:

```
(config)# ipv6 general-prefix my-prefix 6to4 ethernet0
```

| <b>show ipv6 general-prefix</b> | Displays information on general prefixes for an IPv6 addresses. |

## ipv6 local policy route-map

To enable local policy-based routing (PBR) for IPv6 packets, use the **ipv6 local policy route-map** command in global configuration mode. To disable local policy-based routing for IPv6 packets, use the **no** form of this command.

**ipv6 local policy route-map** *route-map-name*  
**no ipv6 local policy route-map** *route-map-name*

### Syntax Description

|                       |                                                                                                                                                   |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>route-map-name</i> | Name of the route map to be used for local IPv6 PBR. The name must match a <i>route-map-name</i> value specified by the <b>route-map</b> command. |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|

### Command Default

IPv6 packets are not policy routed.

### Command Modes

Global configuration (config)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Packets originating from a router are not normally policy routed. However, you can use the **ipv6 local policy route-map** command to policy route such packets. You might enable local PBR if you want packets originated at the router to take a route other than the obvious shortest path.

The **ipv6 local policy route-map** command identifies a route map to be used for local PBR. The **route-map** commands each have a list of **match** and **set** commands associated with them. The **match** commands specify the match criteria, which are the conditions under which packets should be policy routed. The **set** commands specify set actions, which are particular policy routing actions to be performed if the criteria enforced by the **match** commands are met. The **no ipv6 local policy route-map** command deletes the reference to the route map and disables local policy routing.

### Examples

In the following example, packets with a destination IPv6 address matching that allowed by access list pbr-src-90 are sent to the router at IPv6 address 2001:DB8::1:

```
ipv6 access-list src-90
 permit ipv6 host 2001::90 2001:1000::/64
route-map pbr-src-90 permit 10
 match ipv6 address src-90
 set ipv6 next-hop 2001:DB8::1
ipv6 local policy route-map pbr-src-90
```

### Related Commands

|------------------------------|-----------------------------------------------------------------------------|
| <b>ipv6 policy route-map</b> | Configures IPv6 PBR on an interface.                                        |
| <b>match ipv6 address</b>    | Specifies an IPv6 access list to be used to match packets for PBR for IPv6. |
| <b>match length</b>          | Bases policy routing on the Level 3 length of a packet.                     |

| Command                          | Description                                                                                                                                                 |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>route-map (IP)</b>            | Defines the conditions for redistributing routes from one routing protocol into another, or enables policy routing.                                         |
| <b>set default interface</b>     | Specifies the default interface to output packets that pass a match clause of a route map for policy routing and have no explicit route to the destination. |
| <b>set interface</b>             | Specifies the default interface to output packets that pass a match clause of a route map for policy routing.                                               |
| <b>set ipv6 default next-hop</b> | Specifies an IPv6 default next hop to which matching packets will be forwarded.                                                                             |
| <b>set ipv6 next-hop (PBR)</b>   | Indicates where to output IPv6 packets that pass a match clause of a route map for policy routing.                                                          |
| <b>set ipv6 precedence</b>       | Sets the precedence value in the IPv6 packet header.                                                                                                        |

# ipv6 local pool

To configure a local IPv6 prefix pool, use the `ipv6 local pool` configuration command with the prefix pool name. To disband the pool, use the **no** form of this command.

**ipv6 local pool poolname prefix/prefix-length assigned-length [shared] [cache-size size]**  
**no ipv6 local pool poolname**

## Syntax Description

|                        |                                                                                                                                                                                                        |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>poolname</i>        | User-defined name for the local prefix pool.                                                                                                                                                           |
| <i>prefix</i>          | IPv6 prefix assigned to the pool.<br><br>This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.                    |
| <i>/ prefix-length</i> | The length of the IPv6 prefix assigned to the pool. A decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). |
| <i>assigned-length</i> | Length of prefix, in bits, assigned to the user from the pool. The value of the <i>assigned-length</i> argument cannot be less than the value of the <i>/ prefix-length</i> argument.                  |
| <b>shared</b>          | (Optional) Indicates that the pool is a shared pool.                                                                                                                                                   |
| <b>cache-size size</b> | (Optional) Specifies the size of the cache.                                                                                                                                                            |

## Command Default

No pool is configured.

## Command Modes

Global configuration (global)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

All pool names must be unique.

IPv6 prefix pools have a function similar to IPv4 address pools. Contrary to IPv4, a block of addresses (an address prefix) are assigned and not single addresses.

Prefix pools are not allowed to overlap.

Once a pool is configured, it cannot be changed. To change the configuration, the pool must be removed and recreated. All prefixes already allocated will also be freed.

## Examples

This example shows the creation of an IPv6 prefix pool:

```
(config) # ipv6 local pool pool1 2001:0DB8::/29 64
(config) # end
# show ipv6 local pool
```

```
Pool Prefix Free In use
pool1 2001:0DB8::/29 65516 20
```

| <b>peer default ipv6 address pool</b> | Specifies the pool from which client prefixes are assigned for PPP links.                            |
| <b>prefix-delegation pool</b>         | Specifies a named IPv6 local prefix pool from which prefixes are delegated to DHCP for IPv6 clients. |
| <b>show ipv6 local pool</b>           | Displays information about any defined IPv6 address pools.                                           |

# ipv6 mld snooping

To enable Multicast Listener Discovery version 2 (MLDv2) protocol snooping globally, use the **ipv6 mld snooping** command in global configuration mode. To disable the MLDv2 snooping globally, use the **no** form of this command.

**ipv6 mld snooping**  
**no ipv6 mld snooping**

**Syntax Description** This command has no arguments or keywords.

**Command Default** This command is enabled.

**Command Modes** Global configuration (config)

| Command History | Release                      | Modification                                              |
|-----------------|------------------------------|-----------------------------------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced on the Supervisor Engine 720. |

**Usage Guidelines** MLDv2 snooping is supported on the Supervisor Engine 720 with all versions of the Policy Feature Card 3 (PFC3).

To use MLDv2 snooping, configure a Layer 3 interface in the subnet for IPv6 multicast routing or enable the MLDv2 snooping querier in the subnet.

**Examples** This example shows how to enable MLDv2 snooping globally:

```
(config) # ipv6 mld snooping
```

|                         | <b>ipv6 mld ssm-map static</b>    | Configures static SSM mappings.          |
|                         | <b>show ipv6 mld ssm-map</b>      | Displays SSM mapping information.        |

# ipv6 mld state-limit

To limit the number of Multicast Listener Discovery (MLD) states globally, use the **ipv6 mld state-limit** command in global configuration mode. To disable a configured MLD state limit, use the **no** form of this command.

**ipv6 mld** [**vrf** *vrf-name*] **state-limit** *number*  
**no ipv6 mld** [**vrf** *vrf-name*] **state-limit** *number*

## Syntax Description

|                            |                                                                                       |
|----------------------------|---------------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.            |
| <i>number</i>              | Maximum number of MLD states allowed on a router. The valid range is from 1 to 64000. |

## Command Default

No default number of MLD limits is configured. You must configure the number of maximum MLD states allowed globally on a router when you configure this command.

## Command Modes

Global configuration (config)

## Command History

| Release                                                  | Modification                 |
|----------------------------------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1aCisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **ipv6 mld state-limit** command to configure a limit on the number of MLD states resulting from MLD membership reports on a global basis. Membership reports sent after the configured limits have been exceeded are not entered in the MLD cache and traffic for the excess membership reports is not forwarded.

Use the **ipv6 mld limit** command in interface configuration mode to configure the per-interface MLD state limit.

Per-interface and per-system limits operate independently of each other and can enforce different configured limits. A membership state will be ignored if it exceeds either the per-interface limit or global limit.

## Examples

The following example shows how to limit the number of MLD states on a router to 300:

```
(config)# ipv6 mld state-limit 300
```

## Related Commands

| Command                      | Description                                                                                   |
|------------------------------|-----------------------------------------------------------------------------------------------|
| <b>ipv6 mld access-group</b> | Enables the performance of IPv6 multicast receiver access control.                            |
| <b>ipv6 mld limit</b>        | Limits the number of MLD states resulting from MLD membership state on a per-interface basis. |

# ipv6 multicast-routing

To enable multicast routing using Protocol Independent Multicast (PIM) and Multicast Listener Discovery (MLD) on all IPv6-enabled interfaces of the router and to enable multicast forwarding, use the **ipv6 multicast-routing** command in global configuration mode. To stop multicast routing and forwarding, use the **no** form of this command.

**ipv6 multicast-routing** [*vrf vrf-name*]  
**no ipv6 multicast-routing**

## Syntax Description

|                            |                                                                            |
|----------------------------|----------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |
|----------------------------|----------------------------------------------------------------------------|

## Command Default

Multicast routing is not enabled.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **ipv6 multicast-routing** command to enable multicast forwarding. This command also enables Protocol Independent Multicast (PIM) and Multicast Listener Discovery (MLD) on all IPv6-enabled interfaces of the router being configured.

You can configure individual interfaces before you enable multicast so that you can then explicitly disable PIM and MLD protocol processing on those interfaces, as needed. Use the **no ipv6 pim** or the **no ipv6 mld router** command to disable IPv6 PIM or MLD router-side processing, respectively.

## Examples

The following example enables multicast routing and turns on PIM and MLD on all interfaces:

```
(config)# ipv6 multicast-routing
```

## Related Commands

| Command                    | Description                                                      |
|----------------------------|------------------------------------------------------------------|
| <b>ipv6 pim rp-address</b> | Configures the address of a PIM RP for a particular group range. |
| <b>no ipv6 pim</b>         | Turns off IPv6 PIM on a specified interface.                     |
| <b>no ipv6 mld router</b>  | Disables MLD router-side processing on a specified interface.    |

# ipv6 multicast group-range

To disable multicast protocol actions and traffic forwarding for unauthorized groups or channels on all the interfaces in a router, use the **ipv6 multicast group-range** command in global configuration mode. To return to the command's default settings, use the **no** form of this command.

**ipv6 multicast** [**vrf** *vrf-name*] **group-range** [*access-list-name*]  
**no ipv6 multicast** [**vrf** *vrf-name*] **group-range** [*access-list-name*]

## Syntax Description

|                            |                                                                                                                                              |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.                                                                   |
| <i>access-list-name</i>    | (Optional) Name of an access list that contains authenticated subscriber groups and authorized channels that can send traffic to the router. |

## Command Default

Multicast is enabled for groups and channels permitted by a specified access list and disabled for groups and channels denied by a specified access list.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **ipv6 multicast group-range** command provides an access control mechanism for IPv6 multicast edge routing. The access list specified by the *access-list-name* argument specifies the multicast groups or channels that are to be permitted or denied. For denied groups or channels, the router ignores protocol traffic and actions (for example, no Multicast Listener Discovery (MLD) states are created, no mroute states are created, no Protocol Independent Multicast (PIM) joins are forwarded), and drops data traffic on all interfaces in the system, thus disabling multicast for denied groups or channels.

Using the **ipv6 multicast group-range** global configuration command is equivalent to configuring the MLD access control and multicast boundary commands on all interfaces in the system. However, the **ipv6 multicast group-range** command can be overridden on selected interfaces by using the following interface configuration commands:

- **ipv6 mld access-group** *access-list-name*
- **ipv6 multicast boundary scope** *scope-value*

Because the **no ipv6 multicast group-range** command returns the router to its default configuration, existing multicast deployments are not broken.

## Examples

The following example ensures that the router disables multicast for groups or channels denied by an access list named list2:

```
(config) # ipv6 multicast group-range list2
```

The following example shows that the command in the previous example is overridden on an interface specified by int2:

```
(config)# interface int2
(config-if)# ipv6 mld access-group int-list2
```

On int2, MLD states are created for groups or channels permitted by int-list2 but are not created for groups or channels denied by int-list2. On all other interfaces, the access-list named list2 is used for access control.

In this example, list2 can be specified to deny all or most multicast groups or channels, and int-list2 can be specified to permit authorized groups or channels only for interface int2.

**Related Commands**

| Command                              | Description                                                             |
|--------------------------------------|-------------------------------------------------------------------------|
| <b>ipv6 mld access-group</b>         | Performs IPv6 multicast receiver access control.                        |
| <b>ipv6 multicast boundary scope</b> | Configures a multicast boundary on the interface for a specified scope. |

# ipv6 multicast pim-passive-enable

To enable the Protocol Independent Multicast (PIM) passive feature on an IPv6 router, use the **ipv6 multicast pim-passive-enable** command in global configuration mode. To disable this feature, use the **no** form of this command.

**ipv6 multicast pim-passive-enable**  
**no ipv6 multicast pim-passive-enable**

**Syntax Description** This command has no arguments or keywords.

**Command Default** PIM passive mode is not enabled on the router.

**Command Modes** Global configuration (config)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Use the **ipv6 multicast pim-passive-enable** command to configure IPv6 PIM passive mode on a router. Once PIM passive mode is configured globally, use the **ipv6 pim passive** command in interface configuration mode to configure PIM passive mode on a specific interface.

**Examples** The following example configures IPv6 PIM passive mode on a router:

```
(config)# ipv6 multicast pim-passive-enable
```

| Related Commands | Command                 | Description                                          |
|------------------|-------------------------|------------------------------------------------------|
|                  | <b>ipv6 pim passive</b> | Configures PIM passive mode on a specific interface. |

# ipv6 multicast rpf

To enable IPv6 multicast reverse path forwarding (RPF) check to use Border Gateway Protocol (BGP) unicast routes in the Routing Information Base (RIB), use the **ipv6 multicast rpf** command in global configuration mode. To disable this function, use the **no** form of this command.

**ipv6 multicast** [*vrf vrf-name*] **rpf** {*backoff initial-delay max-delay* | **use-bgp**}  
**no ipv6 multicast** [*vrf vrf-name*] **rpf** {*backoff initial-delay max-delay* | **use-bgp**}

## Syntax Description

|                            |                                                                                  |
|----------------------------|----------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.       |
| <b>backoff</b>             | Specifies the backoff delay after a unicast routing change.                      |
| <i>initial-delay</i>       | Initial RPF backoff delay, in milliseconds (ms). The range is from 200 to 65535. |
| <i>max-delay</i>           | Maximum RPF backoff delay, in ms. The range is from 200 to 65535.                |
| <b>use-bgp</b>             | Specifies to use BGP routes for multicast RPF lookups.                           |

## Command Default

The multicast RPF check does not use BGP unicast routes.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

When the **ipv6 multicast rpf** command is configured, multicast RPF check uses BGP unicast routes in the RIB. This is not done by default.

## Examples

The following example shows how to enable the multicast RPF check function:

```
(config)# ipv6 multicast rpf use-bgp
```

## Related Commands

| Command                         | Description                                                                        |
|---------------------------------|------------------------------------------------------------------------------------|
| <b>ipv6 multicast limit</b>     | Configure per-interface multicast route (mroute) state limiters in IPv6.           |
| <b>ipv6 multicast multipath</b> | Enables load splitting of IPv6 multicast traffic across multiple equal-cost paths. |

# ipv6 nd cache expire

To configure the duration of time before an IPv6 neighbor discovery cache entry expires, use the **ipv6 nd cache expire** command in the interface configuration mode. To remove this configuration, use the **no** form of this command.

**ipv6 nd cache expire** *expire-time-in-seconds* [**refresh**]  
**no ipv6 nd cache expire** *expire-time-in-seconds* [**refresh**]

|                           |                               |                                                                                          |
|---------------------------|-------------------------------|------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>expire-time-in-seconds</i> | The time range is from 1 through 65536 seconds. The default is 14400 seconds or 4 hours. |
|                           | <b>refresh</b>                | (Optional) Automatically refreshes the neighbor discovery cache entry.                   |

|                      |                                     |
|----------------------|-------------------------------------|
| <b>Command Modes</b> | Interface configuration (config-if) |
|----------------------|-------------------------------------|

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

By default, a neighbor discovery cache entry is expired and deleted if it remains in the STALE state for 14,400 seconds or 4 hours. The **ipv6 nd cache expire** command allows the expiry time to vary and to trigger auto refresh of an expired entry before the entry is deleted.

When the **refresh** keyword is used, a neighbor discovery cache entry is auto refreshed. The entry moves into the DELAY state and the neighbor unreachability detection process occurs, in which the entry transitions from the DELAY state to the PROBE state after 5 seconds. When the entry reaches the PROBE state, a neighbor solicitation is sent and then retransmitted as per the configuration.

## Examples

The following example shows that the neighbor discovery cache entry is configured to expire in 7200 seconds or 2 hours:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 1/1/4
Device(config-if)# ipv6 nd cache expire 7200
```

|                         |                            |                                                                                                  |
|-------------------------|----------------------------|--------------------------------------------------------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>             | <b>Description</b>                                                                               |
|                         | <b>ipv6 nd na glean</b>    | Configures neighbor discovery to glean an entry from an unsolicited neighbor advertisement.      |
|                         | <b>ipv6 nd nud retry</b>   | Configures the number of times neighbor unreachability detection resends neighbor solicitations. |
|                         | <b>show ipv6 interface</b> | Displays the usability status of interfaces that are configured for IPv6.                        |

## ipv6 nd cache interface-limit (global)

To configure a neighbor discovery cache limit on all interfaces on the device, use the **ipv6 nd cache interface-limit** command in global configuration mode. To remove the neighbor discovery from all interfaces on the device, use the **no** form of this command.

**ipv6 nd cache interface-limit** *size* [**log** *rate*]  
**no ipv6 nd cache interface-limit** *size* [**log** *rate*]

|                           |                        |                                                                               |
|---------------------------|------------------------|-------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>size</i>            | Cache size.                                                                   |
|                           | <b>log</b> <i>rate</i> | (Optional) Adjustable logging rate, in seconds. The valid values are 0 and 1. |

|                        |                                                                |
|------------------------|----------------------------------------------------------------|
| <b>Command Default</b> | Default logging rate for the device is one entry every second. |
|------------------------|----------------------------------------------------------------|

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

| <b>Command History</b> | Release                      | Modification                 |
|------------------------|------------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The <b>ipv6 nd cache interface-limit</b> command in global configuration mode imposes a common per-interface cache size limit on all interfaces on the device. |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|

Issuing the **no** or default form of the command will remove the neighbor discovery limit from every interface on the device that was configured using global configuration mode. It will not remove the neighbor discovery limit from any interface configured using the **ipv6 nd cache interface-limit** command in interface configuration mode.

The default (and maximum) logging rate for the device is one entry every second.

### Examples

The following example shows how to set a common per-interface cache size limit of 4 seconds on all interfaces on the device:

```
(config)# ipv6 nd cache interface-limit 4
```

| <b>Related Commands</b> | Command                                          | Description                                                                         |
|-------------------------|--------------------------------------------------|-------------------------------------------------------------------------------------|
|                         | <b>ipv6 nd cache interface-limit (interface)</b> | Configures a neighbor discovery cache limit on a specified interface on the device. |

# ipv6 nd host mode strict

To enable the conformant, or strict, IPv6 host mode, use the **ipv6 nd host mode strict** command in global configuration mode. To reenable conformant, or loose, IPv6 host mode, use the **no** form of this command.

**ipv6 nd host mode strict**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Nonconformant, or loose, IPv6 host mode is enabled.

**Command Modes** Global configuration (config)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The default IPv6 host mode type is loose, or nonconformant. To enable IPv6 strict, or conformant, host mode, use the **ipv6 nd host mode strict** command. You can change between the two IPv6 host modes using the **no** form of this command.

The **ipv6 nd host mode strict** command selects the type of IPv6 host mode behavior and enters interface configuration mode. However, the **ipv6 nd host mode strict** command is ignored if you have configured IPv6 routing with the **ipv6 unicast-routing** command. In this situation, the default IPv6 host mode type, loose, is used.

## Examples

The following example shows how to configure the device as a strict IPv6 host and enables IPv6 address autoconfiguration on Ethernet interface 0/0:

```
(config)# ipv6 nd host mode strict
(config-if)# interface ethernet0/0
(config-if)# ipv6 address autoconfig
```

The following example shows how to configure the device as a strict IPv6 host and configures a static IPv6 address on Ethernet interface 0/0:

```
(config)# ipv6 nd host mode strict
(config-if)# interface ethernet0/0
(config-if)# ipv6 address 2001::1/64
```

| Related Commands | Command                     | Description                                       |
|------------------|-----------------------------|---------------------------------------------------|
|                  | <b>ipv6 unicast-routing</b> | Enables the forwarding of IPv6 unicast datagrams. |

# ipv6 nd na glean

To configure the neighbor discovery to glean an entry from an unsolicited neighbor advertisement, use the **ipv6 nd na glean** command in the interface configuration mode. To disable this feature, use the **no** form of this command.

**ipv6 nd na glean**  
**no ipv6 nd na glean**

|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | IPv6 nodes may emit a multicast unsolicited neighbor advertisement packet following the successful completion of duplicate address detection (DAD). By default, other IPv6 nodes ignore these unsolicited neighbor advertisement packets. The <b>ipv6 nd na glean</b> command configures the router to create a neighbor advertisement entry on receipt of an unsolicited neighbor advertisement packet (assuming no such entry already exists and the neighbor advertisement has the link-layer address option). Use of this command allows a device to populate its neighbor advertisement cache with an entry for a neighbor before data traffic exchange with the neighbor. |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

The following example shows how to configure neighbor discovery to glean an entry from an unsolicited neighbor advertisement:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 1/1/4
Device(config-if)# ipv6 nd na glean
```

| Related Commands | Command                     | Description                                                                                      |
|------------------|-----------------------------|--------------------------------------------------------------------------------------------------|

|                  | <b>ipv6 nd nud retry</b>    | Configures the number of times neighbor unreachability detection resends neighbor solicitations. |
|                  | <b>show ipv6 interface</b>  | Displays the usability status of interfaces that are configured for IPv6.                        |

## ipv6 nd ns-interval

To configure the interval between IPv6 neighbor solicitation (NS) retransmissions on an interface, use the **ipv6 nd ns-interval** command in interface configuration mode. To restore the default interval, use the **no** form of this command.

**ipv6 nd ns-interval** *milliseconds*  
**no ipv6 nd ns-interval**

### Syntax Description

|                     |                                                                                                                                             |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <i>milliseconds</i> | The interval between IPv6 neighbor solicit transmissions for address resolution. The acceptable range is from 1000 to 3600000 milliseconds. |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------|

### Command Default

0 milliseconds (unspecified) is advertised in router advertisements and the value 1000 is used for the neighbor discovery activity of the router itself.

### Command Modes

Interface configuration (config-if)

### Command History

| Release                                                  | Modification                 |
|----------------------------------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1aCisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

By default, using the **ipv6 nd ns-interval** command changes the NS retransmission interval for both address resolution and duplicate address detection (DAD). To specify a different NS retransmission interval for DAD, use the **ipv6 nd dad time** command.

This value will be included in all IPv6 router advertisements sent out this interface. Very short intervals are not recommended in normal IPv6 operation. When a nondefault value is configured, the configured time is both advertised and used by the router itself.

### Examples

The following example configures an IPv6 neighbor solicit transmission interval of 9000 milliseconds for Ethernet interface 0/0:

```
(config)# interface ethernet 0/0
(config-if)# ipv6 nd ns-interval 9000
```

### Related Commands

| Command                    | Description                                                                                                      |
|----------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>ipv6 nd dad time</b>    | Configures the NS retransmit interval for DAD separately from the NS retransmit interval for address resolution. |
| <b>show ipv6 interface</b> | Displays the usability status of interfaces configured for IPv6.                                                 |

## ipv6 nd nud retry

To configure the number of times the neighbor unreachability detection process resends neighbor solicitations, use the **ipv6 nd nud retry** command in the interface configuration mode. To disable this feature, use the **no** form of this command.

**ipv6 nd nud retry** *base interval max-attempts {final-wait-time}*  
**no ipv6 nd nud retry** *base interval max-attempts {final-wait-time}*

|                           |                        |                                                                                                   |
|---------------------------|------------------------|---------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>base</i>            | The neighbor unreachability detection process base value.                                         |
|                           | <i>interval</i>        | The time interval, in milliseconds, between retries.<br>The range is from 1000 to 32000.          |
|                           | <i>max-attempts</i>    | The maximum number of retry attempts, depending on the base value.<br>The range is from 1 to 128. |
|                           | <i>final-wait-time</i> | The waiting time, in milliseconds, on the last probe.<br>The range is from 1000 to 32000.         |
|                           |                        |                                                                                                   |

**Command Modes** Interface configuration (config-if)

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** When a device runs neighbor unreachability detection to resolve the neighbor detection entry for a neighbor again, it sends three neighbor solicitation packets 1 second apart. In certain situations, for example, spanning-tree events, or high-traffic events, or end-host reloads), three neighbor solicitation packets that are sent at an interval of 1 second may not be sufficient. To help maintain the neighbor cache in such situations, use the **ipv6 nd nud retry** command to configure exponential timers for neighbor solicitation retransmits.

The maximum number of retry attempts is configured using the *max-attempts* argument. The retransmit interval is calculated with the following formula:

$$tm^n$$

here,

- t = Time interval
- m = Base (1, 2, or 3)
- n = Current neighbor solicitation number (where the first neighbor solicitation is 0).

Therefore, **ipv6 nd nud retry 3 1000 5** command retransmits at intervals of 1,3,9,27,81 seconds. If the final wait time is not configured, the entry remains for 243 seconds before it is deleted.

The **ipv6 nd nud retry** command affects only the retransmit rate for the neighbor unreachability detection process, and not for the initial resolution, which uses the default of three neighbor solicitation packets sent 1 second apart.

## Examples

The following example shows how to configure a fixed interval of 1 second and three retransmits:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 1/1/4
Device(config-if)# ipv6 nd nud retry 1 1000 3
```

The following example shows how to configure a retransmit interval of 1, 2, 4, and 8:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 1/1/4
Device(config-if)# ipv6 nd nud retry 2 1000 4
```

The following example shows how to configure the retransmit intervals of 1, 3, 9, 27, 81:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 1/1/4
Device(config-if)# ipv6 nd nud retry 3 1000 5
```

## Related Commands

| Command                     | Description                                                                                 |
|-----------------------------|---------------------------------------------------------------------------------------------|
| <b>ipv6 nd cache expire</b> | Configures the duration of time before an IPv6 neighbor discovery (ND) cache entry expires. |
| <b>ipv6 nd na glean</b>     | Configures neighbor discovery to glean an entry from an unsolicited neighbor advertisement. |
| <b>show ipv6 interface</b>  | Displays the usability status of interfaces that are configured for IPv6.                   |

# ipv6 nd reachable-time

To configure the amount of time that a remote IPv6 node is considered reachable after some reachability confirmation event has occurred, use the **ipv6 nd reachable-time** command in interface configuration mode. To restore the default time, use the **no** form of this command.

**ipv6 nd reachable-time** *milliseconds*  
**no ipv6 nd reachable-time**

## Syntax Description

|                     |                                                                                       |
|---------------------|---------------------------------------------------------------------------------------|
| <i>milliseconds</i> | The amount of time that a remote IPv6 node is considered reachable (in milliseconds). |
|---------------------|---------------------------------------------------------------------------------------|

## Command Default

0 milliseconds (unspecified) is advertised in router advertisements and the value 30000 (30 seconds) is used for the neighbor discovery activity of the router itself.

## Command Modes

Interface configuration (config-if)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The configured time enables the router to detect unavailable neighbors. Shorter configured times enable the router to detect unavailable neighbors more quickly; however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.

The configured time is included in all router advertisements sent out of an interface so that nodes on the same link use the same time value. A value of 0 means indicates that the configured time is unspecified by this router.

## Examples

The following example configures an IPv6 reachable time of 1,700,000 milliseconds for Ethernet interface 0/0:

```
(config)# interface ethernet 0/0
(config-if)# ipv6 nd reachable-time 1700000
```

| <b>show ipv6 interface</b> | Displays the usability status of interfaces configured for IPv6. |

# ipv6 nd resolution data limit

To configure the number of data packets queued pending Neighbor Discovery resolution, use the **ipv6 nd resolution data limit** command in global configuration mode.

**ipv6 nd resolution data limit** *number-of-packets*  
**no ipv6 nd resolution data limit** *number-of-packets*

|                           |                          |                                                                          |
|---------------------------|--------------------------|--------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>number-of-packets</i> | The number of queued data packets. The range is from 16 to 2048 packets. |
|---------------------------|--------------------------|--------------------------------------------------------------------------|

**Command Default** Queue limit is 16 packets.

**Command Modes** Global configuration (config)

| <b>Command History</b> | Release                      | Modification                 |
|------------------------|------------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **ipv6 nd resolution data limit** command allows the customer to configure the number of data packets queued pending Neighbor Discovery resolution. IPv6 Neighbor Discovery queues a data packet that initiates resolution for an unresolved destination. Neighbor Discovery will only queue one packet per destination. Neighbor Discovery also enforces a global (per-router) limit on the number of packets queued. Once the global queue limit is reached, further packets to unresolved destinations are discarded. The minimum (and default) value is 16 packets, and the maximum value is 2048.

In most situations, the default value of 16 queued packets pending Neighbor Discovery resolution is sufficient. However, in some high-scalability scenarios in which the router needs to initiate communication with a very large number of neighbors almost simultaneously, then the value may be insufficient. This may lead to loss of the initial packet sent to some neighbors. In most applications, the initial packet is retransmitted, so initial packet loss generally is not a cause for concern. (Note that dropping the initial packet to an unresolved destination is normal in IPv4.) However, there may be some high-scale configurations where loss of the initial packet is inconvenient. In these cases, the customer can use the **ipv6 nd resolution data limit** command to prevent the initial packet loss by increasing the unresolved packet queue size.

**Examples** The following example configures the global number of data packets held awaiting resolution to be 32:

```
(config)# ipv6 nd resolution data limit 32
```

# ipv6 nd route-owner

To insert Neighbor Discovery-learned routes into the routing table with "ND" status and to enable ND autoconfiguration behavior, use the **ipv6 nd route-owner** command. To remove this information from the routing table, use the **no** form of this command.

**ipv6 ndroute-owner**

## Syntax Description

This command has no arguments or keywords.

## Command Default

The status of Neighbor Discovery-learned routes is "Static."

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **ipv6 nd route-owner** command inserts routes learned by Neighbor Discovery into the routing table with a status of "ND" rather than "Static" or "Connected."

This global command also enables you to use the **ipv6 nd autoconfig default** or **ipv6 nd autoconfig prefix** commands in interface configuration mode. If the **ipv6 nd route-owner** command is not issued, then the **ipv6 nd autoconfig default** and **ipv6 nd autoconfig prefix** commands are accepted by the router but will not work.

## Examples

```
(config)# ipv6 nd route-owner
```

## Related Commands

|-----------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>ipv6 nd autoconfig default</b> | Allows Neighbor Discovery to install a default route to the Neighbor Discovery-derived default router. |
| <b>ipv6 nd autoconfig prefix</b>  | Uses Neighbor Discovery to install all valid on-link prefixes from RAs received on the interface.      |

# ipv6 neighbor

To configure a static entry in the IPv6 neighbor discovery cache, use the **ipv6 neighbor** command in global configuration mode. To remove a static IPv6 entry from the IPv6 neighbor discovery cache, use the **no** form of this command.

**ipv6 neighbor** *ipv6-address interface-type interface-number hardware-address*  
**no ipv6 neighbor** *ipv6-address interface-type interface-number*

## Syntax Description

|                         |                                                                                                                                                                                                                     |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ipv6-address</i>     | The IPv6 address that corresponds to the local data-link address.<br><br>This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons. |
| <i>interface-type</i>   | The specified interface type. For supported interface types, use the question mark (?) online help function.                                                                                                        |
| <i>interface-number</i> | The specified interface number.                                                                                                                                                                                     |
| <i>hardware-address</i> | The local data-link address (a 48-bit address).                                                                                                                                                                     |

## Command Default

Static entries are not configured in the IPv6 neighbor discovery cache.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **ipv6 neighbor** command is similar to the **arp** (global) command.

If an entry for the specified IPv6 address already exists in the neighbor discovery cache--learned through the IPv6 neighbor discovery process--the entry is automatically converted to a static entry.

Use the **show ipv6 neighbors** command to view static entries in the IPv6 neighbor discovery cache. A static entry in the IPv6 neighbor discovery cache can have one of the following states:

- INCOMPLETE (Incomplete)--The interface for this entry is down.
- REACH (Reachable)--The interface for this entry is up.

### Note

Reachability detection is not applied to static entries in the IPv6 neighbor discovery cache; therefore, the descriptions for the INCOMPLETE and REACH states are different for dynamic and static cache entries. See the **show ipv6 neighbors** command for descriptions of the INCOMPLETE and REACH states for dynamic cache entries.

The **clear ipv6 neighbors** command deletes all entries in the IPv6 neighbor discovery cache, except static entries. The **no ipv6 neighbor** command deletes a specified static entry from the neighbor discovery cache; the command does not remove dynamic entries--learned from the IPv6 neighbor discovery process--from the

cache. Disabling IPv6 on an interface by using the **no ipv6 enable** command or the **no ipv6 unnumbered** command deletes all IPv6 neighbor discovery cache entries configured for that interface, except static entries (the state of the entry changes to INCMP).

Static entries in the IPv6 neighbor discovery cache are not modified by the neighbor discovery process.

**Note** Static entries for IPv6 neighbors can be configured only on IPv6-enabled LAN and ATM LAN Emulation interfaces.

### Examples

The following example configures a static entry in the IPv6 neighbor discovery cache for a neighbor with the IPv6 address 2001:0DB8::45A and link-layer address 0002.7D1A.9472 on Ethernet interface 1:

```
(config)# ipv6 neighbor 2001:0DB8::45A ethernet1 0002.7D1A.9472
```

### Related Commands

# ipv6 pim

To reenable IPv6 Protocol Independent Multicast (PIM) on a specified interface, use the **ipv6 pim** command in interface configuration mode. To disable PIM on a specified interface, use the **no** form of the command.

**ipv6 pim**  
**no ipv6 pim**

**Syntax Description** This command has no arguments or keywords.

**Command Default** PIM is automatically enabled on every interface.

**Command Modes** Interface configuration (config-if)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** After a user has enabled the **ipv6 multicast-routing** command, PIM is enabled to run on every interface. Because PIM is enabled on every interface by default, use the **no** form of the **ipv6 pim** command to disable PIM on a specified interface. When PIM is disabled on an interface, it does not react to any host membership notifications from the Multicast Listener Discovery (MLD) protocol.

**Examples** The following example turns off PIM on Fast Ethernet interface 1/0:

```
(config)# interface FastEthernet 1/0
(config-if)# no ipv6 pim
```

| Related Commands | Command                       | Description                                                                                                                |
|------------------|-------------------------------|----------------------------------------------------------------------------------------------------------------------------|
|                  | <b>ipv6 multicast-routing</b> | Enables multicast routing using PIM and MLD on all IPv6-enabled interfaces of the router and enables multicast forwarding. |

# ipv6 pim accept-register

To accept or reject registers at the rendezvous point (RP), use the **ipv6 pim accept-register** command in global configuration mode. To return to the default value, use the **no** form of this command.

**ipv6 pim** [**vrf** *vrf-name*] **accept-register** {**list** *access-list* | **route-map** *map-name*}  
**no ipv6 pim** [**vrf** *vrf-name*] **accept-register** {**list** *access-list* | **route-map** *map-name*}

## Syntax Description

|                                  |                                                                            |
|----------------------------------|----------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i>       | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |
| <b>list</b> <i>access-list</i>   | Defines the access list name.                                              |
| <b>route-map</b> <i>map-name</i> | Defines the route map.                                                     |

## Command Default

All sources are accepted at the RP.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **ipv6 pim accept-register** command to configure a named access list or route map with match attributes. When the permit conditions as defined by the *access-list* and *map-name* arguments are met, the register message is accepted. Otherwise, the register message is not accepted, and an immediate register-stop message is returned to the encapsulating designated router.

## Examples

The following example shows how to filter on all sources that do not have a local multicast Border Gateway Protocol (BGP) prefix:

```
ipv6 pim accept-register route-map reg-filter
route-map reg-filter permit 20
 match as-path 101
ip as-path access-list 101 permit
```

# ipv6 pim allow-rp

To enable the PIM Allow RP feature for all IP multicast-enabled interfaces in an IPv6 device, use the **ip pim allow-rp** command in global configuration mode. To return to the default value, use the **no** form of this command.

```
ipv6 pim allow-rp [{group-list access-list | rp-list access-list [group-list access-list]]  
no ipv6 pim allow-rp
```

|                    |                    |                                                                                              |
|--------------------|--------------------|----------------------------------------------------------------------------------------------|
| Syntax Description | <b>group-list</b>  | (Optional) Identifies an access control list (ACL) of allowed group ranges for PIM Allow RP. |
|                    | <b>rp-list</b>     | (Optional) Specifies an ACL for allowed rendezvous-point (RP) addresses for PIM Allow RP.    |
|                    | <b>access-list</b> | (Optional) Unique number or name of a standard ACL.                                          |

**Command Default** PIM Allow RP is disabled.

**Command Modes** Global configuration (config)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Use this command to enable the receiving device in an IP multicast network to accept a (\*, G) Join from an unexpected (different) RP address.

Before enabling PIM Allow RP, you must first use the **ipv6 pim rp-address** command to define an RP.

|                  | <b>ipv6 pim rp-address</b> | Statically configures the address of a PIM RP for multicast groups. |

# ipv6 pim neighbor-filter list

To filter Protocol Independent Multicast (PIM) neighbor messages from specific IPv6 addresses, use the **ipv6 pim neighbor-filter** command in the global configuration mode. To return to the router default, use the **no** form of this command.

```
ipv6 pim [vrf vrf-name] neighbor-filter list access-list
no ipv6 pim [vrf vrf-name] neighbor-filter list access-list
```

## Syntax Description

|                            |                                                                            |
|----------------------------|----------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |
| <i>access-list</i>         | Name of an IPv6 access list that denies PIM hello packets from a source.   |

## Command Default

PIM neighbor messages are not filtered.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **ipv6 pim neighbor-filter list** command is used to prevent unauthorized routers on the LAN from becoming PIM neighbors. Hello messages from addresses specified in this command are ignored.

## Examples

The following example causes PIM to ignore all hello messages from IPv6 address FE80::A8BB:CCFF:FE03:7200:

```
(config)# ipv6 pim neighbor-filter list nbr_filter_acl
(config)# ipv6 access-list nbr_filter_acl
(config-ipv6-acl)# deny ipv6 host FE80::A8BB:CCFF:FE03:7200 any
(config-ipv6-acl)# permit any any
```

## ipv6 pim rp-address

To configure the address of a Protocol Independent Multicast (PIM) rendezvous point (RP) for a particular group range, use the **ipv6 pim rp-address** command in global configuration mode. To remove an RP address, use the **no** form of this command.

**ipv6 pim** [*vrf vrf-name*] **rp-address** *ipv6-address* [*group-access-list*] [**bidir**]  
**no ipv6 pim rp-address** *ipv6-address* [*group-access-list*] [**bidir**]

| Syntax Description         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |  |

| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |  |
| <i>ipv6-address</i>        | The IPv6 address of a router to be a PIM RP.<br><br>The <i>ipv6-address</i> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |  |
| <i>group-access-list</i>   | (Optional) Name of an access list that defines for which multicast groups the RP should be used.<br><br>If the access list contains any group address ranges that overlap the assigned source-specific multicast (SSM) group address range (FF3x::/96), a warning message is displayed, and the overlapping ranges are ignored. If no access list is specified, the specified RP is used for all valid multicast non-SSM address ranges.<br><br>To support embedded RP, the router configured as the RP must use a configured access list that permits the embedded RP group ranges derived from the embedded RP address.<br><br>Note that the embedded RP group ranges need not include all the scopes (for example, 3 through 7). |  |
| <b>bidir</b>               | (Optional) Indicates that the group range will be used for bidirectional shared-tree forwarding; otherwise, it will be used for sparse-mode forwarding. A single IPv6 address can be configured to be RP only for either bidirectional or sparse-mode group ranges. A single group-range list can be configured to operate either in bidirectional or sparse mode.                                                                                                                                                                                                                                                                                                                                                                  |  |

**Command Default** No PIM RPs are preconfigured. Embedded RP support is enabled by default when IPv6 PIM is enabled (where embedded RP support is provided). Multicast groups operate in PIM sparse mode.

**Command Modes** Global configuration (config)

| Command History | Release                                                      | Modification                 |
|-----------------|--------------------------------------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a<br>Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** When PIM is configured in sparse mode, you must choose one or more routers to operate as the RP. An RP is a single common root of a shared distribution tree and is statically configured on each router.

Where embedded RP support is available, only the RP needs to be statically configured as the RP for the embedded RP ranges. No additional configuration is needed on other IPv6 PIM routers. The other routers will

discover the RP address from the IPv6 group address. If these routers want to select a static RP instead of the embedded RP, the specific embedded RP group range must be configured in the access list of the static RP.

The RP address is used by first-hop routers to send register packets on behalf of source multicast hosts. The RP address is also used by routers on behalf of multicast hosts that want to become members of a group. These routers send join and prune messages to the RP.

If the optional *group-access-list* argument is not specified, the RP is applied to the entire routable IPv6 multicast group range, excluding SSM, which ranges from FFX[3-f]::/8 to FF3X::/96. If the *group-access-list* argument is specified, the IPv6 address is the RP address for the group range specified in the *group-access-list* argument.

You can configure Cisco IOS software to use a single RP for more than one group. The conditions specified by the access list determine which groups the RP can be used for. If no access list is configured, the RP is used for all groups.

A PIM router can use multiple RPs, but only one per group.

## Examples

The following example shows how to set the PIM RP address to 2001::10:10 for all multicast groups:

```
(config) # ipv6 pim rp-address 2001::10:10
```

The following example sets the PIM RP address to 2001::10:10 for the multicast group FF04::/64 only:

```
(config) # ipv6 access-list acc-grp-1
(config-ipv6-acl) # permit ipv6 any ff04::/64
(config) # ipv6 pim rp-address 2001::10:10 acc-grp-1
```

The following example shows how to configure a group access list that permits the embedded RP ranges derived from the IPv6 RP address 2001:0DB8:2::2:

```
(config) # ipv6 pim rp-address 2001:0DB8:2::2 embd-ranges
(config) # ipv6 access-list embd-ranges
(config-ipv6-acl) # permit ipv6 any ff73:240:2:2:2::/96
(config-ipv6-acl) # permit ipv6 any ff74:240:2:2:2::/96
(config-ipv6-acl) # permit ipv6 any ff75:240:2:2:2::/96
(config-ipv6-acl) # permit ipv6 any ff76:240:2:2:2::/96
(config-ipv6-acl) # permit ipv6 any ff77:240:2:2:2::/96
(config-ipv6-acl) # permit ipv6 any ff78:240:2:2:2::/96
```

The following example shows how to enable the address 100::1 as the bidirectional RP for the entries multicast range FF::/8:

```
ipv6 pim rp-address 100::1 bidir
```

In the following example, the IPv6 address 200::1 is enabled as the bidirectional RP for the ranges permitted by the access list named bidir-grps. The ranges permitted by this list are ff05::/16 and ff06::/16.

```
(config) # ipv6 access-list bidir-grps
(config-ipv6-acl) # permit ipv6 any ff05::/16
(config-ipv6-acl) # permit ipv6 any ff06::/16
(config-ipv6-acl) # exit
(config) # ipv6 pim rp-address 200::1 bidir-grps bidir
```

# ipv6 pim rp embedded

To enable embedded rendezvous point (RP) support in IPv6 Protocol Independent Multicast (PIM), use the **ipv6 pim rp-embedded** command in global configuration mode. To disable embedded RP support, use the **no** form of this command.

**ipv6 pim** [**vrf** *vrf-name*] **rp embedded**  
**no ipv6 pim** [**vrf** *vrf-name*] **rp embedded**

## Syntax Description

|                            |                                                                            |
|----------------------------|----------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |
|----------------------------|----------------------------------------------------------------------------|

## Command Default

Embedded RP support is enabled by default.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Because embedded RP support is enabled by default, users will generally use the **no** form of this command to turn off embedded RP support.

The **ipv6 pim rp embedded** command applies only to the embedded RP group ranges ff7X::/16 and fffX::/16. When the router is enabled, it parses groups in the embedded RP group ranges ff7X::/16 and fffX::/16, and extracts the RP to be used from the group address.

## Examples

The following example disables embedded RP support in IPv6 PIM:

```
# no ipv6 pim rp embedded
```

# ipv6 pim spt-threshold infinity

To configure when a Protocol Independent Multicast (PIM) leaf router joins the shortest path tree (SPT) for the specified groups, use the **ipv6 pim spt-threshold infinity** command in global configuration mode. To restore the default value, use the **no** form of this command.

**ipv6 pim** [*vrf vrf-name*] **spt-threshold infinity** [*group-list access-list-name*]  
**no ipv6 pim spt-threshold infinity**

|                           |                                           |                                                                                                                                                                     |
|---------------------------|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>vrf</b> <i>vrf-name</i>                | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.                                                                                          |
|                           | <b>group-list</b> <i>access-list-name</i> | (Optional) Indicates to which groups the threshold applies. Must be a standard IPv6 access list name. If the value is omitted, the threshold applies to all groups. |

**Command Default** When this command is not used, the PIM leaf router joins the SPT immediately after the first packet arrives from a new source. Once the router has joined the SPT, configuring the **ipv6 pim spt-threshold infinity** command will not cause it to switch to the shared tree.

**Command Modes** Global configuration (config)

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Using the **ipv6 pim spt-threshold infinity** command enables all sources for the specified groups to use the shared tree. The **group-list** keyword indicates to which groups the SPT threshold applies.

The *access-list-name* argument refers to an IPv6 access list. When the *access-list-name* argument is specified with a value of 0, or the **group-list** keyword is not used, the SPT threshold applies to all groups. The default setting (that is, when this command is not enabled) is to join the SPT immediately after the first packet arrives from a new source.

## Examples

The following example configures a PIM last-hop router to stay on the shared tree and not switch to the SPT for the group range ff04::/64.:

```
(config)# ipv6 access-list acc-grp-1
(config-ipv6-acl)# permit ipv6 any FF04::/64
(config-ipv6-acl)# exit
(config)# ipv6 pim spt-threshold infinity group-list acc-grp-1
```

# ipv6 prefix-list

To create an entry in an IPv6 prefix list, use the **ipv6 prefix-list** command in global configuration mode. To delete the entry, use the **no** form of this command.

```

ipv6 prefix-list list-name [seq seq-number] {deny ipv6-prefix/prefix-length | permit
ipv6-prefix/prefix-length | description text} [ge ge-value] [le le-value]
no ipv6 prefix-list list-name

```

## Syntax Description

|                                |                                                                                                                                                                                                                                                             |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>list-name</i>               | Name of the prefix list. <ul style="list-style-type: none"> <li>• Cannot be the same name as an existing access list.</li> <li>• Cannot be the name “detail” or “summary” because they are keywords in the <b>show ipv6 prefix-list</b> command.</li> </ul> |
| <b>seq</b> <i>seq-number</i>   | (Optional) Sequence number of the prefix list entry being configured.                                                                                                                                                                                       |
| <b>deny</b>                    | Denies networks that matches the condition.                                                                                                                                                                                                                 |
| <b>permit</b>                  | Permits networks that matches the condition.                                                                                                                                                                                                                |
| <i>ipv6-prefix</i>             | The IPv6 network assigned to the specified prefix list.<br><br>This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.                                                   |
| <i>/prefix-length</i>          | The length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value.                              |
| <b>description</b> <i>text</i> | A description of the prefix list that can be up to 80 characters in length.                                                                                                                                                                                 |
| <b>ge</b> <i>ge-value</i>      | (Optional) Specifies a prefix length greater than or equal to the <i>ipv6-prefix/prefix-length</i> arguments. It is the lowest value of a range of the <i>length</i> (the “from” portion of the length range).                                              |
| <b>le</b> <i>le-value</i>      | (Optional) Specifies a prefix length less than or equal to the <i>ipv6-prefix /prefix-length</i> arguments. It is the highest value of a range of the <i>length</i> (the “to” portion of the length range).                                                 |

## Command Default

No prefix list is created.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **ipv6 prefix-list** command is similar to the **ip prefix-list** command, except that it is IPv6-specific.

To suppress networks from being advertised in updates, use the **distribute-list out** command.

The sequence number of a prefix list entry determines the order of the entries in the list. The router compares network addresses to the prefix list entries. The router begins the comparison at the top of the prefix list, with the entry having the lowest sequence number.

If multiple entries of a prefix list match a prefix, the entry with the lowest sequence number is considered the real match. Once a match or deny occurs, the router does not go through the rest of the prefix list. For efficiency, you may want to put the most common permits or denies near the top of the list, using the *seq-number* argument.

The **show ipv6 prefix-list** command displays the sequence numbers of entries.

IPv6 prefix lists are used to specify certain prefixes or a range of prefixes that must be matched before a permit or deny statement can be applied. Two operand keywords can be used to designate a range of prefix lengths to be matched. A prefix length of less than, or equal to, a value is configured with the **le** keyword. A prefix length greater than, or equal to, a value is specified using the **ge** keyword. The **ge** and **le** keywords can be used to specify the range of the prefix length to be matched in more detail than the usual *ipv6-prefix/prefix-length* argument. For a candidate prefix to match against a prefix list entry three conditions can exist:

- The candidate prefix must match the specified prefix list and prefix length entry.
- The value of the optional **le** keyword specifies the range of allowed prefix lengths from the *prefix-length* argument up to, and including, the value of the **le** keyword.
- The value of the optional **ge** keyword specifies the range of allowed prefix lengths from the value of the **ge** keyword up to, and including, 128.

### Note

The first condition must match before the other conditions take effect.

An exact match is assumed when the **ge** or **le** keywords are not specified. If only one keyword operand is specified then the condition for that keyword is applied, and the other condition is not applied. The *prefix-length* value must be less than the **ge** value. The **ge** value must be less than, or equal to, the **le** value. The **le** value must be less than or equal to 128.

Every IPv6 prefix list, including prefix lists that do not have any permit and deny condition statements, has an implicit deny any any statement as its last match condition.

## Examples

The following example denies all routes with a prefix of ::/0.

```
(config)# ipv6 prefix-list abc deny ::/0
```

The following example permits the prefix 2002::/16:

```
(config)# ipv6 prefix-list abc permit 2002::/16
```

The following example shows how to specify a group of prefixes to accept any prefixes from prefix 5F00::/48 up to and including prefix 5F00::/64.

```
(config)# ipv6 prefix-list abc permit 5F00::/48 le 64
```

The following example denies prefix lengths greater than 64 bits in routes that have the prefix 2001:0DB8::/64.

```
(config)# ipv6 prefix-list abc permit 2001:0DB8::/64 le 128
```

The following example permits mask lengths from 32 to 64 bits in all address space.

```
(config)# ipv6 prefix-list abc permit ::/0 ge 32 le 64
```

The following example denies mask lengths greater than 32 bits in all address space.

```
(config)# ipv6 prefix-list abc deny ::/0 ge 32
```

The following example denies all routes with a prefix of 2002::/128.

```
(config)# ipv6 prefix-list abc deny 2002::/128
```

The following example permits all routes with a prefix of ::/0.

```
(config)# ipv6 prefix-list abc permit ::/0
```

## Related Commands

| <b>show ipv6 prefix-list</b>            | Displays information about an IPv6 prefix list or IPv6 prefix list entries.    |

# ipv6 source-guard attach-policy

To apply IPv6 source guard policy on an interface, use the **ipv6 source-guard attach-policy** in interface configuration mode. To remove this source guard from the interface, use the **no** form of this command.

**ipv6 source-guard attach-policy***[source-guard-policy ]*

## Syntax Description

|                            |                                                                                                                                                    |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>source-guard-policy</i> | (Optional) User-defined name of the source guard policy. The policy name can be a symbolic string (such as Engineering) or an integer (such as 0). |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Default

An IPv6 source-guard policy is not applied on the interface.

## Command Modes

Interface configuration (config-if)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

If no policy is specified using the *source-guard-policy* argument, then the default source-guard policy is applied.

A dependency exists between IPv6 source guard and IPv6 snooping. Whenever IPv6 source guard is configured, when the **ipv6 source-guard attach-policy** command is entered, it verifies that snooping is enabled and issues a warning if it is not. If IPv6 snooping is disabled, the software checks if IPv6 source guard is enabled and sends a warning if it is.

## Examples

The following example shows how to apply IPv6 source guard on an interface:

```
(config)# interface gigabitethernet 0/0/1
(config-if)# ipv6 source-guard attach-policy mysnoopingpolicy
```

## Related Commands

|-----------------------------|---------------------------------------------------------------------------------|
| <b>ipv6 snooping policy</b> | Configures an IPv6 snooping policy and enters IPv6 snooping configuration mode. |

## ipv6 source-route

To enable processing of the IPv6 type 0 routing header (the IPv6 source routing header), use the **ipv6 source-route** command in global configuration mode. To disable the processing of this IPv6 extension header, use the **no** form of this command.

**ipv6 source-route**  
**no ipv6 source-route**

### Syntax Description

This command has no arguments or keywords.

### Command Default

The **no** version of the **ipv6 source-route** command is the default. When the router receives a packet with a type 0 routing header, the router drops the packet and sends an IPv6 Internet Control Message Protocol (ICMP) error message back to the source and logs an appropriate debug message.

### Command Modes

Global configuration (config)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

The default was changed to be the **no** version of the **ipv6 source-route** command, which means this functionality is not enabled. Before this change, this functionality was enabled automatically. User who had configured the **no ipv6 source-route** command before the default was changed will continue to see this configuration in their **show config** command output, even though the **no** version of the command is the default.

The **no ipv6 source-route** command (which is the default) prevents hosts from performing source routing using your routers. When the **no ipv6 source-route** command is configured and the router receives a packet with a type0 source routing header, the router drops the packet and sends an IPv6 ICMP error message back to the source and logs an appropriate debug message.

In IPv6, source routing is performed only by the destination of the packet. Therefore, in order to stop source routing from occurring inside your network, you need to configure an IPv6 access control list (ACL) that includes the following rule:

```
deny ipv6 any any routing
```

The rate at which the router generates all IPv6 ICMP error messages can be limited by using the **ipv6 icmp error-interval** command.

### Examples

The following example disables the processing of IPv6 type 0 routing headers:

```
no ipv6 source-route
```

### Related Commands

| Command                         | Description                                           |
|---------------------------------|-------------------------------------------------------|
| <b>deny (IPv6)</b>              | Sets deny conditions for an IPv6 access list.         |
| <b>ipv6 icmp error-interval</b> | Configures the interval for IPv6 ICMP error messages. |

# ipv6 spd mode

To configure an IPv6 Selective Packet Discard (SPD) mode, use the **ipv6 spd mode** command in global configuration mode. To remove the IPv6 SPD mode, use the **no** form of this command.

```
ipv6 spd mode {aggressive | tos protocol ospf}
no ipv6 spd mode {aggressive | tos protocol ospf}
```

|                           |                          |                                                                                                        |
|---------------------------|--------------------------|--------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>aggressive</b>        | Aggressive drop mode discards incorrectly formatted packets when the IPv6 SPD is in random drop state. |
|                           | <b>tos protocol ospf</b> | OSPF mode allows OSPF packets to be handled with SPD priority.                                         |

**Command Default** No IPv6 SPD mode is configured.

**Command Modes** Global configuration (config)

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The default setting for the IPv6 SPD mode is none, but you may want to use the **ipv6 spd mode** command to configure a mode to be used when a certain SPD state is reached.

The **aggressive** keyword enables aggressive drop mode, which drops deformed packets when IPv6 SPD is in random drop state. The **ospf** keyword enables OSPF mode, in which OSPF packets are handled with SPD priority.

The size of the process input queue governs the SPD state: normal (no drop), random drop, or max. When the process input queue is less than the SPD minimum threshold, SPD takes no action and enters normal state. In the normal state, no packets are dropped. When the input queue reaches the maximum threshold, SPD enters max state, in which normal priority packets are discarded. If the input queue is between the minimum and maximum thresholds, SPD enters the random drop state, in which normal packets may be dropped.

## Examples

The following example shows how to enable the router to drop deformed packets when the router is in the random drop state:

```
(config)# ipv6 spd mode aggressive
```

|                         |                                     |                                                                               |
|-------------------------|-------------------------------------|-------------------------------------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>                      | <b>Description</b>                                                            |
|                         | <b>ipv6 spd queue max-threshold</b> | Configures the maximum number of packets in the IPv6 SPD process input queue. |
|                         | <b>ipv6 spd queue min-threshold</b> | Configures the minimum number of packets in the IPv6 SPD process input queue. |
|                         | <b>show ipv6 spd</b>                | Displays the IPv6 SPD configuration.                                          |

# ipv6 spd queue max-threshold

To configure the maximum number of packets in the IPv6 Selective Packet Discard (SPD) process input queue, use the **ipv6 spd queue max-threshold** command in global configuration mode. To return to the default value, use the **no** form of this command.

**ipv6 spd queue max-threshold** *value*  
**no ipv6 spd queue max-threshold**

## Syntax Description

|              |                                                       |
|--------------|-------------------------------------------------------|
| <i>value</i> | Number of packets. The range is from 0 through 65535. |
|--------------|-------------------------------------------------------|

## Command Default

No SPD queue maximum threshold value is configured.

## Command Modes

Global configuration (config)

## Command History

| Release                                                  | Modification                 |
|----------------------------------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1aCisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **ipv6 spd queue max-threshold** command to configure the SPD queue maximum threshold value.

The size of the process input queue governs the SPD state: normal (no drop), random drop, or max. When the process input queue is less than the SPD minimum threshold, SPD takes no action and enters normal state. In the normal state, no packets are dropped. When the input queue reaches the maximum threshold, SPD enters max state, in which normal priority packets are discarded. If the input queue is between the minimum and maximum thresholds, SPD enters the random drop state, in which normal packets may be dropped.

## Examples

The following example shows how to set the maximum threshold value of the queue to 60,000:

```
(config) # ipv6 spd queue max-threshold 60000
```

## Related Commands

| Command                             | Description                                                                   |
|-------------------------------------|-------------------------------------------------------------------------------|
| <b>ipv6 spd queue min-threshold</b> | Configures the minimum number of packets in the IPv6 SPD process input queue. |
| <b>show ipv6 spd</b>                | Displays the IPv6 SPD configuration.                                          |

## ipv6 traffic interface-statistics

To collect IPv6 forwarding statistics for all interfaces, use the **ipv6 traffic interface-statistics** command in global configuration mode. To ensure that IPv6 forwarding statistics are not collected for any interface, use the **no** form of this command.

**ipv6 traffic interface-statistics** [**unclearable**]  
**no ipv6 traffic interface-statistics** [**unclearable**]

### Syntax Description

|                    |                                                                                                                                     |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>unclearable</b> | (Optional) IPv6 forwarding statistics are kept for all interfaces, but it is not possible to clear the statistics on any interface. |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------|

### Command Default

IPv6 forwarding statistics are collected for all interfaces.

### Command Modes

Global configuration (config)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Using the optional **unclearable** keyword halves the per-interface statistics storage requirements.

### Examples

The following example does not allow statistics to be cleared on any interface:

```
(config)# ipv6 traffic interface-statistics unclearable
```

# ipv6 unicast-routing

To enable the forwarding of IPv6 unicast datagrams, use the **ipv6 unicast-routing** command in global configuration mode. To disable the forwarding of IPv6 unicast datagrams, use the **no** form of this command.

**ipv6 unicast-routing**  
**no ipv6 unicast-routing**

**Syntax Description** This command has no arguments or keywords.

**Command Default** IPv6 unicast routing is disabled.

**Command Modes** Global configuration (config)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Configuring the **no ipv6 unicast-routing** command removes all IPv6 routing protocol entries from the IPv6 routing table.

**Examples** The following example enables the forwarding of IPv6 unicast datagrams:

```
(config) # ipv6 unicast-routing
```

| Related Commands | Command                        | Description                                                                                                                                  |
|------------------|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
|                  | <b>ipv6 address link-local</b> | Configures an IPv6 link-local address for an interface and enables IPv6 processing on the interface.                                         |
|                  | <b>ipv6 address eui-64</b>     | Configures an IPv6 address and enables IPv6 processing on an interface using an EUI-64 interface ID in the low-order 64 bits of the address. |
|                  | <b>ipv6 enable</b>             | Enables IPv6 processing on an interface that has not been configured with an explicit IPv6 address.                                          |
|                  | <b>ipv6 unnumbered</b>         | Enables IPv6 processing on an interface without assigning an explicit IPv6 address to the interface.                                         |
|                  | <b>show ipv6 route</b>         | Displays the current contents of the IPv6 routing table.                                                                                     |

# key chain

To define an authentication key chain needed to enable authentication for routing protocols and enter key-chain configuration mode, use the **key chain** command in global configuration mode. To remove the key chain, use the **no** form of this command.

**key chain** *name-of-chain*  
**no key chain** *name-of-chain*

## Syntax Description

|                      |                                                                                                 |
|----------------------|-------------------------------------------------------------------------------------------------|
| <i>name-of-chain</i> | Name of a key chain. A key chain must have at least one key and can have up to 2147483647 keys. |
|----------------------|-------------------------------------------------------------------------------------------------|

## Command Default

No key chain exists.

## Command Modes

Global configuration (config)

## Usage Guidelines

You must configure a key chain with keys to enable authentication.

Although you can identify multiple key chains, we recommend using one key chain per interface per routing protocol. Upon specifying the **key chain** command, you enter key chain configuration mode.

## Examples

The following example shows how to specify key chain:

```
Device(config-keychain-key)# key-string chestnut
```

## Related Commands

| Command                            | Description                                                                                   |
|------------------------------------|-----------------------------------------------------------------------------------------------|
| <b>accept-lifetime</b>             | Sets the time period during which the authentication key on a key chain is received as valid. |
| <b>key</b>                         | Identifies an authentication key on a key chain.                                              |
| <b>key-string (authentication)</b> | Specifies the authentication string for a key.                                                |
| <b>send-lifetime</b>               | Sets the time period during which an authentication key on a key chain is valid to be sent.   |
| <b>show key chain</b>              | Displays authentication key information.                                                      |

## key-string (authentication)

To specify the authentication string for a key, use the **key-string**(authentication) command in key chain key configuration mode. To remove the authentication string, use the **no** form of this command.

**key-string** *key-string text*

**no key-string** *text*

### Syntax Description

|             |                                                                                                                                                                                                          |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>text</i> | Authentication string that must be sent and received in the packets using the routing protocol being authenticated. The string can contain from 1 to 80 uppercase and lowercase alphanumeric characters. |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Command Default

No authentication string for a key exists.

### Command Modes

Key chain key configuration (config-keychain-key)

### Examples

The following example shows how to specify the authentication string for a key:

```
Device (config-keychain-key) # key-string key1
```

### Related Commands

| Command                | Description                                                                                   |
|------------------------|-----------------------------------------------------------------------------------------------|
| <b>accept-lifetime</b> | Sets the time period during which the authentication key on a key chain is received as valid. |
| <b>key</b>             | Identifies an authentication key on a key chain.                                              |
| <b>key chain</b>       | Defines an authentication key-chain needed to enable authentication for routing protocols.    |
| <b>send-lifetime</b>   | Sets the time period during which an authentication key on a key chain is valid to be sent.   |
| <b>show key chain</b>  | Displays authentication key information.                                                      |

# key

To identify an authentication key on a key chain, use the **key** command in key-chain configuration mode. To remove the key from the key chain, use the **no** form of this command.

**key** *key-id*  
**no key** *key-id*

## Syntax Description

|               |                                                                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>key-id</i> | Identification number of an authentication key on a key chain. The range of keys is from 0 to 2147483647. The key identification numbers need not be consecutive. |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Default

No key exists on the key chain.

## Command Modes

Key-chain configuration (config-keychain)

## Usage Guidelines

It is useful to have multiple keys on a key chain so that the software can sequence through the keys as they become invalid after time, based on the **accept-lifetime** and **send-lifetime** key chain key command settings.

Each key has its own key identifier, which is stored locally. The combination of the key identifier and the interface associated with the message uniquely identifies the authentication algorithm and Message Digest 5 (MD5) authentication key in use. Only one authentication packet is sent, regardless of the number of valid keys. The software starts looking at the lowest key identifier number and uses the first valid key.

If the last key expires, authentication will continue and an error message will be generated. To disable authentication, you must manually delete the last valid key.

To remove all keys, remove the key chain by using the **no key chain** command.

## Examples

The following example shows how to specify a key to identify authentication on a key-chain:

```
Device(config-keychain)# key 1
```

## Related Commands

# show ip nhrp nhs

To display Next Hop Resolution Protocol (NHRP) next hop server (NHS) information, use the **show ip nhrp nhs** command in user EXEC or privileged EXEC mode.

**show ip nhrp nhs** [{*interface*}] [**detail**] [{**redundancy** [{*cluster number* | **preempted** | **running** | **waiting**}]}]

## Syntax Description

|                       |                                                                                                                                            |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <i>interface</i>      | (Optional) Displays NHS information currently configured on the interface. See the table below for types, number ranges, and descriptions. |
| <b>detail</b>         | (Optional) Displays detailed NHS information.                                                                                              |
| <b>redundancy</b>     | (Optional) Displays information about NHS redundancy stacks.                                                                               |
| <i>cluster number</i> | (Optional) Displays redundancy cluster information.                                                                                        |
| <b>preempted</b>      | (Optional) Displays information about NHS that failed to become active and is preempted.                                                   |
| <b>running</b>        | (Optional) Displays NHSs that are currently in Responding or Expecting replies states.                                                     |
| <b>waiting</b>        | (Optional) Displays NHSs awaiting to be scheduled.                                                                                         |

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The table below lists the valid types, number ranges, and descriptions for the optional *interface* argument.

### Note

The valid types can vary according to the platform and interfaces on the platform.

**Table 27: Valid Types, Number Ranges, and Interface Descriptions**

| Valid Types   | Number Ranges   | Interface Descriptions                                                                |
|---------------|-----------------|---------------------------------------------------------------------------------------|
| ANI           | 0 to 1000       | Autonomic-Networking virtual interface                                                |
| Auto-Template | 1 to 999        | Auto-Template interface                                                               |
| Capwap        | 0 to 2147483647 | Control and Provisioning of Wireless Access Points protocol (CAPWAP) tunnel interface |

| Valid Types        | Number Ranges   | Interface Descriptions                                  |
|--------------------|-----------------|---------------------------------------------------------|
| GMPLS              | 0 to 1000       | Multiprotocol Label Switching (MPLS) interface          |
| GigabitEthernet    | 0 to 9          | GigabitEthernet IEEE 802.3z                             |
| InternalInterface  | 0 to 9          | Internal interface                                      |
| LISP               | 0 to 65520      | Locator/ID Separation Protocol (LISP) virtual interface |
| loopback           | 0 to 2147483647 | Loopback interface                                      |
| Null               | 0 to 0          | Null interface                                          |
| PROTECTION_GROUP   | 0 to 0          | Protection-group controller                             |
| Port-channel       | 1 to 128        | Port channel interface                                  |
| TenGigabitEthernet | 0 to 9          | TenGigabitEthernet interface                            |
| Tunnel             | 0 to 2147483647 | Tunnel interface                                        |
| Tunnel-tp          | 0 to 65535      | MPLS Transport Profile interface                        |
| Vlan               | 1 to 4094       | VLAN interface                                          |

## Examples

The following is sample output from the **show ip nhrp nhs detail** command:

```
Switch# show ip nhrp nhs detail

Legend:
  E=Expecting replies
  R=Responding
Tunnel1:
  10.1.1.1          E req-sent 128 req-failed 1 repl-recv 0
Pending Registration Requests:
Registration Request: Reqid 1, Ret 64 NHS 10.1.1.1
```

The table below describes the significant field shown in the display.

**Table 28: show ip nhrp nhs Field Descriptions**

| Field   | Description                                            |
|---------|--------------------------------------------------------|
| Tunnel1 | Interface through which the target network is reached. |

## Related Commands

| Command            | Description                                                                                           |
|--------------------|-------------------------------------------------------------------------------------------------------|
| <b>ip nhrp map</b> | Statically configures the IP-to-NBMA address mapping of IP destinations connected to an NBMA network. |

| Command      | Description                        |
|--------------|------------------------------------|
| show ip nhrp | Displays NHRP mapping information. |

# show ip ports all

To display all the open ports on a device, use the **show ip ports all** in user EXEC or privileged EXEC mode.

## show ip ports all

### Syntax Description

Syntax Description

This command has no arguments or keywords.

### Command Default

No default behavior or values.

### Command Modes

User EXEC (>)

Privileged EXEC (#)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

This command provides a list of all open TCP/IP ports on the system including the ports opened using Cisco networking stack.

To close open ports, you can use one of the following methods:

- Use Access Control List (ACL).
- To close the UDP 2228 port, use the **no l2 traceroute** command.
- To close TCP 80, TCP 443, TCP 6970, TCP 8090 ports, use the **no ip http server** and **no ip http secure-server** commands.

### Examples

The following is sample output from the **show ip ports all** command:

```
Device#
show ip ports all
Proto Local Address Foreign Address State PID/Program Name
TCB Local Address Foreign Address (state)
tcp *:4786 *:* LISTEN 224/[IOS]SMI IBC server process
tcp *:443 *:* LISTEN 286/[IOS]HTTP CORE
tcp *:443 *:* LISTEN 286/[IOS]HTTP CORE
tcp *:80 *:* LISTEN 286/[IOS]HTTP CORE
tcp *:80 *:* LISTEN 286/[IOS]HTTP CORE
udp *:10002 *:* 0/[IOS] Unknown
udp *:2228 10.0.0.0:0 318/[IOS]L2TRACE SERVER
```

The table below describes the significant fields shown in the display

**Table 29: Field Descriptions of show ip ports all**

| Field    | Description              |
|----------|--------------------------|
| Protocol | Transport protocol used. |

show ip ports all

| Field            | Description                                                          |
|------------------|----------------------------------------------------------------------|
| Local Address.   | Device IP Address.                                                   |
| Foreign Address  | Remote or peer address.                                              |
| State            | State of the connection. It can be listen, established or connected. |
| PID/Program Name | Process ID or name                                                   |

**Related Commands**

| Cisco IOS XE Everest 16.5.1aCisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                 |  |         |              |                                                          |                              |
| Usage Guidelines                                         | The <b>show ipv6 access-list</b> command provides output similar to the <b>show ip access-list</b> command, except that it is IPv6-specific.                                 |  |         |              |                                                          |                              |

## Examples

The following output from the **show ipv6 access-list** command shows IPv6 access lists named inbound, tcptraffic, and outbound:

```
# show ipv6 access-list
IPv6 access list inbound
  permit tcp any any eq bgp reflect tcptraffic (8 matches) sequence 10
  permit tcp any any eq telnet reflect tcptraffic (15 matches) sequence 20
  permit udp any any reflect udptraffic sequence 30
IPv6 access list tcptraffic (reflexive) (per-user)
  permit tcp host 2001:0DB8:1::1 eq bgp host 2001:0DB8:1::2 eq 11000 timeout 300 (time
    left 243) sequence 1
  permit tcp host 2001:0DB8:1::1 eq telnet host 2001:0DB8:1::2 eq 11001 timeout 300
    (time left 296) sequence 2
IPv6 access list outbound
  evaluate udptraffic
  evaluate tcptraffic
```

The following sample output shows IPv6 access list information for use with IPsec:

```
# show ipv6 access-list
IPv6 access list Tunnel0-head-0-ACL (crypto)
  permit ipv6 any any (34 matches) sequence 1
IPv6 access list Ethernet2/0-ipsecv6-ACL (crypto)
  permit 89 FE80::/10 any (85 matches) sequence 1
```

The table below describes the significant fields shown in the display.

Table 30: show ipv6 access-list Field Descriptions

| Field                    | Description                                                                                                                                                                                                                                            |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipv6 access list inbound | Name of the IPv6 access list, for example, inbound.                                                                                                                                                                                                    |
| permit                   | Permits any packet that matches the specified protocol type.                                                                                                                                                                                           |
| tcp                      | Transmission Control Protocol. The higher-level (Layer 4) protocol type that the packet must match.                                                                                                                                                    |
| any                      | Equal to ::/0.                                                                                                                                                                                                                                         |
| eq                       | An equal operand that compares the source or destination ports of TCP or UDP packets.                                                                                                                                                                  |
| bgp                      | Border Gateway Protocol. The lower-level (Layer 3) protocol type that the packet must be equal to.                                                                                                                                                     |
| reflect                  | Indicates a reflexive IPv6 access list.                                                                                                                                                                                                                |
| tcptraffic (8 matches)   | The name of the reflexive IPv6 access list and the number of matches for the access list. The <b>clear ipv6 access-list</b> privileged EXEC command resets the IPv6 access list match counters.                                                        |
| sequence 10              | Sequence in which an incoming packet is compared to lines in an access list. Lines in an access list are ordered from first priority (lowest number, for example, 10) to last priority (highest number, for example, 80).                              |
| host 2001:0DB8:1::1      | The source IPv6 host address that the source address of the packet must match.                                                                                                                                                                         |
| host 2001:0DB8:1::2      | The destination IPv6 host address that the destination address of the packet must match.                                                                                                                                                               |
| 11000                    | The ephemeral source port number for the outgoing connection.                                                                                                                                                                                          |
| timeout 300              | The total interval of idle time (in seconds) after which the temporary IPv6 reflexive access list named tcptraffic will time out for the indicated session.                                                                                            |
| (time left 243)          | The amount of idle time (in seconds) remaining before the temporary IPv6 reflexive access list named tcptraffic is deleted for the indicated session. Additional received traffic that matches the indicated session resets this value to 300 seconds. |
| evaluate udptraffic      | Indicates the IPv6 reflexive access list named udptraffic is nested in the IPv6 access list named outbound.                                                                                                                                            |

## Related Commands

| Command                       | Description                                           |
|-------------------------------|-------------------------------------------------------|
| <b>clear ipv6 access-list</b> | Resets the IPv6 access list match counters.           |
| <b>hardware statistics</b>    | Enables the collection of hardware statistics.        |
| <b>show ip access-list</b>    | Displays the contents of all current IP access lists. |

| Command                      | Description                                                                 |
|------------------------------|-----------------------------------------------------------------------------|
| <b>show ip prefix-list</b>   | Displays information about a prefix list or prefix list entries.            |
| <b>show ipv6 prefix-list</b> | Displays information about an IPv6 prefix list or IPv6 prefix list entries. |

# show ipv6 destination-guard policy

To display destination guard information, use the **show ipv6 destination-guard policy** command in privileged EXEC mode.

**show ipv6 destination-guard policy** [*policy-name*]

## Syntax Description

|                    |                                                  |
|--------------------|--------------------------------------------------|
| <i>policy-name</i> | (Optional) Name of the destination guard policy. |
|--------------------|--------------------------------------------------|

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

If the *policy-name* argument is specified, only the specified policy information is displayed. If the *policy-name* argument is not specified, information is displayed for all policies.

## Examples

The following is sample output from the **show ipv6 destination-guard policy** command when the policy is applied to a VLAN:

```
# show ipv6 destination-guard policy poll
Destination guard policy destination:
  enforcement always
    Target: vlan 300
```

The following is sample output from the **show ipv6 destination-guard policy** command when the policy is applied to an interface:

```
# show ipv6 destination-guard policy poll
Destination guard policy destination:
  enforcement always
    Target: Gi0/0/1
```

## Related Commands

| Command                              | Description                           |
|--------------------------------------|---------------------------------------|
| <b>ipv6 destination-guard policy</b> | Defines the destination guard policy. |

# show ipv6 dhcp

To display the Dynamic Host Configuration Protocol (DHCP) unique identifier (DUID) on a specified device, use the **show ipv6 dhcp** command in user EXEC or privileged EXEC mode.

**show ipv6 dhcp**

## Syntax Description

This command has no arguments or keywords.

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **show ipv6 dhcp** command uses the DUID based on the link-layer address for both client and server identifiers. The device uses the MAC address from the lowest-numbered interface to form the DUID. The network interface is assumed to be permanently attached to the device. Use the **show ipv6 dhcp** command to display the DUID of a device.

## Examples

The following is sample output from the **show ipv6 dhcp** command. The output is self-explanatory:

```
# show ipv6 dhcp
This device's DHCPv6 unique identifier(DUID): 000300010002FCA5DC1C
```

# show ipv6 dhcp binding

To display automatic client bindings from the Dynamic Host Configuration Protocol (DHCP) for IPv6 server binding table, use the **show ipv6 dhcp binding** command in user EXEC or privileged EXEC mode.

**show ipv6 dhcp binding** [*ipv6-address*] [**vrf** *vrf-name*]

|                           |                            |                                                                            |
|---------------------------|----------------------------|----------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>ipv6-address</i>        | (Optional) The address of a DHCP for IPv6 client.                          |
|                           | <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |

|                      |                     |
|----------------------|---------------------|
| <b>Command Modes</b> | User EXEC (>)       |
|                      | Privileged EXEC (#) |

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **show ipv6 dhcp binding** command displays all automatic client bindings from the DHCP for IPv6 server binding table if the *ipv6-address* argument is not specified. When the *ipv6-address* argument is specified, only the binding for the specified client is displayed.

If the **vrf** *vrf-name* keyword and argument combination is specified, all bindings that belong to the specified VRF are displayed.

**Note** The **ipv6 dhcp server vrf enable** command must be enabled for the configured VRF to work. If the command is not configured, the output of the **show ipv6 dhcp binding** command will not display the configured VRF; it will only display the default VRF details.

## Examples

The following sample output displays all automatic client bindings from the DHCP for IPv6 server binding table:

```
# show ipv6 dhcp binding

Client: FE80::A8BB:CCFF:FE00:300
  DUID: 00030001AABBCC000300
  Username : client_1
  Interface: Virtual-Access2.1
  IA PD: IA ID 0x000C0001, T1 75, T2 135
    Prefix: 2001:380:E00::/64
           preferred lifetime 150, valid lifetime 300
           expires at Dec 06 2007 12:57 PM (262 seconds)
Client: FE80::A8BB:CCFF:FE00:300 (Virtual-Access2.2)
  DUID: 00030001AABBCC000300
  IA PD: IA ID 0x000D0001, T1 75, T2 135
    Prefix: 2001:0DB8:E00:1::/64
```

```
preferred lifetime 150, valid lifetime 300
expires at Dec 06 2007 12:58 PM (288 seconds)
```

The table below describes the significant fields shown in the display.

**Table 31: show ipv6 dhcp binding Field Descriptions**

| Field                              | Description                                                                                                                                                                                                                                                                                              |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Client                             | Address of a specified client.                                                                                                                                                                                                                                                                           |
| DUID                               | DHCP unique identifier (DUID).                                                                                                                                                                                                                                                                           |
| Virtual-Access2.1                  | First virtual client. When an IPv6 DHCP client requests two prefixes with the same DUID but a different identity association for prefix delegation (IAPD ) on two different interfaces, these prefixes are considered to be for two different clients, and interface information is maintained for both. |
| Username : client_1                | The username associated with the binding.                                                                                                                                                                                                                                                                |
| IA PD                              | Collection of prefixes assigned to a client.                                                                                                                                                                                                                                                             |
| IA ID                              | Identifier for this IAPD.                                                                                                                                                                                                                                                                                |
| Prefix                             | Prefixes delegated to the indicated IAPD on the specified client.                                                                                                                                                                                                                                        |
| preferred lifetime, valid lifetime | The preferred lifetime and valid lifetime settings, in seconds, for the specified client.                                                                                                                                                                                                                |
| Expires at                         | Date and time at which the valid lifetime expires.                                                                                                                                                                                                                                                       |
| Virtual-Access2.2                  | Second virtual client. When an IPv6 DHCP client requests two prefixes with the same DUID but different IAIDs on two different interfaces, these prefixes are considered to be for two different clients, and interface information is maintained for both.                                               |

When the DHCPv6 pool on the Cisco IOS DHCPv6 server is configured to obtain prefixes for delegation from an authentication, authorization, and accounting (AAA) server, it sends the PPP username from the incoming PPP session to the AAA server for obtaining the prefixes. The PPP username is associated with the binding is displayed in output from the **show ipv6 dhcp binding** command. If there is no PPP username associated with the binding, this field value is displayed as "unassigned."

The following example shows that the PPP username associated with the binding is "client\_1":

```
# show ipv6 dhcp binding

Client: FE80::2AA:FF:FE8B:CC
DUID: 0003000100AA00BB00CC
Username : client_1
Interface : Virtual-Access2
IA PD: IA ID 0x00130001, T1 75, T2 135
Prefix: 2001:0DB8:1:3::/80
        preferred lifetime 150, valid lifetime 300
        expires at Aug 07 2008 05:19 AM (225 seconds)
```

The following example shows that the PPP username associated with the binding is unassigned:

**show ipv6 dhcp binding**

```
# show ipv6 dhcp binding

Client: FE80::2AA:FF:FE8B:CC
DUID: 0003000100AA00BB00CC
Username : unassigned
Interface : Virtual-Access2
IA PD: IA ID 0x00130001, T1 150, T2 240
Prefix: 2001:0DB8:1:1::/80
        preferred lifetime 300, valid lifetime 300
        expires at Aug 11 2008 06:23 AM (233 seconds)
```

**Related Commands**

| Command                            | Description                                                             |
|------------------------------------|-------------------------------------------------------------------------|
| <b>ipv6 dhcp server vrf enable</b> | Enables the DHCPv6 server VRF-aware feature.                            |
| <b>clear ipv6 dhcp binding</b>     | Deletes automatic client bindings from the DHCP for IPv6 binding table. |

# show ipv6 dhcp conflict

To display address conflicts found by a Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server when addresses are offered to the client, use the **show ipv6 dhcp conflict** command in privileged EXEC mode.

**show ipv6 dhcp conflict** [*ipv6-address*] [**vrf** *vrf-name*]

## Syntax Description

|                            |                                                                            |
|----------------------------|----------------------------------------------------------------------------|
| <i>ipv6-address</i>        | (Optional) The address of a DHCP for IPv6 client.                          |
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |

## Command Modes

Privileged EXEC (#)

## Command History

| Release                                                  | Modification                 |
|----------------------------------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1aCisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

When you configure the DHCPv6 server to detect conflicts, it uses ping. The client uses neighbor discovery to detect clients and reports to the server through a DECLINE message. If an address conflict is detected, the address is removed from the pool, and the address is not assigned until the administrator removes the address from the conflict list.

## Examples

The following is a sample output from the **show ipv6 dhcp conflict** command. This command shows the pool and prefix values for DHCP conflicts.:

```
# show ipv6 dhcp conflict
Pool 350, prefix 2001:0DB8:1005::/48
      2001:0DB8:1005::10
```

## Related Commands

|--------------------------|-------------------------------------------------------------|
| clear ipv6 dhcp conflict | Clears an address conflict from the DHCPv6 server database. |

# show ipv6 dhcp database

To display the Dynamic Host Configuration Protocol (DHCP) for IPv6 binding database agent information, use the **show ipv6 dhcp database** command in user EXEC or privileged EXEC mode.

**show ipv6 dhcp database** [*agent-URL*]

## Syntax Description

|                  |                                                                                               |
|------------------|-----------------------------------------------------------------------------------------------|
| <i>agent-URL</i> | (Optional) A flash, NVRAM, FTP, TFTP, or remote copy protocol (RCP) uniform resource locator. |
|------------------|-----------------------------------------------------------------------------------------------|

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Each permanent storage to which the binding database is saved is called the database agent. An agent can be configured using the **ipv6 dhcp database** command. Supported database agents include FTP and TFTP servers, RCP, Flash file system, and NVRAM.

The **show ipv6 dhcp database** command displays DHCP for IPv6 binding database agent information. If the *agent-URL* argument is specified, only the specified agent is displayed. If the *agent-URL* argument is not specified, all database agents are shown.

## Examples

The following is sample output from the **show ipv6 dhcp database** command:

```
# show ipv6 dhcp database
Database agent tftp://172.19.216.133/db.tftp:
  write delay: 69 seconds, transfer timeout: 300 seconds
  last written at Jan 09 2003 01:54 PM,
    write timer expires in 56 seconds
  last read at Jan 06 2003 05:41 PM
  successful read times 1
  failed read times 0
  successful write times 3172
  failed write times 2
Database agent nvram:/dhcpv6-binding:
  write delay: 60 seconds, transfer timeout: 300 seconds
  last written at Jan 09 2003 01:54 PM,
    write timer expires in 37 seconds
  last read at never
  successful read times 0
  failed read times 0
  successful write times 3325
  failed write times 0
Database agent flash:/dhcpv6-db:
  write delay: 82 seconds, transfer timeout: 3 seconds
  last written at Jan 09 2003 01:54 PM,
    write timer expires in 50 seconds
  last read at never
```

```

successful read times 0
failed read times 0
successful write times 2220
failed write times 614

```

The table below describes the significant fields shown in the display.

**Table 32: show ipv6 dhcp database Field Descriptions**

| Field                         | Description                                                                                                                                              |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Database agent                | Specifies the database agent.                                                                                                                            |
| Write delay                   | The amount of time (in seconds) to wait before updating the database.                                                                                    |
| transfer timeout              | Specifies how long (in seconds) the DHCP server should wait before canceling a database transfer. Transfers that exceed the timeout period are canceled. |
| Last written                  | The last date and time bindings were written to the file server.                                                                                         |
| Write timer expires...        | The length of time, in seconds, before the write timer expires.                                                                                          |
| Last read                     | The last date and time bindings were read from the file server.                                                                                          |
| Successful/failed read times  | The number of successful or failed read times.                                                                                                           |
| Successful/failed write times | The number of successful or failed write times.                                                                                                          |

#### Related Commands

| Command                   | Description                                                |
|---------------------------|------------------------------------------------------------|
| <b>ipv6 dhcp database</b> | Specifies DHCP for IPv6 binding database agent parameters. |

# show ipv6 dhcp guard policy

To display Dynamic Host Configuration Protocol for IPv6 (DHCPv6) guard information, use the **show ipv6 dhcp guard policy** command in privileged EXEC mode.

**show ipv6 dhcp guard policy** [*policy-name*]

## Syntax Description

|                    |                                      |
|--------------------|--------------------------------------|
| <i>policy-name</i> | (Optional) DHCPv6 guard policy name. |
|--------------------|--------------------------------------|

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

If the *policy-name* argument is specified, only the specified policy information is displayed. If the *policy-name* argument is not specified, information is displayed for all policies.

## Examples

The following is sample output from the **show ipv6 dhcp guard guard** command:

```
# show ipv6 dhcp guard policy

Dhcp guard policy: default
  Device Role: dhcp client
  Target: Et0/3

Dhcp guard policy: test1
  Device Role: dhcp server
  Target: vlan 0      vlan 1      vlan 2      vlan 3      vlan 4
  Max Preference: 200
  Min Preference: 0
  Source Address Match Access List: acl1
  Prefix List Match Prefix List: pfxlist1

Dhcp guard policy: test2
  Device Role: dhcp relay
  Target: Et0/0 Et0/1 Et0/2
```

The table below describes the significant fields shown in the display.

**Table 33: show ipv6 dhcp guard Field Descriptions**

| Field       | Description                                                          |
|-------------|----------------------------------------------------------------------|
| Device Role | The role of the device. The role is either client, server or relay.  |
| Target      | The name of the target. The target is either an interface or a VLAN. |

|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

If no interfaces are specified, all interfaces on which DHCP for IPv6 (client or server) is enabled are shown. If an interface is specified, only information about the specified interface is displayed.

## Examples

The following is sample output from the **show ipv6 dhcp interface** command. In the first example, the command is used on a router that has an interface acting as a DHCP for IPv6 server. In the second example, the command is used on a router that has an interface acting as a DHCP for IPv6 client:

```
# show ipv6 dhcp interface
Ethernet2/1 is in server mode
  Using pool: svr-pl
  Preference value: 20
  Rapid-Commit is disabled
Router2# show ipv6 dhcp interface
Ethernet2/1 is in client mode
  State is OPEN (1)
  List of known servers:
    Address: FE80::202:FCFF:FEA1:7439, DUID 000300010002FCA17400
    Preference: 20
      IA PD: IA ID 0x00040001, T1 120, T2 192
        Prefix: 3FFE:C00:C18:1::/72
          preferred lifetime 240, valid lifetime 54321
          expires at Nov 08 2002 09:10 AM (54319 seconds)
        Prefix: 3FFE:C00:C18:2::/72
          preferred lifetime 300, valid lifetime 54333
          expires at Nov 08 2002 09:11 AM (54331 seconds)
        Prefix: 3FFE:C00:C18:3::/72
          preferred lifetime 280, valid lifetime 51111
          expires at Nov 08 2002 08:17 AM (51109 seconds)
      DNS server: 1001::1
      DNS server: 1001::2
      Domain name: domain1.net
      Domain name: domain2.net
      Domain name: domain3.net
```

```
Prefix name is cli-p1
Rapid-Commit is enabled
```

The table below describes the significant fields shown in the display.

**Table 34: show ipv6 dhcp interface Field Descriptions**

| Field                                | Description                                                                                                             |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| Ethernet2/1 is in server/client mode | Displays whether the specified interface is in server or client mode.                                                   |
| Preference value:                    | The advertised (or default of 0) preference value for the indicated server.                                             |
| Prefix name is cli-p1                | Displays the IPv6 general prefix pool name, in which prefixes successfully acquired on this interface are stored.       |
| Using pool: svr-p1                   | The name of the pool that is being used by the interface.                                                               |
| State is OPEN                        | State of the DHCP for IPv6 client on this interface. "Open" indicates that configuration information has been received. |
| List of known servers                | Lists the servers on the interface.                                                                                     |
| Address, DUID                        | Address and DHCP unique identifier (DUID) of a server heard on the specified interface.                                 |
| Rapid commit is disabled             | Displays whether the <b>rapid-commit</b> keyword has been enabled on the interface.                                     |

The following example shows the DHCP for IPv6 relay agent configuration on FastEthernet interface 0/0, and use of the **show ipv6 dhcp interface** command displays relay agent information on FastEthernet interface 0/0:

```
(config-if)# ipv6 dhcp relay destination FE80::250:A2FF:FEBF:A056 FastEthernet0/1
# show ipv6 dhcp interface FastEthernet 0/0
FastEthernet0/0 is in relay mode
Relay destinations:
FE80::250:A2FF:FEBF:A056 via FastEthernet0/1
```

#### Related Commands

| Command                            | Description                                                                                                                      |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>ipv6 dhcp client pd</b>         | Enables the DHCP for IPv6 client process and enables requests for prefix delegation through a specified interface.               |
| <b>ipv6 dhcp relay destination</b> | Specifies a destination address to which client messages are forwarded and enables DHCP for IPv6 relay service on the interface. |
| <b>ipv6 dhcp server</b>            | Enables DHCP for IPv6 service on an interface.                                                                                   |

# show ipv6 dhcp relay binding

To display DHCPv6 Internet Assigned Numbers Authority (IANA) and DHCPv6 Identity Association for Prefix Delegation (IAPD) bindings on a relay agent, use the **show ipv6 dhcp relay binding** command in user EXEC or privileged EXEC mode.

**show ipv6 dhcp relay binding** [**vrf** *vrf-name*]

## Syntax Description

**vrf** *vrf-name* (Optional) Specifies a virtual routing and forwarding (VRF) configuration.

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

If the **vrf** *vrf-name* keyword-argument pair is specified, all bindings belonging to the specified VRF are displayed.

### Note

Only the DHCPv6 IAPD bindings on a relay agent are displayed on the Cisco uBR10012 and Cisco uBR7200 series universal broadband devices.

## Examples

The following is sample output from the **show ipv6 dhcp relay binding** command:

```
Device# show ipv6 dhcp relay binding
```

The following example shows output from the **show ipv6 dhcp relay binding** command with a specified VRF name on a Cisco uBR10012 universal broadband device:

```
Device# show ipv6 dhcp relay binding vrf vrf1
```

```
Prefix: 2001:DB8:0:1:/64 (Bundle100.600)
DUID: 000300010023BED94D31
IAID: 3201912114
lifetime: 600
```

The table below describes the significant fields shown in the display.

**Table 35: show ipv6 dhcp relay binding Field Descriptions**

| Field  | Description           |
|--------|-----------------------|
| Prefix | IPv6 prefix for DHCP. |

| Field    | Description                                               |
|----------|-----------------------------------------------------------|
| DUID     | DHCP Unique Identifier (DUID) for the IPv6 relay binding. |
| IAID     | Identity Association Identification (IAID) for DHCP.      |
| lifetime | Lifetime of the prefix, in seconds.                       |

**Related Commands**

| Command                                 | Description                                                                     |
|-----------------------------------------|---------------------------------------------------------------------------------|
| <b>clear ipv6 dhcp relay binding</b>    | Clears a specific IPv6 address or IPv6 prefix of a DHCP for IPv6 relay binding. |
| <b>debug ipv6 dhcp relay</b>            | Enables debugging for IPv6 DHCP relay agent.                                    |
| <b>debug ipv6 dhcp relay bulk-lease</b> | Enables bulk lease query debugging for IPv6 DHCP relay agent.                   |

## show ipv6 eigrp events

To display Enhanced Interior Gateway Routing Protocol (EIGRP) events logged for IPv6, use the **show ipv6 eigrp events** command in user EXEC or privileged EXEC mode.

**show ipv6 eigrp events** [{errmsg | sia}] [event-num-start event-num-end] [type]

### Syntax Description

|                        |                                                                                   |
|------------------------|-----------------------------------------------------------------------------------|
| <b>errmsg</b>          | (Optional) Displays error messages being logged.                                  |
| <b>sia</b>             | (Optional) Displays Stuck In Active (SIA) messages.                               |
| <b>event-num-start</b> | (Optional) Starting number of the event range. The range is from 1 to 4294967295. |
| <b>event-num-end</b>   | (Optional) Ending number of the event range. The range is from 1 to 4294967295.   |
| <b>type</b>            | (Optional) Displays event types being logged.                                     |

### Command Default

If no event range is specified, information for all IPv6 EIGRP events is displayed.

### Command Modes

User EXEC (>)

Privileged EXEC (#)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

The **show ipv6 eigrp events** command is used to analyze a network failure by the Cisco support team and is not intended for general use. This command provides internal state information about EIGRP and how it processes route notifications and changes.

### Examples

The following is sample output from the **show ipv6 eigrp events** command. The fields are self-explanatory.

```
# show ipv6 eigrp events

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **show ipv6 eigrp interfaces** command to determine the interfaces on which EIGRP is active and to get information about EIGRP processes related to those interfaces. The optional *type number* argument and the **detail** keyword can be entered in any order.

If an interface is specified, only that interface is displayed. Otherwise, all interfaces on which EIGRP is running are displayed.

If an autonomous system is specified, only the routing process for the specified autonomous system is displayed. Otherwise, all EIGRP processes are displayed.

## Examples

The following is sample output from the **show ipv6 eigrp interfaces** command:

```
# show ipv6 eigrp 1 interfaces
```

```
IPv6-EIGRP interfaces for process 1
Interface      Peers    Xmit Queue  Mean    Pacing Time  Multicast    Pending
              Un/Reliable SRTT      Un/Reliable Flow Timer    Routes
Et0/0          0         0/0         0       0/10         0            0
```

The following is sample output from the **show ipv6 eigrp interfaces detail** command:

```
# show ipv6 eigrp interfaces detail
```

```
IPv6-EIGRP interfaces for process 1
Interface      Peers    Xmit Queue  Mean    Pacing Time  Multicast    Pending
              Un/Reliable SRTT      Un/Reliable Flow Timer    Routes
Et0/0          0         0/0         0       0/10         0            0
```

```

Hello interval is 5 sec
Next xmit serial <none>
Un/reliable mcasts: 0/0 Un/reliable ucasts: 0/0
Mcast exceptions: 0 CR packets: 0 ACKs suppressed: 0
Retransmissions sent: 0 Out-of-sequence rcvd: 0
Authentication mode is not set

```

The following sample output from the **show ipv6 eigrp interface detail** command displays detailed information about a specific interface on which the **no ipv6 next-hop self** command is configured with the **no-ecmp-mode** option:

```
Device# show ipv6 eigrp interfaces detail tunnel 0
```

```

EIGRP-IPv6 Interfaces for AS(1)
              Xmit Queue   PeerQ           Mean   Pacing Time   Multicast   Pending
Interface      Peers  Un/Reliable  Un/Reliable  SRTT    Un/Reliable   Flow Timer   Routes
Tu0/0           2      0/0         0/0         29      0/0          136         0
Hello-interval is 5, Hold-time is 15
  Split-horizon is disabled
  Next xmit serial <none>
  Packetized sent/expedited: 48/1
  Hello's sent/expedited: 13119/49
  Un/reliable mcasts: 0/20  Un/reliable ucasts: 31/398
  Mcast exceptions: 5  CR packets: 5  ACKs suppressed: 1
  Retransmissions sent: 355  Out-of-sequence rcvd: 6
  Next-hop-self disabled, next-hop info forwarded, ECMP mode Enabled
  Topology-ids on interface - 0
  Authentication mode is not set

```

The table below describes the significant fields shown in the displays.

**Table 36: show ipv6 eigrp interfaces Field Descriptions**

| Field                   | Description                                                                                                                  |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Interface               | Interface over which EIGRP is configured.                                                                                    |
| Peers                   | Number of directly connected EIGRP neighbors.                                                                                |
| Xmit Queue Un/Reliable  | Number of packets remaining in the Unreliable and Reliable transmit queues.                                                  |
| Mean SRTT               | Mean smooth round-trip time (SRTT) interval (in seconds).                                                                    |
| Pacing Time Un/Reliable | Pacing time (in seconds) used to determine when EIGRP packets (unreliable and reliable) should be sent out of the interface. |
| Multicast Flow Timer    | Maximum number of seconds in which the device will send multicast EIGRP packets.                                             |
| Pending Routes          | Number of routes in the transmit queue waiting to be sent.                                                                   |
| Hello interval is 5 sec | Length (in seconds) of the hello interval.                                                                                   |

# show ipv6 eigrp topology

To display Enhanced Interior Gateway Routing Protocol (EIGRP) IPv6 topology table entries, use the **show ipv6 eigrp topology** command in user EXEC or privileged EXEC mode.

**show ipv6 eigrp topology** [{*as-number* *ipv6-address*}] [{**active** | **all-links** | **pending** | **summary** | **zero-successors**}]

## Syntax Description

|                        |                                                                                                                                                      |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>as-number</i>       | (Optional) Autonomous system number.                                                                                                                 |
| <i>ipv6-address</i>    | (Optional) IPv6 address.                                                                                                                             |
| <b>active</b>          | (Optional) Displays only active entries in the EIGRP topology table.                                                                                 |
| <b>all-links</b>       | (Optional) Displays all entries in the EIGRP topology table (including nonfeasible-successor sources).                                               |
| <b>pending</b>         | (Optional) Displays all entries in the EIGRP topology table that are either waiting for an update from a neighbor or waiting to reply to a neighbor. |
| <b>summary</b>         | (Optional) Displays a summary of the EIGRP topology table.                                                                                           |
| <b>zero-successors</b> | (Optional) Displays the available routes that have zero successors.                                                                                  |

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

If this command is used without any keywords or arguments, only routes that are feasible successors are displayed. The **show ipv6 eigrp topology** command can be used to determine Diffusing Update Algorithm (DUAL) states and to debug possible DUAL problems.

## Examples

The following is sample output from the **show ipv6 eigrp topology** command. The fields in the display are self-explanatory.

```
# show ipv6 eigrp topology

IPv6-EIGRP Topology Table for AS(1)/ID(2001:0DB8:10::/64)
Codes: P - Passive, A - Active, U - Update, Q - Query, R - Reply,
r - reply Status, s - sia Status
P 2001:0DB8:3::/64, 1 successors, FD is 281600
via Connected, Ethernet1/0
```

The following sample output from the **show ipv6 eigrp topology prefix** command displays ECMP mode information when the **no ipv6 next-hop-self** command is configured without the **no-ecmp-mode** option in the EIGRP topology. The ECMP mode provides information about the path that is being

advertised. If there is more than one successor, the top most path will be advertised as the default path over all interfaces, and the message “ECMP Mode: Advertise by default” will be displayed in the output. If any path other than the default path is advertised, the message “ECMP Mode: Advertise out <Interface name>” will be displayed. The fields in the display are self-explanatory.

```
# show ipv6 eigrp topology 2001:DB8:10::1/128

EIGRP-IPv6 Topology Entry for AS(1)/ID(192.0.2.100) for 2001:DB8:10::1/128
State is Passive, Query origin flag is 1, 2 Successor(s), FD is 284160
Descriptor Blocks:
FE80::A8BB:CCFF:FE01:2E01 (Tunnel0), from FE80::A8BB:CCFF:FE01:2E01, Send flag is 0x0
  Composite metric is (284160/281600), route is Internal
  Vector metric:
    Minimum bandwidth is 10000 Kbit
    Total delay is 1100 microseconds
    Reliability is 255/255
    Load is 1/5
    Minimum MTU is 1400
    Hop count is 1
    Originating router is 10.10.1.1
  ECMP Mode: Advertise by default
FE80::A8BB:CCFF:FE01:3E01 (Tunnel1), from FE80::A8BB:CCFF:FE01:3E01, Send flag is 0x0
  Composite metric is (284160/281600), route is Internal
  Vector metric:
    Minimum bandwidth is 10000 Kbit
    Total delay is 1100 microseconds
    Reliability is 255/255
    Load is 1/5
    Minimum MTU is 1400
    Hop count is 1
    Originating router is 10.10.2.2
  ECMP Mode: Advertise out Tunnel1
```

|-------------------------------------------|-----------------------------------------------|
| <b>show eigrp address-family topology</b> | Displays entries in the EIGRP topology table. |

## show ipv6 eigrp traffic

To display the number of Enhanced Interior Gateway Routing Protocol (EIGRP) for IPv6 packets sent and received, use the **show ipv6 eigrp traffic** command in user EXEC or privileged EXEC mode.

**show ipv6 eigrp traffic** [*as-number*]

### Syntax Description

|                  |                                      |
|------------------|--------------------------------------|
| <i>as-number</i> | (Optional) Autonomous system number. |
|------------------|--------------------------------------|

### Command Modes

User EXEC (>)

Privileged EXEC (#)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Use the **show ipv6 eigrp traffic** command to provide information on packets received and sent.

### Examples

The following is sample output from the **show ipv6 eigrp traffic** command:

```
# show ipv6 eigrp traffic
IPv6-EIGRP Traffic Statistics for process 9
Hellos sent/received: 218/205
Updates sent/received: 7/23
Queries sent/received: 2/0
Replies sent/received: 0/2
Acks sent/received: 21/14
```

The table below describes the significant fields shown in the display.

**Table 37: show ipv6 eigrp traffic Field Descriptions**

| Field                 | Description                                                                 |
|-----------------------|-----------------------------------------------------------------------------|
| process 9             | Autonomous system number specified in the <b>ipv6 router eigrp</b> command. |
| Hellos sent/received  | Number of hello packets sent and received.                                  |
| Updates sent/received | Number of update packets sent and received.                                 |
| Queries sent/received | Number of query packets sent and received.                                  |
| Replies sent/received | Number of reply packets sent and received.                                  |
| Acks sent/received    | Number of acknowledgment packets sent and received.                         |

**Related Commands**

| Command                  | Description                                    |
|--------------------------|------------------------------------------------|
| <b>ipv6 router eigrp</b> | Configures the EIGRP for IPv6 routing process. |

# show ipv6 general-prefix

To display information on IPv6 general prefixes, use the **show ipv6 general-prefix** command in user EXEC or privileged EXEC mode.

**show ipv6 general-prefix**

## Syntax Description

This command has no arguments or keywords.

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **show ipv6 general-prefix** command to view information on IPv6 general prefixes.

## Examples

The following example shows an IPv6 general prefix called my-prefix, which has been defined based on a 6to4 interface. The general prefix is also being used to define an address on interface loopback42.

```
# show ipv6 general-prefix
IPv6 Prefix my-prefix, acquired via 6to4
2002:B0B:B0B::/48
  Loopback42 (Address command)
```

The table below describes the significant fields shown in the display.

**Table 38: show ipv6 general-prefix Field Descriptions**

| Field                        | Description                                                                                                                                                     |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPv6 Prefix                  | User-defined name of the IPv6 general prefix.                                                                                                                   |
| Acquired via                 | The general prefix has been defined based on a 6to4 interface. A general prefix can also be defined manually or acquired using DHCP for IPv6 prefix delegation. |
| 2002:B0B:B0B::/48            | The prefix value for this general prefix.                                                                                                                       |
| Loopback42 (Address command) | List of interfaces where this general prefix is used.                                                                                                           |

## Related Commands

| ipv6 general-prefix | Defines a general prefix for an IPv6 address manually. |

# show ipv6 interface

To display the usability status of interfaces configured for IPv6, use the **show ipv6 interface** command in user EXEC or privileged EXEC mode.

**show ipv6 interface** [**brief** ][*type number*][**prefix**]

|                           |               |                                                                                          |
|---------------------------|---------------|------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>brief</b>  | (Optional) Displays a brief summary of IPv6 status and configuration for each interface. |
|                           | <i>type</i>   | (Optional) The interface type about which to display information.                        |
|                           | <i>number</i> | (Optional) The interface number about which to display information.                      |
|                           | <b>prefix</b> | (Optional) Prefix generated from a local IPv6 prefix pool.                               |

**Command Default** All IPv6 interfaces are displayed.

**Command Modes** User EXEC (>)  
Privileged EXEC (#)

|                        |                              |                              |

|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **show ipv6 interface** command provides output similar to the show ip interface command, except that it is IPv6-specific.

Use the **show ipv6 interface** command to validate the IPv6 status of an interface and its configured addresses. The show ipv6 interface command also displays the parameters that IPv6 is using for operation on this interface and any configured features.

If the interface's hardware is usable, the interface is marked up. If the interface can provide two-way communication for IPv6, the line protocol is marked up.

If you specify an optional interface type and number, the command displays information only about that specific interface. For a specific interface, you can enter the prefix keyword to see the IPv6 neighbor discovery (ND) prefixes that are configured on the interface.

## Interface Information for a Specific Interface with IPv6 Configured

The **show ipv6 interface** command displays information about the specified interface.

```
(config)# show ipv6 interface ethernet0/0
Ethernet0/0 is up, line protocol is up
IPv6 is enabled, link-local address is FE80::A8BB:CCFF:FE00:6700
No Virtual link-local address(es):
Global unicast address(es):
  2001::1, subnet is 2001::/64 [DUP]
  2001::A8BB:CCFF:FE00:6700, subnet is 2001::/64 [EUI]
  2001:100::1, subnet is 2001:100::/64
```

```

Joined group address(es):
  FF02::1
  FF02::2
  FF02::1:FF00:1
  FF02::1:FF00:6700
MTU is 1500 bytes
ICMP error messages limited to one every 100 milliseconds
ICMP redirects are enabled
ICMP unreachable are sent
ND DAD is enabled, number of DAD attempts: 1
ND reachable time is 30000 milliseconds (using 30000)
ND advertised reachable time is 0 (unspecified)
ND advertised retransmit interval is 0 (unspecified)
ND router advertisements are sent every 200 seconds
ND router advertisements live for 1800 seconds
ND advertised default router preference is Medium
Hosts use stateless autoconfig for addresses.

```

The table below describes the significant fields shown in the display.

**Table 39: show ipv6 interface Field Descriptions**

| Field                                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ethernet0/0 is up, line protocol is up                                                   | Indicates whether the interface hardware is active (whether line signal is present) and whether it has been taken down by an administrator. If the interface hardware is usable, the interface is marked "up." For an interface to be usable, both the interface hardware and line protocol must be up.                                                                                                                 |
| line protocol is up, down (down is not shown in sample output)                           | Indicates whether the software processes that handle the line protocol consider the line usable (that is, whether keepalives are successful or IPv6 CP has been negotiated). If the interface can provide two-way communication, the line protocol is marked up. For an interface to be usable, both the interface hardware and line protocol must be up.                                                               |
| IPv6 is enabled, stalled, disabled (stalled and disabled are not shown in sample output) | Indicates that IPv6 is enabled, stalled, or disabled on the interface. If IPv6 is enabled, the interface is marked "enabled." If duplicate address detection processing identified the link-local address of the interface as being a duplicate address, the processing of IPv6 packets is disabled on the interface and the interface is marked "stalled." If IPv6 is not enabled, the interface is marked "disabled." |
| link-local address                                                                       | Displays the link-local address assigned to the interface.                                                                                                                                                                                                                                                                                                                                                              |
| Global unicast address(es):                                                              | Displays the global unicast addresses assigned to the interface.                                                                                                                                                                                                                                                                                                                                                        |
| Joined group address(es):                                                                | Indicates the multicast groups to which this interface belongs.                                                                                                                                                                                                                                                                                                                                                         |
| MTU                                                                                      | Maximum transmission unit of the interface.                                                                                                                                                                                                                                                                                                                                                                             |
| ICMP error messages                                                                      | Specifies the minimum interval (in milliseconds) between error messages sent on this interface.                                                                                                                                                                                                                                                                                                                         |
| ICMP redirects                                                                           | The state of Internet Control Message Protocol (ICMP) IPv6 redirect messages on the interface (the sending of the messages is enabled or disabled).                                                                                                                                                                                                                                                                     |

| Field                                             | Description                                                                                                                                                                                                                                                                                                          |
|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ND DAD                                            | The state of duplicate address detection on the interface (enabled or disabled).                                                                                                                                                                                                                                     |
| number of DAD attempts:                           | Number of consecutive neighbor solicitation messages that are sent on the interface while duplicate address detection is performed.                                                                                                                                                                                  |
| ND reachable time                                 | Displays the neighbor discovery reachable time (in milliseconds) assigned to this interface.                                                                                                                                                                                                                         |
| ND advertised reachable time                      | Displays the neighbor discovery reachable time (in milliseconds) advertised on this interface.                                                                                                                                                                                                                       |
| ND advertised retransmit interval                 | Displays the neighbor discovery retransmit interval (in milliseconds) advertised on this interface.                                                                                                                                                                                                                  |
| ND router advertisements                          | Specifies the interval (in seconds) for neighbor discovery router advertisements (RAs) sent on this interface and the amount of time before the advertisements expire.<br><br>As of Cisco IOS Release 12.4(2)T, this field displays the default router preference (DRP) value sent by this device on this interface. |
| ND advertised default router preference is Medium | The DRP for the device on a specific interface.                                                                                                                                                                                                                                                                      |

The **show ipv6 interface** command displays information about attributes that may be associated with an IPv6 address assigned to the interface.

| Attribute | Description                                                                                                                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ANY       | Anycast. The address is an anycast address, as specified when configured using the <b>ipv6 address</b> command.                                                                                     |
| CAL       | Calendar. The address is timed and has valid and preferred lifetimes.                                                                                                                               |
| DEP       | Deprecated. The timed address is deprecated.                                                                                                                                                        |
| DUP       | Duplicate. The address is a duplicate, as determined by duplicate address detection (DAD). To re-attempt DAD, the user must use the <b>shutdown</b> or <b>no shutdown</b> command on the interface. |
| EUI       | EUI-64 based. The address was generated using EUI-64.                                                                                                                                               |
| OFF       | Offlink. The address is offlink.                                                                                                                                                                    |

| Attribute | Description                                                                                                     |
|-----------|-----------------------------------------------------------------------------------------------------------------|
| OOD       | Overly optimistic DAD. DAD will not be performed for this address. This attribute applies to virtual addresses. |
| PRE       | Preferred. The timed address is preferred.                                                                      |
| TEN       | Tentative. The address is in a tentative state per DAD.                                                         |
| UNA       | Unactivated. The virtual address is not active and is in a standby state.                                       |
| VIRT      | Virtual. The address is virtual and is managed by HSRP, VRRP, or GLBP.                                          |

### show ipv6 interface Command Using the brief Keyword

The following is sample output from the **show ipv6 interface** command when entered with the **brief** keyword:

```
# show ipv6 interface brief
Ethernet0 is up, line protocol is up
Ethernet0          [up/up]
    unassigned
Ethernet1          [up/up]
    2001:0DB8:1000:/29
Ethernet2          [up/up]
    2001:0DB8:2000:/29
Ethernet3          [up/up]
    2001:0DB8:3000:/29
Ethernet4          [up/down]
    2001:0DB8:4000:/29
Ethernet5          [administratively down/down]
    2001:123::210:7BFF:FEC2:ACD8
Interface          Status          IPv6 Address
Ethernet0          up              3FFE:C00:0:1:260:3EFF:FE11:6770
Ethernet1          up              unassigned
Fddi0              up              3FFE:C00:0:2:260:3EFF:FE11:6772
Serial0            administratively down unassigned
Serial1            administratively down unassigned
Serial2            administratively down unassigned
Serial3            administratively down unassigned
Tunnel0            up              unnumbered (Ethernet0)
Tunnel1            up              3FFE:700:20:1::12
```

### IPv6 Interface with ND Prefix Configured

This sample output shows the characteristics of an interface that has generated a prefix from a local IPv6 prefix pool:

```
# show ipv6 interface Ethernet 0/0 prefix

interface Ethernet0/0
  ipv6 address 2001:0DB8::1/64
  ipv6 address 2001:0DB8::2/64
```

```

ipv6 nd prefix 2001:0DB8:2::/64
ipv6 nd prefix 2001:0DB8:3::/64 2592000 604800 off-link
end
.
.
.
IPv6 Prefix Advertisements Ethernet0/0
Codes: A - Address, P - Prefix-Advertisement, O - Pool
       U - Per-user prefix, D - Default
       N - Not advertised, C - Calendar
       default [LA] Valid lifetime 2592000, preferred lifetime 604800
AD  2001:0DB8:1::/64 [LA] Valid lifetime 2592000, preferred lifetime 604800
APD 2001:0DB8:2::/64 [LA] Valid lifetime 2592000, preferred lifetime 604800
P   2001:0DB8:3::/64 [A] Valid lifetime 2592000, preferred lifetime 604800

```

The default prefix shows the parameters that are configured using the `ipv6 nd prefix default` command.

### IPv6 Interface with DRP Configured

This sample output shows the state of the DRP preference value as advertised by this device through an interface:

```

# show ipv6 interface gigabitethernet 0/1
GigabitEthernet0/1 is up, line protocol is up
IPv6 is enabled, link-local address is FE80::130
Description: Management network (dual stack)
Global unicast address(es):
  FEC0:240:104:1000::130, subnet is FEC0:240:104:1000::/64
Joined group address(es):
  FF02::1
  FF02::2
  FF02::1:FF00:130
MTU is 1500 bytes
ICMP error messages limited to one every 100 milliseconds
ICMP redirects are enabled
ND DAD is enabled, number of DAD attempts: 1
ND reachable time is 30000 milliseconds
ND advertised reachable time is 0 milliseconds
ND advertised retransmit interval is 0 milliseconds
ND router advertisements are sent every 200 seconds
ND router advertisements live for 1800 seconds
ND advertised default router preference is Low
Hosts use stateless autoconfig for addresses.

```

### IPv6 Interface with HSRP Configured

When HSRP IPv6 is first configured on an interface, the interface IPv6 link-local address is marked unactive (UNA) because it is no longer advertised, and the HSRP IPv6 virtual link-local address is added to the virtual link-local address list with the UNA and tentative DAD (TEN) attributes set. The interface is also programmed to listen for the HSRP IPv6 multicast address.

This sample output shows the status of UNA and TEN attributes, when HSRP IPv6 is configured on an interface:

```

# show ipv6 interface ethernet 0/0
Ethernet0/0 is up, line protocol is up
IPv6 is enabled, link-local address is FE80:2::2 [UNA]
Virtual link-local address(es):

```

```

FE80::205:73FF:FEA0:1 [UNA/TEN]
Global unicast address(es):
  2001:2::2, subnet is 2001:2::/64
Joined group address(es):
  FF02::1
  FF02::2
  FF02::66
  FF02::1:FF00:2
MTU is 1500 bytes
ICMP error messages limited to one every 100 milliseconds
ND DAD is enabled, number of DAD attempts: 1

```

After the HSRP group becomes active, the UNA and TEN attributes are cleared, and the overly optimistic DAD (OOD) attribute is set. The solicited node multicast address for the HSRP virtual IPv6 address is also added to the interface.

This sample output shows the status of UNA, TEN and OOD attributes, when HSRP group is activated:

```

# show ipv6 interface ethernet 0/0
Ethernet0/0 is up, line protocol is up
IPv6 is enabled, link-local address is FE80:2::2 [UNA]
Virtual link-local address(es):
  FE80::205:73FF:FEA0:1 [OPT]
Global unicast address(es):
  2001:2::2, subnet is 2001:2::/64
Joined group address(es):
  FF02::1
  FF02::2
  FF02::66
  FF02::1:FF00:2
  FF02::1:FFA0:1
MTU is 1500 bytes
ICMP error messages limited to one every 100 milliseconds
ICMP redirects are enabled
ND DAD is enabled, number of DAD attempts: 1

```

The table below describes additional significant fields shown in the displays for the **show ipv6 interface** command with HSRP configured.

**Table 40: show ipv6 interface Command with HSRP Configured Field Descriptions**

| Field                                                  | Description                                                                             |
|--------------------------------------------------------|-----------------------------------------------------------------------------------------|
| IPv6 is enabled, link-local address is FE80:2::2 [UNA] | The interface IPv6 link-local address is marked UNA because it is no longer advertised. |
| FE80::205:73FF:FEA0:1 [UNA/TEN]                        | The virtual link-local address list with the UNA and TEN attributes set.                |
| FF02::66                                               | HSRP IPv6 multicast address.                                                            |
| FE80::205:73FF:FEA0:1 [OPT]                            | HSRP becomes active, and the HSRP virtual address marked OPT.                           |
| FF02::1:FFA0:1                                         | HSRP solicited node multicast address.                                                  |

### IPv6 Interface with Minimum RA Interval Configured

When you enable Mobile IPv6 on an interface, you can configure a minimum interval between IPv6 router advertisement (RA) transmissions. The **show ipv6 interface** command output reports the minimum RA interval, when configured. If the minimum RA interval is not explicitly configured, then it is not displayed.

In the following example, the maximum RA interval is configured as 100 seconds, and the minimum RA interval is configured as 60 seconds on Ethernet interface 1/0:

```
(config-if)# ipv6 nd ra-interval 100 60
```

Subsequent use of the **show ipv6 interface** then displays the interval as follows:

```
(config)# show ipv6 interface ethernet 1/0
Ethernet1/0 is administratively down, line protocol is down
IPv6 is enabled, link-local address is FE80::A8BB:CCFF:FE00:5A01 [TEN]
No Virtual link-local address(es):
No global unicast address is configured
Joined group address(es):
  FE02::1
  FE02::2
MTU is 1500 bytes
ICMP error messages limited to one every 100 milliseconds
ICMP redirects are enabled
ICMP unreachable are sent
ND DAD is enabled, number of DAD attempts: 1
ND reachable time is 30000 milliseconds
ND advertised reachable time is 0 milliseconds
ND advertised retransmit interval is 0 milliseconds
ND router advertisements are sent every 60 to 100 seconds
ND router advertisements live for 1800 seconds
ND advertised default router preference is Medium
Hosts use stateless autoconfig for addresses.
```

In the following example, the maximum RA interval is configured as 100 milliseconds (ms), and the minimum RA interval is configured as 60 ms on Ethernet interface 1/0:

```
(config)# show ipv6 interface ethernet 1/0
Ethernet1/0 is administratively down, line protocol is down
IPv6 is enabled, link-local address is FE80::A8BB:CCFF:FE00:5A01 [TEN]
No Virtual link-local address(es):
No global unicast address is configured
Joined group address(es):
  FE02::1
  FE02::2
MTU is 1500 bytes
ICMP error messages limited to one every 100 milliseconds
ICMP redirects are enabled
ICMP unreachable are sent
ND DAD is enabled, number of DAD attempts: 1
ND reachable time is 30000 milliseconds
ND advertised reachable time is 0 milliseconds
ND advertised retransmit interval is 0 milliseconds
ND router advertisements are sent every 60 to 100 milliseconds
ND router advertisements live for 1800 seconds
ND advertised default router preference is Medium
Hosts use stateless autoconfig for addresses.
```

The table below describes additional significant fields shown in the displays for the **show ipv6 interface** command with minimum RA interval information configured.

**Table 41: show ipv6 interface Command with Minimum RA Interval Information Configuration Field Descriptions**

| Field                                                          | Description                                                                                                                                                                                   |
|----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ND router advertisements are sent every 60 to 100 seconds      | ND RAs are sent at an interval randomly selected from a value between the minimum and maximum values. In this example, the minimum value is 60 seconds, and the maximum value is 100 seconds. |
| ND router advertisements are sent every 60 to 100 milliseconds | ND RAs are sent at an interval randomly selected from a value between the minimum and maximum values. In this example, the minimum value is 60 ms, and the maximum value is 100 ms.           |

#### Related Commands

| Command                    | Description                                                                |
|----------------------------|----------------------------------------------------------------------------|
| <b>ipv6 nd prefix</b>      | Configures which IPv6 prefixes are included in IPv6 router advertisements. |
| <b>ipv6 nd ra interval</b> | Configures the interval between IPv6 RA transmissions on an interface.     |
| <b>show ip interface</b>   | Displays the usability status of interfaces configured for IP.             |

# show ipv6 mfib

To display the forwarding entries and interfaces in the IPv6 Multicast Forwarding Information Base (MFIB), use the **show ipv6 mfib** command in user EXEC or privileged EXEC mode.

**show ipv6 mfib** [**vrf** *vrf-name*] [{**all** | **linkscope** | **verbose** *group-address-name* | *ipv6-prefix* / *prefix-length* *source-address-name* | **interface** | **status** | **summary**}]

**show ipv6 mfib** [**vrf** *vrf-name*] [{**all** | **linkscope** | **verbose** | **interface** | **status** | **summary**}]

## Syntax Description

|                            |                                                                                                                                                                                                                                           |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.                                                                                                                                                                |
| <b>all</b>                 | (Optional) Displays all forwarding entries and interfaces in the IPv6 MFIB.                                                                                                                                                               |
| <b>linkscope</b>           | (Optional) Displays the link-local groups.                                                                                                                                                                                                |
| <b>verbose</b>             | (Optional) Provides additional information, such as the MAC encapsulation header and platform-specific information.                                                                                                                       |
| <i>ipv6-prefix</i>         | (Optional) The IPv6 network assigned to the interface. The default IPv6 prefix is 128.<br><br>This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.  |
| / <i>prefix-length</i>     | (Optional) The length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value. |
| <i>group-address-name</i>  | (Optional) IPv6 address or name of the multicast group.                                                                                                                                                                                   |
| <i>source-address-name</i> | (Optional) IPv6 address or name of the multicast group.                                                                                                                                                                                   |
| <b>interface</b>           | (Optional) Interface settings and status.                                                                                                                                                                                                 |
| <b>status</b>              | (Optional) General settings and status.                                                                                                                                                                                                   |

|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **show ipv6 mfib** command to display MFIB entries; and forwarding interfaces, and their traffic statistics. This command can be enabled on virtual IP (VIP) if the router is operating in distributed mode.

A forwarding entry in the MFIB has flags that determine the default forwarding and signaling behavior to use for packets matching the entry. The entry also has per-interface flags that further specify the forwarding

behavior for packets received or forwarded on specific interfaces. The table below describes the MFIB forwarding entries and interface flags.

**Table 42: MFIB Entries and Interface Flags**

| Flag | Description                                                                                                                                       |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| F    | Forward--Data is forwarded out of this interface.                                                                                                 |
| A    | Accept--Data received on this interface is accepted for forwarding.                                                                               |
| IC   | Internal copy--Deliver to the router a copy of the packets received or forwarded on this interface.                                               |
| NS   | Negate signal--Reverse the default entry signaling behavior for packets received on this interface.                                               |
| DP   | Do not preserve--When signaling the reception of a packet on this interface, do not preserve a copy of it (discard it instead).                   |
| SP   | Signal present--The reception of a packet on this interface was just signaled.                                                                    |
| S    | Signal--By default, signal the reception of packets matching this entry.                                                                          |
| C    | Perform directly connected check for packets matching this entry. Signal the reception if packets were originated by a directly connected source. |

## Examples

The following example displays the forwarding entries and interfaces in the MFIB. The router is configured for fast switching, and it has a receiver joined to FF05::1 on Ethernet1/1 and a source (2001::1:1:20) sending on Ethernet1/2:

```
# show ipv6 mfib
IP Multicast Forwarding Information Base
Entry Flags: C - Directly Connected, S - Signal, IA - Inherit A flag,
              AR - Activity Required, D - Drop
Forwarding Counts: Pkt Count/Pkts per second/Avg Pkt Size/Kbits per second
Other counts: Total/RPF failed/Other drops
Interface Flags: A - Accept, F - Forward, NS - Negate Signalling
                 IC - Internal Copy, NP - Not platform switched
                 SP - Signal Present
Interface Counts: FS Pkt Count/PS Pkt Count
(*,FF00::/8) Flags: C
  Forwarding: 0/0/0/0, Other: 0/0/0
  Tunnel0 Flags: NS
(*,FF00::/15) Flags: D
  Forwarding: 0/0/0/0, Other: 0/0/0
(*,FF05::1) Flags: C
  Forwarding: 2/0/100/0, Other: 0/0/0
  Tunnel0 Flags: A NS
  Ethernet1/1 Flags: F NS
    Pkts: 0/2
(2001::1:1:200,FF05::1) Flags:
  Forwarding: 5/0/100/0, Other: 0/0/0
  Ethernet1/2 Flags: A
  Ethernet1/1 Flags: F NS
    Pkts: 3/2
(*,FF10::/15) Flags: D
  Forwarding: 0/0/0/0, Other: 0/0/0
```

The table below describes the significant fields shown in the display.

Table 43: show ipv6 mfib Field Descriptions

| Field             | Description                                                                                                                                                                                                                                                         |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Entry Flags       | Information about the entry.                                                                                                                                                                                                                                        |
| Forwarding Counts | Statistics on the packets that are received from and forwarded to at least one interface.                                                                                                                                                                           |
| Pkt Count/        | Total number of packets received and forwarded since the creation of the multicast forwarding state to which this counter applies.                                                                                                                                  |
| Pkts per second/  | Number of packets received and forwarded per second.                                                                                                                                                                                                                |
| Avg Pkt Size/     | Total number of bytes divided by the total number of packets for this multicast forwarding state. There is no direct display for the total number of bytes. You can calculate the total number of bytes by multiplying the average packet size by the packet count. |
| Kbits per second  | Bytes per second divided by packets per second divided by 1000.                                                                                                                                                                                                     |
| Other counts:     | Statistics on the received packets. These counters include statistics about the packets received and forwarded and packets received but not forwarded.                                                                                                              |
| Interface Flags:  | Information about the interface.                                                                                                                                                                                                                                    |
| Interface Counts: | Interface statistics.                                                                                                                                                                                                                                               |

The following example shows forwarding entries and interfaces in the MFIB, with a group address of FF03:1::1 specified:

```
# show ipv6 mfib FF03:1::1
IP Multicast Forwarding Information Base
Entry Flags:C - Directly Connected, S - Signal, IA - Inherit A
flag,
      AR - Activity Required, D - Drop
Forwarding Counts:Pkt Count/Pkts per second/Avg Pkt Size/Kbits per
second
Other counts:Total/RPF failed/Other drops
Interface Flags:A - Accept, F - Forward, NS - Negate Signalling
      IC - Internal Copy, NP - Not platform switched
      SP - Signal Present
Interface Counts:FS Pkt Count/PS Pkt Count
*,FF03:1::1) Flags:C
  Forwarding:0/0/0/0, Other:0/0/0
  Tunnel1 Flags:A NS
  GigabitEthernet5/0.25 Flags:F NS
    Pkts:0/0
  GigabitEthernet5/0.24 Flags:F NS
    Pkts:0/0
(5002:1::2,FF03:1::1) Flags:

  Pkts:0/0
  GigabitEthernet5/0.24 Flags:F NS
  Pkts:0/0
.
.
.
  GigabitEthernet5/0.16 Flags:F NS
  Pkts:0/0
```

The following example shows forwarding entries and interfaces in the MFIB, with a group address of FFE0 and a prefix of 15:

```
# show ipv6 mfib FFE0::/15
```

```

IP Multicast Forwarding Information Base
Entry Flags:C - Directly Connected, S - Signal, IA - Inherit A flag,
          AR - Activity Required, D - Drop
Forwarding Counts:Pkt Count/Pkts per second/Avg Pkt Size/Kbits per second
Other counts:Total/RPF failed/Other drops
Interface Flags:A - Accept, F - Forward, NS - Negate Signalling
          IC - Internal Copy, NP - Not platform switched
          SP - Signal Present
Interface Counts:FS Pkt Count/PS Pkt Count
(*,FFE0::/15) Flags:D
Forwarding:0/0/0/0, Other:0/0/0

```

The following example shows output of the **show ipv6 mfib** command used with the **verbose** keyword. It shows forwarding entries and interfaces in the MFIB and additional information such as the MAC encapsulation header and platform-specific information.

```

# show ipv6 mfib ff33::1:1 verbose
IP Multicast Forwarding Information Base
Entry Flags: C - Directly Connected, S - Signal, IA - Inherit A flag,
          AR - Activity Required, K - Keepalive
Forwarding Counts: Pkt Count/Pkts per second/Avg Pkt Size/Kbits per second
Other counts: Total/RPF failed/Other drops
Platform per slot HW-Forwarding Counts: Pkt Count/Byte Count
Platform flags: HF - Forwarding entry, HB - Bridge entry, HD - NonRPF Drop entry,
          NP - Not platform switchable, RPL - RPF-ltl linkage,
          MCG - Metset change, ERR - S/w Error Flag, RTY - In RetryQ,
          LP - L3 pending, MP - Met pending, AP - ACL pending
Interface Flags: A - Accept, F - Forward, NS - Negate Signalling
          IC - Internal Copy, NP - Not platform switched

| <b>show ipv6 mfib count</b>     | Displays summary traffic statistics from the MFIB about the group and source.             |
| <b>show ipv6 mfib interface</b> | Displays information about IPv6 multicast-enabled interfaces and their forwarding status. |

| Command                       | Description                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>show ipv6 mfib status</b>  | Displays the general MFIB configuration and operational status.                                                  |
| <b>show ipv6 mfib summary</b> | Displays summary information about the number of IPv6 MFIB entries (including link-local groups) and interfaces. |

# show ipv6 mld groups

To display the multicast groups that are directly connected to the router and that were learned through Multicast Listener Discovery (MLD), use the **show ipv6 mld groups** command in user EXEC or privileged EXEC mode.

**show ipv6 mld** [*vrf vrf-name*] **groups** [*link-local*] [{*group-name* *group-address*}] [*interface-type interface-number*] [{*detail* | *explicit*}]

| Syntax Description                       |  |                                                                                                            |
|------------------------------------------|--|------------------------------------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i>               |  | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.                                 |
| <b>link-local</b>                        |  | (Optional) Displays the link-local groups.                                                                 |
| <i>group-name</i>   <i>group-address</i> |  | (Optional) IPv6 address or name of the multicast group.                                                    |
| <i>interface-type interface-number</i>   |  | (Optional) Interface type and number.                                                                      |
| <b>detail</b>                            |  | (Optional) Displays detailed information about individual sources.                                         |
| <b>explicit</b>                          |  | (Optional) Displays information about the hosts being explicitly tracked on each interface for each group. |

|                      |                     |
|----------------------|---------------------|
| <b>Command Modes</b> | User EXEC (>)       |
|                      | Privileged EXEC (#) |

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                                                                                                                       |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | If you omit all optional arguments, the <b>show ipv6 mld groups</b> command displays by group address and interface type and number all directly connected multicast groups, including link-local groups (where the <b>link-local</b> keyword is not available) used. |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                 |                                                                                                                                                                                                       |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Examples</b> | The following is sample output from the <b>show ipv6 mld groups</b> command. It shows all of the groups joined by Fast Ethernet interface 2/1, including link-local groups used by network protocols. |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

```
# show ipv6 mld groups FastEthernet 2/1
MLD Connected Group Membership
Group Address      Interface          Uptime            Expires
FF02::2            FastEthernet2/1   3d18h             never
FF02::D            FastEthernet2/1   3d18h             never
FF02::16           FastEthernet2/1   3d18h             never
FF02::1:FF00:1     FastEthernet2/1   3d18h             00:00:27
FF02::1:FF00:79    FastEthernet2/1   3d18h             never
FF02::1:FF23:83C2  FastEthernet2/1   3d18h             00:00:22
FF02::1:FFAF:2C39  FastEthernet2/1   3d18h             never
FF06:7777::1       FastEthernet2/1   3d18h             00:00:26
```

The following is sample output from the **show ipv6 mld groups** command using the **detail** keyword:

```
# show ipv6 mld groups detail
Interface:      Ethernet2/1/1
Group:          FF33::1:1:1
Uptime:         00:00:11
Router mode:    INCLUDE
Host mode:      INCLUDE
Last reporter:  FE80::250:54FF:FE60:3B14
Group source list:
Source Address      Uptime    Expires    Fwd  Flags
2004:4::6           00:00:11  00:04:08   Yes  Remote Ac 4
```

The following is sample output from the **show ipv6 mld groups** command using the **explicit** keyword:

```
# show ipv6 mld groups explicit
Ethernet1/0, FF05::1
  Up:00:43:11 EXCLUDE(0/1) Exp:00:03:17
  Host Address      Uptime    Expires
  FE80::A8BB:CCFF:FE00:800  00:43:11  00:03:17
  Mode:EXCLUDE
Ethernet1/0, FF05::6
  Up:00:42:22 INCLUDE(1/0) Exp:not used
  Host Address      Uptime    Expires
  FE80::A8BB:CCFF:FE00:800  00:42:22  00:03:17
  Mode:INCLUDE
    300::1
    300::2
    300::3
Ethernet1/0 - Interface
ff05::1 - Group address
Up:Uptime for the group
EXCLUDE/INCLUDE - The mode the group is in on the router.
(0/1) (1/0) - (Number of hosts in INCLUDE mode/Number of hosts in EXCLUDE moe)
Exp:Expiry time for the group.
FE80::A8BB:CCFF:FE00:800 - Host ipv6 address.
00:43:11 - Uptime for the host.
00:03:17 - Expiry time for the host
Mode:INCLUDE/EXCLUDE - Mode the Host is operating in.
300::1, 300::2, 300::3 - Sources that the host has joined in the above specified mode.
```

The table below describes the significant fields shown in the display.

**Table 45: show ipv6 mld groups Field Descriptions**

| Field          | Description                                                                                                                                                                                                                                                                                                                                           |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group Address  | Address of the multicast group.                                                                                                                                                                                                                                                                                                                       |
| Interface      | Interface through which the group is reachable.                                                                                                                                                                                                                                                                                                       |
| Uptime         | How long (in hours, minutes, and seconds) this multicast group has been known.                                                                                                                                                                                                                                                                        |
| Expires        | How long (in hours, minutes, and seconds) until the entry is removed from the MLD groups table.<br><br>The expiration timer shows "never" if the router itself has joined the group, and the expiration timer shows "not used" when the router mode of the group is INCLUDE. In this situation, the expiration timers on the source entries are used. |
| Last reporter: | Last host to report being a member of the multicast group.                                                                                                                                                                                                                                                                                            |

| Field      | Description                                           |
|------------|-------------------------------------------------------|
| Flags Ac 4 | Flags counted toward the MLD state limits configured. |

| <b>ipv6 mld query-interval</b> | Configures the frequency at which the Cisco IOS software sends MLD host-query messages. |

## show ipv6 mld interface

To display multicast-related information about an interface, use the **show ipv6 mld interface** command in user EXEC or privileged EXEC mode.

**show ipv6 mld** [*vrf vrf-name*] **interface** [*type number*]

### Syntax Description

|                     |                                                                            |
|---------------------|----------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |
| <b>type number</b>  | (Optional) Interface type and number.                                      |

### Command Modes

User EXEC (>)

Privileged EXEC (#)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

If you omit the optional *type* and *number* arguments, the **show ipv6 mld interface** command displays information about all interfaces.

### Examples

The following is sample output from the **show ipv6 mld interface** command for Ethernet interface 2/1/1:

```
# show ipv6 mld interface Ethernet 2/1/1
Global State Limit : 2 active out of 2 max
Loopback0 is administratively down, line protocol is down
  Internet address is ::/0
.
.
.
Ethernet2/1/1 is up, line protocol is up
  Internet address is FE80::260:3EFF:FE86:5649/10
  MLD is enabled on interface
  Current MLD version is 2
  MLD query interval is 125 seconds
  MLD querier timeout is 255 seconds
  MLD max query response time is 10 seconds
  Last member query response interval is 1 seconds
  Interface State Limit : 2 active out of 3 max
  State Limit permit access list:
  MLD activity: 83 joins, 63 leaves
  MLD querying router is FE80::260:3EFF:FE86:5649 (this system)
```

The table below describes the significant fields shown in the display.

**Table 46: show ipv6 mld interface Field Descriptions**

| Field                                     | Description                                    |
|-------------------------------------------|------------------------------------------------|
| Global State Limit: 2 active out of 2 max | Two globally configured MLD states are active. |

| Field                                                         | Description                                                                                                                                                                                                                    |
|---------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ethernet2/1/1 is up, line protocol is up                      | Interface type, number, and status.                                                                                                                                                                                            |
| Internet address is...                                        | Internet address of the interface and subnet mask being applied to the interface.                                                                                                                                              |
| MLD is enabled in interface                                   | Indicates whether Multicast Listener Discovery (MLD) has been enabled on the interface with the <b>ipv6 multicast-routing</b> command.                                                                                         |
| Current MLD version is 2                                      | The current MLD version.                                                                                                                                                                                                       |
| MLD query interval is 125 seconds                             | Interval (in seconds) at which the Cisco IOS software sends MLD query messages, as specified with the <b>ipv6 mld query-interval</b> command.                                                                                  |
| MLD querier timeout is 255 seconds                            | The length of time (in seconds) before the router takes over as the querier for the interface, as specified with the <b>ipv6 mld query-timeout</b> command.                                                                    |
| MLD max query response time is 10 seconds                     | The length of time (in seconds) that hosts have to answer an MLD Query message before the router deletes their group, as specified with the <b>ipv6 mld query-max-response-time</b> command.                                   |
| Last member query response interval is 1 seconds              | Used to calculate the maximum response code inserted in group and source-specific query. Also used to tune the "leave latency" of the link. A lower value results in reduced time to detect the last member leaving the group. |
| Interface State Limit : 2 active out of 3 max                 | Two out of three configured interface states are active.                                                                                                                                                                       |
| State Limit permit access list: change                        | Activity for the state permit access list.                                                                                                                                                                                     |
| MLD activity: 83 joins, 63 leaves                             | Number of groups joins and leaves that have been received.                                                                                                                                                                     |
| MLD querying router is FE80::260:3EFF:FE86:5649 (this system) | IPv6 address of the querying router.                                                                                                                                                                                           |

| Command                        | Description                                                                             |
|--------------------------------|-----------------------------------------------------------------------------------------|
| <b>ipv6 mld join-group</b>     | Configures MLD reporting for a specified group and source.                              |
| <b>ipv6 mld query-interval</b> | Configures the frequency at which the Cisco IOS software sends MLD host-query messages. |

# show ipv6 mld snooping

Use the **show ipv6 mld snooping** command in EXEC mode to display IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping configuration of the switch or the VLAN.

**show ipv6 mld snooping** [**vlan** *vlan-id*]

## Syntax Description

|             |                |                                                                     |
|-------------|----------------|---------------------------------------------------------------------|
| <b>vlan</b> | <i>vlan-id</i> | (Optional) Specify a VLAN; the range is 1 to 1001 and 1006 to 4094. |
|-------------|----------------|---------------------------------------------------------------------|

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use this command to display MLD snooping configuration for the switch or for a specific VLAN.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

To configure the dual IPv4 and IPv6 template, enter the **sdm prefer dual-ipv4-and-ipv6** global configuration command and reload the switch.

## Examples

This is an example of output from the show ipv6 mld snooping vlan command. It shows snooping characteristics for a specific VLAN.

```
# show ipv6 mld snooping vlan 100
Global MLD Snooping configuration:
-----
MLD snooping : Enabled
MLDv2 snooping (minimal) : Enabled
Listener message suppression : Enabled
TCN solicit query : Disabled
TCN flood query count : 2
Robustness variable : 3
Last listener query count : 2
Last listener query interval : 1000
Vlan 100:
-----
MLD snooping : Disabled
MLDv1 immediate leave : Disabled
Explicit host tracking : Enabled
Multicast router learning mode : pim-dvmrp
Robustness variable : 3
Last listener query count : 2
Last listener query interval : 1000
```

This is an example of output from the **show ipv6 mld snooping** command. It displays snooping characteristics for all VLANs on the switch.

```
# show ipv6 mld snooping
Global MLD Snooping configuration:
-----
MLD snooping : Enabled
MLDv2 snooping (minimal) : Enabled
Listener message suppression : Enabled
TCN solicit query : Disabled
TCN flood query count : 2
Robustness variable : 3
Last listener query count : 2
Last listener query interval : 1000

Vlan 1:
-----
MLD snooping : Disabled
MLDv1 immediate leave : Disabled
Explicit host tracking : Enabled
Multicast router learning mode : pim-dvmrp
Robustness variable : 1
Last listener query count : 2
Last listener query interval : 1000

<output truncated>

Vlan 951:
-----
MLD snooping : Disabled
MLDv1 immediate leave : Disabled
Explicit host tracking : Enabled
Multicast router learning mode : pim-dvmrp
Robustness variable : 3
Last listener query count : 2
Last listener query interval : 1000
```

## show ipv6 mld ssm-map

To display Source Specific Multicast (SSM) mapping information, use the **show ipv6 mld ssm-map static** command in user EXEC or privileged EXEC mode.

**show ipv6 mld** [**vrf** *vrf-name*] **ssm-map** [*source-address*]

### Syntax Description

|                            |                                                                                                        |
|----------------------------|--------------------------------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.                             |
| <i>source-address</i>      | (Optional) Source address associated with an MLD membership for a group identified by the access list. |

### Command Modes

User EXEC (>)

Privileged EXEC (#)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

If the optional *source-address* argument is not used, all SSM mapping information is displayed.

### Examples

The following example shows all SSM mappings for the router:

```
# show ipv6 mld ssm-map
SSM Mapping   : Enabled
DNS Lookup    : Enabled
```

The following examples show SSM mapping for the source address 2001:0DB8::1:

```
# show ipv6 mld ssm-map 2001:0DB8::1
Group address  : 2001:0DB8::1
Group mode ssm : TRUE
Database      : STATIC
Source list    : 2001:0DB8::2
                2001:0DB8::3

Router# show ipv6 mld ssm-map 2001:0DB8::2
Group address  : 2001:0DB8::2
Group mode ssm : TRUE
Database      : DNS
Source list    : 2001:0DB8::3
                2001:0DB8::1
```

The table below describes the significant fields shown in the displays.

**Table 47: show ipv6 mld ssm-map Field Descriptions**

| Field       | Description                         |
|-------------|-------------------------------------|
| SSM Mapping | The SSM mapping feature is enabled. |

| Field                 | Description                                                                                           |
|-----------------------|-------------------------------------------------------------------------------------------------------|
| DNS Lookup            | The DNS lookup feature is automatically enabled when the SSM mapping feature is enabled.              |
| Group address         | Group address identified by a specific access list.                                                   |
| Group mode ssm : TRUE | The identified group is functioning in SSM mode.                                                      |
| Database : STATIC     | The router is configured to determine source addresses by checking static SSM mapping configurations. |
| Database : DNS        | The router is configured to determine source addresses using DNS-based SSM mapping.                   |
| Source list           | Source address associated with a group identified by the access list.                                 |

**Related Commands**

| Command                           | Description                                                            |
|-----------------------------------|------------------------------------------------------------------------|
| <b>debug ipv6 mld ssm-map</b>     | Displays debug messages for SSM mapping.                               |
| <b>ipv6 mld ssm-map enable</b>    | Enables the SSM mapping feature for groups in the configured SSM range |
| <b>ipv6 mld ssm-map query dns</b> | Enables DNS-based SSM mapping.                                         |
| <b>ipv6 mld ssm-map static</b>    | Configures static SSM mappings.                                        |

## show ipv6 mld traffic

To display the Multicast Listener Discovery (MLD) traffic counters, use the **show ipv6 mld traffic** command in user EXEC or privileged EXEC mode.

**show ipv6 mld** [**vrf vrf-name**] **traffic**

|                           |                                                                                                |
|---------------------------|------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>vrf vrf-name</b> (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |
|---------------------------|------------------------------------------------------------------------------------------------|

|                      |                                      |

| <b>Command Modes</b> | User EXEC (>)<br>Privileged EXEC (#) |
|----------------------|--------------------------------------|

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                    |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | Use the <b>show ipv6 mld traffic</b> command to check if the expected number of MLD protocol messages have been received and sent. |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------|

|                 |                                                                             |
|-----------------|-----------------------------------------------------------------------------|
| <b>Examples</b> | The following example displays the MLD protocol messages received and sent. |
|-----------------|-----------------------------------------------------------------------------|

```
# show ipv6 mld traffic

MLD Traffic Counters
Elapsed time since counters cleared:00:00:21

Valid MLD Packets      Received      Sent
Queries                1              0
Reports                2              1
Leaves                 0              0
Mtrace packets         0              0
Errors:
Malformed Packets                        0
Bad Checksums                          0
Martian source                        0
Packets Received on MLD-disabled Interface 0
```

The table below describes the significant fields shown in the display.

**Table 48: show ipv6 mld traffic Field Descriptions**

| Field                               | Description                                                                               |
|-------------------------------------|-------------------------------------------------------------------------------------------|
| Elapsed time since counters cleared | Indicates the amount of time (in hours, minutes, and seconds) since the counters cleared. |
| Valid MLD packets                   | Number of valid MLD packets received and sent.                                            |
| Queries                             | Number of valid queries received and sent.                                                |

| Field          | Description                                                  |
|----------------|--------------------------------------------------------------|
| Reports        | Number of valid reports received and sent.                   |
| Leaves         | Number of valid leaves received and sent.                    |
| Mtrace packets | Number of multicast trace packets received and sent.         |
| Errors         | Types of errors and the number of errors that have occurred. |

## show ipv6 mrib client

To display information about the clients of the Multicast Routing Information Base (MRIB), use the **show ipv6 mrib client** command in user EXEC or privileged EXEC mode.

**show ipv6 mrib** [**vrf** *vrf-name*] **client** [**filter**] [**name** {*client-name* | *client-name* : *client-id*}]

### Syntax Description

|                                       |                                                                                                                                                                         |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i>            | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.                                                                                              |
| <b>filter</b>                         | (Optional) Displays information about MRIB flags that each client owns and that each client is interested in.                                                           |
| <b>name</b>                           | (Optional) The name of a multicast routing protocol that acts as a client of MRIB, such as Multicast Listener Discovery (MLD) and Protocol Independent Multicast (PIM). |
| <i>client-name</i> : <i>client-id</i> | The name and ID of a multicast routing protocol that acts as a client of MRIB, such as MLD and PIM. The colon is required.                                              |

### Command Modes

User EXEC (>)

Privileged EXEC (#)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Use the **filter** keyword to display information about the MRIB flags each client owns and the flags in which each client is interested.

### Examples

The following is sample output from the **show ipv6 mrib client** command:

```
# show ipv6 mrib client
IP MRIB client-connections
igmp:145          (connection id 0)
pim:146 (connection id 1)
mfib ipv6:3       (connection id 2)
slot 3  mfib ipv6 rp agent:16  (connection id 3)
slot 1  mfib ipv6 rp agent:16  (connection id 4)
slot 0  mfib ipv6 rp agent:16  (connection id 5)
slot 4  mfib ipv6 rp agent:16  (connection id 6)
slot 2  mfib ipv6 rp agent:16  (connection id 7)
```

The table below describes the significant fields shown in the display.

**Table 49: show ipv6 mrib client Field Descriptions**

| Field                                                                                                                      | Description                        |
|----------------------------------------------------------------------------------------------------------------------------|------------------------------------|
| igmp:145 (connection id 0) pim:146 (connection id 1) mrib ipv6:3 (connection id 2) mrib ipv6 rp agent:16 (connection id 3) | Client ID (client name:process ID) |

## show ipv6 mrib route

To display Multicast Routing Information Base (MRIB) route information, use the **show ipv6 mrib route** command in user EXEC or privileged EXEC mode.

**show ipv6 mrib** [**vrf** *vrf-name*] **route** [{**link-local** | **summary** | [{*source-address**source-name* | \*}]}]  
[*groupname-or-address* [*prefix-length*]]}]

### Syntax Description

|                               |                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i>    | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.                                             |
| <b>link-local</b>             | (Optional) Displays the link-local groups.                                                                             |
| <b>summary</b>                | (Optional) Displays the number of MRIB entries (including link-local groups) and interfaces present in the MRIB table. |
| <i>source address-or-name</i> | (Optional) IPv6 address or name of the source.                                                                         |
| <b>*</b>                      | (Optional) Displays all MRIB route information.                                                                        |
| <i>groupname or-address</i>   | (Optional) IPv6 address or name of the multicast group.                                                                |
| <i>prefix-length</i>          | (Optional) IPv6 prefix length.                                                                                         |

### Command Modes

User EXEC (>)

Privileged EXEC (#)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

All entries are created by various clients of the MRIB, such as Multicast Listener Discovery (MLD), Protocol Independent Multicast (PIM), and Multicast Forwarding Information Base (MFIB). The flags on each entry or interface serve as a communication mechanism between various clients of the MRIB. The entries reveal how PIM sends register messages for new sources and the action taken.

The **summary** keyword shows the count of all entries, including link-local entries.

The interface flags are described in the table below.

**Table 50: Description of Interface Flags**

| Flag | Description                                                        |
|------|--------------------------------------------------------------------|
| F    | Forward--Data is forwarded out of this interface                   |
| A    | Accept--Data received on this interface is accepted for forwarding |
| IC   | Internal copy                                                      |
| NS   | Negate signal                                                      |

| Flag | Description                      |
|------|----------------------------------|
| DP   | Do not preserve                  |
| SP   | Signal present                   |
| II   | Internal interest                |
| ID   | Internal uninterest              |
| LI   | Local interest                   |
| LD   | Local uninterest                 |
| C    | Perform directly connected check |

Special entries in the MRIB indicate exceptions from the normal behavior. For example, no signaling or notification is necessary for arriving data packets that match any of the special group ranges. The special group ranges are as follows:

- Undefined scope (FFX0::/16)
- Node local groups (FFX1::/16)
- Link-local groups (FFX2::/16)
- Source Specific Multicast (SSM) groups (FF3X::/32).

For all the remaining (usually sparse-mode) IPv6 multicast groups, a directly connected check is performed and the PIM notified if a directly connected source arrives. This procedure is how PIM sends register messages for new sources.

## Examples

The following is sample output from the **show ipv6 mrib route** command using the **summary** keyword:

```
# show ipv6 mrib route summary
MRIB Route-DB Summary
  No. of (*,G) routes = 52
  No. of (S,G) routes = 0
  No. of Route x Interfaces (RxI) = 10
```

The table below describes the significant fields shown in the display.

**Table 51: show ipv6 mrib route Field Descriptions**

| Field                           | Description                                         |
|---------------------------------|-----------------------------------------------------|
| No. of (*, G) routes            | Number of shared tree routes in the MRIB.           |
| No. of (S, G) routes            | Number of source tree routes in the MRIB.           |
| No. of Route x Interfaces (RxI) | Sum of all the interfaces on each MRIB route entry. |

# show ipv6 mroute

To display the information in the PIM topology table in a format similar to the **show ip mroute** command, use the **show ipv6 mroute** command in user EXEC or privileged EXEC mode.

**show ipv6 mroute** [**vrf** *vrf-name*] [{**link-local** | [{*group-name* | *group-address* | {*source-address* *source-name*}]}}] [**summary**] [**count**]

## Syntax Description

|                                            |                                                                                                                                                                                                              |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i>                 | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.                                                                                                                                   |
| <b>link-local</b>                          | (Optional) Displays the link-local groups.                                                                                                                                                                   |
| <i>group-name</i>   <i>group-address</i>   | (Optional) IPv6 address or name of the multicast group.                                                                                                                                                      |
| <i>source-address</i>   <i>source-name</i> | (Optional) IPv6 address or name of the source.                                                                                                                                                               |
| <b>summary</b>                             | (Optional) Displays a one-line, abbreviated summary of each entry in the IPv6 multicast routing table.                                                                                                       |
| <b>count</b>                               | (Optional) Displays statistics from the Multicast Forwarding Information Base (MFIB) about the group and source, including number of packets, packets per second, average packet size, and bytes per second. |

## Command Default

The **show ipv6 mroute** command displays all groups and sources.

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The IPv6 multicast implementation does not have a separate mroute table. For this reason, the **show ipv6 mroute** command enables you to display the information in the PIM topology table in a format similar to the **show ip mroute** command.

If you omit all optional arguments and keywords, the **show ipv6 mroute** command displays all the entries in the PIM topology table (except link-local groups where the **link-local** keyword is available).

The Cisco IOS software populates the PIM topology table by creating (S,G) and (\*,G) entries based on PIM protocol messages, MLD reports, and traffic. The asterisk (\*) refers to all source addresses, the "S" refers to a single source address, and the "G" is the destination multicast group address. In creating (S, G) entries, the software uses the best path to that destination group found in the unicast routing table (that is, through Reverse Path Forwarding [RPF]).

Use the **show ipv6 mroute** command to display the forwarding status of each IPv6 multicast route.

## Examples

The following is sample output from the **show ipv6 mroute** command:

```
# show ipv6 mroute ff07::1
Multicast Routing Table
Flags:D - Dense, S - Sparse, B - Bidir Group, s - SSM Group,
      C - Connected, L - Local, I - Received Source Specific Host Report,
      P - Pruned, R - RP-bit set, F - Register flag, T - SPT-bit set,
      J - Join SPT
Timers:Uptime/Expires
Interface state:Interface, State
(*, FF07::1), 00:04:45/00:02:47, RP 2001:0DB8:6::6, flags:S
  Incoming interface:Tunnel5
  RPF nbr:6:6:6::6
  Outgoing interface list:
    POS4/0, Forward, 00:04:45/00:02:47
(2001:0DB8:999::99, FF07::1), 00:02:06/00:01:23, flags:SFT
  Incoming interface:POS1/0
  RPF nbr:2001:0DB8:999::99
  Outgoing interface list:
    POS4/0, Forward, 00:02:06/00:03:27
```

The following is sample output from the **show ipv6 mroute** command with the **summary** keyword:

```
# show ipv6 mroute ff07::1 summary
Multicast Routing Table
Flags:D - Dense, S - Sparse, B - Bidir Group, s - SSM Group,
      C - Connected, L - Local, I - Received Source Specific Host Report,
      P - Pruned, R - RP-bit set, F - Register flag, T - SPT-bit set,
      J - Join SPT
Timers:Uptime/Expires
Interface state:Interface, State
(*, FF07::1), 00:04:55/00:02:36, RP 2001:0DB8:6::6, OIF count:1, flags:S
(2001:0DB8:999::99, FF07::1), 00:02:17/00:01:12, OIF count:1, flags:SFT
```

The following is sample output from the **show ipv6 mroute** command with the **count** keyword:

```
# show ipv6 mroute ff07::1 count
IP Multicast Statistics
71 routes, 24 groups, 0.04 average sources per group
Forwarding Counts:Pkt Count/Pkts per second/Avg Pkt Size/Kilobits per second
Other counts:Total/RPF failed/Other drops(OIF-null, rate-limit etc)
Group:FF07::1
  RP-tree:
    RP Forwarding:0/0/0/0, Other:0/0/0
    LC Forwarding:0/0/0/0, Other:0/0/0
  Source:2001:0DB8:999::99,
    RP Forwarding:0/0/0/0, Other:0/0/0
    LC Forwarding:0/0/0/0, Other:0/0/0
  HW Forwd: 20000/0/92/0, Other:0/0/0
  Tot. shown:Source count:1, pkt count:20000
```

The table below describes the significant fields shown in the display.

Table 52: show ipv6 mroute Field Descriptions

| Field                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flags:                    | <p>Provides information about the entry.</p> <ul style="list-style-type: none"> <li>• S--sparse. Entry is operating in sparse mode.</li> <li>• s--SSM group. Indicates that a multicast group is within the SSM range of IP addresses. This flag is reset if the SSM range changes.</li> <li>• C--connected. A member of the multicast group is present on the directly connected interface.</li> <li>• L--local. The router itself is a member of the multicast group.</li> <li>• I--received source specific host report. Indicates that an (S, G) entry was created by an (S, G) report. This flag is set only on the designated router (DR).</li> <li>• P--pruned. Route has been pruned. The Cisco IOS software keeps this information so that a downstream member can join the source.</li> <li>• R--RP-bit set. Indicates that the (S, G) entry is pointing toward the RP. This is typically prune state along the shared tree for a particular source.</li> <li>• F--register flag. Indicates that the software is registering for a multicast source.</li> <li>• T--SPT-bit set. Indicates that packets have been received on the shortest path source tree.</li> <li>• J--join SPT. For (*, G) entries, indicates that the rate of traffic flowing down the shared tree is exceeding the SPT-Threshold value set for the group. (The default SPT-Threshold setting is 0 kbps.) When the J - Join shortest path tree (SPT) flag is set, the next (S, G) packet received down the shared tree triggers an (S, G) join in the direction of the source, thereby causing the router to join the source tree. The default SPT-Threshold value of 0 kbps is used for the group, and the J - Join SPT flag is always set on (*, G) entries and is never cleared. The router immediately switches to the shortest path source tree when traffic from a new source is received</li> </ul> |
| Timers:<br>Uptime/Expires | <p>"Uptime" indicates per interface how long (in hours, minutes, and seconds) the entry has been in the IPv6 multicast routing table. "Expires" indicates per interface how long (in hours, minutes, and seconds) until the entry will be removed from the IPv6 multicast routing table.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Interface state:          | <p>Indicates the state of the incoming or outgoing interface.</p> <ul style="list-style-type: none"> <li>• Interface. Indicates the type and number of the interface listed in the incoming or outgoing interface list.</li> <li>• Next-Hop. "Next-Hop" specifies the IP address of the downstream neighbor.</li> <li>• State/Mode. "State" indicates that packets will either be forwarded, pruned, or null on the interface depending on whether there are restrictions due to access lists. "Mode" indicates that the interface is operating in sparse mode.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Field                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (* , FF07::1) and (2001:0DB8:999::99) | Entry in the IPv6 multicast routing table. The entry consists of the IPv6 address of the source router followed by the IPv6 address of the multicast group. An asterisk (*) in place of the source router indicates all sources.<br><br>Entries in the first format are referred to as (*, G) or "star comma G" entries. Entries in the second format are referred to as (S, G) or "S comma G" entries; (*, G) entries are used to build (S, G) entries. |
| RP                                    | Address of the RP router.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| flags:                                | Information set by the MRIB clients on this MRIB entry.                                                                                                                                                                                                                                                                                                                                                                                                  |
| Incoming interface:                   | Expected interface for a multicast packet from the source. If the packet is not received on this interface, it is discarded.                                                                                                                                                                                                                                                                                                                             |
| RPF nbr                               | IP address of the upstream router to the RP or source.                                                                                                                                                                                                                                                                                                                                                                                                   |
| Outgoing interface list:              | Interfaces through which packets will be forwarded. For (S,G) entries, this list will not include the interfaces inherited from the (*,G) entry.                                                                                                                                                                                                                                                                                                         |

## Related Commands

| Command                       | Description                                                                                                                |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>ipv6 multicast-routing</b> | Enables multicast routing using PIM and MLD on all IPv6-enabled interfaces of the router and enables multicast forwarding. |
| <b>show ipv6 mfib</b>         | Displays the forwarding entries and interfaces in the IPv6 MFIB.                                                           |

# show ipv6 mtu

To display maximum transmission unit (MTU) cache information for IPv6 interfaces, use the **show ipv6 mtu** command in user EXEC or privileged EXEC mode.

**show ipv6 mtu** [**vrf** *vrfname*]

## Syntax Description

|                |                                                                                              |
|----------------|----------------------------------------------------------------------------------------------|
| <b>vrf</b>     | (Optional) Displays an IPv6 Virtual Private Network (VPN) routing/forwarding instance (VRF). |
| <i>vrfname</i> | (Optional) Name of the IPv6 VRF.                                                             |

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **vrf** keyword and *vrfname* argument allow you to view MTUs related to a specific VRF.

## Examples

The following is sample output from the **show ipv6 mtu** command:

```
# show ipv6 mtu
MTU      Since      Destination Address
1400     00:04:21   5000:1::3
1280     00:04:50   FE80::203:A0FF:FED6:141D
```

The following is sample output from the **show ipv6 mtu** command using the **vrf** keyword and *vrfname* argument. This example provides information about the VRF named *vrfname1*:

```
# show ipv6 mtu vrf vrfname1
MTU      Since      Source Address      Destination Address
1300     00:00:04   2001:0DB8:2         2001:0DB8:7
```

The table below describes the significant fields shown in the display.

**Table 53: show ipv6 mtu Field Descriptions**

| Field               | Description                                                                                                                                                 |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MTU                 | MTU, which was contained in the Internet Control Message Protocol (ICMP) packet-too-big message, used for the path to the destination address.              |
| Since               | Age of the entry since the ICMP packet-too-big message was received.                                                                                        |
| Destination Address | Address contained in the received ICMP packet-too-big message. Packets originating from this router to this address should be no bigger than the given MTU. |

**Related Commands**

| Command         | Description                                             |
|-----------------|---------------------------------------------------------|
| <b>ipv6 mtu</b> | Sets the MTU size of IPv6 packets sent on an interface. |

# show ipv6 nd destination

To display information about IPv6 host-mode destination cache entries, use the **show ipv6 nd destination** command in user EXEC or privileged EXEC mode.

**show ipv6 nd destination**[*vrf vrf-name*][*interface-type interface-number*]

## Syntax Description

|                            |                                                                            |
|----------------------------|----------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |
| <i>interface-type</i>      | (Optional) Specifies the Interface type.                                   |
| <i>interface-number</i>    | (Optional) Specifies the Interface number.                                 |

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **show ipv6 nd destination** command to display information about IPv6 host-mode destination cache entries. If the **vrf vrf-name** keyword and argument pair is used, then only information about the specified VRF is displayed. If the *interface-type* and *interface-number* arguments are used, then only information about the specified interface is displayed.

## Examples

```
# show ipv6 nd destination

IPv6 ND destination cache (table: default)
Code: R - Redirect
  2001::1 [8]
    via FE80::A8BB:CCFF:FE00:5B00/Ethernet0/0
```

The following table describes the significant fields shown in the display.

**Table 54: show ipv6 nd destination Field Descriptions**

| Field              | Description                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------|
| Code: R - Redirect | Destinations learned through redirect.                                                                    |
| 2001::1 [8]        | The value displayed in brackets is the time, in seconds, since the destination cache entry was last used. |

|---------------------------------|----------------------------------------------------|
| <b>ipv6 nd host mode strict</b> | Enables the conformant, or strict, IPv6 host mode. |

# show ipv6 nd on-link prefix

To display information about on-link prefixes learned through router advertisements (RAs), use the **show ipv6 nd on-link prefix** command in user EXEC or privileged EXEC mode.

**show ipv6 nd on-link prefix***[vrf vrf-name][interface-type interface-number]*

## Syntax Description

|                            |                                                                            |
|----------------------------|----------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |
| <i>interface-type</i>      | (Optional) Specifies the Interface type.                                   |
| <i>interface-number</i>    | (Optional) Specifies the Interface number.                                 |

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **show ipv6 nd on-link prefix** command to display information about on-link prefixes learned through RAs.

Prefixes learned from an RA may be inspected using the **show ipv6 nd on-link prefix** command. If the **vrf vrf-name** keyword and argument pair is used, then only information about the specified VRF is displayed. If the *interface-type* and *interface-number* arguments are used, then only information about the specified interface is displayed.

## Examples

The following example displays information about on-link prefixes learned through RAs:

```
# show ipv6 nd on-link prefix

IPv6 ND on-link Prefix (table: default), 2 prefixes
Code: A - Autonomous Address Config
A 2001::/64 [2591994/604794]
router FE80::A8BB:CCFF:FE00:5A00/Ethernet0/0
2001:1:2::/64 [2591994/604794]
router FE80::A8BB:CCFF:FE00:5A00/Ethernet0/0
```

## Related Commands

| Command                         | Description                                        |
|---------------------------------|----------------------------------------------------|
| <b>ipv6 nd host mode strict</b> | Enables the conformant, or strict, IPv6 host mode. |

# show ipv6 neighbors

To display IPv6 neighbor discovery (ND) cache information, use the **show ipv6 neighbors** command in user EXEC or privileged EXEC mode.

**show ipv6 neighbors** [{*interface-type interface-number* *ipv6-address* *ipv6-hostname* | **statistics**}]

## Syntax Description

|                         |                                                                                                                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>interface-type</i>   | (Optional) Specifies the type of the interface from which IPv6 neighbor information is to be displayed.                                                                                                  |
| <i>interface-number</i> | (Optional) Specifies the number of the interface from which IPv6 neighbor information is to be displayed.                                                                                                |
| <i>ipv6-address</i>     | (Optional) Specifies the IPv6 address of the neighbor.<br><br>This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons. |
| <i>ipv6-hostname</i>    | (Optional) Specifies the IPv6 hostname of the remote networking device.                                                                                                                                  |
| <b>statistics</b>       | (Optional) Displays ND cache statistics.                                                                                                                                                                 |

## Command Default

All IPv6 ND cache entries are listed.

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

When the *interface-type* and *interface-number* arguments are not specified, cache information for all IPv6 neighbors is displayed. Specifying the *interface-type* and *interface-number* arguments displays only cache information about the specified interface.

Specifying the **statistics** keyword displays ND cache statistics.

The following is sample output from the **show ipv6 neighbors** command when entered with an interface type and number:

```
# show ipv6 neighbors ethernet 2
IPv6 Address                               Age Link-layer Addr State Interface
2000:0:0:4::2                             0 0003.a0d6.141e REACH Ethernet2
FE80::203:A0FF:FED6:141E                   0 0003.a0d6.141e REACH Ethernet2
3001:1::45a                               - 0002.7d1a.9472 REACH Ethernet2
```

The following is sample output from the **show ipv6 neighbors** command when entered with an IPv6 address:

```
# show ipv6 neighbors 2000:0:0:4::2
```

```
IPv6 Address                               Age Link-layer Addr State Interface
2000:0:0:4::2                             0 0003.a0d6.141e REACH Ethernet2
```

The table below describes the significant fields shown in the displays.

**Table 55: show ipv6 neighbors Field Descriptions**

| Field           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| State           | <p>The state of the neighbor cache entry. Following are the states for dynamic entries in the IPv6 neighbor discovery cache:</p> <ul style="list-style-type: none"> <li>• <b>INCMP (Incomplete)</b>--Address resolution is being performed on the entry. A neighbor solicitation message has been sent to the solicited-node multicast address of the target, but the corresponding neighbor advertisement message has not yet been received.</li> <li>• <b>REACH (Reachable)</b>--Positive confirmation was received within the last ReachableTime milliseconds that the forward path to the neighbor was functioning properly. While in REACH state, the device takes no special action as packets are sent.</li> <li>• <b>STALE</b>--More than ReachableTime milliseconds have elapsed since the last positive confirmation was received that the forward path was functioning properly. While in STALE state, the device takes no action until a packet is sent.</li> <li>• <b>DELAY</b>--More than ReachableTime milliseconds have elapsed since the last positive confirmation was received that the forward path was functioning properly. A packet was sent within the last DELAY_FIRST_PROBE_TIME seconds. If no reachability confirmation is received within DELAY_FIRST_PROBE_TIME seconds of entering the DELAY state, send a neighbor solicitation message and change the state to PROBE.</li> <li>• <b>PROBE</b>--A reachability confirmation is actively sought by resending neighbor solicitation messages every RetransTimer milliseconds until a reachability confirmation is received.</li> <li>• <b>????</b>--Unknown state.</li> </ul> <p>Following are the possible states for static entries in the IPv6 neighbor discovery cache:</p> <ul style="list-style-type: none"> <li>• <b>INCMP (Incomplete)</b>--The interface for this entry is down.</li> <li>• <b>REACH (Reachable)</b>--The interface for this entry is up.</li> </ul> <p><b>Note</b> Reachability detection is not applied to static entries in the IPv6 neighbor discovery cache; therefore, the descriptions for the INCMP (Incomplete) and REACH (Reachable) states are different for dynamic and static cache entries.</p> |
| Interface       | Interface from which the address was reachable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

The following is sample output from the **show ipv6 neighbors** command with the **statistics** keyword:

```
# show ipv6 neighbor statistics

IPv6 ND Statistics
Entries 2, High-water 2, Gleaned 1, Scavenged 0
Entry States
  INCMP 0 REACH 0 STALE 2 GLEAN 0 DELAY 0 PROBE 0
Resolutions (INCMP)
  Requested 1, timeouts 0, resolved 1, failed 0
  In-progress 0, High-water 1, Throttled 0, Data discards 0
Resolutions (PROBE)
  Requested 3, timeouts 0, resolved 3, failed 0
```

The table below describes the significant fields shown in this display:

**Table 56: show ipv6 neighbors statistics Field Descriptions**

| Field               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Entries             | Total number of ND neighbor entries in the ND cache.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| High-Water          | Maximum amount (so far) of ND neighbor entries in ND cache.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Gleaned             | Number of ND neighbor entries gleaned (that is, learned from a neighbor NA or other ND packet).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Scavenged           | Number of stale ND neighbor entries that have timed out and been removed from the cache.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Entry States        | Number of ND neighbor entries in each state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Resolutions (INCMP) | <p>Statistics for neighbor resolutions attempted in INCMP state (that is, resolutions prompted by a data packet). Details about the resolutions attempted in INCMP state are follows:</p> <ul style="list-style-type: none"> <li>• Requested--Total number of resolutions requested.</li> <li>• Timeouts--Number of timeouts during resolutions.</li> <li>• Resolved--Number of successful resolutions.</li> <li>• Failed--Number of unsuccessful resolutions.</li> <li>• In-progress--Number of resolutions in progress.</li> <li>• High-water--Maximum number (so far) of resolutions in progress.</li> <li>• Throttled--Number of times resolution request was ignored due to maximum number of resolutions in progress limit.</li> <li>• Data discards--Number of data packets discarded that are awaiting neighbor resolution.</li> </ul> |

| Field               | Description                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## show ipv6 nhrp

To display Next Hop Resolution Protocol (NHRP) mapping information, use the **show ipv6 nhrp** command in user EXEC or privileged EXEC mode.

**show ipv6 nhrp** [{dynamic [*ipv6-address*] | incomplete | static}] [{address | interface}] [{brief | detail}] [purge]

### Syntax Description

|                     |                                                                                                                                                                                                                                                               |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dynamic</b>      | (Optional) Displays dynamic (learned) IPv6-to-nonbroadcast multiaccess address (NBMA) mapping entries. Dynamic NHRP mapping entries are obtained from NHRP resolution/registration exchanges. See the table below for types, number ranges, and descriptions. |
| <i>ipv6-address</i> | (Optional) The IPv6 address of the cache entry.                                                                                                                                                                                                               |
| <b>incomplete</b>   | (Optional) Displays information about NHRP mapping entries for which the IPv6-to-NBMA is not resolved. See the table below for types, number ranges, and descriptions.                                                                                        |
| <b>static</b>       | (Optional) Displays static IPv6-to-NBMA address mapping entries. Static NHRP mapping entries are configured using the <b>ipv6 nhrp map</b> command. See the table below for types, number ranges, and descriptions.                                           |
| <i>address</i>      | (Optional) NHRP mapping entry for specified protocol addresses.                                                                                                                                                                                               |
| <i>interface</i>    | (Optional) NHRP mapping entry for the specified interface. See the table below for types, number ranges, and descriptions.                                                                                                                                    |
| <b>brief</b>        | (Optional) Displays a short output of the NHRP mapping.                                                                                                                                                                                                       |
| <b>detail</b>       | (Optional) Displays detailed information about NHRP mapping.                                                                                                                                                                                                  |
| <b>purge</b>        | (Optional) Displays NHRP purge information.                                                                                                                                                                                                                   |

### Command Modes

User EXEC (>)

Privileged EXEC (#)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

The table below lists the valid types, number ranges, and descriptions for the optional *interface* argument.

#### Note

The valid types can vary according to the platform and interfaces on the platform.

Table 57: Valid Types, Number Ranges, and Interface Description

| Valid Types       | Number Ranges   | Interface Descriptions         |
|-------------------|-----------------|--------------------------------|
| async             | 1               | Async                          |
| atm               | 0 to 6          | ATM                            |
| bvi               | 1 to 255        | Bridge-Group Virtual Interface |
| cdma-ix           | 1               | CDMA Ix                        |
| ctunnel           | 0 to 2147483647 | C-Tunnel                       |
| dialer            | 0 to 20049      | Dialer                         |
| ethernet          | 0 to 4294967295 | Ethernet                       |
| fastethernet      | 0 to 6          | FastEthernet IEEE 802.3        |

## Examples

The following is sample output from the **show ipv6 nhrp** command:

```
# show ipv6 nhrp
2001:0db8:3c4d:0015::1a2f:3d2c/48 via
2001:0db8:3c4d:0015::1a2f:3d2c
Tunnel0 created 6d05h, never expire
```

The table below describes the significant fields shown in the display.

**Table 58: show ipv6 nhrp Field Descriptions**

| Field                             | Description                                             |
|-----------------------------------|---------------------------------------------------------|
| 2001:0db8:3c4d:0015::1a2f:3d2c/48 | Target network.                                         |
| 2001:0db8:3c4d:0015::1a2f:3d2c    | Next hop to reach the target network.                   |
| Tunnel0                           | Interface through which the target network is reached.  |
| created 6d05h                     | Length of time since the entry was created (dayshours). |
| never expire                      | Indicates that static entries never expire.             |

The following is sample output from the **show ipv6 nhrp** command using the **brief** keyword:

```
# show ipv6 nhrp brief
2001:0db8:3c4d:0015:0000:0000:1a2f:3d2c/48
  via 2001:0db8:3c4d:0015:0000:0000:1a2f:3d2c
Interface: Tunnel0 Type: static
NBMA address: 10.11.11.99
```

The table below describes the significant fields shown in the display.

**Table 59: show ipv6 nhrp brief Field Descriptions**

| Field                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## show ipv6 ospf Output Example

The following is sample output from the **show ipv6 ospf** command:

```
# show ipv6 ospf
Routing Process "ospfv3 1" with ID 10.10.10.1
  SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
  Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
  LSA group pacing timer 240 secs
  Interface flood pacing timer 33 msec
  Retransmission pacing timer 66 msec
  Number of external LSA 0. Checksum Sum 0x000000
  Number of areas in this device is 1. 1 normal 0 stub 0 nssa
    Area BACKBONE(0)
      Number of interfaces in this area is 1
      MD5 Authentication, SPI 1000
      SPF algorithm executed 2 times
      Number of LSA 5. Checksum Sum 0x02A005
      Number of DCbitless LSA 0
      Number of indication LSA 0
      Number of DoNotAge LSA 0
      Flood list length 0
```

The table below describes the significant fields shown in the display.

**Table 60: show ipv6 ospf Field Descriptions**

| Field                                         | Description                                                   |
|-----------------------------------------------|---------------------------------------------------------------|
| Routing process "ospfv3 1" with ID 10.10.10.1 | Process ID and OSPF device ID.                                |
| LSA group pacing timer                        | Configured LSA group pacing timer (in seconds).               |
| Interface flood pacing timer                  | Configured LSA flood pacing timer (in milliseconds).          |
| Retransmission pacing timer                   | Configured LSA retransmission pacing timer (in milliseconds). |
| Number of areas                               | Number of areas in device, area addresses, and so on.         |

**show ipv6 ospf With Area Encryption Example**

The following sample output shows the **show ipv6 ospf** command with area encryption information:

```
# show ipv6 ospf
Routing Process "ospfv3 1" with ID 10.0.0.1
It is an area border device
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 0. Checksum Sum 0x000000
Number of areas in this device is 2. 2 normal 0 stub 0 nssa
Reference bandwidth unit is 100 mbps
  Area BACKBONE(0)
    Number of interfaces in this area is 2
    SPF algorithm executed 3 times
    Number of LSA 31. Checksum Sum 0x107493
    Number of DCbitless LSA 0
    Number of indication LSA 0
    Number of DoNotAge LSA 20
    Flood list length 0
  Area 1
    Number of interfaces in this area is 2
    NULL Encryption SHA-1 Auth, SPI 1001
    SPF algorithm executed 7 times
    Number of LSA 20. Checksum Sum 0x095E6A
    Number of DCbitless LSA 0
    Number of indication LSA 0
    Number of DoNotAge LSA 0
    Flood list length 0
```

The table below describes the significant fields shown in the display.

**Table 61: show ipv6 ospf with Area Encryption Information Field Descriptions**

| Field  | Description                        |
|--------|------------------------------------|
| Area 1 | Subsequent fields describe area 1. |

| Field                                | Description                                                                                                                                                                              |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NULL Encryption SHA-1 Auth, SPI 1001 | Displays the encryption algorithm (in this case, null, meaning no encryption algorithm is used), the authentication algorithm (SHA-1), and the security policy index (SPI) value (1001). |

The following example displays the configuration values for SPF and LSA throttling timers:

```
# show ipv6 ospf
Routing Process "ospfv3 1" with ID 10.9.4.1
Event-log enabled, Maximum number of events: 1000, Mode: cyclic
It is an autonomous system boundary device
Redistributing External Routes from,
    ospf 2
Initial SPF schedule delay 5000 msec
Minimum hold time between two consecutive SPF's 10000 msec
Maximum wait time between two consecutive SPF's 10000 msec
Minimum LSA interval 5 sec
Minimum LSA arrival 1000 msec
```

The table below describes the significant fields shown in the display.

**Table 62: show ipv6 ospf with SPF and LSA Throttling Timer Field Descriptions**

| Field                                                      | Description                                                           |
|------------------------------------------------------------|-----------------------------------------------------------------------|
| Initial SPF schedule delay                                 | Delay time of SPF calculations.                                       |
| Minimum hold time between two consecutive SPF's            | Minimum hold time between consecutive SPF calculations.               |
| Maximum wait time between two consecutive SPF's 10000 msec | Maximum hold time between consecutive SPF calculations.               |
| Minimum LSA interval 5 sec                                 | Minimum time interval (in seconds) between link-state advertisements. |
| Minimum LSA arrival 1000 msec                              | Maximum arrival time (in milliseconds) of link-state advertisements.  |

The following example shows information about LSAs that are currently being rate limited:

```
# show ipv6 ospf rate-limit
List of LSAs that are in rate limit Queue
  LSAID: 0.0.0.0 Type: 0x2001 Adv Rtr: 10.55.55.55 Due in: 00:00:00.500
  LSAID: 0.0.0.0 Type: 0x2009 Adv Rtr: 10.55.55.55 Due in: 00:00:00.500
```

The table below describes the significant fields shown in the display.

**Table 63: show ipv6 ospf rate-limit Field Descriptions**

| Field | Description               |
|-------|---------------------------|
| LSAID | Link-state ID of the LSA. |
| Type  | Description of the LSA.   |

| Field   | Description                                            |
|---------|--------------------------------------------------------|
| Adv Rtr | ID of the advertising device.                          |
| Due in: | Remaining time until the generation of the next event. |

# show ipv6 ospf border-routers

To display the internal Open Shortest Path First (OSPF) routing table entries to an Area Border Router (ABR) and Autonomous System Boundary Router (ASBR), use the **show ipv6 ospf border-routers** command in user EXEC or privileged EXEC mode.

**show ip ospf** [*process-id*] **border-routers**

## Syntax Description

|                   |                                                                                                                                                                                                    |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>process-id</i> | (Optional) Internal identification. It is locally assigned and can be any positive integer. The number used here is the number assigned administratively when the OSPF routing process is enabled. |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

The following is sample output from the **show ipv6 ospf border-routers** command:

```
# show ipv6 ospf border-routers
```

```
OSPFv3 Process 1 internal Routing Table
Codes: i - Intra-area route, I - Inter-area route
i 172.16.4.4 [2] via FE80::205:5FFF:FED3:5808, FastEthernet0/0, ABR, Area 1, SPF 13
i 172.16.4.4 [1] via FE80::205:5FFF:FED3:5406, POS4/0, ABR, Area 0, SPF 8
i 172.16.3.3 [1] via FE80::205:5FFF:FED3:5808, FastEthernet0/0, ASBR, Area 1, SPF 3
```

The table below describes the significant fields shown in the display.

**Table 64: show ipv6 ospf border-routers Field Descriptions**

| Field                                                                              | Description                                                  |
|------------------------------------------------------------------------------------|--------------------------------------------------------------|
| i - Intra-area route, I - Inter-area route                                         | The type of this route.                                      |
| 172.16.4.4, 172.16.3.3                                                             | Router ID of the destination router.                         |
| [2], [1]                                                                           | Metric used to reach the destination router.                 |
| FE80::205:5FFF:FED3:5808,<br>FE80::205:5FFF:FED3:5406,<br>FE80::205:5FFF:FED3:5808 | Link-local routers.                                          |
| FastEthernet0/0, POS4/0                                                            | The interface on which the IPv6 OSPF protocol is configured. |
| ABR                                                                                | Area border router.                                          |

| Field                | Description                                                                                |
|----------------------|--------------------------------------------------------------------------------------------|
| ASBR                 | Autonomous system boundary router.                                                         |
| Area 0, Area 1       | The area ID of the area from which this route is learned.                                  |
| SPF 13, SPF 8, SPF 3 | The internal number of the shortest path first (SPF) calculation that installs this route. |

# show ipv6 ospf event

To display detailed information about IPv6 Open Shortest Path First (OSPF) events, use the **show ipv6 ospf event** command in privileged EXEC mode.

**show ipv6 ospf** [*process-id*] **event** [{**generic** | **interface** | **lsa** | **neighbor** | **reverse** | **rib** | **spf**}]

| Syntax Description |                                                                                                                                                                                                    |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>process-id</i>  | (Optional) Internal identification. It is locally assigned and can be any positive integer. The number used here is the number assigned administratively when the OSPF routing process is enabled. |
| <b>generic</b>     | (Optional) Generic information regarding OSPF for IPv6 events.                                                                                                                                     |
| <b>interface</b>   | (Optional) Interface state change events, including old and new states.                                                                                                                            |
| <b>lsa</b>         | (Optional) LSA arrival and LSA generation events.                                                                                                                                                  |
| <b>neighbor</b>    | (Optional) Neighbor state change events, including old and new states.                                                                                                                             |
| <b>reverse</b>     | (Optional) Keyword to allow the display of events in reverse-from the latest to the oldest or from oldest to the latest.                                                                           |
| <b>rib</b>         | (Optional) Routing Information Base (RIB) update, delete, and redistribution events.                                                                                                               |
| <b>spf</b>         | (Optional) Scheduling and SPF run events.                                                                                                                                                          |

**Command Modes** Privileged EXEC (#)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** An OSPF event log is kept for every OSPF instance. If you enter no keywords with the **show ipv6 ospf event** command, all information in the OSPF event log is displayed. Use the keywords to filter specific information.

## Examples

The following example shows scheduling and SPF run events, LSA arrival and LSA generation events, in order from the oldest events to the latest generated events:

```
# show ipv6 ospf event spf lsa reverse

OSPFv3 Router with ID (10.0.0.1) (Process ID 1)
1 *Sep 29 11:59:18.367: Rcv Changed Type-0x2009 LSA, LSID 10.0.0.0, Adv-Rtr 192.168.0.1,
Seq# 80007699, Age 3600
3 *Sep 29 11:59:18.367: Schedule SPF, Area 0, Change in LSID 10.0.0.0, LSA type P

The table below describes the significant fields shown in the display.

**Table 65: show ip ospf Field Descriptions**

| Field                                           | Description                                                                      |
|-------------------------------------------------|----------------------------------------------------------------------------------|
| OSPFv3 Router with ID (10.0.0.1) (Process ID 1) | Process ID and OSPF router ID.                                                   |
| Rcv Changed Type-0x2009 LSA                     | Description of newly arrived LSA.                                                |
| LSID                                            | Link-state ID of the LSA.                                                        |
| Adv-Rtr                                         | ID of the advertising router.                                                    |
| Seq#                                            | Link state sequence number (detects old or duplicate link state advertisements). |
| Age                                             | Link state age (in seconds).                                                     |
| Schedule SPF                                    | Enables SPF to run.                                                              |
| Area                                            | OSPF area ID.                                                                    |
| Change in LSID                                  | Changed link-state ID of the LSA.                                                |
| LSA type                                        | LSA type.                                                                        |

# show ipv6 ospf graceful-restart

To display Open Shortest Path First for IPv6 (OSPFv3) graceful restart information, use the **show ipv6 ospf graceful-restart** command in privileged EXEC mode.

**show ipv6 ospf graceful-restart**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC (#)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Use the **show ipv6 ospf graceful-restart** command to discover information about the OSPFv3 graceful restart feature.

## Examples

The following example displays OSPFv3 graceful restart information:

```
# show ipv6 ospf graceful-restart
Routing Process "ospf 1"
  Graceful Restart enabled
    restart-interval limit: 120 sec, last restart 00:00:15 ago (took 36 secs)
  Graceful Restart helper support enabled
  Router status : Active
  Router is running in SSO mode
  OSPF restart state : NO_RESTART
  Router ID 10.1.1.1, checkpoint Router ID 10.0.0.0
```

The table below describes the significant fields shown in the display.

**Table 66: show ipv6 ospf graceful-restart Field Descriptions**

| Field                                    | Description                                                                                                                                                                                                                                                   |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Routing Process "ospf 1"                 | The OSPFv3 routing process ID.                                                                                                                                                                                                                                |
| Graceful Restart enabled                 | The graceful restart feature is enabled on this router.                                                                                                                                                                                                       |
| restart-interval limit: 120 sec          | The restart-interval limit.                                                                                                                                                                                                                                   |
| last restart 00:00:15 ago (took 36 secs) | How long ago the last graceful restart occurred, and how long it took to occur.                                                                                                                                                                               |
| Graceful Restart helper support enabled  | Graceful restart helper mode is enabled. Because graceful restart mode is also enabled on this router, you can identify this router as being graceful-restart capable. A router that is graceful-restart-aware cannot be configured in graceful-restart mode. |

| Field                                             | Description                                                         |
|---------------------------------------------------|---------------------------------------------------------------------|
| Router status : Active                            | This router is in active, as opposed to standby, mode.              |
| Router is running in SSO mode                     | The router is in stateful switchover mode.                          |
| OSPF restart state : NO_RESTART                   | The current OSPFv3 restart state.                                   |
| Router ID 10.1.1.1, checkpoint Router ID 10.0.0.0 | The IPv6 addresses of the current router and the checkpoint router. |

**Related Commands**

| Command                         | Description                                    |
|---------------------------------|------------------------------------------------|
| <b>show ipv6 ospf interface</b> | Displays OSPFv3-related interface information. |

# show ipv6 ospf interface

To display Open Shortest Path First (OSPF)-related interface information, use the **showipv6ospfinterface** command in user EXEC or privileged mode.

**show ipv6 ospf** [*process-id*] [*area-id*] **interface** [*type number*] [**brief**]

## Syntax Description

|                    |                                                                                                                                                                                                    |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>process-id</i>  | (Optional) Internal identification. It is locally assigned and can be any positive integer. The number used here is the number assigned administratively when the OSPF routing process is enabled. |
| <i>area-id</i>     | (Optional) Displays information about a specified area only.                                                                                                                                       |
| <i>type number</i> | (Optional) Interface type and number.                                                                                                                                                              |
| <b>brief</b>       | (Optional) Displays brief overview information for OSPF interfaces, states, addresses and masks, and areas on the router.                                                                          |

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

### show ipv6 ospf interface Standard Output Example

The following is sample output from the **showipv6ospfinterface** command:

```
# show ipv6 ospf interface
ATM3/0 is up, line protocol is up
  Link Local Address 2001:0DB1:205:5FFF:FED3:5808, Interface ID 13
  Area 1, Process ID 1, Instance ID 0, Router ID 172.16.3.3
  Network Type POINT_TO_POINT, Cost: 1
  Transmit Delay is 1 sec, State POINT_TO_POINT,
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
    Hello due in 00:00:06
  Index 1/2/2, flood queue length 0
  Next 0x0(0)/0x0(0)/0x0(0)
  Last flood scan length is 12, maximum is 12
  Last flood scan time is 0 msec, maximum is 0 msec
  Neighbor Count is 1, Adjacent neighbor count is 1
    Adjacent with neighbor 172.16.4.4
  Suppress hello for 0 neighbor(s)
FastEthernet0/0 is up, line protocol is up
  Link Local Address 2001:0DB1:205:5FFF:FED3:5808, Interface ID 3
  Area 1, Process ID 1, Instance ID 0, Router ID 172.16.3.3
  Network Type BROADCAST, Cost: 1
  Transmit Delay is 1 sec, State BDR, Priority 1
  Designated Router (ID) 172.16.6.6, local address 2001:0DB1:205:5FFF:FED3:6408
  Backup Designated router (ID) 172.16.3.3, local address 2001:0DB1:205:5FFF:FED3:5808
```

```

Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
  Hello due in 00:00:05
Index 1/1/1, flood queue length 0
Next 0x0(0)/0x0(0)/0x0(0)
Last flood scan length is 12, maximum is 12
Last flood scan time is 0 msec, maximum is 0 msec
Neighbor Count is 1, Adjacent neighbor count is 1
  Adjacent with neighbor 172.16.6.6 (Designated Router)
Suppress hello for 0 neighbor(s)

```

The table below describes the significant fields shown in the display.

**Table 67: show ipv6 ospf interface Field Descriptions**

| Field                                                     | Description                                                                                       |
|-----------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| ATM3/0                                                    | Status of the physical link and operational status of protocol.                                   |
| Link Local Address                                        | Interface IPv6 address.                                                                           |
| Area 1, Process ID 1, Instance ID 0, Router ID 172.16.3.3 | The area ID, process ID, instance ID, and router ID of the area from which this route is learned. |
| Network Type POINT_TO_POINT, Cost: 1                      | Network type and link-state cost.                                                                 |
| Transmit Delay                                            | Transmit delay, interface state, and router priority.                                             |
| Designated Router                                         | Designated router ID and respective interface IP address.                                         |
| Backup Designated router                                  | Backup designated router ID and respective interface IP address.                                  |
| Timer intervals configured                                | Configuration of timer intervals.                                                                 |
| Hello                                                     | Number of seconds until the next hello packet is sent out this interface.                         |
| Neighbor Count                                            | Count of network neighbors and list of adjacent neighbors.                                        |

### Cisco IOS Release 12.2(33)SRB Example

The following is sample output of the **show ipv6 ospf interface** command when the **brief** keyword is entered.

```
# show ipv6 ospf interface brief
```

```

Interface    PID    Area          Intf ID    Cost    State  Nbrs  F/C
VL0          6      0             21         65535   DOWN   0/0
Se3/0        6      0             14         64      P2P    0/0
Lo1          6      0             20         1       LOOP   0/0
Se2/0        6      6             10         62      P2P    0/0
Tu0          1000   0             19         11111   DOWN   0/0

```

### OSPF with Authentication on the Interface Example

The following is sample output from the **showipv6ospfinterface** command with authentication enabled on the interface:

```
# show ipv6 ospf interface
Ethernet0/0 is up, line protocol is up
  Link Local Address 2001:0DB1:A8BB:CCFF:FE00:6E00, Interface ID 2
  Area 0, Process ID 1, Instance ID 0, Router ID 10.10.10.1
  Network Type BROADCAST, Cost:10
  MD5 Authentication SPI 500, secure socket state UP (errors:0)
  Transmit Delay is 1 sec, State BDR, Priority 1
  Designated Router (ID) 10.11.11.1, local address 2001:0DB1:A8BB:CCFF:FE00:6F00
  Backup Designated router (ID) 10.10.10.1, local address
2001:0DB1:A8BB:CCFF:FE00:6E00
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
    Hello due in 00:00:01
  Index 1/1/1, flood queue length 0
  Next 0x0(0)/0x0(0)/0x0(0)
  Last flood scan length is 1, maximum is 1
  Last flood scan time is 0 msec, maximum is 0 msec
  Neighbor Count is 1, Adjacent neighbor count is 1
    Adjacent with neighbor 10.11.11.1 (Designated Router)
  Suppress hello for 0 neighbor(s)
```

### OSPF with Null Authentication Example

The following is sample output from the **showipv6ospfinterface** command with null authentication configured on the interface:

```
# show ipv6 ospf interface
Ethernet0/0 is up, line protocol is up
  Link Local Address 2001:0DB1:A8BB:CCFF:FE00:6E00, Interface ID 2
  Area 0, Process ID 1, Instance ID 0, Router ID 10.10.10.1
  Network Type BROADCAST, Cost:10
  Authentication NULL
  Transmit Delay is 1 sec, State BDR, Priority 1
  Designated Router (ID) 10.11.11.1, local address 2001:0DB1:A8BB:CCFF:FE00:6F00
  Backup Designated router (ID) 10.10.10.1, local address
2001:0DB1:A8BB:CCFF:FE00:6E00
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
    Hello due in 00:00:03
  Index 1/1/1, flood queue length 0
  Next 0x0(0)/0x0(0)/0x0(0)
  Last flood scan length is 1, maximum is 1
  Last flood scan time is 0 msec, maximum is 0 msec
  Neighbor Count is 1, Adjacent neighbor count is 1
    Adjacent with neighbor 10.11.11.1 (Designated Router)
  Suppress hello for 0 neighbor(s)
```

### OSPF with Authentication for the Area Example

The following is sample output from the **showipv6ospfinterface** command with authentication configured for the area:

```
# show ipv6 ospf interface
```

```

Ethernet0/0 is up, line protocol is up
  Link Local Address 2001:0DB1:A8BB:CCFF:FE00:6E00, Interface ID 2
  Area 0, Process ID 1, Instance ID 0, Router ID 10.10.10.1
  Network Type BROADCAST, Cost:10
  MD5 Authentication (Area) SPI 1000, secure socket state UP (errors:0)
  Transmit Delay is 1 sec, State BDR, Priority 1
  Designated Router (ID) 10.11.11.1, local address 2001:0DB1:A8BB:CCFF:FE00:6F00
  Backup Designated router (ID) 10.10.10.1, local address
FE80::A8BB:CCFF:FE00:6E00
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
  Hello due in 00:00:03
  Index 1/1/1, flood queue length 0
  Next 0x0(0)/0x0(0)/0x0(0)
  Last flood scan length is 1, maximum is 1
  Last flood scan time is 0 msec, maximum is 0 msec
  Neighbor Count is 1, Adjacent neighbor count is 1
    Adjacent with neighbor 10.11.11.1 (Designated Router)
  Suppress hello for 0 neighbor(s)

```

### OSPF with Dynamic Cost Example

The following display shows sample output from the **showipv6ospfinterface** command when the OSPF cost dynamic is configured.

```

# show ipv6 ospf interface serial 2/0
Serial2/0 is up, line protocol is up
  Link Local Address 2001:0DB1:A8BB:CCFF:FE00:100, Interface ID 10
  Area 1, Process ID 1, Instance ID 0, Router ID 172.1.1.1
  Network Type POINT_TO_MULTIPOINT, Cost: 64 (dynamic), Cost Hysteresis: 200
  Cost Weights: Throughput 100, Resources 20, Latency 80, L2-factor 100
  Transmit Delay is 1 sec, State POINT_TO_MULTIPOINT,
  Timer intervals configured, Hello 30, Dead 120, Wait 120, Retransmit 5
  Hello due in 00:00:19
  Index 1/2/3, flood queue length 0
  Next 0x0(0)/0x0(0)/0x0(0)
  Last flood scan length is 0, maximum is 0
  Last flood scan time is 0 msec, maximum is 0 msec
  Neighbor Count is 0, Adjacent neighbor count is 0
  Suppress hello for 0 neighbor(s)

```

### OSPF Graceful Restart Example

The following display shows sample output from the **showipv6ospfinterface** command when the OSPF graceful restart feature is configured:

```

# show ipv6 ospf interface
Ethernet0/0 is up, line protocol is up
  Link Local Address FE80::A8BB:CCFF:FE00:300, Interface ID 2
  Area 0, Process ID 1, Instance ID 0, Router ID 10.3.3.3
  Network Type POINT_TO_POINT, Cost: 10
  Transmit Delay is 1 sec, State POINT_TO_POINT,
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
  Graceful Restart p2p timeout in 00:00:19
  Hello due in 00:00:02
  Graceful Restart helper support enabled
  Index 1/1/1, flood queue length 0
  Next 0x0(0)/0x0(0)/0x0(0)
  Last flood scan length is 1, maximum is 1

```

**show ipv6 ospf interface**

```

Last flood scan time is 0 msec, maximum is 0 msec
Neighbor Count is 1, Adjacent neighbor count is 1
  Adjacent with neighbor 10.1.1.1
Suppress hello for 0 neighbor(s)

```

**Example of an Enabled Protocol**

The following display shows that the OSPF interface is enabled for Bidirectional Forwarding Detection (BFD):

```

# show ipv6 ospf interface
Serial10/0 is up, line protocol is up
  Link Local Address FE80::A8BB:CCFF:FE00:6500, Interface ID 42
  Area 1, Process ID 1, Instance ID 0, Router ID 10.0.0.1
  Network Type POINT_TO_POINT, Cost: 64
  Transmit Delay is 1 sec, State POINT_TO_POINT, BFD enabled
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
    Hello due in 00:00:07
  Index 1/1/1, flood queue length 0
  Next 0x0(0)/0x0(0)/0x0(0)
  Last flood scan length is 1, maximum is 1
  Last flood scan time is 0 msec, maximum is 0 msec
  Neighbor Count is 1, Adjacent neighbor count is 1
    Adjacent with neighbor 10.1.0.1
  Suppress hello for 0 neighbor(s)

```

# show ipv6 ospf request-list

To display a list of all link-state advertisements (LSAs) requested by a router, use the **show ipv6 ospf request-list** command in user EXEC or privileged EXEC mode.

**show ipv6 ospf** [*process-id*] [*area-id*] **request-list** [*neighbor*] [*interface*] [*interface-neighbor*]

| Syntax Description        |                                                                                                                                                                                                                               |  |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <i>process-id</i>         | (Optional) Internal identification. It is locally assigned and can be any positive integer. The number used here is the number assigned administratively when the Open Shortest Path First (OSPF) routing process is enabled. |  |
| <i>area-id</i>            | (Optional) Displays information only about a specified area.                                                                                                                                                                  |  |
| <i>neighbor</i>           | (Optional) Displays the list of all LSAs requested by the router from this neighbor.                                                                                                                                          |  |
| <i>interface</i>          | (Optional) Displays the list of all LSAs requested by the router from this interface.                                                                                                                                         |  |
| <i>interface-neighbor</i> | (Optional) Displays the list of all LSAs requested by the router on this interface, from this neighbor.                                                                                                                       |  |

```

The table below describes the significant fields shown in the display.

*Table 68: show ipv6 ospf request-list Field Descriptions*

| Field                                                   | Description                                                      |
|---------------------------------------------------------|------------------------------------------------------------------|
| OSPFv3 Router with ID (192.168.255.5)<br>(Process ID 1) | Identification of the router for which information is displayed. |
| Interface Ethernet0/0                                   | Interface for which information is displayed.                    |
| Type                                                    | Type of LSA.                                                     |
| LS ID                                                   | Link-state ID of the LSA.                                        |
| ADV RTR                                                 | IP address of advertising router.                                |
| Seq NO                                                  | Sequence number of LSA.                                          |
| Age                                                     | Age of LSA (in seconds).                                         |
| Checksum                                                | Checksum of LSA.                                                 |

# show ipv6 ospf retransmission-list

To display a list of all link-state advertisements (LSAs) waiting to be re-sent, use the **show ipv6 ospf retransmission-list** command in user EXEC or privileged EXEC mode.

**show ipv6 ospf** [*process-id*] [*area-id*] **retransmission-list** [*neighbor*] [*interface*] [*interface-neighbor*]

| Syntax Description        |  |                                                                                                                                                                                                    |
|---------------------------|--|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>process-id</i>         |  | (Optional) Internal identification. It is locally assigned and can be any positive integer. The number used here is the number assigned administratively when the OSPF routing process is enabled. |
| <i>area-id</i>            |  | (Optional) Displays information only about a specified area.                                                                                                                                       |
| <i>neighbor</i>           |  | (Optional) Displays the list of all LSAs waiting to be re-sent for this neighbor.                                                                                                                  |
| <i>interface</i>          |  | (Optional) Displays the list of all LSAs waiting to be re-sent on this interface.                                                                                                                  |
| <i>interface neighbor</i> |  | (Optional) Displays the list of all LSAs waiting to be re-sent on this interface, from this neighbor.                                                                                              |

| Command Modes | User EXEC (>)       |
|---------------|---------------------|
|               | Privileged EXEC (#) |

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

| Usage Guidelines | The information displayed by the <b>show ipv6 ospf retransmission-list</b> command is useful in debugging Open Shortest Path First (OSPF) routing operations. |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Examples | The following is sample output from the <b>show ipv6 ospf retransmission-list</b> command: |
|----------|--------------------------------------------------------------------------------------------|
|----------|--------------------------------------------------------------------------------------------|

```
# show ipv6 ospf retransmission-list

      OSPFv3 Router with ID (192.168.255.2) (Process ID 1)
Neighbor 192.168.255.1, interface Ethernet0/0
Link state retransmission due in 3759 msec, Queue length 1
Type   LS ID      ADV RTR      Seq NO      Age      Checksum
0x2001  0             192.168.255.2  0x80000222  1        0x00AE52
```

The table below describes the significant fields shown in the display.

**Table 69: show ipv6 ospf retransmission-list Field Descriptions**

| Field                                                | Description                                                      |
|------------------------------------------------------|------------------------------------------------------------------|
| OSPFv3 Router with ID (192.168.255.2) (Process ID 1) | Identification of the router for which information is displayed. |

| Field                            | Description                                         |
|----------------------------------|-----------------------------------------------------|
| Interface Ethernet0/0            | Interface for which information is displayed.       |
| Link state retransmission due in | Length of time before next link-state transmission. |
| Queue length                     | Number of elements in the retransmission queue.     |
| Type                             | Type of LSA.                                        |
| LS ID                            | Link-state ID of the LSA.                           |
| ADV RTR                          | IP address of advertising router.                   |
| Seq NO                           | Sequence number of the LSA.                         |
| Age                              | Age of LSA (in seconds).                            |
| Checksum                         | Checksum of LSA.                                    |

# show ipv6 ospf statistics

To display Open Shortest Path First for IPv6 (OSPFv6) shortest path first (SPF) calculation statistics, use the **show ipv6 ospf statistics** command in user EXEC or privileged EXEC mode.

**show ipv6 ospf statistics [detail]**

## Syntax Description

|               |                                                                                                                 |
|---------------|-----------------------------------------------------------------------------------------------------------------|
| <b>detail</b> | (Optional) Displays statistics separately for each OSPF area and includes additional, more detailed statistics. |
|---------------|-----------------------------------------------------------------------------------------------------------------|

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **show ipv6 ospf statistics** command provides important information about SPF calculations and the events that trigger them. This information can be meaningful for both OSPF network maintenance and troubleshooting. For example, entering the **show ipv6 ospf statistics** command is recommended as the first troubleshooting step for link-state advertisement (LSA) flapping.

## Examples

The following example provides detailed statistics for each OSPFv6 area:

```
# show ipv6 ospf statistics detail
Area 0: SPF algorithm executed 3 times
SPF 1 executed 00:06:57 ago, SPF type Full
SPF calculation time (in msec):
SPT    Prefix D-Int  Sum    D-Sum  Ext    D-Ext  Total
0      0      0      0      0      0      0      0
RIB manipulation time (in msec):
RIB Update    RIB Delete
0              0
LSIDs processed R:1 N:0 Prefix:0 SN:0 SA:0 X7:0
Change record R N SN SA L
LSAs changed 1
Changed LSAs. Recorded is Advertising Router, LSID and LS type:
10.2.2.2/0(R)
SPF 2 executed 00:06:47 ago, SPF type Full
SPF calculation time (in msec):
SPT    Prefix D-Int  Sum    D-Sum  Ext    D-Ext  Total
0      0      0      0      0      0      0      0
RIB manipulation time (in msec):
RIB Update    RIB Delete
0              0
LSIDs processed R:1 N:0 Prefix:1 SN:0 SA:0 X7:0
Change record R L P
LSAs changed 4
Changed LSAs. Recorded is Advertising Router, LSID and LS type:
10.2.2.2/2(L) 10.2.2.2/0(R) 10.2.2.2/2(L) 10.2.2.2/0(P)
```

The table below describes the significant fields shown in the display.

**Table 70: show ipv6 ospf statistics Field Descriptions**

| Field           | Description                                                                                                                                                                                                                                                                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Area            | OSPF area ID.                                                                                                                                                                                                                                                                                                                               |
| SPF             | Number of SPF algorithms executed in the OSPF area. The number increases by one for each SPF algorithm that is executed in the area.                                                                                                                                                                                                        |
| Executed ago    | Time in milliseconds that has passed between the start of the SPF algorithm execution and the current time.                                                                                                                                                                                                                                 |
| SPF type        | SPF type can be Full or Incremental.                                                                                                                                                                                                                                                                                                        |
| SPT             | Time in milliseconds required to compute the first stage of the SPF algorithm (to build a short path tree). The SPT time plus the time required to process links to stub networks equals the Intra time.                                                                                                                                    |
| Ext             | Time in milliseconds for the SPF algorithm to process external and not so stubby area (NSSA) LSAs and to install external and NSSA routes in the routing table.                                                                                                                                                                             |
| Total           | Total duration time in milliseconds for the SPF algorithm process.                                                                                                                                                                                                                                                                          |
| LSIDs processed | Number of LSAs processed during the SPF calculation: <ul style="list-style-type: none"> <li>• N--Network LSA.</li> <li>• R--Router LSA.</li> <li>• SA--Summary Autonomous System Boundary Router (ASBR) (SA) LSA.</li> <li>• SN--Summary Network (SN) LSA.</li> <li>• Stub--Stub links.</li> <li>• X7--External Type-7 (X7) LSA.</li> </ul> |

# show ipv6 ospf summary-prefix

To display a list of all summary address redistribution information configured under an OSPF process, use the **show ipv6 ospf summary-prefix** command in user EXEC or privileged EXEC mode.

**show ipv6 ospf** [*process-id*] **summary-prefix**

## Syntax Description

|                   |                                                                                                                                                                                                    |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>process-id</i> | (Optional) Internal identification. It is locally assigned and can be any positive integer. The number used here is the number assigned administratively when the OSPF routing process is enabled. |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The *process-id* argument can be entered as a decimal number or as an IPv6 address format.

## Examples

The following is sample output from the **show ipv6 ospf summary-prefix** command:

```
# show ipv6 ospf summary-prefix

OSPFv3 Process 1, Summary-prefix
FE00::/24 Metric 16777215, Type 0, Tag 0
```

The table below describes the significant fields shown in the display.

**Table 71: show ipv6 ospf summary-prefix Field Descriptions**

| Field          | Description                                                  |
|----------------|--------------------------------------------------------------|
| OSPFv3 Process | Process ID of the router for which information is displayed. |
| Metric         | Metric used to reach the destination router.                 |
| Type           | Type of link-state advertisement (LSA).                      |
| Tag            | LSA tag.                                                     |

# show ipv6 ospf timers rate-limit

To display all of the link-state advertisements (LSAs) in the rate limit queue, use the **show ipv6 ospf timers rate-limit** command in privileged EXEC mode.

**show ipv6 ospf timers rate-limit**

## Syntax Description

This command has no arguments or keywords.

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **show ipv6 ospf timers rate-limit** command to discover when LSAs in the queue will be sent.

## Examples

### show ipv6 ospf timers rate-limit Output Example

The following is sample output from the **show ipv6 ospf timers rate-limit** command:

```
# show ipv6 ospf timers rate-limit
List of LSAs that are in rate limit Queue
  LSAID: 0.0.0.0 Type: 0x2001 Adv Rtr: 55.55.55.55 Due in: 00:00:00.500
  LSAID: 0.0.0.0 Type: 0x2009 Adv Rtr: 55.55.55.55 Due in: 00:00:00.500
```

The table below describes the significant fields shown in the display.

**Table 72: show ipv6 ospf timers rate-limit Field Descriptions**

| Field   | Description                                                      |
|---------|------------------------------------------------------------------|
| LSAID   | ID of the LSA.                                                   |
| Type    | Type of LSA.                                                     |
| Adv Rtr | ID of the advertising router.                                    |
| Due in: | When the LSA is scheduled to be sent (in hours:minutes:seconds). |

# show ipv6 ospf traffic

To display IPv6 Open Shortest Path First Version 3 (OSPFv3) traffic statistics, use the **show ipv6 ospf traffic** command in privileged EXEC mode.

**show ipv6 ospf** [*process-id*] **traffic** [*interface-type interface-number*]

|                           |                                        |                                                                                                                                                                                          |
|---------------------------|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>process-id</i>                      | (Optional) OSPF process ID for which you want traffic statistics (for example, queue statistics, statistics for each interface under the OSPF process, and per OSPF process statistics). |
|                           | <i>interface-type interface-number</i> | (Optional) Type and number associated with a specific OSPF interface.                                                                                                                    |

**Command Default** When the **show ipv6 ospf traffic** command is entered without any arguments, global OSPF traffic statistics are displayed, including queue statistics for each OSPF process, statistics for each interface, and per OSPF process statistics.

**Command Modes** Privileged EXEC (#)

| <b>Command History</b> | Release                      | Modification                 |
|------------------------|------------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** You can limit the displayed traffic statistics to those for a specific OSPF process by entering a value for the *process-id* argument, or you can limit output to traffic statistics for a specific interface associated with an OSPF process by entering values for the *interface-type* and *interface-number* arguments. To reset counters and clear statistics, use the **clear ipv6 ospf traffic** command.

## Examples

The following example shows the display output for the **show ipv6 ospf traffic** command for OSPFv3:

```
# show ipv6 ospf traffic
OSPFv3 statistics:
  Rcvd: 32 total, 0 checksum errors
        10 hello, 7 database desc, 2 link state req
        9 link state updates, 4 link state acks
        0 LSA ignored
  Sent: 45 total, 0 failed
        17 hello, 12 database desc, 2 link state req
        8 link state updates, 6 link state acks
  OSPFv3 Router with ID (10.1.1.4) (Process ID 6)
OSPFv3 queues statistic for process ID 6
  Hello queue size 0, no limit, max size 2
  Router queue size 0, limit 200, drops 0, max size 2
Interface statistics:
  Interface Serial2/0
OSPFv3 packets received/sent
  Type           Packets      Bytes
RX Invalid       0             0
RX Hello         5            196
RX DB des        4            172
```

## show ipv6 ospf traffic

```

RX LS req      1          52
RX LS upd      4         320

The network administrator wants to start collecting new statistics, resetting the counters and clearing the traffic statistics by entering the **clear ipv6 ospf traffic** command as follows:

```
# clear ipv6 ospf traffic
```

The table below describes the significant fields shown in the display.

**Table 73: show ipv6 ospf traffic Field Descriptions**

| Field                                     | Description                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OSPFv3 statistics                         | Traffic statistics accumulated for all OSPF processes running on the router. To ensure compatibility with the <b>show ip traffic</b> command, only checksum errors are displayed. Identifies the route map name.                                                                                                                                                                                 |
| OSPFv3 queues statistic for process ID    | Queue statistics specific to Cisco IOS software.                                                                                                                                                                                                                                                                                                                                                 |
| Hello queue                               | Statistics for the internal Cisco IOS queue between the packet switching code (process IP Input) and the OSPF hello process for all received OSPF packets.                                                                                                                                                                                                                                       |
| Router queue                              | Statistics for the internal Cisco IOS queue between the OSPF hello process and the OSPF router for all received OSPF packets except OSPF hellos.                                                                                                                                                                                                                                                 |
| queue size                                | Actual size of the queue.                                                                                                                                                                                                                                                                                                                                                                        |
| queue limit                               | Maximum allowed size of the queue.                                                                                                                                                                                                                                                                                                                                                               |
| queue max size                            | Maximum recorded size of the queue.                                                                                                                                                                                                                                                                                                                                                              |
| Interface statistics                      | Per-interface traffic statistics for all interfaces that belong to the specific OSPFv3 process ID.                                                                                                                                                                                                                                                                                               |
| OSPFv3 packets received/sent              | Number of OSPFv3 packets received and sent on the interface, sorted by packet types.                                                                                                                                                                                                                                                                                                             |
| OSPFv3 header errors                      | Packet appears in this section if it was discarded because of an error in the header of an OSPFv3 packet. The discarded packet is counted under the appropriate discard reason.                                                                                                                                                                                                                  |
| OSPFv3 LSA errors                         | Packet appears in this section if it was discarded because of an error in the header of an OSPF link-state advertisement (LSA). The discarded packet is counted under the appropriate discard reason.                                                                                                                                                                                            |
| Summary traffic statistics for process ID | <p>Summary traffic statistics accumulated for an OSPFv3 process.</p> <p><b>Note</b> The OSPF process ID is a unique value assigned to the OSPFv3 process in the configuration.</p> <p>The value for the received errors is the sum of the OSPFv3 header errors that are detected by the OSPFv3 process, unlike the sum of the checksum errors that are listed in the global OSPF statistics.</p> |

 **show ipv6 ospf traffic****Related Commands**

| Command                        | Description                         |
|--------------------------------|-------------------------------------|
| <b>clear ip ospf traffic</b>   | Clears OSPFv2 traffic statistics.   |
| <b>clear ipv6 ospf traffic</b> | Clears OSPFv3 traffic statistics.   |
| <b>show ip ospf traffic</b>    | Displays OSPFv2 traffic statistics. |

# show ipv6 ospf virtual-links

To display parameters and the current state of Open Shortest Path First (OSPF) virtual links, use the **show ipv6 ospf virtual-links** command in user EXEC or privileged EXEC mode.

**show ipv6 ospf virtual-links**

## Syntax Description

This command has no arguments or keywords.

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The information displayed by the **show ipv6 ospf virtual-links** command is useful in debugging OSPF routing operations.

## Examples

The following is sample output from the **show ipv6 ospf virtual-links** command:

```
# show ipv6 ospf virtual-links
Virtual Link OSPF_VL0 to router 172.16.6.6 is up
  Interface ID 27, IPv6 address FEC0:6666:6666::
  Run as demand circuit
  DoNotAge LSA allowed.
  Transit area 2, via interface ATM3/0, Cost of using 1
  Transmit Delay is 1 sec, State POINT_TO_POINT,
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
  Hello due in 00:00:06
```

The table below describes the significant fields shown in the display.

**Table 74: show ipv6 ospf virtual-links Field Descriptions**

| Field                                            | Description                                                                  |
|--------------------------------------------------|------------------------------------------------------------------------------|
| Virtual Link OSPF_VL0 to router 172.16.6.6 is up | Specifies the OSPF neighbor, and if the link to that neighbor is up or down. |
| Interface ID                                     | Interface ID and IPv6 address of the router.                                 |
| Transit area 2                                   | The transit area through which the virtual link is formed.                   |
| via interface ATM3/0                             | The interface through which the virtual link is formed.                      |
| Cost of using 1                                  | The cost of reaching the OSPF neighbor through the virtual link.             |
| Transmit Delay is 1 sec                          | The transmit delay (in seconds) on the virtual link.                         |
| State POINT_TO_POINT                             | The state of the OSPF neighbor.                                              |

| Field                | Description                                          |
|----------------------|------------------------------------------------------|
| Timer intervals...   | The various timer intervals configured for the link. |
| Hello due in 0:00:06 | When the next hello is expected from the neighbor.   |

The following sample output from the **show ipv6 ospf virtual-links** command has two virtual links. One is protected by authentication, and the other is protected by encryption.

```
# show ipv6 ospf virtual-links
Virtual Link OSPFv3_VL1 to router 10.2.0.1 is up
  Interface ID 69, IPv6 address 2001:0DB8:11:0:A8BB:CCFF:FE00:6A00
  Run as demand circuit
  DoNotAge LSA allowed.
  Transit area 1, via interface Serial12/0, Cost of using 64
  NULL encryption SHA-1 auth SPI 3944, secure socket UP (errors: 0)
  Transmit Delay is 1 sec, State POINT_TO_POINT,
  Timer intervals configured, Hello 2, Dead 10, Wait 40, Retransmit 5
    Adjacency State FULL (Hello suppressed)
      Index 1/2/4, retransmission queue length 0, number of retransmission 1
      First 0x0(0)/0x0(0)/0x0(0) Next 0x0(0)/0x0(0)/0x0(0)
      Last retransmission scan length is 1, maximum is 1
      Last retransmission scan time is 0 msec, maximum is 0 msec
Virtual Link OSPFv3_VL0 to router 10.1.0.1 is up
  Interface ID 67, IPv6 address 2001:0DB8:13:0:A8BB:CCFF:FE00:6700
  Run as demand circuit
  DoNotAge LSA allowed.
  Transit area 1, via interface Serial11/0, Cost of using 128
  MD5 authentication SPI 940, secure socket UP (errors: 0)
  Transmit Delay is 1 sec, State POINT_TO_POINT,
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
    Adjacency State FULL (Hello suppressed)
      Index 1/1/3, retransmission queue length 0, number of retransmission 1
      First 0x0(0)/0x0(0)/0x0(0) Next 0x0(0)/0x0(0)/0x0(0)
      Last retransmission scan length is 1, maximum is 1
      Last retransmission scan time is 0 msec, maximum is 0 msec
```

# show ipv6 pim anycast-RP

To verify IPv6 PIM anycast RP operation, use the **show ipv6 pim anycast-RP** command in user EXEC or privileged EXEC mode.

**show ipv6 pim anycast-RP** *rp-address*

## Syntax Description

|                   |                            |
|-------------------|----------------------------|
| <i>rp-address</i> | RP address to be verified. |
|-------------------|----------------------------|

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

### Examples

```
# show ipv6 pim anycast-rp 110::1:1:1
```

```
Anycast RP Peers For 110::1:1:1    Last Register/Register-Stop received  
20::1:1:1 00:00:00/00:00:00
```

## Related Commands

| Command             | Description                                                      |
|---------------------|------------------------------------------------------------------|
| ipv6 pim anycast-RP | Configures the address of the PIM RP for an anycast group range. |

## show ipv6 pim bsr

To display information related to Protocol Independent Multicast (PIM) bootstrap router (BSR) protocol processing, use the **show ipv6 pim bsr** command in user EXEC or privileged EXEC mode.

**show ipv6 pim** [*vrf vrf-name*] **bsr** {**election** | **rp-cache** | **candidate-rp**}

### Syntax Description

|                     |                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.                                   |
| <b>election</b>     | Displays BSR state, BSR election, and bootstrap message (BSM)-related timers.                                |
| <b>rp-cache</b>     | Displays candidate rendezvous point (C-RP) cache learned from unicast C-RP announcements on the elected BSR. |
| <b>candidate-rp</b> | Displays C-RP state on devices that are configured as C-RPs.                                                 |

### Command Modes

User EXEC (>)

Privileged EXEC (#)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Use the **show ipv6 pim bsr** command to display details of the BSR election-state machine, C-RP advertisement state machine, and the C-RP cache. Information on the C-RP cache is displayed only on the elected BSR device, and information on the C-RP state machine is displayed only on a device configured as a C-RP.

### Examples

The following example displays BSM election information:

```
# show ipv6 pim bsr election
PIMv2 BSR information
BSR Election Information
Scope Range List: ff00::/8
This system is the Bootstrap Router (BSR)
BSR Address: 60::1:1:4
Uptime: 00:11:55, BSR Priority: 0, Hash mask length: 126
RPF: FE80::A8BB:CCFF:FE03:C400,Ethernet0/0
BS Timer: 00:00:07
This system is candidate BSR
Candidate BSR address: 60::1:1:4, priority: 0, hash mask length: 126
```

The table below describes the significant fields shown in the display.

**Table 75: show ipv6 pim bsr election Field Descriptions**

| Field            | Description                                  |
|------------------|----------------------------------------------|
| Scope Range List | Scope to which this BSR information applies. |

| Field                                     | Description                                                                                                                                                                                        |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| This system is the Bootstrap Router (BSR) | Indicates this device is the BSR and provides information on the parameters associated with it.                                                                                                    |
| BS Timer                                  | On the elected BSR, the BS timer shows the time in which the next BSM will be originated.<br><br>On all other devices in the domain, the BS timer shows the time at which the elected BSR expires. |
| This system is candidate BSR              | Indicates this device is the candidate BSR and provides information on the parameters associated with it.                                                                                          |

The following example displays information that has been learned from various C-RPs at the BSR. In this example, two candidate RPs have sent advertisements for the FF00::/8 or the default IPv6 multicast range:

```
# show ipv6 pim bsr rp-cache
PIMv2 BSR C-RP Cache
BSR Candidate RP Cache
Group(s) FF00::/8, RP count 2
  RP 10::1:1:3
    Priority 192, Holdtime 150
    Uptime: 00:12:36, expires: 00:01:55
  RP 20::1:1:1
    Priority 192, Holdtime 150
    Uptime: 00:12:36, expires: 00:01:5
```

The following example displays information about the C-RP. This RP has been configured without a specific scope value, so the RP will send C-RP advertisements to all BSRs about which it has learned through BSMs it has received.

```
# show ipv6 pim bsr candidate-rp
PIMv2 C-RP information
  Candidate RP: 10::1:1:3
    All Learnt Scoped Zones, Priority 192, Holdtime 150
    Advertisement interval 60 seconds
    Next advertisement in 00:00:33
```

The following example confirms that the IPv6 C-BSR is PIM-enabled. If PIM is disabled on an IPv6 C-BSR interface, or if a C-BSR or C-RP is configured with the address of an interface that does not have PIM enabled, the **show ipv6 pim bsr** command used with the **election** keyword would display that information instead.

```
# show ipv6 pim bsr election

PIMv2 BSR information

BSR Election Information
  Scope Range List: ff00::/8
  BSR Address: 2001:DB8:1:1:2
  Uptime: 00:02:42, BSR Priority: 34, Hash mask length: 28
  RPF: FE80::20:1:2,Ethernet1/0
  BS Timer: 00:01:27
```

# show ipv6 pim df

To display the designated forwarder (DF)-election state of each interface for each rendezvous point (RP), use the **show ipv6 pim df** command in user EXEC or privileged EXEC mode.

**show ipv6 pim** [**vrf** *vrf-name*] **df** [*interface-type interface-number*] [*rp-address*]

|                           |                                        |                                                                                                             |
|---------------------------|----------------------------------------|-------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>vrf</b> <i>vrf-name</i>             | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.                                  |
|                           | <i>interface-type interface-number</i> | (Optional) Interface type and number. For more information, use the question mark (?) online help function. |
|                           | <i>rp-address</i>                      | (Optional) RP IPv6 address.                                                                                 |

**Command Default** If no interface or RP address is specified, all DFs are displayed.

**Command Modes** User EXEC (>)  
Privileged EXEC (#)

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Use the **show ipv6 pim df** command to display the state of the DF election for each RP on each Protocol Independent Multicast (PIM)-enabled interface if the bidirectional multicast traffic is not flowing as expected.

## Examples

The following example displays the DF-election states:

```
# show ipv6 pim df
Interface      DF State      Timer      Metrics
Ethernet0/0    Winner        4s 8ms     [120/2]
  RP :200::1
Ethernet1/0    Lose         0s 0ms     [inf/inf]
  RP :200::1
```

The following example shows information on the RP:

```
# show ipv6 pim df
Interface      DF State      Timer      Metrics
Ethernet0/0    None:RP LAN  0s 0ms     [inf/inf]
  RP :200::1
Ethernet1/0    Winner        7s 600ms   [0/0]
  RP :200::1
Ethernet2/0    Winner        9s 8ms     [0/0]
  RP :200::1
```

The table below describes the significant fields shown in the display.

Table 76: show ipv6 pim df Field Descriptions

| Field     | Description                                                                                                                                                                                                                                                                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | Interface type and number that is configured to run PIM.                                                                                                                                                                                                                                                                                               |
| DF State  | <p>The state of the DF election on the interface. The state can be:</p> <ul style="list-style-type: none"> <li>• Offer</li> <li>• Winner</li> <li>• Backoff</li> <li>• Lose</li> <li>• None:RP LAN</li> </ul> <p>The None:RP LAN state indicates that no DF election is taking place on this LAN because the RP is directly connected to this LAN.</p> |
| Timer     | DF election timer.                                                                                                                                                                                                                                                                                                                                     |
| Metrics   | Routing metrics to the RP announced by the DF.                                                                                                                                                                                                                                                                                                         |
| RP        | The IPv6 address of the RP.                                                                                                                                                                                                                                                                                                                            |

**Related Commands**

| Command                           | Description                                                                   |
|-----------------------------------|-------------------------------------------------------------------------------|
| <b>debug ipv6 pim df-election</b> | Displays debug messages for PIM bidirectional DF-election message processing. |
| <b>ipv6 pim rp-address</b>        | Configures the address of a PIM RP for a particular group range.              |
| <b>show ipv6 pim df winner</b>    | Displays the DF-election winner on each interface for each RP.                |

# show ipv6 pim group-map

To display an IPv6 Protocol Independent Multicast (PIM) group mapping table, use the **show ipv6 pim group-map** command in user EXEC or privileged EXEC mode.

```
{show ipv6 pim [vrf vrf-name] group-map [{group-namegroup-address}] [{group-range group-mask}]
[info-source {bsr | default | embedded-rp | static}]}
```

## Syntax Description

|                                          |                                                                                                                              |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i>               | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.                                                   |
| <i>group-name</i>   <i>group-address</i> | (Optional) IPv6 address or name of the multicast group.                                                                      |
| <i>group-range</i>   <i>group-mask</i>   | (Optional) Group range list. Includes group ranges with the same prefix or mask length.                                      |
| <b>info-source</b>                       | (Optional) Displays all mappings learned from a specific source, such as the bootstrap router (BSR) or static configuration. |
| <b>bsr</b>                               | Displays ranges learned through the BSR.                                                                                     |
| <b>default</b>                           | Displays ranges enabled by default.                                                                                          |
| <b>embedded-rp</b>                       | Displays group ranges learned through the embedded rendezvous point (RP).                                                    |
| <b>static</b>                            | Displays ranges enabled by static configuration.                                                                             |

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **show ipv6 pim group-map** command to find all group mappings installed by a given source of information, such as BSR or static configuration.

You can also use this command to find which group mapping a router at a specified IPv6 group address is using by specifying a group address, or to find an exact group mapping entry by specifying a group range and mask length.

## Examples

The following is sample output from the **show ipv6 pim group-map** command:

```
# show ipv6 pim group-map
FF33::/32*
  SSM
  Info source:Static
  Uptime:00:08:32, Groups:0
FF34::/32*
  SSM
```

```
Info source:Static
Uptime:00:09:42, Groups:0
```

The table below describes the significant fields shown in the display.

**Table 77: show ipv6 pim group-map Field Descriptions**

| Field       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RP          | Address of the RP router if the protocol is sparse mode or bidir.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Protocol    | <p>Protocol used: sparse mode (SM), Source Specific Multicast (SSM), link-local (LL), or NOROUTE (NO).</p> <p>LL is used for the link-local scoped IPv6 address range (ff[0-f]2::/16). LL is treated as a separate protocol type, because packets received with these destination addresses are not forwarded, but the router might need to receive and process them.</p> <p>NOROUTE or NO is used for the reserved and node-local scoped IPv6 address range (ff[0-f][0-1]::/16). These addresses are nonroutable, and the router does not need to process them.</p> |
| Groups      | How many groups are present in the topology table from this range.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Info source | Mappings learned from a specific source; in this case, static configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Uptime      | The uptime for the group mapping displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

The following example displays the group mappings learned from BSRs that exist in the PIM group-to-RP or mode-mapping cache. The example shows the address of the BSR from which the group mappings have been learned and the associated timeout.

```
Router# show ipv6 pim group-map info-source bsr

```

# show ipv6 pim interface

To display information about interfaces configured for Protocol Independent Multicast (PIM), use the **show ipv6 pim interface** command in privileged EXEC mode.

**show ipv6 pim** [*vrf vrf-name*] **interface** [*state-on*] [*state-off*] [*type number*]

## Syntax Description

|                     |                                                                            |
|---------------------|----------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |
| <b>state-on</b>     | (Optional) Displays interfaces with PIM enabled.                           |
| <b>state-off</b>    | (Optional) Displays interfaces with PIM disabled.                          |
| <b>type number</b>  | (Optional) Interface type and number.                                      |

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **show ipv6 pim interface** command is used to check if PIM is enabled on an interface, the number of neighbors, and the designated router (DR) on the interface.

## Examples

The following is sample output from the **show ipv6 pim interface** command using the **state-on** keyword:

```
# show ipv6 pim interface state-on
Interface          PIM  Nbr  Hello  DR
                   Count Intvl Prior
Ethernet0          on   0    30     1
  Address:FE80::208:20FF:FE08:D7FF
  DR       :this system
POS1/0             on   0    30     1
  Address:FE80::208:20FF:FE08:D554
  DR       :this system
POS4/0             on   1    30     1
  Address:FE80::208:20FF:FE08:D554
  DR       :FE80::250:E2FF:FE8B:4C80
POS4/1             on   0    30     1
  Address:FE80::208:20FF:FE08:D554
  DR       :this system
Loopback0          on   0    30     1
  Address:FE80::208:20FF:FE08:D554
  DR       :this system
```

The table below describes the significant fields shown in the display.

**Table 78: show ipv6 pim interface Field Descriptions**

| Field       | Description                                                               |
|-------------|---------------------------------------------------------------------------|
| Interface   | Interface type and number that is configured to run PIM.                  |
| PIM         | Whether PIM is enabled on an interface.                                   |
| Nbr Count   | Number of PIM neighbors that have been discovered through this interface. |
| Hello Intvl | Frequency, in seconds, of PIM hello messages.                             |
| DR          | IP address of the designated router (DR) on a network.                    |
| Address     | Interface IP address of the next-hop router.                              |

The following is sample output from the **show ipv6 pim interface** command, modified to display passive interface information:

```
(config)# show ipv6 pim interface gigabitethernet0/0/0

Interface                PIM   Nbr   Hello  DR   BFD
                        Count Intvl Prior
GigabitEthernet0/0/0    on/P  0     30     1   On
  Address: FE80::A8BB:CCFF:FE00:9100
  DR      : this system
```

The table below describes the significant change shown in the display.

**Table 79: show ipv6 pim interface Field Description**

| Field | Description                                                                                              |
|-------|----------------------------------------------------------------------------------------------------------|
| PIM   | Whether PIM is enabled on an interface. When PIM passive mode is used, a "P" is displayed in the output. |

| <b>show ipv6 pim neighbor</b> | Displays the PIM neighbors discovered by the Cisco IOS software. |

## show ipv6 pim join-prune statistic

To display the average join-prune aggregation for the most recently aggregated 1000, 10,000, and 50,000 packets for each interface, use the **show ipv6 pim join-prune statistic** command in user EXEC or privileged EXEC mode.

**show ipv6 pim** [**vrf vrf-name**] **join-prune statistic** [*interface-type*]

### Syntax Description

|                            |                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.                       |
| <i>interface-type</i>      | (Optional) Interface type. For more information, use the question mark (?) online help function. |

### Command Modes

User EXEC (>)

Privileged EXEC (#)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

When Protocol Independent Multicast (PIM) sends multiple joins and prunes simultaneously, it aggregates them into a single packet. The **show ipv6 pim join-prune statistic** command displays the average number of joins and prunes that were aggregated into a single packet over the last 1000 PIM join-prune packets, over the last 10,000 PIM join-prune packets, and over the last 50,000 PIM join-prune packets.

### Examples

The following example provides the join/prune aggregation on Ethernet interface 0/0/0:

```
# show ipv6 pim join-prune statistic Ethernet0/0/0
PIM Average Join/Prune Aggregation for last (1K/10K/50K) packets
Interface          Transmitted          Received
Ethernet0/0/0      0 / 0 / 0           1 / 0 / 0
```

The table below describes the significant fields shown in the display.

**Table 80: show ipv6 pim join-prune statistics Field Descriptions**

| Field       | Description                                                                                     |
|-------------|-------------------------------------------------------------------------------------------------|
| Interface   | The interface from which the specified packets were transmitted or on which they were received. |
| Transmitted | The number of packets transmitted on the interface.                                             |
| Received    | The number of packets received on the interface.                                                |

# show ipv6 pim limit

To display Protocol Independent Multicast (PIM) interface limit, use the **show ipv6 pim limit** command in privileged EXEC mode.

```
show ipv6 pim [vrf vrf-name] limit [interface]
```

## Syntax Description

|                            |                                                                            |
|----------------------------|----------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |
| <i>interface</i>           | (Optional) Specific interface for which limit information is provided.     |

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **show ipv6 pim limit** command checks interface statistics for limits. If the optional *interface* argument is enabled, only information for the specified interface is shown.

## Examples

The following example displays s PIM interface limit information:

```
# show ipv6 pim limit
```

## Related Commands

| Command                          | Description                                                                       |
|----------------------------------|-----------------------------------------------------------------------------------|
| <b>ipv6 multicast limit</b>      | Configures per-interface mroute state limiters in IPv6.                           |
| <b>ipv6 multicast limit cost</b> | Applies a cost to mroutes that match per interface mroute state limiters in IPv6. |

# show ipv6 pim neighbor

To display the Protocol Independent Multicast (PIM) neighbors discovered by the Cisco software, use the **show ipv6 pim neighbor** command in privileged EXEC mode.

**show ipv6 pim** [**vrf** *vrf-name*] **neighbor** [**detail**] [{*interface-type interface-number* | **count**}]

## Syntax Description

|                                        |                                                                                                                           |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i>             | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.                                                |
| <b>detail</b>                          | (Optional) Displays the additional addresses of the neighbors learned, if any, through the routable address hello option. |
| <i>interface-type interface-number</i> | (Optional) Interface type and number.                                                                                     |
| <b>count</b>                           | (Optional) Displays neighbor counts on each interface.                                                                    |

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **show ipv6 pim neighbor** command displays which routers on the LAN are configured for PIM.

## Examples

The following is sample output from the **show ipv6 pim neighbor** command using the detail keyword to identify the additional addresses of the neighbors learned through the routable address hello option:

```
# show ipv6 pim neighbor detail
```

```
Neighbor Address(es)      Interface      Uptime      Expires DR pri Bidir
FE80::A8BB:CCFF:FE00:401  Ethernet0/0    01:34:16    00:01:16 1      B
60::1:1:3
FE80::A8BB:CCFF:FE00:501  Ethernet0/0    01:34:15    00:01:18 1      B
60::1:1:4
```

The table below describes the significant fields shown in the display.

**Table 81: show ipv6 pim neighbor Field Descriptions**

| Field              | Description                                                                             |
|--------------------|-----------------------------------------------------------------------------------------|
| Neighbor addresses | IPv6 address of the PIM neighbor.                                                       |
| Interface          | Interface type and number on which the neighbor is reachable.                           |
| Uptime             | How long (in hours, minutes, and seconds) the entry has been in the PIM neighbor table. |

| Field   | Description                                                                                                      |
|---------|------------------------------------------------------------------------------------------------------------------|
| Expires | How long (in hours, minutes, and seconds) until the entry will be removed from the IPv6 multicast routing table. |
| DR      | Indicates that this neighbor is a designated router (DR) on the LAN.                                             |
| pri     | DR priority used by this neighbor.                                                                               |
| Bidir   | The neighbor is capable of PIM in bidirectional mode.                                                            |

|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **show ipv6 pim range-list** command displays IPv6 multicast range lists on a per-client and per-mode basis. A client is the entity from which the specified range list was learned. The clients can be config, and the modes can be Source Specific Multicast (SSM) or sparse mode (SM).

**Examples** The following is sample output from the **show ipv6 pim range-list** command:

```
# show ipv6 pim range-list
config SSM Exp:never Learnt from :::

# show ipv6 pim topology

To display Protocol Independent Multicast (PIM) topology table information for a specific group or all groups, use the **show ipv6 pim topology** command in user EXEC or privileged EXEC mode.

**show ipv6 pim** [**vrf** *vrf-name*] **topology** [{*group-name* | *group-address* [{*source-address* *source-name*}] | **link-local**}] **route-count** [**detail**]

## Syntax Description

|                                            |                                                                            |
|--------------------------------------------|----------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i>                 | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |
| <i>group-name</i>   <i>group-address</i>   | (Optional) IPv6 address or name of the multicast group.                    |
| <i>source-address</i>   <i>source-name</i> | (Optional) IPv6 address or name of the source.                             |
| <b>link-local</b>                          | (Optional) Displays the link-local groups.                                 |
| <b>route-count</b>                         | (Optional) Displays the number of routes in PIM topology table.            |

## Usage Guidelines

This command shows the PIM topology table for a given group--(\*, G), (S, G), and (S, G) Rendezvous Point Tree (RPT)-- as internally stored in a PIM topology table. The PIM topology table may have various entries for a given group, each with its own interface list. The resulting forwarding state is maintained in the Multicast Routing Information Base (MRIB) table, which shows which interface the data packet should be accepted on and which interfaces the data packet should be forwarded to for a given (S, G) entry. Additionally, the Multicast Forwarding Information Base (MFIB) table is used during forwarding to decide on per-packet forwarding actions.

The **route-count** keyword shows the count of all entries, including link-local entries.

PIM communicates the contents of these entries through the MRIB, which is an intermediary for communication between multicast routing protocols (such as PIM), local membership protocols (such as Multicast Listener Discovery [MLD]), and the multicast forwarding engine of the system.

For example, an interface is added to the (\*, G) entry in PIM topology table upon receipt of an MLD report or PIM (\*, G) join message. Similarly, an interface is added to the (S, G) entry upon receipt of the MLD INCLUDE report for the S and G or PIM (S, G) join message. Then PIM installs an (S, G) entry in the MRIB with the immediate list (from (S, G)) and the inherited list (from (\*, G)). Therefore, the proper forwarding state for a given entry (S, G) can be seen only in the MRIB or the MFIB, not in the PIM topology table.

## Examples

The following is sample output from the **show ipv6 pim topology** command:

```
# show ipv6 pim topology
```

```

IP PIM Multicast Topology Table
Entry state:(*/S,G)[RPT/SPT] Protocol Uptime Info
Entry flags:KAT - Keep Alive Timer, AA - Assume Alive, PA - Probe Alive,
             RA - Really Alive, LH - Last Hop, DSS - Don't Signal Sources,
             RR - Register Received, SR - Sending Registers, E - MSDP External,
             DCC - Don't Check Connected
Interface state:Name, Uptime, Fwd, Info
Interface flags:LI - Local Interest, LD - Local Dissinterest,
II - Internal Interest, ID - Internal Dissinterest,
LH - Last Hop, AS - Assert, AB - Admin Boundary
(*,FF05::1)
SM UP:02:26:56 JP:Join(now) Flags:LH
RP:40::1:1:2
RPF:Ethernet1/1,FE81::1
   Ethernet0/1          02:26:56   fwd LI LH
(50::1:1:200,FF05::1)
SM UP:00:00:07 JP:Null(never) Flags:
RPF:Ethernet1/1,FE80::30:1:4
   Ethernet1/1          00:00:07   off LI

```

The table below describes the significant fields shown in the display.

**Table 83: show ipv6 pim topology Field Descriptions**

| Field            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Entry flags: KAT | The keepalive timer (KAT) associated with a source is used to keep track of two intervals while the source is alive. When a source first becomes active, the first-hop router sets the keepalive timer to 3 minutes and 30 seconds, during which time it does not probe to see if the source is alive. Once this timer expires, the router enters the probe interval and resets the timer to 65 seconds, during which time the router assumes the source is alive and starts probing to determine if it actually is. If the router determines that the source is alive, the router exits the probe interval and resets the keepalive timer to 3 minutes and 30 seconds. If the source is not alive, the entry is deleted at the end of the probe interval. |
| AA, PA           | The assume alive (AA) and probe alive (PA) flags are set when the router is in the probe interval for a particular source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| RR               | The register received (RR) flag is set on the (S, G) entries on the Route Processor (RP) as long as the RP receives registers from the source Designated Router (DR), which keeps the source state alive on the RP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| SR               | The sending registers (SR) flag is set on the (S, G) entries on the DR as long as it sends registers to the RP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## show ipv6 pim traffic

To display the Protocol Independent Multicast (PIM) traffic counters, use the **show ipv6 pim traffic** command in user EXEC or privileged EXEC mode.

**show ipv6 pim** [**vrf vrf-name**] **traffic**

### Syntax Description

|                     |                                                                            |
|---------------------|----------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |
|---------------------|----------------------------------------------------------------------------|

### Command Modes

User EXEC (>)

Privileged EXEC (#)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Use the **show ipv6 pim traffic** command to check if the expected number of PIM protocol messages have been received and sent.

### Examples

The following example shows the number of PIM protocol messages received and sent.

```
# show ipv6 pim traffic

PIM Traffic Counters
Elapsed time since counters cleared:00:05:29

Valid PIM Packets      Received    Sent
Hello                  22          22
Join-Prune              0           0
Register                0           0
Register Stop           0           0
Assert                  0           0
Bidir DF Election       0           0
Errors:
Malformed Packets              0
Bad Checksums                  0
Send Errors                     0
Packet Sent on Loopback Errors  0
Packets Received on PIM-disabled Interface  0
Packets Received with Unknown PIM Version  0
```

The table below describes the significant fields shown in the display.

**Table 84: show ipv6 pim traffic Field Descriptions**

| Field                               | Description                                                                               |
|-------------------------------------|-------------------------------------------------------------------------------------------|
| Elapsed time since counters cleared | Indicates the amount of time (in hours, minutes, and seconds) since the counters cleared. |
| Valid PIM Packets                   | Number of valid PIM packets received and sent.                                            |

| Field         | Description                                               |
|---------------|-----------------------------------------------------------|
| Hello         | Number of valid hello messages received and sent.         |
| Join-Prune    | Number of join and prune announcements received and sent. |
| Register      | Number of PIM register messages received and sent.        |
| Register Stop | Number of PIM register stop messages received and sent.   |
| Assert        | Number of asserts received and sent.                      |

# show ipv6 pim tunnel

To display information about the Protocol Independent Multicast (PIM) register encapsulation and de-encapsulation tunnels on an interface, use the **show ipv6 pim tunnel** command in privileged EXEC mode.

**show ipv6 pim** [**vrf** *vrf-name*] **tunnel** [*interface-type interface-number*]

|                           |                                        |                                                                            |
|---------------------------|----------------------------------------|----------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>vrf</b> <i>vrf-name</i>             | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |
|                           | <i>interface-type interface-number</i> | (Optional) Tunnel interface type and number.                               |

**Command Modes** Privileged EXEC (#)

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** If you use the **show ipv6 pim tunnel** command without the optional *interface* keyword, information about the PIM register encapsulation and de-encapsulation tunnel interfaces is displayed.

The PIM encapsulation tunnel is the register tunnel. An encapsulation tunnel is created for every known rendezvous point (RP) on each router. The PIM decapsulation tunnel is the register decapsulation tunnel. A decapsulation tunnel is created on the RP for the address that is configured to be the RP address.

## Examples

The following is sample output from the **show ipv6 pim tunnel** command on the RP:

```
# show ipv6 pim tunnel
Tunnel0*
  Type  :PIM Encap
  RP    :100::1
  Source:100::1
Tunnel0*
  Type  :PIM Decap
  RP    :100::1
  Source: -
```

The following is sample output from the **show ipv6 pim tunnel** command on a non-RP:

```
# show ipv6 pim tunnel
Tunnel0*
  Type  :PIM Encap
  RP    :100::1
  Source:2001::1:1:1
```

The table below describes the significant fields shown in the display.

**Table 85: show ipv6 pim tunnel Field Descriptions**

| Field    | Description         |
|----------|---------------------|
| Tunnel0* | Name of the tunnel. |

| Field  | Description                                                                     |
|--------|---------------------------------------------------------------------------------|
| Type   | Type of tunnel. Can be PIM encapsulation or PIM de-encapsulation.               |
| source | Source address of the router that is sending encapsulating registers to the RP. |

# show ipv6 policy

To display the IPv6 policy-based routing (PBR) configuration, use the **show ipv6 policy** command in user EXEC or privileged EXEC mode.

**show ipv6 policy**

## Syntax Description

This command has no arguments or keywords.

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

IPv6 policy matches will be counted on route maps, as is done in IPv4. Therefore, IPv6 policy matches can also be displayed on the **show route-map** command.

## Examples

The following example displays the PBR configuration:

```
# show ipv6 policy
```

```
Interface          Routemap
Ethernet0/0        src-1
```

The table below describes the significant fields shown in the display.

| Field     | Description                                                                               |
|-----------|-------------------------------------------------------------------------------------------|
| Interface | Interface type and number that is configured to run Protocol-Independent Multicast (PIM). |
| Routemap  | The name of the route map on which IPv6 policy matches were counted.                      |

## Related Commands

| Command               | Description                                                   |
|-----------------------|---------------------------------------------------------------|
| <b>show route-map</b> | Displays all route maps configured or only the one specified. |

# show ipv6 prefix-list

To display information about an IPv6 prefix list or IPv6 prefix list entries, use the **show ipv6 prefix-list** command in user EXEC or privileged EXEC mode.

```
show ipv6 prefix-list [{detail | summary}] [list-name]
show ipv6 prefix-list list-name ipv6-prefix/prefix-length [{longer | first-match}]
show ipv6 prefix-list list-name seq seq-num
```

| Syntax Description | detail   summary | (Optional) Displays detailed or summarized information about all IPv6 prefix lists.                                                                                                                                            |
|--------------------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | list-name        | (Optional) The name of a specific IPv6 prefix list.                                                                                                                                                                            |
|                    | ipv6-prefix      | All prefix list entries for the specified IPv6 network.<br><br>This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.                      |
|                    | / prefix-length  | The length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value. |
|                    | longer           | (Optional) Displays all entries of an IPv6 prefix list that are more specific than the given <i>ipv6-prefix / prefix-length</i> values.                                                                                        |
|                    | first-match      | (Optional) Displays the entry of an IPv6 prefix list that matches the given <i>ipv6-prefix / prefix-length</i> values.                                                                                                         |
|                    | seq seq-num      | The sequence number of the IPv6 prefix list entry.                                                                                                                                                                             |

**Command Default** Displays information about all IPv6 prefix lists.

**Command Modes** User EXEC (>)  
Privileged EXEC (#)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **show ipv6 prefix-list** command provides output similar to the **show ip prefix-list** command, except that it is IPv6-specific.

**Examples** The following example shows the output of the **show ipv6 prefix-list** command with the **detail** keyword:

```
# show ipv6 prefix-list detail
Prefix-list with the last deletion/insertion: bgp-in
ipv6 prefix-list 6to4:
```

```

count: 1, range entries: 0, sequences: 5 - 5, refcount: 2
seq 5 permit 2002::/16 (hit count: 313, refcount: 1)
ipv6 prefix-list aggregate:
count: 2, range entries: 2, sequences: 5 - 10, refcount: 30
seq 5 deny 3FFE:C00::/24 ge 25 (hit count: 568, refcount: 1)
seq 10 permit ::/0 le 48 (hit count: 31310, refcount: 1)
ipv6 prefix-list bgp-in:
count: 6, range entries: 3, sequences: 5 - 30, refcount: 31
seq 5 deny 5F00::/8 le 128 (hit count: 0, refcount: 1)
seq 10 deny ::/0 (hit count: 0, refcount: 1)
seq 15 deny ::/1 (hit count: 0, refcount: 1)
seq 20 deny ::/2 (hit count: 0, refcount: 1)
seq 25 deny ::/3 ge 4 (hit count: 0, refcount: 1)
seq 30 permit ::/0 le 128 (hit count: 240664, refcount: 0)

```

The table below describes the significant fields shown in the display.

**Table 86: show ipv6 prefix-list Field Descriptions**

| Field                                           | Description                                         |
|-------------------------------------------------|-----------------------------------------------------|
| Prefix list with the latest deletion/insertion: | Prefix list that was last modified.                 |
| count                                           | Number of entries in the list.                      |
| range entries                                   | Number of entries with matching range.              |
| sequences                                       | Sequence number for the prefix entry.               |
| refcount                                        | Number of objects currently using this prefix list. |
| seq                                             | Entry number in the list.                           |
| permit, deny                                    | Granting status.                                    |
| hit count                                       | Number of matches for the prefix entry.             |

The following example shows the output of the **show ipv6 prefix-list** command with the **summary** keyword:

```

# show ipv6 prefix-list summary
Prefix-list with the last deletion/insertion: bgp-in
ipv6 prefix-list 6to4:
count: 1, range entries: 0, sequences: 5 - 5, refcount: 2
ipv6 prefix-list aggregate:
count: 2, range entries: 2, sequences: 5 - 10, refcount: 30
ipv6 prefix-list bgp-in:
count: 6, range entries: 3, sequences: 5 - 30, refcount: 31

```

## Related Commands

| Command                       | Description                                           |
|-------------------------------|-------------------------------------------------------|
| <b>clear ipv6 prefix-list</b> | Resets the hit count of the prefix list entries.      |
| <b>distribute-list in</b>     | Filters networks received in updates.                 |
| <b>distribute-list out</b>    | Suppresses networks from being advertised in updates. |
| <b>ipv6 prefix-list</b>       | Creates an entry in an IPv6 prefix list.              |

| Command                             | Description                                                            |

|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The information displayed by the **show ipv6 protocols** command is useful in debugging routing operations.

## Examples

The following sample output from the **show ipv6 protocols** command displays Intermediate System-to-Intermediate System (IS-IS) routing protocol information:

```
# show ipv6 protocols

IPv6 Routing Protocol is "connected"
IPv6 Routing Protocol is "static"
IPv6 Routing Protocol is "isis"
  Interfaces:
    Ethernet0/0/3
    Ethernet0/0/1
    Serial1/0/1
    Loopback1 (Passive)
    Loopback2 (Passive)
    Loopback3 (Passive)
    Loopback4 (Passive)
    Loopback5 (Passive)
  Redistribution:
    Redistributing protocol static at level 1
  Inter-area redistribution
    Redistributing L1 into L2 using prefix-list word
  Address Summarization:
    L2: 33::/16 advertised with metric 0
    L2: 44::/16 advertised with metric 20
    L2: 66::/16 advertised with metric 10
    L2: 77::/16 advertised with metric 10
```

The table below describes the significant fields shown in the display.

**Table 87: show ipv6 protocols Field Descriptions for IS-IS Processes**

| Field                     | Description                                                                                                                               |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| IPv6 Routing Protocol is  | Specifies the IPv6 routing protocol used.                                                                                                 |
| Interfaces                | Specifies the interfaces on which the IPv6 IS-IS protocol is configured.                                                                  |
| Redistribution            | Lists the protocol that is being redistributed.                                                                                           |
| Inter-area redistribution | Lists the IS-IS levels that are being redistributed into other levels.                                                                    |
| using prefix-list         | Names the prefix list used in the interarea redistribution.                                                                               |
| Address Summarization     | Lists all the summary prefixes. If the summary prefix is being advertised, "advertised with metric x" will be displayed after the prefix. |

The following sample output from the **show ipv6 protocols** command displays the Border Gateway Protocol (BGP) information for autonomous system 30:

```
# show ipv6 protocols

IPv6 Routing Protocol is "bgp 30"
  IGP synchronization is disabled
  Redistribution:
    Redistributing protocol connected
  Neighbor(s):
    Address                FiltIn FiltOut Weight RoutemapIn RoutemapOut
    2001:DB8:0:ABCD::1      5       7    200
    2001:DB8:0:ABCD::2
    2001:DB8:0:ABCD::3      rmap-in  rmap-out
                           rmap-in  rmap-out
```

The table below describes the significant fields shown in the display.

**Table 88: show ipv6 protocols Field Descriptions for BGP Process**

| Field                    | Description                                            |
|--------------------------|--------------------------------------------------------|
| IPv6 Routing Protocol is | Specifies the IPv6 routing protocol used.              |
| Redistribution           | Lists the protocol that is being redistributed.        |
| Address                  | Neighbor IPv6 address.                                 |
| FiltIn                   | AS-path filter list applied to input.                  |
| FiltOut                  | AS-path filter list applied to output.                 |
| Weight                   | Neighbor weight value used in BGP best path selection. |
| RoutemapIn               | Neighbor route map applied to input.                   |
| RoutemapOut              | Neighbor route map applied to output.                  |

The following is sample output from the **show ipv6 protocols summary** command:

```
# show ipv6 protocols summary
```

```

Index Process Name
0      connected
1      static
2      rip myrip
3      bgp 30

```

The following sample output from the **show ipv6 protocols** command displays the EIGRP information including the vector metric and EIGRP IPv6 NSF:

```

# show ipv6 protocols

IPv6 Routing Protocol is "connected"
IPv6 Routing Protocol is "bgp 1"
  IGP synchronization is disabled
  Redistribution:
    None
IPv6 Routing Protocol is "bgp multicast"
IPv6 Routing Protocol is "ND"
IPv6 Routing Protocol is "eigrp 1"
EIGRP-IPv6 VR(name) Address-Family Protocol for AS(1)
  Metric weight K1=1, K2=0, K3=1, K4=0, K5=0 K6=0
  Metric rib-scale 128
  Metric version 64bit
  NSF-aware route hold timer is 260
  EIGRP NSF enabled
    NSF signal timer is 15s
    NSF converge timer is 65s
  Router-ID: 10.1.2.2
  Topology : 0 (base)
    Active Timer: 3 min
    Distance: internal 90 external 170
    Maximum path: 16
    Maximum hopcount 100
    Maximum metric variance 1
    Total Prefix Count: 0
    Total Redist Count: 0

Interfaces:
Redistribution:
  None

```

The following example displays IPv6 protocol information after configuring redistribution in an Open Shortest Path First (OSPF) domain:

```

# redistribute ospf 1 match internal
(config-rtr)# end
# show ipv6 protocols

IPv6 Routing Protocol is "connected"
IPv6 Routing Protocol is "ND"
IPv6 Routing Protocol is "rip 1"
  Interfaces:
    Ethernet0/1
    Loopback9
  Redistribution:
    Redistributing protocol ospf 1 (internal)
IPv6 Routing Protocol is "ospf 1"
  Interfaces (Area 0):
    Ethernet0/0
  Redistribution:
    None

```

# show ipv6 rip

To display information about current IPv6 Routing Information Protocol (RIP) processes, use the **show ipv6 rip** command in user EXEC or privileged EXEC mode.

**show ipv6 rip** [*name*] [**vrf** *vrf-name*][**{database | next-hops}**]

**show ipv6 rip** [*name*] [**{database | next-hops}**]

| Syntax Description         |                                                                                                                                                                                                        |  |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <i>name</i>                | (Optional) Name of the RIP process. If the name is not entered, details of all configured RIP processes are displayed.                                                                                 |  |
| <b>vrf</b> <i>vrf-name</i> | (Optional) Displays information about the specified Virtual Routing and Forwarding (VRF) instance.                                                                                                     |  |
| <b>database</b>            | (Optional) Displays information about entries in the specified RIP IPv6 routing table.                                                                                                                 |  |
| <b>next-hops</b>           | (Optional) Displays information about the next hop addresses for the specified RIP IPv6 process. If no RIP process name is specified, the next-hop addresses for all RIP IPv6 processes are displayed. |  |

**Command Default** Information about all current IPv6 RIP processes is displayed.

**Command Modes** User EXEC (>)

Privileged EXEC (#)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

The following is sample output from the **show ipv6 rip** command:

```
# show ipv6 rip

RIP process "one", port 521, multicast-group FF02::9, pid 55
  Administrative distance is 25. Maximum paths is 4
  Updates every 30 seconds, expire after 180
  Holddown lasts 0 seconds, garbage collect after 120
  Split horizon is on; poison reverse is off
  Default routes are not generated
  Periodic updates 8883, trigger updates 2
Interfaces:
  Ethernet2
Redistribution:
RIP process "two", port 521, multicast-group FF02::9, pid 61
  Administrative distance is 120. Maximum paths is 4
  Updates every 30 seconds, expire after 180
  Holddown lasts 0 seconds, garbage collect after 120
  Split horizon is on; poison reverse is off
  Default routes are not generated
```

```

    Periodic updates 8883, trigger updates 0
  Interfaces:
    None
  Redistribution:

```

The table below describes the significant fields shown in the display.

**Table 89: show ipv6 rip Field Descriptions**

| Field                   | Description                                                                                                                                                                                                                   |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RIP process             | The name of the RIP process.                                                                                                                                                                                                  |
| port                    | The port that the RIP process is using.                                                                                                                                                                                       |
| multicast-group         | The IPv6 multicast group of which the RIP process is a member.                                                                                                                                                                |
| pid                     | The process identification number (pid) assigned to the RIP process.                                                                                                                                                          |
| Administrative distance | Used to rank the preference of sources of routing information. Connected routes have an administrative distance of 1 and are preferred over the same route learned by a protocol with a larger administrative distance value. |
| Updates                 | The value (in seconds) of the update timer.                                                                                                                                                                                   |
| expire                  | The interval (in seconds) in which updates expire.                                                                                                                                                                            |
| Holddown                | The value (in seconds) of the hold-down timer.                                                                                                                                                                                |
| garbage collect         | The value (in seconds) of the garbage-collect timer.                                                                                                                                                                          |
| Split horizon           | The split horizon state is either on or off.                                                                                                                                                                                  |
| poison reverse          | The poison reverse state is either on or off.                                                                                                                                                                                 |
| Default routes          | The origination of a default route into RIP. Default routes are either generated or not generated.                                                                                                                            |
| Periodic updates        | The number of RIP update packets sent on an update timer.                                                                                                                                                                     |
| trigger updates         | The number of RIP update packets sent as triggered updates.                                                                                                                                                                   |

The following is sample output from the **show ipv6 rip database** command.

```

# show ipv6 rip one database

RIP process "one", local RIB
  2001:72D:1000::/64, metric 2
    Ethernet2/2001:DB8:0:ABCD::1, expires in 168 secs
  2001:72D:2000::/64, metric 2, installed
    Ethernet2/2001:DB8:0:ABCD::1, expires in 168 secs
  2001:72D:3000::/64, metric 2, installed
    Ethernet2/2001:DB8:0:ABCD::1, expires in 168 secs
    Ethernet1/2001:DB8::1, expires in 120 secs
  2001:72D:4000::/64, metric 16, expired, [advertise 119/hold 0]
    Ethernet2/2001:DB8:0:ABCD::1
  3004::/64, metric 2 tag 2A, installed
    Ethernet2/2001:DB8:0:ABCD::1, expires in 168 secs

```

The table below describes the significant fields shown in the display.

**Table 90: show ipv6 rip database Field Descriptions**

| Field                        | Description                                                                                        |
|------------------------------|----------------------------------------------------------------------------------------------------|
| RIP process                  | The name of the RIP process.                                                                       |
| 2001:72D:1000::/64           | The IPv6 route prefix.                                                                             |
| metric                       | Metric for the route.                                                                              |
| installed                    | Route is installed in the IPv6 routing table.                                                      |
| Ethernet2/2001:DB8:0:ABCD::1 | Interface and LL next hop through which the IPv6 route was learned.                                |
| expires in                   | The interval (in seconds) before the route expires.                                                |
| advertise                    | For an expired route, the value (in seconds) during which the route will be advertised as expired. |
| hold                         | The value (in seconds) of the hold-down timer.                                                     |
| tag                          | Route tag.                                                                                         |

The following is sample output from the **show ipv6 rip next-hops** command.

```
# show ipv6 rip one next-hops

RIP process "one", Next Hops
  FE80::210:7BFF:FEC2:ACCF/Ethernet4/2 [1 routes]
  FE80::210:7BFF:FEC2:B286/Ethernet4/2 [2 routes]
```

The table below describes the significant fields shown in the display.

**Table 91: show ipv6 rip next-hops Field Descriptions**

| Field                       | Description                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RIP process                 | The name of the RIP process.                                                                                                                                                                                                                                                                                                                                                                                        |
| 2001:DB8:0:1::1/Ethernet4/2 | The next-hop address and interface through which it was learned. Next hops are either the addresses of IPv6 RIP neighbors from which we have learned routes or explicit next hops received in IPv6 RIP advertisements.<br><br><b>Note</b> An IPv6 RIP neighbor may choose to advertise all its routes with an explicit next hop. In this case the address of the neighbor would not appear in the next hop display. |
| [1 routes]                  | The number of routes in the IPv6 RIP routing table using the specified next hop.                                                                                                                                                                                                                                                                                                                                    |

The following is sample output from the **show ipv6 rip vrf** command:

```
# show ipv6 rip vrf red
```

```

RIP VRF "red", port 521, multicast-group 2001:DB8::/32, pid 295
Administrative distance is 120. Maximum paths is 16
Updates every 30 seconds, expire after 180
Holddown lasts 0 seconds, garbage collect after 120
Split horizon is on; poison reverse is off
Default routes are not generated
Periodic updates 99, trigger updates 3
Full Advertisement 0, Delayed Events 0
Interfaces:
  Ethernet0/1
  Loopback2
Redistribution:
  None

```

The table below describes the significant fields shown in the display.

**Table 92: show ipv6 rip vrf Field Descriptions**

| Field                   | Description                                                                                                                                                                                                                   |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RIP VRF                 | The name of the RIP VRF.                                                                                                                                                                                                      |
| port                    | The port that the RIP process is using.                                                                                                                                                                                       |
| multicast-group         | The IPv6 multicast group of which the RIP process is a member.                                                                                                                                                                |
| Administrative distance | Used to rank the preference of sources of routing information. Connected routes have an administrative distance of 1 and are preferred over the same route learned by a protocol with a larger administrative distance value. |
| Updates                 | The value (in seconds) of the update timer.                                                                                                                                                                                   |
| expires after           | The interval (in seconds) in which updates expire.                                                                                                                                                                            |
| Holddown                | The value (in seconds) of the hold-down timer.                                                                                                                                                                                |
| garbage collect         | The value (in seconds) of the garbage-collect timer.                                                                                                                                                                          |
| Split horizon           | The split horizon state is either on or off.                                                                                                                                                                                  |
| poison reverse          | The poison reverse state is either on or off.                                                                                                                                                                                 |
| Default routes          | The origination of a default route into RIP. Default routes are either generated or not generated.                                                                                                                            |
| Periodic updates        | The number of RIP update packets sent on an update timer.                                                                                                                                                                     |
| trigger updates         | The number of RIP update packets sent as triggered updates.                                                                                                                                                                   |

The following is sample output from **show ipv6 rip vrf next-hops** command:

```
Device# show ipv6 rip vrf blue next-hops
```

```

RIP VRF "blue", local RIB
AAAA::/64, metric 2, installed
Ethernet0/0/FE80::A8BB:CCFF:FE00:7C00, expires in 177 secs

```

Table 93: show ipv6 rip vrf next-hops Field Descriptions

| Field                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RIP VRF                               | The name of the RIP VRF.                                                                                                                                                                                                                                                                                                                                                                                                    |
| metric                                | Metric for the route.                                                                                                                                                                                                                                                                                                                                                                                                       |
| installed                             | Route is installed in the IPv6 routing table.                                                                                                                                                                                                                                                                                                                                                                               |
| Ethernet0/0/FE80::A8BB:CCFF:FE00:7C00 | <p>The next hop address and interface through which it was learned. Next hops are either the addresses of IPv6 RIP neighbors from which we have learned routes, or explicit next hops received in IPv6 RIP advertisements.</p> <p><b>Note</b> An IPv6 RIP neighbor may choose to advertise all its routes with an explicit next hop. In this case the address of the neighbor would not appear in the next hop display.</p> |
| expires in                            | The interval (in seconds) before the route expires.                                                                                                                                                                                                                                                                                                                                                                         |

The following is sample output from **show ipv6 rip vrf database** command:

```
# show ipv6 rip vrf blue database

RIP VRF "blue", Next Hops
FE80::A8BB:CCFF:FE00:7C00/Ethernet0/0 [1 paths]
```

Table 94: show ipv6 rip vrf database Field Descriptions

| Field                                 | Description                                                                          |
|---------------------------------------|--------------------------------------------------------------------------------------|
| RIP VRF                               | The name of the RIP VRF.                                                             |
| FE80::A8BB:CCFF:FE00:7C00/Ethernet0/0 | Interface and LL next hop through which the IPv6 route was learned.                  |
| 1 paths                               | Indicates the number of unique paths to this router that exist in the routing table. |

#### Related Commands

| Command                         | Description                                                  |
|---------------------------------|--------------------------------------------------------------|
| <b>clear ipv6 rip</b>           | Deletes routes from the IPv6 RIP routing table.              |
| <b>debug ipv6 rip</b>           | Displays the current contents of the IPv6 RIP routing table. |
| <b>ipv6 rip vrf-mode enable</b> | Enables VRF-aware support for IPv6 RIP.                      |

## show ipv6 route

To display contents of the IPv6 routing table, use the **show ipv6 route** command in user EXEC or privileged EXEC mode.

**show ipv6 route** [{*ipv6-address* | *ipv6-prefix/prefix-length* [**longer-prefixes**]}] [{*protocol*}] | [**repair**] | [{**updated** [**boot-up**] [*day month*] [*time*]}] | **interface** *type number* | **nd** | **nsf** | **table** *table-id* | **watch**}]

### Syntax Description

|                              |                                                                                                                                                                                                                                                                             |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ipv6-address</i>          | (Optional) Displays routing information for a specific IPv6 address.                                                                                                                                                                                                        |
| <i>ipv6-prefix</i>           | (Optional) Displays routing information for a specific IPv6 network.                                                                                                                                                                                                        |
| <i>/prefix-length</i>        | (Optional) The length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value.                                   |
| <b>longer-prefixes</b>       | (Optional) Displays output for longer prefix entries.                                                                                                                                                                                                                       |
| <i>protocol</i>              | (Optional) The name of a routing protocol or the keyword <b>connected</b> , <b>local</b> , <b>mobile</b> , or <b>static</b> . If you specify a routing protocol, use one of the following keywords: <b>bgp</b> , <b>isis</b> , <b>eigrp</b> , <b>ospf</b> , or <b>rip</b> . |
| <b>repair</b>                | (Optional) Displays routes with repair paths.                                                                                                                                                                                                                               |
| <b>updated</b>               | (Optional) Displays routes with time stamps.                                                                                                                                                                                                                                |
| <b>boot-up</b>               | (Optional) Displays routing information since bootup.                                                                                                                                                                                                                       |
| <i>day month</i>             | (Optional) Displays routes since the specified day and month.                                                                                                                                                                                                               |
| <i>time</i>                  | (Optional) Displays routes since the specified time, in <i>hh:mm</i> format.                                                                                                                                                                                                |
| <b>interface</b>             | (Optional) Displays information about the interface.                                                                                                                                                                                                                        |
| <i>type</i>                  | (Optional) Interface type.                                                                                                                                                                                                                                                  |
| <i>number</i>                | (Optional) Interface number.                                                                                                                                                                                                                                                |
| <b>nd</b>                    | (Optional) Displays only routes from the IPv6 Routing Information Base (RIB) that are owned by Neighbor Discovery (ND).                                                                                                                                                     |
| <b>nsf</b>                   | (Optional) Displays routes in the nonstop forwarding (NSF) state.                                                                                                                                                                                                           |
| <b>repair</b>                | (Optional)                                                                                                                                                                                                                                                                  |
| <b>table</b> <i>table-id</i> | (Optional) Displays IPv6 RIB table information for the specified table ID. The table ID must be in hexadecimal format. The range is from 0 to 0xFFFFFFFF.                                                                                                                   |
| <b>watch</b>                 | (Optional) Displays information about route watchers.                                                                                                                                                                                                                       |

**Command Default** If none of the optional syntax elements is chosen, all IPv6 routing information for all active routing tables is displayed.

**Command Modes** User EXEC (>)  
Privileged EXEC (#)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **show ipv6 route** command provides output similar to the **show ip route** command, except that the information is IPv6-specific.

When the *ipv6-address* or *ipv6-prefix/prefix-length* argument is specified, the longest match lookup is performed from the routing table, and only route information for that address or network is displayed. When a routing protocol is specified, only routes for that protocol are displayed. When the **connected**, **local**, **mobile**, or **static** keyword is specified, only the specified type of route is displayed. When the **interface** keyword and *type* and *number* arguments are specified, only routes for the specified interface are displayed.

## Examples

The following is sample output from the **show ipv6 route** command when no keywords or arguments are specified:

```
# show ipv6 route

IPv6 Routing Table - 9 entries
Codes: C - Connected, L - Local, S - Static, R - RIP, B - BGP
       I1 - ISIS L1, I2 - ISIS L2, IA - IIS interarea
B   2001:DB8:4::2/48 [20/0]
    via FE80::A8BB:CCFF:FE02:8B00, Serial6/0
L   2001:DB8:4::3/48 [0/0]
    via ::, Ethernet1/0
C   2001:DB8:4::4/48 [0/0]
    via ::, Ethernet1/0
LC  2001:DB8:4::5/48 [0/0]
    via ::, Loopback0
L   2001:DB8:4::6/48 [0/0]
    via ::, Serial6/0
C   2001:DB8:4::7/48 [0/0]
    via ::, Serial6/0

The table below describes the significant fields shown in the display.

Table 95: show ipv6 route Field Descriptions

| Field                            | Description                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Codes:                           | Indicates the protocol that derived the route. Values are as follows: <ul style="list-style-type: none"> <li>• B—BGP derived</li> <li>• C—Connected</li> <li>• I1—ISIS L1—Integrated IS-IS Level 1 derived</li> <li>• I2—ISIS L2—Integrated IS-IS Level 2 derived</li> <li>• IA—ISIS interarea—Integrated IS-IS interarea derived</li> <li>• L—Local</li> <li>• R—RIP derived</li> <li>• S—Static</li> </ul> |
| 2001:DB8:4::2/48                 | Indicates the IPv6 prefix of the remote network.                                                                                                                                                                                                                                                                                                                                                             |
| [20/0]                           | The first number in brackets is the administrative distance of the information source; the second number is the metric for the route.                                                                                                                                                                                                                                                                        |
| via<br>FE80::A8BB:CCFF:FE02:8B00 | Specifies the address of the next device to the remote network.                                                                                                                                                                                                                                                                                                                                              |

When the *ipv6-address* or *ipv6-prefix/prefix-length* argument is specified, only route information for that address or network is displayed. The following is sample output from the **show ipv6 route** command when IPv6 prefix 2001:DB8::/35 is specified. The fields in the display are self-explanatory.

```
# show ipv6 route 2001:DB8::/35

IPv6 Routing Table - 261 entries
Codes: C - Connected, L - Local, S - Static, R - RIP, B - BGP
I1 - ISIS L1, I2 - ISIS L2, IA - ISIS interarea
B 2001:DB8::/35 [20/3]
    via FE80::60:5C59:9E00:16, Tunnell
```

When you specify a protocol, only routes for that particular routing protocol are shown. The following is sample output from the **show ipv6 route bgp** command. The fields in the display are self-explanatory.

```
# show ipv6 route bgp

IPv6 Routing Table - 9 entries
Codes: C - Connected, L - Local, S - Static, R - RIP, B - BGP
I1 - ISIS L1, I2 - ISIS L2, IA - ISIS interarea
B 2001:DB8:4::4/64 [20/0]
    via FE80::A8BB:CCFF:FE02:8B00, Serial6/0
```

The following is sample output from the **show ipv6 route local** command. The fields in the display are self-explanatory.

## # show ipv6 route local

```
IPv6 Routing Table - 9 entries
Codes: C - Connected, L - Local, S - Static, R - RIP, B - BGP
       I1 - ISIS L1, I2 - ISIS L2, IA - ISIS interarea
L   2001:DB8:4::2/128 [0/0]
    via ::, Ethernet1/0
LC  2001:DB8:4::1/128 [0/0]
    via ::, Loopback0
L   2001:DB8:4::3/128 [0/0]
    via ::, Serial6/0
L   FE80::/10 [0/0]
    via ::, Null0
L   FF00::/8 [0/0]
    via ::, Null0
```

The following is sample output from the **show ipv6 route** command when the 6PE multipath feature is enabled. The fields in the display are self-explanatory.

## # show ipv6 route

```
IPv6 Routing Table - default - 19 entries
Codes: C - Connected, L - Local, S - Static, R - RIP, B - BGP
       U - Per-user Static route
       I1 - ISIS L1, I2 - ISIS L2, IA - ISIS interarea, IS - ISIS summary
       O - OSPF intra, OI - OSPF inter, OE1 - OSPF ext 1, OE2 - OSPF ext 2
.
.
.
B   2001:DB8::/64 [200/0]
    via ::FFFF:172.16.0.1
    via ::FFFF:172.30.30.1
```

## Related Commands

| Command                        | Description                                                                |
|--------------------------------|----------------------------------------------------------------------------|
| <b>ipv6 route</b>              | Establishes a static IPv6 route.                                           |
| <b>show ipv6 interface</b>     | Displays IPv6 interface information.                                       |
| <b>show ipv6 route summary</b> | Displays the current contents of the IPv6 routing table in summary format. |
| <b>show ipv6 tunnel</b>        | Displays IPv6 tunnel information.                                          |

# show ipv6 routers

To display IPv6 router advertisement (RA) information received from on-link devices, use the **show ipv6 routers** command in user EXEC or privileged EXEC mode.

**show ipv6 routers** [*interface-type interface-number*][**conflicts**][**vrf vrf-name**][**detail**]

## Syntax Description

|                          |                                                                                                      |
|--------------------------|------------------------------------------------------------------------------------------------------|
| <i>interface -type</i>   | (Optional) Specifies the Interface type.                                                             |
| <i>interface -number</i> | (Optional) Specifies the Interface number.                                                           |
| <b>conflicts</b>         | (Optional) Displays RAs that differ from the RAs configured for a specified interface.               |
| <b>vrf vrf-name</b>      | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.                           |
| <b>detail</b>            | (Optional) Provides detail about the eligibility of the neighbor for election as the default device. |

## Command Default

When an interface is not specified, on-link RA information is displayed for all interface types. (The term *on-link* refers to a locally reachable address on the link.)

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Devices that advertise parameters that differ from the RA parameters configured for the interface on which the RAs are received are marked as conflicting.

## Examples

The following is sample output from the **show ipv6 routers** command when entered without an IPv6 interface type and number:

```
# show ipv6 routers
```

```
Device FE80::83B3:60A4 on Tunnel5, last update 3 min
  Hops 0, Lifetime 6000 sec, AddrFlag=0, OtherFlag=0
  Reachable time 0 msec, Retransmit time 0 msec
  Prefix 3FFE:C00:8007::800:207C:4E37/96 autoconfig
  Valid lifetime -1, preferred lifetime -1
Device FE80::290:27FF:FE8C:B709 on Tunnel57, last update 0 min
  Hops 64, Lifetime 1800 sec, AddrFlag=0, OtherFlag=0
  Reachable time 0 msec, Retransmit time 0 msec
```

The following sample output shows a single neighboring device that is advertising a high default device preference and is indicating that it is functioning as a Mobile IPv6 home agent on this link.

```
# show ipv6 routers
```

```

IPv6 ND Routers (table: default)
  Device FE80::100 on Ethernet0/0, last update 0 min
  Hops 64, Lifetime 50 sec, AddrFlag=0, OtherFlag=0, MTU=1500
  HomeAgentFlag=1, Preference=High
  Reachable time 0 msec, Retransmit time 0 msec
  Prefix 2001::100/64 onlink autoconfig
  Valid lifetime 2592000, preferred lifetime 604800

```

The following table describes the significant fields shown in the displays.

**Table 96: show ipv6 routers Field Descriptions**

| Field              | Description                                                                                                                                                                                                                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hops               | The configured hop limit value for the RA.                                                                                                                                                                                                                                                                      |
| Lifetime           | The configured lifetime value for the RA. A value of 0 indicates that the device is not a default device. A value other than 0 indicates that the device is a default device.                                                                                                                                   |
| AddrFlag           | If the value is 0, the RA received from the device indicates that addresses are not configured using the stateful autoconfiguration mechanism. If the value is 1, the addresses are configured using this mechanism.                                                                                            |
| OtherFlag          | If the value is 0, the RA received from the device indicates that information other than addresses is not obtained using the stateful autoconfiguration mechanism. If the value is 1, other information is obtained using this mechanism. (The value of OtherFlag can be 1 only if the value of AddrFlag is 1.) |
| MTU                | The maximum transmission unit (MTU).                                                                                                                                                                                                                                                                            |
| HomeAgentFlag=1    | The value can be either 0 or 1. A value of 1 indicates that the device from which the RA was received is functioning as a mobile IPv6 home agent on this link, and a value of 0 indicates it is not functioning as a mobile IPv6 home agent on this link.                                                       |
| Preference=High    | The DRP value, which can be high, medium, or low.                                                                                                                                                                                                                                                               |
| Retransmit time    | The configured RetransTimer value. The time value to be used on this link for neighbor solicitation transmissions, which are used in address resolution and neighbor unreachability detection. A value of 0 means the time value is not specified by the advertising device.                                    |
| Prefix             | A prefix advertised by the device. Also indicates if on-link or autoconfig bits were set in the RA message.                                                                                                                                                                                                     |
| Valid lifetime     | The length of time (in seconds) relative to the time the advertisement is sent that the prefix is valid for the purpose of on-link determination. A value of -1 (all ones, 0xffffffff) represents infinity.                                                                                                     |
| preferred lifetime | The length of time (in seconds) relative to the time the advertisements is sent that addresses generated from the prefix via address autoconfiguration remain valid. A value of -1 (all ones, 0xffffffff) represents infinity.                                                                                  |

When the *interface-type* and *interface-number* arguments are specified, RA details about that specific interface are displayed. The following is sample output from the **show ipv6 routers** command when entered with an interface type and number:

```
# show ipv6 routers tunnel 5
```

```
Device FE80::83B3:60A4 on Tunnel5, last update 5 min
  Hops 0, Lifetime 6000 sec, AddrFlag=0, OtherFlag=0
  Reachable time 0 msec, Retransmit time 0 msec
  Prefix 3FFE:C00:8007::800:207C:4E37/96 autoconfig
  Valid lifetime -1, preferred lifetime -1
```

Entering the **conflicts** keyword with the **show ipv6 routers** command displays information for devices that are advertising parameters different from the parameters configured for the interface on which the advertisements are being received, as the following sample output shows:

```
# show ipv6 routers conflicts
```

```
Device FE80::203:FDFE:FE34:7039 on Ethernet1, last update 1 min, CONFLICT
  Hops 64, Lifetime 1800 sec, AddrFlag=0, OtherFlag=0
  Reachable time 0 msec, Retransmit time 0 msec
  Prefix 2003::/64 onlink autoconfig
  Valid lifetime -1, preferred lifetime -1
Device FE80::201:42FF:FECA:A5C on Ethernet1, last update 0 min, CONFLICT
  Hops 64, Lifetime 1800 sec, AddrFlag=0, OtherFlag=0
  Reachable time 0 msec, Retransmit time 0 msec
  Prefix 2001::/64 onlink autoconfig
  Valid lifetime -1, preferred lifetime -1
```

Use of the **detail** keyword provides information about the preference rank of the device, its eligibility for election as default device, and whether the device has been elected:

```
# show ipv6 routers detail
```

```
Device FE80::A8BB:CCFF:FE00:5B00 on Ethernet0/0, last update 0 min
  Rank 0x811 (elegant), Default Router
  Hops 64, Lifetime 1800 sec, AddrFlag=0, OtherFlag=0, MTU=1500
  HomeAgentFlag=0, Preference=Medium, trustlevel = 0
  Reachable time 0 (unspecified), Retransmit time 0 (unspecified)
  Prefix 2001::/64 onlink autoconfig
  Valid lifetime 2592000, preferred lifetime 604800
```

# show ipv6 rpf

To check Reverse Path Forwarding (RPF) information for a given unicast host address and prefix, use the **show ipv6 rpf** command in user EXEC or privileged EXEC mode.

**show ipv6 rpf** {*source-vrf* [*access-list*] | **vrf** *receiver-vrf*{*source-vrf* [*access-list*] | **select**}}

## Syntax Description

|                     |                                                                                                     |
|---------------------|-----------------------------------------------------------------------------------------------------|
| <i>source-vrf</i>   | Name or address of the virtual routing and forwarding (VRF) on which lookups are to be performed.   |
| <i>receiver-vrf</i> | Name or address of the VRF in which the lookups originate.                                          |
| <i>access-list</i>  | Name or address of access control list (ACL) to be applied to the group-based VRF selection policy. |
| <b>vrf</b>          | Displays information about the VRF instance.                                                        |
| <b>select</b>       | Displays group-to-VRF mapping information.                                                          |

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **show ipv6 rpf** command displays information about how IPv6 multicast routing performs Reverse Path Forwarding (RPF). Because the router can find RPF information from multiple routing tables (for example, unicast Routing Information Base [RIB], multiprotocol Border Gateway Protocol [BGP] routing table, or static mroutes), the **show ipv6 rpf** command to display the source from which the information is retrieved.

## Examples

The following example displays RPF information for the unicast host with the IPv6 address of 2001::1:1:2:

```
# show ipv6 rpf 2001::1:1:2
RPF information for 2001::1:1:2
  RPF interface:Ethernet3/2
  RPF neighbor:FE80::40:1:3
  RPF route/mask:20::/64
  RPF type:Unicast
  RPF recursion count:0

  Metric:30
```

The table below describes the significant fields shown in the display.

**Table 97: show ipv6 rpf Field Descriptions**

| Field                           | Description                                                                                                                                |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| RPF information for 2001::1:1:2 | Source address that this information concerns.                                                                                             |
| RPF interface:Ethernet3/2       | For the given source, the interface from which the router expects to get packets.                                                          |
| RPF neighbor:FE80::40:1:3       | For the given source, the neighbor from which the router expects to get packets.                                                           |
| RPF route/mask:20::/64          | Route number and mask that matched against this source.                                                                                    |
| RPF type:Unicast                | Routing table from which this route was obtained, either unicast, multiprotocol BGP, or static mroutes.                                    |
| RPF recursion count             | Indicates the number of times the route is recursively resolved.                                                                           |
| Metric preference:110           | The preference value used for selecting the unicast routing metric to the Route Processor (RP) announced by the designated forwarder (DF). |
| Metric:30                       | Unicast routing metric to the RP announced by the DF.                                                                                      |

# show ipv6 source-guard policy

To display the IPv6 source-guard policy configuration, use the **show ipv6 source-guard policy** command in user EXEC or privileged EXEC mode.

**show ipv6 source-guard policy***[source-guard-policy]*

|                           |                            |                                                                                                                                     |
|---------------------------|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>source-guard-policy</i> | User-defined name of the snooping policy. The policy name can be a symbolic string (such as Engineering) or an integer (such as 0). |
|---------------------------|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------|

|                      |                                      |

| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                     |         |              |                              |                              |

|                         |                                                                                                                                                                                                                                                                                        |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The <b>show ipv6 source-guard policy</b> command displays the IPv6 source-guard policy configuration, as well as all the interfaces on which the policy is applied. The command also displays IPv6 prefix guard information if the IPv6 prefix guard feature is enabled on the device. |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

```
# show ipv6 source-guard policy policy1
```

Policy policy1 configuration:

```
data-glean
prefix-guard
address-guard
```

Policy policy1 is applied on the following targets:

| Target      | Type | Policy  | Feature      | Target range |
|-------------|------|---------|--------------|--------------|
| Ethernet0/0 | PORT | policy1 | source-guard | vlan all     |
| vlan 100    | VLAN | policy1 | source-guard | vlan all     |

| Command                                | Description                                                                                                                                                                                                                                                                                                                  |         |             |                                        |                                            |                                 |                                                                                             |
| <b>ipv6 source-guard attach-policy</b> | Applies IPv6 source guard on an interface.                                                                                                                                                                                                                                                                                   |         |             |                                        |                                            |                                 |                                                                                             |
| <b>ipv6 source-guard policy</b>        | Defines an IPv6 source-guard policy name and enters source-guard policy configuration mode.                                                                                                                                                                                                                                  |         |             |                                        |                                            |                                 |                                                                                             |

# show ipv6 spd

To display the IPv6 Selective Packet Discard (SPD) configuration, use the **show ipv6 spd** command in privileged EXEC mode.

**show ipv6 spd**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC (#)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Use the **show ipv6 spd** command to display the SPD configuration, which may provide useful troubleshooting information.

**Examples** The following is sample output from the **show ipv6 spd** command:

```
# show ipv6 spd
Current mode: normal
Queue max threshold: 74, Headroom: 100, Extended Headroom: 10
IPv6 packet queue: 0
```

The table below describes the significant fields shown in the display.

**Table 98: show ipv6 spd Field Description**

| Field                   | Description                      |
|-------------------------|----------------------------------|
| Current mode: normal    | The current SPD state or mode.   |
| Queue max threshold: 74 | The process input queue maximum. |

| Related Commands | Command                      | Description                                                              |
|------------------|------------------------------|--------------------------------------------------------------------------|
|                  | ipv6 spd queue max-threshold | Configures the maximum number of packets in the SPD process input queue. |

# show ipv6 static

To display the current contents of the IPv6 routing table, use the **show ipv6 static** command in user EXEC or privileged EXEC mode.

**show ipv6 static** [{*ipv6-address* | *ipv6-prefix/prefix-length*}] [{**interface** *type number* | **recursive**}] [**detail**]

## Syntax Description

|                       |                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ipv6-address</i>   | (Optional) Provides routing information for a specific IPv6 address.<br><br>This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.                                                                                                                                                       |
| <i>ipv6-prefix</i>    | (Optional) Provides routing information for a specific IPv6 network.<br><br>This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.                                                                                                                                                       |
| <i>/prefix-length</i> | (Optional) The length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value.                                                                                                                                    |
| <b>interface</b>      | (Optional) Name of an interface.                                                                                                                                                                                                                                                                                                                                             |
| <i>type</i>           | (Optional, but required if the <b>interface</b> keyword is used) Interface type. For a list of supported interface types, use the question mark (?) online help function.                                                                                                                                                                                                    |
| <i>number</i>         | (Optional, but required if the <b>interface</b> keyword is used) Interface number. For specific numbering syntax for supported interface types, use the question mark (?) online help function.                                                                                                                                                                              |
| <b>recursive</b>      | (Optional) Allows the display of recursive static routes only.                                                                                                                                                                                                                                                                                                               |
| <b>detail</b>         | (Optional) Specifies the following additional information: <ul style="list-style-type: none"> <li>• For valid recursive routes, the output path set and maximum resolution depth.</li> <li>• For invalid recursive routes, the reason why the route is not valid.</li> <li>• For invalid direct or fully specified routes, the reason why the route is not valid.</li> </ul> |

## Command Default

All IPv6 routing information for all active routing tables is displayed.

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **show ipv6 static** command provides output similar to the **show ip route** command, except that it is IPv6-specific.

When the *ipv6-address* or *ipv6-prefix/prefix-length* argument is specified, a longest match lookup is performed from the routing table and only route information for that address or network is displayed. Only the information matching the criteria specified in the command syntax is displayed. For example, when the *type number* arguments are specified, only the specified interface-specific routes are displayed.

## Examples

### show ipv6 static Command with No Options Specified in the Command Syntax: Example

When no options specified in the command, those routes installed in the IPv6 Routing Information Base (RIB) are marked with an asterisk, as shown in the following example:

```
# show ipv6 static

IPv6 Static routes
Code: * - installed in RIB
* 3000::/16, interface Ethernet1/0, distance 1
* 4000::/16, via nexthop 2001:1::1, distance 1
  5000::/16, interface Ethernet3/0, distance 1
* 5555::/16, via nexthop 4000::1, distance 1
  5555::/16, via nexthop 9999::1, distance 1
* 5555::/16, interface Ethernet2/0, distance 1
* 6000::/16, via nexthop 2007::1, interface Ethernet1/0, distance 1
```

The table below describes the significant fields shown in the display.

**Table 99: show ipv6 static Field Descriptions**

| Field       | Description                                                          |
|-------------|----------------------------------------------------------------------|
| via nexthop | Specifies the address of the next in the path to the remote network. |
| distance 1  | Indicates the administrative distance to the specified route.        |

### show ipv6 static Command with the IPv6 Address and Prefix: Example

When the *ipv6-address* or *ipv6-prefix/prefix-length* argument is specified, only information about static routes for that address or network is displayed. The following is sample output from the **show ipv6 route** command when entered with the IPv6 prefix 2001:200::/35:

```
# show ipv6 static 2001:200::/35

IPv6 Static routes
Code: * - installed in RIB
* 2001:200::/35, via nexthop 4000::1, distance 1
  2001:200::/35, via nexthop 9999::1, distance 1
* 2001:200::/35, interface Ethernet2/0, distance 1
```

**show ipv6 static interface Command: Example**

When an interface is supplied, only those static routes with the specified interface as the outgoing interface are displayed. The **interface** keyword may be used with or without the IPv6 address and prefix specified in the command statement.

```
# show ipv6 static interface ethernet 3/0
```

IPv6 Static routes Code: \* - installed in RIB 5000::/16, interface Ethernet3/0, distance 1

**show ipv6 static recursive Command: Example**

When the **recursive** keyword is specified, only recursive static routes are displayed:

```
# show ipv6 static recursive
```

IPv6 Static routes Code: \* - installed in RIB \* 4000::/16, via nexthop 2001:1::1, distance 1 \* 5555::/16, via nexthop 4000::1, distance 1 5555::/16, via nexthop 9999::1, distance 1

**show ipv6 static detail Command: Example**

When the **detail** keyword is specified, the following additional information is displayed:

- For valid recursive routes, the output path set and maximum resolution depth.
- For invalid recursive routes, the reason why the route is not valid.
- For invalid direct or fully specified routes, the reason why the route is not valid.

```
# show ipv6 static detail
```

```
IPv6 Static routes
Code: * - installed in RIB
* 3000::/16, interface Ethernet1/0, distance 1
* 4000::/16, via nexthop 2001:1::1, distance 1
    Resolves to 1 paths (max depth 1)
    via Ethernet1/0
5000::/16, interface Ethernet3/0, distance 1
    Interface is down
* 5555::/16, via nexthop 4000::1, distance 1
    Resolves to 1 paths (max depth 2)
    via Ethernet1/0
5555::/16, via nexthop 9999::1, distance 1
    Route does not fully resolve
* 5555::/16, interface Ethernet2/0, distance 1
* 6000::/16, via nexthop 2007::1, interface Ethernet1/0, distance 1
```

|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                      |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The <b>show ipv6 traffic</b> command provides output similar to the <b>show ip traffic</b> command, except that it is IPv6-specific. |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------|

|                 |                                                                           |
|-----------------|---------------------------------------------------------------------------|
| <b>Examples</b> | The following is sample output from the <b>show ipv6 traffic</b> command: |
|-----------------|---------------------------------------------------------------------------|

```
# show ipv6 traffic
IPv6 statistics:
  Rcvd:  0 total, 0 local destination
         0 source-routed, 0 truncated
         0 format errors, 0 hop count exceeded
         0 bad header, 0 unknown option, 0 bad source
         0 unknown protocol, 0 not a device
         0 fragments, 0 total reassembled
         0 reassembly timeouts, 0 reassembly failures
         0 unicast RPF drop, 0 suppressed RPF drop
  Sent:  0 generated, 0 forwarded
         0 fragmented into 0 fragments, 0 failed
         0 encapsulation failed, 0 no route, 0 too big
  Mcast: 0 received, 0 sent
ICMP statistics:
  Rcvd:  0 input, 0 checksum errors, 0 too short
         0 unknown info type, 0 unknown error type
  unreach: 0 routing, 0 admin, 0 neighbor, 0 address, 0 port
  parameter: 0 error, 0 header, 0 option
         0 hopcount expired, 0 reassembly timeout, 0 too big
         0 echo request, 0 echo reply
         0 group query, 0 group report, 0 group reduce
         0 device solicit, 0 device advert, 0 redirects
```

The following is sample output for the **show ipv6 interface** command without IPv6 CEF running:

```
# show ipv6 interface ethernet 0/1/1
Ethernet0/1/1 is up, line protocol is up
IPv6 is enabled, link-local address is FE80::203:FDFE:FE49:9
Description: sat-2900a f0/12
Global unicast address(es):
 7::7, subnet is 7::/32
Joined group address(es):
 FF02::1
 FF02::2
 FF02::1:FF00:7
 FF02::1:FF49:9
MTU is 1500 bytes
ICMP error messages limited to one every 100 milliseconds
ICMP redirects are enabled
Input features: RPF
Unicast RPF access-list MINI
  Process Switching:
    0 verification drops
    0 suppressed verification drops
ND DAD is enabled, number of DAD attempts: 1
ND reachable time is 30000 milliseconds
```

The following is sample output for the **show ipv6 interface** command with IPv6 CEF running:

```
# show ipv6 interface ethernet 0/1/1
Ethernet0/1/1 is up, line protocol is up
IPv6 is enabled, link-local address is FE80::203:FDFE:FE49:9
Description: sat-2900a f0/12
Global unicast address(es):
 7::7, subnet is 7::/32
Joined group address(es):
 FF02::1
 FF02::2
 FF02::1:FF00:7
 FF02::1:FF49:9
MTU is 1500 bytes
ICMP error messages limited to one every 100 milliseconds
ICMP redirects are enabled
Input features: RPF
Unicast RPF access-list MINI
  Process Switching:
    0 verification drops
    0 suppressed verification drops
  CEF Switching:
    0 verification drops
    0 suppressed verification drops
ND DAD is enabled, number of DAD attempts: 1
ND reachable time is 30000 milliseconds
ND advertised reachable time is 0 milliseconds
ND advertised retransmit interval is 0 milliseconds
ND router advertisements are sent every 200 seconds
ND router advertisements live for 1800 seconds
Hosts use stateless autoconfig for addresses.
```

The table below describes the significant fields shown in the display.

**Table 100: show ipv6 traffic Field Descriptions**

| Field         | Description                      |
|---------------|----------------------------------|
| source-routed | Number of source-routed packets. |

| Field                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| truncated                                 | Number of truncated packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| format errors                             | Errors that can result from checks performed on header fields, the version number, and packet length.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| not a device                              | Message sent when IPv6 unicast routing is not enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 0 unicast RPF drop, 0 suppressed RPF drop | Number of unicast and suppressed reverse path forwarding (RPF) drops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| failed                                    | Number of failed fragment transmissions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| encapsulation failed                      | Failure that can result from an unresolved address or try-and-queue packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| no route                                  | Counted when the software discards a datagram it did not know how to route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| unreach                                   | <p>Unreachable messages received are as follows:</p> <ul style="list-style-type: none"> <li>• routing--Indicates no route to the destination.</li> <li>• admin--Indicates that communication with the destination is administratively prohibited.</li> <li>• neighbor--Indicates that the destination is beyond the scope of the source address. | Process Switching                         | Displays process RPF counts, such as verification and suppressed verification drops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| CEF Switching                             | Displays CEF switching counts, such as verification drops and suppressed verification drops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

# show key chain

To display the keychain, use the **show key chain** command.

**show key chain** [*name-of-chain*]

## Syntax Description

|                      |                                                                                 |
|----------------------|---------------------------------------------------------------------------------|
| <i>name-of-chain</i> | (Optional) Name of the key chain to display, as named in the key chain command. |
|----------------------|---------------------------------------------------------------------------------|

## Command Default

If the command is used without any parameters, then it lists out all the key chains.

## Command Modes

Privileged EXEC (#)

## Examples

The following is sample output from the **show key chain** command:

```
show key chain
Device# show key chain

Key-chain AuthenticationGLBP:
  key 1 -- text "Thisisasecretkey"
    accept lifetime (always valid) - (always valid) [valid now]
    send lifetime (always valid) - (always valid) [valid now]
Key-chain glbp2:
  key 100 -- text "abc123"
    accept lifetime (always valid) - (always valid) [valid now]
    send lifetime (always valid) - (always valid) [valid now]
```

## Related Commands

|----------------------|---------------------------------------------------------------------------------------------|
| <b>key-string</b>    | Specifies the authentication string for a key.                                              |
| <b>send-lifetime</b> | Sets the time period during which an authentication key on a key chain is valid to be sent. |

# show track

To display information about objects that are tracked by the tracking process, use the **show track** command in privileged EXEC mode.

```
show track [{object-number [brief] | application [brief] | interface [brief] | ip[route [brief] | [sla [brief]] | ipv6 [route [brief]] | list [route [brief]] | resolution [ip | ipv6] | stub-object [brief] | summary | timers}]
```

## Syntax Description

|                      |                                                                                                 |
|----------------------|-------------------------------------------------------------------------------------------------|
| <i>object-number</i> | (Optional) Object number that represents the object to be tracked. The range is from 1 to 1000. |
| <b>brief</b>         | (Optional) Displays a single line of information related to the preceding argument or keyword.  |
| <b>application</b>   | (Optional) Displays tracked application objects.                                                |
| <b>interface</b>     | (Optional) Displays tracked interface objects.                                                  |
| <b>ip route</b>      | (Optional) Displays tracked IP route objects.                                                   |
| <b>ip sla</b>        | (Optional) Displays tracked IP SLA objects.                                                     |
| <b>ipv6 route</b>    | (Optional) Displays tracked IPv6 route objects.                                                 |
| <b>list</b>          | (Optional) Displays the list of boolean objects.                                                |
| <b>resolution</b>    | (Optional) Displays resolution of tracked parameters.                                           |
| <b>summary</b>       | (Optional) Displays the summary of the specified object.                                        |
| <b>timers</b>        | (Optional) Displays polling interval timers.                                                    |

## Command Modes

Privileged EXEC (#)

## Command History

| Release | Modification                 |
|---------|------------------------------|
|         | This command was introduced. |

## Usage Guidelines

Use this command to display information about objects that are tracked by the tracking process. When no arguments or keywords are specified, information for all objects is displayed.

A maximum of 1000 objects can be tracked. Although 1000 tracked objects can be configured, each tracked object uses CPU resources. The amount of available CPU resources on a device is dependent upon variables such as traffic load and how other protocols are configured and run. The ability to use 1000 tracked objects is dependent upon the available CPU. Testing should be conducted on site to ensure that the service works under the specific site traffic conditions.

## Examples

The following example shows information about the state of IP routing on the interface that is being tracked:

```
Device# show track 1

Track 1
  Interface GigabitEthernet 1/0/1 ip routing
  IP routing is Down (no IP addr)
  1 change, last change 00:01:08
```

The table below describes the significant fields shown in the displays.

**Table 101: show track Field Descriptions**

| Field                                      | Description                                                                                                              |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| Track                                      | Object number that is being tracked.                                                                                     |
| Interface GigabitEthernet 1/0/1 ip routing | Interface type, interface number, and object that is being tracked.                                                      |
| IP routing is                              | State value of the object, displayed as Up or Down. If the object is down, the reason is displayed.                      |
| 1 change, last change                      | Number of times that the state of a tracked object has changed and the time (in <i>hh:mm:ss</i> ) since the last change. |

## Related Commands

| Command                      | Description                                                                   |
|------------------------------|-------------------------------------------------------------------------------|
| <b>show track resolution</b> | Displays the resolution of tracked parameters.                                |
| <b>track interface</b>       | Configures an interface to be tracked and enters tracking configuration mode. |
| <b>track ip route</b>        | Tracks the state of an IP route and enters tracking configuration mode.       |

# track

To configure an interface to be tracked where the Gateway Load Balancing Protocol (GLBP) weighting changes based on the state of the interface, use the **track** command in global configuration mode. To remove the tracking, use the **no** form of this command.

**track** *object-number* **interface** *type number* {**line-protocol** | **ip routing** | **ipv6 routing**}  
**no track** *object-number* **interface** *type number* {**line-protocol** | **ip routing** | **ipv6 routing**}

## Syntax Description

|                                     |                                                                                                                                                                         |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>object-number</i>                | Object number in the range from 1 to 1000 representing the interface to be tracked.                                                                                     |
| <b>interface</b> <i>type number</i> | Interface type and number to be tracked.                                                                                                                                |
| <b>line-protocol</b>                | Tracks whether the interface is up.                                                                                                                                     |
| <b>ip routing</b>                   | Tracks whether IP routing is enabled, an IP address is configured on the interface, and the interface state is up, before reporting to GLBP that the interface is up.   |
| <b>ipv6 routing</b>                 | Tracks whether IPv6 routing is enabled, an IP address is configured on the interface, and the interface state is up, before reporting to GLBP that the interface is up. |

## Command Default

The state of the interfaces is not tracked.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                  |
|------------------------------|-------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced.. |

## Usage Guidelines

Use the **track** command in conjunction with the **glbp weighting** and **glbp weighting track** commands to configure parameters for an interface to be tracked. If a tracked interface on a GLBP device goes down, the weighting for that device is reduced. If the weighting falls below a specified minimum, the device will lose its ability to act as an active GLBP virtual forwarder.

A maximum of 1000 objects can be tracked. Although 1000 tracked objects can be configured, each tracked object uses CPU resources. The amount of available CPU resources on a device is dependent upon variables such as traffic load and how other protocols are configured and run. The ability to use 1000 tracked objects is dependent upon the available CPU. Testing should be conducted on site to ensure that the service works under the specific site traffic conditions.

## Examples

In the following example, TenGigabitEthernet interface 0/0/1 tracks whether GigabitEthernet interfaces 1/0/1 and 1/0/3 are up. If either of the GigabitEthernet interface goes down, the GLBP weighting is reduced by the default value of 10. If both GigabitEthernet interfaces go down, the GLBP weighting will fall below the lower threshold and the device will no longer be an active forwarder. To resume its role as an active forwarder, the device must have both tracked interfaces back up, and the weighting must rise above the upper threshold.

```
Device(config)# track 1 interface GigabitEthernet 1/0/1 line-protocol
```

```
Device(config-track)# exit
Device(config)# track 2 interface GigabitEthernet 1/0/3 line-protocol
Device(config-track)# exit
Device(config)# interface TenGigabitEthernet 0/0/1
Device(config-if)# ip address 10.21.8.32 255.255.255.0
Device(config-if)# glbp 10 weighting 110 lower 95 upper 105
Device(config-if)# glbp 10 weighting track 1
Device(config-if)# glbp 10 weighting track 2
```

**Related Commands**

|-----------------------------|---------------------------------------------------------------------------------|
| <b>glbp weighting</b>       | Specifies the initial weighting value of a GLBP gateway.                        |
| <b>glbp weighting track</b> | Specifies an object to be tracked that affects the weighting of a GLBP gateway. |

## vrrp

To create a Virtual Router Redundancy Protocol version 3 (VRRPv3) group and enter VRRPv3 group configuration mode, use the **vrrp**. To remove the VRRPv3 group, use the **no** form of this command.

```
vrrp group-id address-family {ipv4 | ipv6}  
no vrrp group-id address-family {ipv4 | ipv6}
```

### Syntax Description

|                       |                                                          |
|-----------------------|----------------------------------------------------------|
| <i>group-id</i>       | Virtual router group number. The range is from 1 to 255. |
| <b>address-family</b> | Specifies the address-family for this VRRP group.        |
| <b>ipv4</b>           | (Optional) Specifies IPv4 address.                       |
| <b>ipv6</b>           | (Optional) Specifies IPv6 address.                       |

### Command Default

None

### Command Modes

Interface configuration (config-if)

### Command History

| Release                      | Modification                  |
|------------------------------|-------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced.. |

### Usage Guidelines

#### Examples

The following example shows how to create a VRRPv3 group and enter VRRP configuration mode:

```
Device(config-if)# vrrp 3 address-family ipv4
```

### Related Commands

| Command                 | Description                                   |
|-------------------------|-----------------------------------------------|
| <b>timers advertise</b> | Sets the advertisement timer in milliseconds. |

## vrrp description

To assign a description to the Virtual Router Redundancy Protocol (VRRP) group, use the **vrrp description** command in interface configuration mode. To remove the description, use the **no** form of this command.

**description** *text*

**no description**

### Syntax Description

|             |                                                                            |
|-------------|----------------------------------------------------------------------------|
| <i>text</i> | Text (up to 80 characters) that describes the purpose or use of the group. |
|-------------|----------------------------------------------------------------------------|

### Command Default

There is no description of the VRRP group.

### Command Modes

VRRP configuration (config-if-vrrp)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Examples

The following example enables VRRP. VRRP group 1 is described as Building A – Marketing and Administration.

```
Device(config-if-vrrp)# description Building A - Marketing and Administration
```

### Related Commands

| Command     | Description                                                        |
|-------------|--------------------------------------------------------------------|
| <b>vrrp</b> | Creates a VRRPv3 group and enters VRRPv3 group configuration mode. |

## vrrp preempt

To configure the device to take over as primary virtual router for a Virtual Router Redundancy Protocol (VRRP) group if it has higher priority than the current primary virtual router, use the **preempt** command in VRRP configuration mode. To disable this function, use the **no** form of this command.

**preempt** [**delay minimum seconds**]  
**no preempt**

|                           |                                                                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>delay minimum seconds</b> (Optional) Number of seconds that the device will delay before issuing an advertisement claiming primary ownership. The default delay is 0 seconds. |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                        |                          |

|------------------------|------------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | By default, the device being configured with this command will take over as primary virtual router for the group if it has a higher priority than the current primary virtual router. You can configure a delay, which will cause the VRRP device to wait the specified number of seconds before issuing an advertisement claiming primary ownership. |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|             |                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------|
| <b>Note</b> | The device that is the IP address owner will preempt, regardless of the setting of this command. |
|-------------|--------------------------------------------------------------------------------------------------|

### Examples

The following example configures the device to preempt the current primary virtual router when its priority of 200 is higher than that of the current primary virtual router. If the device preempts the current primary virtual router, it waits 15 seconds before issuing an advertisement claiming it is the primary virtual router.

```
Device(config-if-vrrp)#preempt delay minimum 15
```

| <b>Related Commands</b> | Command         | Description                                                        |
|-------------------------|-----------------|--------------------------------------------------------------------|
|                         | <b>vrrp</b>     | Creates a VRRPv3 group and enters VRRPv3 group configuration mode. |
|                         | <b>priority</b> | Sets the priority level of the device within a VRRP group.         |

## vrrp priority

To set the priority level of the device within a Virtual Router Redundancy Protocol (VRRP) group, use the **priority** command in interface configuration mode. To remove the priority level of the device, use the **no** form of this command.

**priority** *level*  
**no priority** *level*

### Syntax Description

|              |                                                                                               |
|--------------|-----------------------------------------------------------------------------------------------|
| <i>level</i> | Priority of the device within the VRRP group. The range is from 1 to 254. The default is 100. |
|--------------|-----------------------------------------------------------------------------------------------|

### Command Default

The priority level is set to the default value of 100.

### Command Modes

VRRP configuration (config-if-vrrp)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Use this command to control which device becomes the primary virtual router.

### Examples

The following example configures the device with a priority of 254:

```
Device(config-if-vrrp)# priority 254
```

### Related Commands

| Command             | Description                                                                                                                                      |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrrp</b>         | Creates a VRRPv3 group and enters VRRPv3 group configuration mode.                                                                               |
| <b>vrrp preempt</b> | Configures the device to take over as primary virtual router for a VRRP group if it has higher priority than the current primary virtual router. |

## vrrp timers advertise

To configure the interval between successive advertisements by the primary virtual router in a Virtual Router Redundancy Protocol (VRRP) group, use the **timers advertise** command in VRRP configuration mode. To restore the default value, use the **no** form of this command.

**timers advertise** [*msec*] *interval*  
**no timers advertise** [*msec*] *interval*

### Syntax Description

|                 |                                                                                                                                                                                                                                                                                                                         |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>group</i>    | Virtual router group number. The group number range is from 1 to 255.                                                                                                                                                                                                                                                   |
| <b>msec</b>     | (Optional) Changes the unit of the advertisement time from seconds to milliseconds. Without this keyword, the advertisement interval is in seconds.                                                                                                                                                                     |
| <i>interval</i> | Time interval between successive advertisements by the primary virtual router. The unit of the interval is in seconds, unless the <b>msec</b> keyword is specified. The default is 1 second. The valid range is 1 to 255 seconds. When the <b>msec</b> keyword is specified, the valid range is 50 to 999 milliseconds. |

### Command Default

The default interval of 1 second is configured.

### Command Modes

VRRP configuration (config-if-vrrp)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

The advertisements being sent by the primary virtual router communicate the state and priority of the current primary virtual router.

The **vrrp timers advertise** command configures the time between successive advertisement packets and the time before other routers declare the primary router to be down. Routers or access servers on which timer values are not configured can learn timer values from the primary router. The timers configured on the primary router always override any other timer settings. All routers in a VRRP group must use the same timer values. If the same timer values are not set, the devices in the VRRP group will not communicate with each other and any misconfigured device will change its state to primary.

### Examples

The following example shows how to configure the primary virtual router to send advertisements every 4 seconds:

```
Device(config-if-vrrp)# timers advertise 4
```

### Related Commands

| Command     | Description                                                        |
|-------------|--------------------------------------------------------------------|
| <b>vrrp</b> | Creates a VRRPv3 group and enters VRRPv3 group configuration mode. |

| Command             | Description                                                                                                                                                 |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>timers learn</b> | Configures the device, when it is acting as backup virtual router for a VRRP group, to learn the advertisement interval used by the primary virtual router. |

## vrrs leader

To specify a leader's name to be registered with Virtual Router Redundancy Service (VRRS), use the **vrrs leader** command. To remove the specified VRRS leader, use the **no** form of this command.

**vrrs leader** *vrrs-leader-name*  
**no vrrs leader** *vrrs-leader-name*

### Syntax Description

|                         |                           |
|-------------------------|---------------------------|
| <i>vrrs-leader-name</i> | Name of VRRS Tag to lead. |
|-------------------------|---------------------------|

### Command Default

A registered VRRS name is unavailable by default.

### Command Modes

VRRP configuration (config-if-vrrp)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Examples

The following example specifies a leader's name to be registered with VRRS:

```
Device(config-if-vrrp)# vrrs leader leader-1
```

### Related Commands

# clear ip mfib counters

To clear all the active IPv4 Multicast Forwarding Information Base (MFIB) traffic counters, use the **clear ip mfib counters** command in privileged EXEC mode.

**clear ip mfib** [**global** | **vrf \***] **counters** [*group-address*] [*hostname* | *source-address*]

|                    |                       |                                                                                     |
|--------------------|-----------------------|-------------------------------------------------------------------------------------|
| Syntax Description | <b>global</b>         | (Optional) Resets the IP MFIB cache to the global default configuration.            |
|                    | <b>vrf *</b>          | (Optional) Clears the IP MFIB cache for all VPN routing and forwarding instances.   |
|                    | <i>group-address</i>  | (Optional) Limits the active MFIB traffic counters to the indicated group address.  |
|                    | <i>hostname</i>       | (Optional) Limits the active MFIB traffic counters to the indicated host name.      |
|                    | <i>source-address</i> | (Optional) Limits the active MFIB traffic counters to the indicated source address. |

|                 |      |
|-----------------|------|
| Command Default | None |
|-----------------|------|

|               |                     |
|---------------|---------------------|
| Command Modes | Privileged EXEC (#) |
|---------------|---------------------|

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Example

The following example shows how to reset all the active MFIB traffic counters for all the multicast tables:

```
# clear ip mfib counters
```

The following example shows how to reset the IP MFIB cache counters to the global default configuration:

```
# clear ip mfib global counters
```

The following example shows how to clear the IP MFIB cache for all the VPN routing and forwarding instances:

```
# clear ip mfib vrf * counters
```

# clear ip mroute

To delete the entries in the IP multicast routing table, use the **clear ip mroute** command in privileged EXEC mode.

**clear ip mroute** [**vrf** *vrf-name*] [**\*** | *ip-address* | *group-address*] [*hostname* | *source-address*]

|                           |                            |                                                                                                            |
|---------------------------|----------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies the name that is assigned to the multicast VPN routing and forwarding (VRF) instance. |
|                           | <b>*</b>                   | Specifies all Multicast routes.                                                                            |
|                           | <i>ip-address</i>          | Multicast routes for the IP address.                                                                       |
|                           | <i>group-address</i>       | Multicast routes for the group address.                                                                    |
|                           | <i>hostname</i>            | (Optional) Multicast routes for the host name.                                                             |
|                           | <i>source-address</i>      | (Optional) Multicast routes for the source address.                                                        |

**Command Default** None

**Command Modes** Privileged EXEC

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

The *group-address* variable specifies one of the following:

- Name of the multicast group as defined in the DNS hosts table or with the **ip host** command.
- IP address of the multicast group in four-part, dotted notation.

If you specify a group name or address, you can also enter the source argument to specify a name or address of a multicast source that is sending to the group. A source does not need to be a member of the group.

## Example

The following example shows how to delete all the entries from the IP multicast routing table:

```
# clear ip mroute *
```

The following example shows how to delete all the sources on the 228.3.0.0 subnet that are sending to the multicast group 224.2.205.42 from the IP multicast routing table. This example shows how to delete all sources on network 228.3, not individual sources:

```
# clear ip mroute 224.2.205.42 228.3.0.0
```

# debug condition vrf

To limit debug output to a specific virtual routing and forwarding (VRF) instance, use the **debug condition vrf** command in privileged EXEC mode. To remove the debug condition, use the **no** form of the command.

**debug condition vrf** {**default** | **global** | **green** | **name** {*vrf-name* | **green**}}

**no debug condition vrf** {**default** | **global** | **green** | **name** {*vrf-name* | **green**}}

## Syntax Description

| Syntax                      | Description                              |
|-----------------------------|------------------------------------------|
| <b>default</b>              | Specifies the default routing table.     |
| <b>global</b>               | Specifies the global routing table.      |
| <b>green</b>                | Specifies the VRF name.                  |
| <b>name</b> <i>vrf-name</i> | Specifies the name of the routing table. |

## Command Modes

Privileged EXEC mode (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use this command to limit debug output to a single VRF.

### Caution

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use the **debug** commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. It is best to use the **debug** commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased **debug** command processing overhead will affect system use.

## Example

The following example shows how to limit debugging output to VRF red:

```
Device# debug condition vrf red
```

# debug ip pim

To display PIM packets received and transmitted, as well as PIM related events, use the **debug ip pim** command in privileged EXEC mode. To disable the debug output, use the **no** form of the command.

**debug ip pim** [{**vrf** *vrf-name*}] [{*ip-address* | **atm** | **auto-rp** | **bfd** | **bsr** | **crimson** | **df** *rp-address* | **drlb** | **hello** | **timers**}]

**no debug ip pim** [{**vrf** *vrf-name*}] [{*ip-address* | **atm** | **auto-rp** | **bfd** | **bsr** | **crimson** | **df** *rp-address* | **drlb** | **hello** | **timers**}]

## Syntax Description

| Syntax                      | Description                                                                                                                                                                            |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i>  | (Optional) Specifies the VPN Routing and Forwarding instance.<br><br>This keyword overrides debugging of any VRFs specified in the <b>debug condition vrf</b> <i>vrf-name</i> command. |
| <i>ip-address</i>           | (Optional) Specifies the IP group address.                                                                                                                                             |
| <b>atm</b>                  | (Optional) Displays debugging information about PIM ATM signalling activity.                                                                                                           |
| <b>auto-rp</b>              | (Optional) Displays debugging information about Auto-RP information.                                                                                                                   |
| <b>bfd</b>                  | (Optional) Displays debugging information about BFD configuration.                                                                                                                     |
| <b>bsr</b>                  | (Optional) Displays debugging information about PIM Candidate-RP and BSR activity.                                                                                                     |
| <b>crimson</b>              | (Optional) Displays debugging information about Crimson database activity.                                                                                                             |
| <b>df</b> <i>rp-address</i> | (Optional) Displays debugging information about PIM RP designated forwarder election activity.                                                                                         |
| <b>drlb</b>                 | (Optional) Displays debugging information about PIM designated router load-balancing activity.                                                                                         |
| <b>hello</b>                | (Optional) Displays debugging information about PIM Hello packets received and sent.                                                                                                   |
| <b>timers</b>               | (Optional) Displays debugging information about PIM timer events.                                                                                                                      |

## Command Modes

Privileged EXEC mode (#)

**Command History****Release****Modification**

Cisco IOS XE Everest 16.5.1a

This command was introduced.

**Usage Guidelines****Caution**

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use the **debug** commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. It is best to use the **debug** commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased **debug** command processing overhead will affect system use.

You can debug a maximum of 8 VRFs in a PIM at a time. To debug multiple VRFs at the same time, perform the following sequence of steps:

```
debug condition vrf vrf-name1
debug condition vrf vrf-name2
.
.
.
debug condition vrf vrf-name8
debug ip pim
```

**Example**

The following example shows how to display the Crimson database activity:

```
Device# debug ip pim crimson
```

The following example shows how to debug the two VRFs red and green in a PIM at the same time:

```
Device# debug condition vrf red
Device# debug condition vrf green
Device# debug ip pim
```

## debug ipv6 pim

To enable debugging on Protocol Independent Multicast (PIM) protocol activity, use the **debug ipv6 pim** command in privileged EXEC mode. To restore the default value, use the **no** form of this command.

```
debug ipv6 pim
[{vrf vrf-name }]
[{bfd interface-type interface-number | bsr | crimson | df-election [{interface interface-type
interface-number | rp rp-address}]|drlb|group group-address |interface interface-type
interface-number |limit [{group-address }]|neighbor interface-type interface-number }]
```

```
no debug ipv6 pim
[{vrf vrf-name }]
[{bfd interface-type interface-number | bsr | crimson | df-election [{interface interface-type
interface-number | rp rp-address}]|drlb|group group-address |interface interface-type
interface-number |limit [{group-address }]|neighbor interface-type interface-number }]
```

### Syntax Description

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines****Caution**

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use the **debug** commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. It is best to use the **debug** commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased **debug** command processing overhead will affect system use.

You can debug a maximum of 8 VRFs in a PIM at a time. To debug multiple VRFs at the same time, perform the following sequence of steps:

```
debug condition vrf vrf-name1
debug condition vrf vrf-name2
.
.
.
debug condition vrf vrf-name8
debug ip pim
```

**Example**

The following example shows how to display the Crimson database activity:

```
Device# debug ipv6 pim crimson
```

The following example shows how to debug VRF red:

```
Device# debug vrf red ipv6 pim
```

# ip igmp filter

To control whether or not all the hosts on a Layer 2 interface can join one or more IP multicast groups by applying an Internet Group Management Protocol (IGMP) profile to the interface, use the **ip igmp filter** interface configuration command on the stack or on a standalone . To remove the specified profile from the interface, use the **no** form of this command.

**ip igmp filter** *profile number*  
**no ip igmp filter**

|                    |                                                                                     |                              |
|--------------------|-------------------------------------------------------------------------------------|------------------------------|
| Syntax Description | <i>profile number</i> IGMP profile number to be applied. The range is 1—4294967295. |                              |
| Command Default    | No IGMP filters are applied.                                                        |                              |
| Command Modes      | Interface configuration (config-if)                                                 |                              |
| Command History    | Release                                                                             | Modification                 |
|                    | Cisco IOS XE Everest 16.5.1a                                                        | This command was introduced. |

**Usage Guidelines**

You can apply IGMP filters only to Layer 2 physical interfaces; you cannot apply IGMP filters to routed ports, switch virtual interfaces (SVIs), or ports that belong to an EtherChannel group.

An IGMP profile can be applied to one or more port interfaces, but one port can have only one profile applied to it.

## Example

This example shows how to configure IGMP profile 40 to permit the specified range of IP multicast addresses, then shows how to apply that profile to a port as a filter:

```
(config)# ip igmp profile 40
(config-igmp-profile)# permit
(config-igmp-profile)# range 233.1.1.1 233.255.255.255
(config-igmp-profile)# exit
(config)# interface gigabitethernet1/0/2
(config-if)# switchport
*Jan 3 18:04:17.007: %LINK-3-UPDOWN: Interface GigabitEthernet1/0/1, changed state to down.
NOTE: If this message appears, this interface changes to layer 2, so that you can apply the
filter.
(config-if)# ip igmp filter 40
```

You can verify your setting by using the **show running-config** command in privileged EXEC mode and by specifying an interface.

## ip igmp max-groups

To set the maximum number of Internet Group Management Protocol (IGMP) groups that a Layer 2 interface can join or to configure the IGMP throttling action when the maximum number of entries is in the forwarding table, use the **ip igmp max-groups** interface configuration command on the stack or on a standalone . To set the maximum back to the default, which is to have no maximum limit, or to return to the default throttling action, which is to drop the report, use the **no** form of this command.

**ip igmp max-groups** {*max number* | **action** { **deny** | **replace** } }  
**no ip igmp max-groups** {*max number* | **action** }

| <b>Syntax Description</b>    | <table> <tr> <td data-bbox="386 632 565 663"><i>max number</i></td><td data-bbox="573 632 1528 699">Maximum number of IGMP groups that an interface can join. | <b>Usage Guidelines</b>      | <p>You can use this command only on Layer 2 physical interfaces and on logical EtherChannel interfaces. You cannot set IGMP maximum groups for routed ports, switch virtual interfaces (SVIs), or ports that belong to an EtherChannel group.</p> <p>Follow these guidelines when configuring the IGMP throttling action:</p> <ul style="list-style-type: none"> <li>• If you configure the throttling action as deny, and set the maximum group limit, the entries that were previously in the forwarding table are not removed, but are aged out. After these entries are aged out, when the maximum number of entries is in the forwarding table, the drops the next IGMP report received on the interface.</li> <li>• If you configure the throttling action as replace, and set the maximum group limitation, the entries that were previously in the forwarding table are removed. When the maximum number of entries is in the forwarding table, the replaces a randomly selected multicast entry with the received IGMP report.</li> <li>• When the maximum group limitation is set to the default (no maximum), entering the <b>ip igmp max-groups {deny   replace}</b> command has no effect.</li> </ul> |                   |                                                                                                               |                              |                                                                                                                                          |                       |                                                                                                                                                                    |

### Example

The following example shows how to limit the number of IGMP groups that a port can join to 25:

```
(config)# interface gigabitethernet1/0/2
(config-if)# ip igmp max-groups 25
```

The following example shows how to configure the to replace the existing group with the new group for which the IGMP report was received when the maximum number of entries is in the forwarding table:

```
(config)# interface gigabitethernet2/0/1
(config-if)# ip igmp max-groups action replace
```

You can verify your setting by using the **show running-config** privileged EXEC command and by specifying an interface.

## ip igmp profile

To create an Internet Group Management Protocol (IGMP) profile and enter IGMP profile configuration mode, use the **ip igmp profile** global configuration command on the `stack` or on a standalone . From this mode, you can specify the configuration of the IGMP profile to be used for filtering IGMP membership reports from a switch port. To delete the IGMP profile, use the **no** form of this command.

**ip igmp profile** *profile number*  
**no ip igmp profile** *profile number*

|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <i>profile number</i> The IGMP profile number being configured. The range is from 1—4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                              |
| <b>Command Default</b>    | No IGMP profiles are defined. When configured, the default action for matching an IGMP profile is to deny matching addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                              |
| <b>Command Modes</b>      | Global configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                              |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | This command was introduced. |
| <b>Usage Guidelines</b>   | <p>When you are in IGMP profile configuration mode, you can create a profile by using these commands:</p> <ul style="list-style-type: none"><li>• <b>deny</b>—Specifies that matching addresses are denied; this is the default condition.</li><li>• <b>exit</b>—Exits from igmp-profile configuration mode.</li><li>• <b>no</b>—Negates a command or resets to its defaults.</li><li>• <b>permit</b>—Specifies that matching addresses are permitted.</li><li>• <b>range</b>—Specifies a range of IP addresses for the profile. This can be a single IP address or a range with a start and an end address.</li></ul> <p>When entering a range, enter the low IP multicast address, a space, and the high IP multicast address.</p> <p>You can apply an IGMP profile to one or more Layer 2 interfaces, but each interface can have only one profile applied to it.</p> |                              |

### Example

The following example shows how to configure IGMP profile 40, which permits the specified range of IP multicast addresses:

```
(config)# ip igmp profile 40
(config-igmp-profile)# permit
(config-igmp-profile)# range 233.1.1.1 233.255.255.255
```

You can verify your settings by using the **show ip igmp profile** command in privileged EXEC mode.

# ip igmp snooping

To globally enable Internet Group Management Protocol (IGMP) snooping on the or to enable it on a per-VLAN basis, use the **ip igmp snooping** global configuration command on the stack or on a standalone . To return to the default setting, use the **no** form of this command.

```
ip igmp snooping [vlan vlan-id]
no ip igmp snooping [vlan vlan-id]
```

|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                | This command was introduced. |
| Usage Guidelines   | When IGMP snooping is enabled globally, it is enabled in all of the existing VLAN interfaces. When IGMP snooping is globally disabled, it is disabled on all of the existing VLAN interfaces.<br><br>VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs, and cannot be used in IGMP snooping. |                              |

## Example

The following example shows how to globally enable IGMP snooping:

```
(config)# ip igmp snooping
```

The following example shows how to enable IGMP snooping on VLAN 1:

```
(config)# ip igmp snooping vlan 1
```

You can verify your settings by entering the **show ip igmp snooping** command in privileged EXEC mode.

## ip igmp snooping last-member-query-count

To configure how often Internet Group Management Protocol (IGMP) snooping will send query messages in response to receiving an IGMP leave message, use the **ip igmp snooping last-member-query-count** command in global configuration mode. To set *count* to the default value, use the **no** form of this command.

```
ip igmp snooping [vlan vlan-id] last-member-query-count count
no ip igmp snooping [vlan vlan-id] last-member-query-count count
```

|                           |                                                                                                                                   |                              |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <b>vlan vlan-id</b> (Optional) Sets the count value on a specific VLAN ID. The range is from 1—1001. Do not enter leading zeroes. |                              |
|                           | <b>count</b> Interval at which query messages are sent, in milliseconds. The range is from 1—7. The default is 2.                 |                              |
| <b>Command Default</b>    | A query is sent every 2 milliseconds.                                                                                             |                              |
| <b>Command Modes</b>      | Global configuration                                                                                                              |                              |
| <b>Command History</b>    | <b>Release</b>                                                                                                                    | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                      | This command was introduced. |

**Usage Guidelines** When a multicast host leaves a group, the host sends an IGMP leave message. To check if this host is the last to leave the group, IGMP query messages are sent when the leave message is seen until the **last-member-query-interval** timeout period expires. If no response is received to the last-member queries before the timeout period expires, the group record is deleted.

Use the **ip igmp snooping last-member-query-interval** command to configure the timeout period.

When both IGMP snooping immediate-leave processing and the query count are configured, immediate-leave processing takes precedence.

**Note** Do not set the count to 1 because the loss of a single packet (the query packet from the switch to the host or the report packet from the host to the switch) may result in traffic forwarding being stopped even if the receiver is still there. Traffic continues to be forwarded after the next general query is sent by the switch, but the interval during which a receiver may not receive the query could be as long as 1 minute (with the default query interval).

The leave latency in Cisco IOS software may increase by up to 1 last-member query interval (LMQI) value when the switch is processing more than one leave within an LMQI. In such a scenario, the average leave latency is determined by the  $(\text{count} + 0.5) * \text{LMQI}$ . The result is that the default leave latency can range from 2.0 to 3.0 seconds with an average of 2.5 seconds under a higher load of IGMP leave processing. The leave latency under load for the minimum LMQI value of 100 milliseconds and a count of 1 is from 100 to 200 milliseconds, with an average of 150 milliseconds. This is done to limit the impact of higher rates of IGMP leave messages.

### Example

The following example shows how to set the last member query count to 5:

```
(config)# ip igmp snooping last-member-query-count 5
```

## ip igmp snooping querier

To globally enable the Internet Group Management Protocol (IGMP) querier function in Layer 2 networks, use the **ip igmp snooping querier** global configuration command. Use the command with keywords to enable and configure the IGMP querier feature on a VLAN interface. To return to the default settings, use the **no** form of this command.

**ip igmp snooping** [**vlan** *vlan-id*] **querier** [**address** *ip-address* | **max-response-time** *response-time* | **query-interval** *interval-count* | **tcn query** {**count** *count* | **interval** *interval*} | **timer expiry** *expiry-time* | **version** *version*]  
**no ip igmp snooping** [**vlan** *vlan-id*] **querier** [**address** | **max-response-time** | **query-interval** | **tcn query** {**count** | **interval**} | **timer expiry** | **version**]

| Syntax Description                            |  |                                                                                                                                                                |
|-----------------------------------------------|--|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vlan</b> <i>vlan-id</i>                    |  | (Optional) Enables IGMP snooping and the IGMP querier function on the specified VLAN. Ranges are 1—1001 and 1006—4094.                                         |
| <b>address</b> <i>ip-address</i>              |  | (Optional) Specifies a source IP address. If you do not specify an IP address, the querier tries to use the global IP address configured for the IGMP querier. |
| <b>max-response-time</b> <i>response-time</i> |  | (Optional) Sets the maximum time to wait for an IGMP querier report. The range is 1—25 seconds.                                                                |
| <b>query-interval</b> <i>interval-count</i>   |  | (Optional) Sets the interval between IGMP queriers. The range is 1—18000 seconds.                                                                              |
| <b>tcn query</b>                              |  | (Optional) Sets parameters related to Topology Change Notifications (TCNs).                                                                                    |
| <b>count</b> <i>count</i>                     |  | Sets the number of TCN queries to be executed during the TCN interval time. The range is 1—10.                                                                 |
| <b>interval</b> <i>interval</i>               |  | Sets the TCN query interval time. The range is 1—255.                                                                                                          |
| <b>timer expiry</b> <i>expiry-time</i>        |  | (Optional) Sets the length of time until the IGMP querier expires. The range is 60—300 seconds.                                                                |
| <b>version</b> <i>version</i>                 |  | (Optional) Selects the IGMP version number that the querier feature uses. Select either 1 or 2.                                                                |

**Command Default** The IGMP snooping querier feature is globally disabled on the .  
 When enabled, the IGMP snooping querier disables itself if it detects IGMP traffic from a multicast router.

**Command Modes** Global configuration

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use this command to enable IGMP snooping to detect the IGMP version and IP address of a device that sends IGMP query messages, which is also called a querier.

By default, the IGMP snooping querier is configured to detect devices that use IGMP Version 2 (IGMPv2), but does not detect clients that are using IGMP Version 1 (IGMPv1). You can manually configure the **max-response-time** value when devices use IGMPv2. You cannot configure the max-response-time when devices use IGMPv1. (The value cannot be configured, and is set to zero).

Non-RFC-compliant devices running IGMPv1 might reject IGMP general query messages that have a non-zero value as the **max-response-time** value. If you want the devices to accept the IGMP general query messages, configure the IGMP snooping querier to run IGMPv1.

VLAN IDs 1002—1005 are reserved for Token Ring and FDDI VLANs, and cannot be used in IGMP snooping.

## Example

The following example shows how to globally enable the IGMP snooping querier feature:

```
(config)# ip igmp snooping querier
```

The following example shows how to set the IGMP snooping querier maximum response time to 25 seconds:

```
(config)# ip igmp snooping querier max-response-time 25
```

The following example shows how to set the IGMP snooping querier interval time to 60 seconds:

```
(config)# ip igmp snooping querier query-interval 60
```

The following example shows how to set the IGMP snooping querier TCN query count to 25:

```
(config)# ip igmp snooping querier tcn count 25
```

The following example shows how to set the IGMP snooping querier timeout value to 60 seconds:

```
(config)# ip igmp snooping querier timer expiry 60
```

The following example shows how to set the IGMP snooping querier feature to Version 2:

```
(config)# ip igmp snooping querier version 2
```

You can verify your settings by entering the **show ip igmp snooping** privileged EXEC command.

# ip igmp snooping report-suppression

To enable Internet Group Management Protocol (IGMP) report suppression, use the **ip igmp snooping report-suppression** global configuration command on the stack or on a standalone . To disable IGMP report suppression, and to forward all IGMP reports to multicast routers, use the **no** form of this command.

**ip igmp snooping report-suppression**  
**no ip igmp snooping report-suppression**

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                              |                              |

| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                 | This command was introduced. |
| <b>Usage Guidelines</b>   | IGMP report suppression is supported only when the multicast query has IGMPv1 and IGMPv2 reports. This feature is not supported when the query includes IGMPv3 reports.                                                                                                                                                                                                                                                                      |                              |
|                           | The uses IGMP report suppression to forward only one IGMP report per multicast router query to multicast devices. When IGMP report suppression is enabled (the default), the sends the first IGMP report from all the hosts for a group to all the multicast routers. The does not send the remaining IGMP reports for the group to the multicast routers. This feature prevents duplicate reports from being sent to the multicast devices. |                              |
|                           | If the multicast router query includes requests only for IGMPv1 and IGMPv2 reports, the forwards only the first IGMPv1 or IGMPv2 report from all the hosts for a group to all of the multicast routers. If the multicast router query also includes requests for IGMPv3 reports, the forwards all IGMPv1, IGMPv2, and IGMPv3 reports for a group to the multicast devices.                                                                   |                              |
|                           | If you disable IGMP report suppression by entering the <b>no ip igmp snooping report-suppression</b> command, all IGMP reports are forwarded to all of the multicast routers.                                                                                                                                                                                                                                                                |                              |

## Example

The following example shows how to disable report suppression:

```
(config)# no ip igmp snooping report-suppression
```

You can verify your settings by entering the **show ip igmp snooping** command in privileged EXEC mode.

# ip igmp snooping vlan mrouter

To add a multicast router port, use the **ip igmp snooping mrouter** global configuration command on the stack or on a standalone . To return to the default settings, use the **no** form of this command.

|                        |                                                  |
|------------------------|--------------------------------------------------|
| <b>Command Default</b> | By default, there are no multicast router ports. |
|------------------------|--------------------------------------------------|

|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                          |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | VLAN IDs 1002—1005 are reserved for Token Ring and FDDI VLANs, and cannot be used in IGMP snooping. The configuration is saved in NVRAM. |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------|

## Example

The following example shows how to configure a port as a multicast router port:

```
(config)# ip igmp snooping vlan 1 mrouter interface gigabitethernet1/0/2
```

You can verify your settings by entering the **show ip igmp snooping** privileged EXEC command.

# ip igmp snooping vlan static

To enable Internet Group Management Protocol (IGMP) snooping and to statically add a Layer 2 port as a member of a multicast group, use the **ip igmp snooping vlan static** global configuration command on the stack or on a standalone . To remove the port specified as members of a static multicast group, use the **no** form of this command.

**ip igmp snooping vlan** *vlan-id* **static** *ip-address* **interface** *interface-id*  
**no ip igmp snooping vlan** *vlan-id* **static** *ip-address* **interface** *interface-id*

| <b>Usage Guidelines</b>   | <p>VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs, and cannot be used in IGMP snooping.</p> <p>The configuration is saved in NVRAM.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Example

The following example shows how to statically configure a host on an interface:

```
(config)# ip igmp snooping vlan 1 static 224.2.4.12 interface
gigabitEthernet1/0/1
```

Configuring port gigabitethernet1/0/1 on group 224.2.4.12

You can verify your settings by entering the **show ip igmp snooping** command in privileged EXEC mode.

# ip multicast auto-enable

To support authentication, authorization, and accounting (AAA) enabling of IP multicast, use the **ip multicast auto-enable** command. This command allows multicast routing to be enabled dynamically on dialup interfaces using AAA attributes from a RADIUS server. To disable IP multicast for AAA, use the **no** form of this command.

**ip multicast auto-enable**  
**no ip multicast auto-enable**

|                           | Cisco IOS XE Everest 16.5.1a               | This command was introduced. |
| <b>Usage Guidelines</b>   | None                                       |                              |

## Example

The following example shows how to enable AAA on IP multicast:

```
(config) # ip multicast auto-enable
```

# ip multicast-routing

To enable IP multicast routing, use the **ip multicast-routing** command in global configuration mode. To disable IP multicast routing, use the **no** form of this command.

**ip multicast-routing** [**vrf** *vrf-name*]  
**no ip multicast-routing** [**vrf** *vrf-name*]

|                           |                                                                                                                                                                             |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>vrf</b> (Optional) Enables IP multicast routing for the Multicast VPN routing and forwarding (MVRP) <i>vrf-name</i> instance specified for the <i>vrf-name</i> argument. |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                        |                                   |
|------------------------|-----------------------------------|
| <b>Command Default</b> | IP multicast routing is disabled. |
|------------------------|-----------------------------------|

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

| <b>Command History</b> | Release                     | Modification                 |
|------------------------|-----------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

|                         |                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | When IP multicast routing is disabled, the Cisco IOS XE software does not forward any multicast packets. |
|-------------------------|----------------------------------------------------------------------------------------------------------|

|             |                                                                                                                                                                                                                              |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Note</b> | For IP multicast, after enabling IP multicast routing, PIM must be configured on all interfaces. Disabling IP multicast routing does not remove PIM; PIM still must be explicitly removed from the interface configurations. |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

The following example shows how to enable IP multicast routing:

```
Device> enable
Device# configure terminal
Device(config)# ip multicast-routing
```

The following example shows how to enable IP multicast routing on a specific VRF:

```
Device(config)# ip multicast-routing vrf vrf1
```

| <b>Related Commands</b> | Command       | Description                  |
|-------------------------|---------------|------------------------------|
|                         | <b>ip pim</b> | Enables PIM on an interface. |

## ip pim accept-register

To configure a candidate rendezvous point (RP) switch to filter Protocol Independent Multicast (PIM) register messages, use the **ip pim accept-register** command in global configuration mode. To disable this function, use the **no** form of this command.

```
ip pim [vrf vrf-name ] accept-register {list access-list}
no ip pim [vrf vrf-name ] accept-register
```

|                    |
