| Datagrams: Rcvd      | Number of update packets received from a neighbor.                                                                                                                                                                                                                                                                 |
| retransmit           | Number of packets retransmitted.                                                                                                                                                                                                                                                                                   |
| fastretransmit       | Number of duplicate acknowledgments retransmitted for an out of order segment before the retransmission timer expires.                                                                                                                                                                                             |
| partialack           | Number of retransmissions for partial acknowledgments (transmissions before or without subsequent acknowledgments).                                                                                                                                                                                                |
| Second Congestion    | Number of second retransmissions sent due to congestion.                                                                                                                                                                                                                                                           |

### show ip bgp neighbors (4-Byte Autonomous System Numbers)

The following partial example shows output for several external BGP neighbors in autonomous systems with 4-byte autonomous system numbers, 65536 and 65550. This example requires Cisco IOS Release 12.0(32)SY8, 12.0(33)S3, 12.2(33)SRE, 12.2(33)XNE, 12.2(33)SXII, Cisco IOS XE Release 2.4, or a later release.

Device#**show ip bgp neighbors**

```
BGP neighbor is 192.168.1.2, remote AS 65536, external link
  BGP version 4, remote router ID 0.0.0.0
  BGP state = Idle
  Last read 02:03:38, last write 02:03:38, hold time is 120, keepalive interval is 70
seconds
  Configured hold time is 120, keepalive interval is 70 seconds
  Minimum holdtime from neighbor is 0 seconds
.
.
.
BGP neighbor is 192.168.3.2, remote AS 65550, external link
  Description: finance
  BGP version 4, remote router ID 0.0.0.0
  BGP state = Idle
  Last read 02:03:48, last write 02:03:48, hold time is 120, keepalive interval is 70
seconds
  Configured hold time is 120, keepalive interval is 70 seconds
  Minimum holdtime from neighbor is 0 seconds
```

### show ip bgp neighbors advertised-routes

The following example displays routes advertised for only the 172.16.232.178 neighbor:

Device#**show ip bgp neighbors 172.16.232.178 advertised-routes**

```
BGP table version is 27, local router ID is 172.16.232.181
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete
Network          Next Hop          Metric LocPrf Weight Path
*>i10.0.0.0      172.16.232.179      0      100      0 ?
*> 10.20.2.0     10.0.0.0             0           32768 i
```

The table below describes the significant fields shown in the display.

**Table 152: show ip bgp neighbors advertised-routes Field Descriptions**

| Field             | Description                                                                                                                                                     |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BGP table version | Internal version number of the table. This is the primary routing table with which the neighbor has been updated. The number increments when the table changes. |
| local router ID   | IP address of the local BGP speaker.                                                                                                                            |

| Field        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status codes | Status of the table entry. The status is displayed at the beginning of each line in the table. It can be one of the following values: <ul style="list-style-type: none"> <li>• s—The table entry is suppressed.</li> <li>• d—The table entry is dampened and will not be advertised to BGP neighbors.</li> <li>• h—The table entry does not contain the best path based on historical information.</li> <li>• *—The table entry is valid.</li> <li>• &gt;—The table entry is the best entry to use for that network.</li> <li>• i—The table entry was learned via an internal BGP (iBGP) session.</li> </ul> |
| Origin codes | Origin of the entry. The origin code is placed at the end of each line in the table. It can be one of the following values: <ul style="list-style-type: none"> <li>• i—Entry originated from Interior Gateway Protocol (IGP) and was advertised with a <b>network</b> router configuration command.</li> <li>• e—Entry originated from Exterior Gateway Protocol (EGP).</li> <li>• ?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP.</li> </ul>                                                                                                        |
| Network      | IP address of a network entity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Next Hop     | IP address of the next system used to forward a packet to the destination network. An entry of 0.0.0.0 indicates that there are non-BGP routes in the path to the destination network.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Metric       | If shown, this is the value of the interautonomous system metric. This field is not used frequently.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| LocPrf       | Local preference value as set with the <b>set local-preference</b> route-map configuration command. The default value is 100.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Weight       | Weight of the route as set via autonomous system filters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Path         | Autonomous system paths to the destination network. There can be one entry in this field for each autonomous system in the path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

### show ip bgp neighbors check-control-plane-failure

The following is sample output from the **show ip bgp neighbors** command entered with the **check-control-plane-failure** option configured:

```
Device#show ip bgp neighbors 10.10.10.1
```

```
BGP neighbor is 10.10.10.1, remote AS 10, internal link
  Fall over configured for session
  BFD is configured. BFD peer is Up. Using BFD to detect fast fallover (single-hop) with
  c-bit check-control-plane-failure.
```

```

Inherits from template cbit-tps for session parameters
BGP version 4, remote router ID 10.7.7.7
BGP state = Established, up for 00:03:55
Last read 00:00:02, last write 00:00:21, hold time is 180, keepalive interval is 60 seconds

Neighbor sessions:
  1 active, is not multiseession capable (disabled)
Neighbor capabilities:
  Route refresh: advertised and received(new)
  Four-octets ASN Capability: advertised and received
  Address family IPv4 Unicast: advertised and received
  Enhanced Refresh Capability: advertised and received
  Multiseession Capability:
  Stateful switchover support enabled: NO for session 1

```

### show ip bgp neighbors paths

The following is sample output from the **show ip bgp neighbors** command entered with the **paths** keyword:

```
Device#show ip bgp neighbors 172.29.232.178 paths 10
```

```

Address      Refcount Metric Path
0x60E577B0      2      40 10 ?

```

The table below describes the significant fields shown in the display.

**Table 153: show ip bgp neighbors paths Field Descriptions**

| Field    | Description                                                                                                         |
|----------|---------------------------------------------------------------------------------------------------------------------|
| Address  | Internal address where the path is stored.                                                                          |
| Refcount | Number of routes using that path.                                                                                   |
| Metric   | Multi Exit Discriminator (MED) metric for the path. (The name of this metric for BGP versions 2 and 3 is INTER_AS.) |
| Path     | Autonomous system path for that route, followed by the origin code for that route.                                  |

### show ip bgp neighbors received prefix-filter

The following example shows that a prefix list that filters all routes in the 10.0.0.0 network has been received from the 192.168.20.72 neighbor:

```
Device#show ip bgp neighbors 192.168.20.72 received prefix-filter
```

```

Address family:IPv4 Unicast
ip prefix-list 192.168.20.72:1 entries
  seq 5 deny 10.0.0.0/8 le 32

```

The table below describes the significant fields shown in the display.

**Table 154: show ip bgp neighbors received prefix-filter Field Descriptions**

| Field          | Description                                                 |
|----------------|-------------------------------------------------------------|
| Address family | Address family mode in which the prefix filter is received. |
| ip prefix-list | Prefix list sent from the specified neighbor.               |

**show ip bgp neighbors policy**

The following sample output shows the policies applied to the neighbor at 192.168.1.2. The output displays both inherited policies and policies configured on the neighbor device. Inherited policies are policies that the neighbor inherits from a peer group or a peer-policy template.

```
Device#show ip bgp neighbors 192.168.1.2 policy
Neighbor: 192.168.1.2, Address-Family: IPv4 Unicast
Locally configured policies:
  route-map ROUTE in
Inherited policies:
  prefix-list NO-MARKETING in
  route-map ROUTE in
  weight 300
  maximum-prefix 10000
```

**BGP Attribute Filter and Enhanced Attribute Error Handling**

The following is sample output from the **show ip bgp neighbors** command that indicates the discard attribute values and treat-as-withdraw attribute values configured. It also provides a count of received Updates matching a treat-as-withdraw attribute, a count of received Updates matching a discard attribute, and a count of received malformed Updates that are treat-as-withdraw.

```
Device#show ip bgp vpnv4 all neighbors 10.0.103.1

BGP neighbor is 10.0.103.1, remote AS 100, internal link
Path-attribute treat-as-withdraw inbound
Path-attribute treat-as-withdraw value 128
Path-attribute treat-as-withdraw 128 in: count 2

```

**BGP Additional Paths**

The following output indicates that the neighbor is capable of advertising additional paths and sending additional paths it receives. It is also capable of receiving additional paths and advertised paths.

```
Device#show ip bgp neighbors 10.108.50.2
```

```

BGP neighbor is 10.108.50.2, remote AS 1, internal link
BGP version 4, remote router ID 192.168.252.252
BGP state = Established, up for 00:24:25
Last read 00:00:24, last write 00:00:24, hold time is 180, keepalive interval is 60 seconds

Neighbor capabilities:
  Additional paths Send: advertised and received
  Additional paths Receive: advertised and received
  Route refresh: advertised and received(old & new)
  Graceful Restart Capabilty: advertised and received
  Address family IPv4 Unicast: advertised and received

```

### BGP—Multiple Cluster IDs

In the following output, the cluster ID of the neighbor is displayed. (The vertical bar and letter “i” for “include” cause the device to display only lines that include the user's input after the “i”, in this case, “cluster-id.”) The cluster ID displayed is the one directly configured through a neighbor or a template.

```

Device#show ip bgp neighbors 192.168.2.2 | i cluster-id

Configured with the cluster-id 192.168.15.6

```

### BGP Peak Prefix Watermark

The following sample output shows the peak watermarks and their timestamps displayed for the peak number of route entries per neighbor bases:

```

Device#show ip bgp ipv4 unicast neighbors 11.11.11.11

BGP neighbor is 11.11.11.11, remote AS 1, internal link
BGP version 4, remote router ID 0.0.0.0
BGP state = Idle, down for 00:01:43
Neighbor sessions:
  0 active, is not multisession capable (disabled)
Stateful switchover support enabled: NO
Do log neighbor state changes (via global configuration)
Default minimum time between advertisement runs is 0 seconds

```

```

For address family: IPv4 Unicast
BGP table version 27, neighbor version 1/27
Output queue size : 0
Index 0, Advertise bit 0
Slow-peer detection is disabled
Slow-peer split-update-group dynamic is disabled

```

|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bgp asnotation dot</b>                        | Changes the default display and the regular expression match format of BGP 4-byte autonomous system numbers from asplain (decimal values) to dot notation.                       |
| <b>bgp enhanced-error</b>                        | Restores the default behavior of treating Update messages that have a malformed attribute as withdrawn, or includes iBGP peers in the Enhanced Attribute Error Handling feature. |
| <b>neighbor path-attribute discard</b>           | Configures the device to discard unwanted Update messages from the specified neighbor that contain a specified path attribute.                                                   |
| <b>neighbor path-attribute treat-as-withdraw</b> | Configures the device to withdraw from the specified neighbor unwanted Update messages that contain a specified attribute.                                                       |
| <b>neighbor send-label</b>                       | Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router.                                                                                            |
| <b>neighbor send-label explicit-null</b>         | Enables a BGP router to send MPLS labels with explicit-null information for a CSC-CE router and BGP routes to a neighboring CSC-PE router.                                       |
| <b>router bgp</b>                                | Configures the BGP routing process.                                                                                                                                              |

# show ip eigrp interfaces

To display information about interfaces that are configured for the Enhanced Interior Gateway Routing Protocol (EIGRP), use the **show ip eigrp interfaces** command in user EXEC or privileged EXEC mode.

**show ip eigrp** [*vrf vrf-name*] [*autonomous-system-number*] **interfaces** [*type number*] [{**detail**}]

| Syntax Description | <b>vrf</b> <i>vrf-name</i>      | (Optional) Displays information about the specified virtual routing and forwarding (VRF) instance.                                                                       |
|--------------------|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | <i>autonomous-system-number</i> | (Optional) Autonomous system number whose output needs to be filtered.                                                                                                   |
|                    | <i>type</i>                     | (Optional) Interface type. For more information, use the question mark (?) online help function.                                                                         |
|                    | <i>number</i>                   | (Optional) Interface or subinterface number. For more information about the numbering syntax for your networking device, use the question mark (?) online help function. |
|                    | <b>detail</b>                   | (Optional) Displays detailed information about EIGRP interfaces for a specific EIGRP process.                                                                            |

| Command Modes | User EXEC (>)       |
|---------------|---------------------|
|               | Privileged EXEC (#) |

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

| Usage Guidelines | <p>Use the <b>show ip eigrp interfaces</b> command to display active EIGRP interfaces and EIGRP-specific interface settings and statistics. The optional <i>type number</i> argument and the <b>detail</b> keyword can be entered in any order.</p> <p>If an interface is specified, only information about that interface is displayed. Otherwise, information about all interfaces on which EIGRP is running is displayed.</p> <p>If an autonomous system is specified, only the routing process for the specified autonomous system is displayed. Otherwise, all EIGRP processes are displayed.</p> <p>This command can be used to display information about EIGRP named and EIGRP autonomous system configurations.</p> <p>This command displays the same information as the <b>show eigrp address-family interfaces</b> command. Cisco recommends using the <b>show eigrp address-family interfaces</b> command.</p> |

## Examples

The following is sample output from the **show ip eigrp interfaces** command:

```
Device#show ip eigrp interfaces
EIGRP-IPv4 Interfaces for AS(60)
      Xmit Queue    Mean    Pacing Time    Multicast    Pending
```

| Interface | Peers | Un/Reliable | SRTT | Un/Reliable | Flow Timer | Routes |
|-----------|-------|-------------|------|-------------|------------|--------|
| Di0       | 0     | 0/0         | 0    | 11/434      | 0          | 0      |
| Et0       | 1     | 0/0         | 337  | 0/10        | 0          | 0      |
| SE0:1.16  | 1     | 0/0         | 10   | 1/63        | 103        | 0      |
| Tu0       | 1     | 0/0         | 330  | 0/16        | 0          | 0      |

The following sample output from the **show ip eigrp interfaces detail** command displays detailed information about all active EIGRP interfaces:

```
Device#show ip eigrp interfaces detail
```

```
EIGRP-IPv4 Interfaces for AS(1)
                                Xmit Queue  PeerQ           Mean    Pacing Time    Multicast    Pending
Interface      Peers  Un/Reliable  Un/Reliable  SRTT    Un/Reliable  Flow Timer    Routes
Et0/0          1      0/0         0/0         525     0/2         3264         0
Hello-interval is 5, Hold-time is 15
  Split-horizon is enabled
  Next xmit serial <none>
  Packetized sent/expedited: 3/0
  Hello's sent/expedited: 6/2
  Un/reliable mcasts: 0/6  Un/reliable ucasts: 7/4
  Mcast exceptions: 1  CR packets: 1  ACKs suppressed: 0
  Retransmissions sent: 1  Out-of-sequence rcvd: 0
  Topology-ids on interface - 0
  Authentication mode is not set
```

The following sample output from the **show ip eigrp interfaces detail** command displays detailed information about a specific interface on which the **no ip next-hop self** command is configured along with the **no-ecmp-mode** option:

```
Device#show ip eigrp interfaces detail tunnel 0
```

```
EIGRP-IPv4 Interfaces for AS(1)
                                Xmit Queue  PeerQ           Mean    Pacing Time    Multicast    Pending
Interface      Peers  Un/Reliable  Un/Reliable  SRTT    Un/Reliable  Flow Timer    Routes
Tu0/0          2      0/0         0/0         2       0/0         50           0
Hello-interval is 5, Hold-time is 15
  Split-horizon is disabled
  Next xmit serial <none>
  Packetized sent/expedited: 24/3
  Hello's sent/expedited: 28083/9
  Un/reliable mcasts: 0/19  Un/reliable ucasts: 18/64
  Mcast exceptions: 5  CR packets: 5  ACKs suppressed: 0
  Retransmissions sent: 52  Out-of-sequence rcvd: 2
  Next-hop-self disabled, next-hop info forwarded, ECMP mode Enabled
  Topology-ids on interface - 0
  Authentication mode is not set
```

The table below describes the significant fields shown in the displays.

**Table 155: show ip eigrp interfaces Field Descriptions**

| Field     | Description                                   |
|-----------|-----------------------------------------------|
| Interface | Interface on which EIGRP is configured.       |
| Peers     | Number of directly connected EIGRP neighbors. |

| Field                     | Description                                                                                                                                                              |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PeerQ Un/Reliable         | Number of unreliable and reliable packets queued for transmission to specific peers on the interface.                                                                    |
| Xmit Queue Un/Reliable    | Number of packets remaining in the Unreliable and Reliable transmit queues.                                                                                              |
| Mean SRTT                 | Mean smooth round-trip time (SRTT) interval (in seconds).                                                                                                                |
| Pacing Time Un/Reliable   | Pacing time (in seconds) used to determine when EIGRP packets (unreliable and reliable) should be sent out of the interface .                                            |
| Multicast Flow Timer      | Maximum number of seconds for which the device will send multicast EIGRP packets.                                                                                        |
| Pending Routes            | Number of routes in the transmit queue waiting to be sent.                                                                                                               |
| Packetized sent/expedited | Number of EIGRP routes that have been prepared for sending packets to neighbors on an interface, and the number of times multiple routes were stored in a single packet. |
| Hello's sent/expedited    | Number of EIGRP hello packets that have been sent on an interface and packets that were expedited.                                                                       |

**Related Commands**

| Command                                     | Description                                                                |
|---------------------------------------------|----------------------------------------------------------------------------|
| <b>show eigrp address-family interfaces</b> | Displays information about address family interfaces configured for EIGRP. |
| <b>show ip eigrp neighbors</b>              | Displays neighbors discovered by EIGRP.                                    |

# show ip eigrp neighbors

To display neighbors discovered by the Enhanced Interior Gateway Routing Protocol (EIGRP), use the **show ip eigrp neighbors** command in privileged EXEC mode.

**show ip eigrp** [**vrf** *vrf-name*] [*autonomous-system-number*] **neighbors** [{**static**|**detail**}] [*interface-type interface-number*]

## Syntax Description

|                                        |                                                                                                |
|----------------------------------------|------------------------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i>             | (Optional) Displays information about the specified VPN Routing and Forwarding (VRF) instance. |
| <i>autonomous-system-number</i>        | (Optional) Autonomous-system-number-specific output is displayed.                              |
| <b>static</b>                          | (Optional) Displays static neighbors.                                                          |
| <b>detail</b>                          | (Optional) Displays detailed neighbor information.                                             |
| <i>interface-type interface-number</i> | (Optional) Interface-specific output is displayed.                                             |

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **show ip eigrp neighbors** command can be used to display information about EIGRP named and EIGRP autonomous-system configurations. Use the **show ip eigrp neighbors** command to display dynamic and static neighbor states. You can use this command for also debugging certain types of transport problems.

This command displays the same information as the **show eigrp address-family neighbors** command. Cisco recommends that you use the **show eigrp address-family neighbors** command.

## Examples

The following is sample output from the **show ip eigrp neighbors** command:

```
Device#show ip eigrp neighbors
```

| H | Address  | Interface | Hold (sec) | Uptime   | SRTT (ms) | RTO  | Q Cnt | Seq Num |
|---|----------|-----------|------------|----------|-----------|------|-------|---------|
| 0 | 10.1.1.2 | Et0/0     | 13         | 00:00:03 | 1996      | 5000 | 0     | 5       |
| 2 | 10.1.1.9 | Et0/0     | 14         | 00:02:24 | 206       | 5000 | 0     | 5       |
| 1 | 10.1.2.3 | Et0/1     | 11         | 00:20:39 | 2202      | 5000 | 0     | 5       |

The table below describes the significant fields shown in the display.

**Table 156: show ip eigrp neighbors Field Descriptions**

| Field     | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| Address   | IP address of the EIGRP peer.                                           |
| Interface | Interface on which the router is receiving hello packets from the peer. |

| Field   | Description                                                                                                                                                                               |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hold    | Time in seconds for which EIGRP waits to hear from the peer before declaring it down.                                                                                                     |
| Uptime  | Elapsed time (in hours:minutes: seconds) since the local router first heard from this neighbor.                                                                                           |
| SRTT    | Smooth round-trip time. This is the number of milliseconds required for an EIGRP packet to be sent to this neighbor and for the local router to receive an acknowledgment of that packet. |
| RTO     | Retransmission timeout (in milliseconds). This is the amount of time the software waits before resending a packet from the retransmission queue to a neighbor.                            |
| Q Cnt   | Number of EIGRP packets (update, query, and reply) that the software is waiting to send.                                                                                                  |
| Seq Num | Sequence number of the last update, query, or reply packet that was received from this neighbor.                                                                                          |

The following is sample output from the **show ip eigrp neighbors detail** command:

```
Device#show ip eigrp neighbors detail
```

```
EIGRP-IPv4 VR(foo) Address-Family Neighbors for AS(1)
H   Address                Interface      Hold Uptime    SRTT   RTO   Q   Seq
                               (sec)         (ms)          Cnt Num
0   192.168.10.1            Gi2/0         12 00:00:21 1600   5000   0   3
    Static neighbor (Lisp Encap)

    Topology-ids from peer - 0
```

The table below describes the significant fields shown in the display.

**Table 157: show ip eigrp neighbors detail Field Descriptions**

| Field      | Description                                                                                                                                                                               |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| H          | This column lists the order in which a peering session was established with the specified neighbor. The order is specified with sequential numbering starting with 0.                     |
| Address    | IP address of the EIGRP peer.                                                                                                                                                             |
| Interface  | Interface on which the router is receiving hello packets from the peer.                                                                                                                   |
| Hold       | Time in seconds for which EIGRP waits to hear from the peer before declaring it down.                                                                                                     |
| Lisp Encap | Indicates that routes from this neighbor are LISP encapsulated.                                                                                                                           |
| Uptime     | Elapsed time (in hours:minutes: seconds) since the local router first heard from this neighbor.                                                                                           |
| SRTT       | Smooth round-trip time. This is the number of milliseconds required for an EIGRP packet to be sent to this neighbor and for the local router to receive an acknowledgment of that packet. |
| RTO        | Retransmission timeout (in milliseconds). This is the amount of time the software waits before resending a packet from the retransmission queue to a neighbor.                            |
| Q Cnt      | Number of EIGRP packets (update, query, and reply) that the software is waiting to send.                                                                                                  |

| Field   | Description                                                                                      |
|---------|--------------------------------------------------------------------------------------------------|
| Seq Num | Sequence number of the last update, query, or reply packet that was received from this neighbor. |
| Version | The software version that the specified peer is running.                                         |
| Retrans | Number of times that a packet has been retransmitted.                                            |
| Retries | Number of times an attempt was made to retransmit a packet.                                      |

**Related Commands**

|--------------------------------------------|-----------------------------------------|
| <b>show eigrp address-family neighbors</b> | Displays neighbors discovered by EIGRP. |

# show ip eigrp topology

To display Enhanced Interior Gateway Routing Protocol (EIGRP) topology table entries, use the **show ip eigrp topology** command in user EXEC or privileged EXEC mode.

**show ip eigrp topology** [{ *network* [{ *mask* }] *prefix* | **active** | **all-links** | **detail-links** | **pending** | **secondary-paths** | **summary** | **zero-successors** }]

| Syntax Description | <i>network</i>         | (Optional) Network address.                                                                                                                      |
|--------------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | <i>mask</i>            | (Optional) Network mask.                                                                                                                         |
|                    | <i>prefix</i>          | (Optional) Network prefix in the format <i>&lt;network&gt;/&lt;length&gt;</i> , for example, 192.168.0.0/16.                                     |
|                    | <b>active</b>          | (Optional) Displays all topology entries that are in the active state.                                                                           |
|                    | <b>all-links</b>       | (Optional) Displays all the entries in the EIGRP topology table (including nonfeasible successor sources).                                       |
|                    | <b>detail-links</b>    | (Optional) Displays all the topology entries with additional details.                                                                            |
|                    | <b>pending</b>         | (Optional) Displays all the entries in the EIGRP topology table that are either waiting for an update from a neighbor or to reply to a neighbor. |
|                    | <b>secondary-paths</b> | (Optional) Displays the secondary paths in the topology.                                                                                         |
|                    | <b>summary</b>         | (Optional) Displays a summary of the EIGRP topology table.                                                                                       |
|                    | <b>zero-successors</b> | (Optional) Displays the available routes that have zero successors.                                                                              |

**Command Default** If this command is used without any of the optional keywords, only topology entries with feasible successors are displayed and only feasible paths are shown.

**Command Modes** User EXEC (>)  
Privileged EXEC (#)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Use the **show ip eigrp topology** command to display topology entries, feasible and nonfeasible paths, metrics, and states. This command can be used without any arguments or keywords to display only topology entries with feasible successors and feasible paths. The **all-links** keyword displays all the paths, whether feasible or not, and the **detail-links** keyword displays additional details about these paths.

Use this command to display information about EIGRP named and EIGRP autonomous system configurations. This command displays the same information as the **show eigrp address-family topology** command. We recommend that you use the **show eigrp address-family topology** command.

## Examples

The following is a sample output from the **show ip eigrp topology** command:

```
Device# show ip eigrp topology

EIGRP-IPv4 Topology Table for AS(1)/ID(10.0.0.1)
Codes: P - Passive, A - Active, U - Update, Q - Query, R - Reply,
       r - Reply status, s - sia status
P 10.0.0.0/8, 1 successors, FD is 409600
    via 192.0.2.1 (409600/128256), Ethernet0/0
P 192.16.1.0/24, 1 successors, FD is 409600
    via 192.0.2.1 (409600/128256), Ethernet0/0
P 10.0.0.0/8, 1 successors, FD is 281600
    via Summary (281600/0), Null0
P 10.0.1.0/24, 1 successors, FD is 281600
    via Connected, Ethernet0/0
```

The following is a sample output from the **show ip eigrp topology prefix** command, and displays detailed information about a single prefix. The prefix shown is an EIGRP internal route.

```
Device# show ip eigrp topology 10.0.0.0/8

EIGRP-IPv4 VR(vr1) Topology Entry for AS(1)/ID(10.1.1.2) for 10.0.0.0/8
State is Passive, Query origin flag is 1, 1 Successor(s), FD is 82329600, RIB is 643200
Descriptor Blocks:
  10.1.1.1 (Ethernet2/0), from 10.1.1.1, Send flag is 0x0
    Composite metric is (82329600/163840), route is Internal
    Vector metric:
      Minimum bandwidth is 16000 Kbit
      Total delay is 631250000 picoseconds
      Reliability is 255/255
      Load is 1/5
      Minimum MTU is 1500
      Hop count is 1
      Originating router is 10.1.1.1
```

The following is a sample output from the **show ip eigrp topology prefix** command, and displays detailed information about a single prefix. The prefix shown is an EIGRP external route.

```
Device# show ip eigrp topology 192.16.1.0/24

EIGRP-IPv4 Topology Entry for AS(1)/ID(10.0.0.1) for 192.16.1.0/24
State is Passive, Query origin flag is 1, 1 Successor(s), FD is 409600, RIB is 643200
Descriptor Blocks:
  172.16.1.0/24 (Ethernet0/0), from 10.0.1.2, Send flag is 0x0
    Composite metric is (409600/128256), route is External
    Vector metric:
      Minimum bandwidth is 10000 Kbit
      Total delay is 6000 picoseconds
      Reliability is 255/255
      Load is 1/5
      Minimum MTU is 1500
      Hop count is 1
      Originating router is 192.16.1.0/24
    External data:
      AS number of route is 0
      External protocol is Connected, external metric is 0
      Administrator tag is 0 (0x00000000)
```

The following is a sample output from the **show ip eigrp topology prefix** command displays Equal Cost Multipath (ECMP) mode information when the **no ip next-hop-self** command is configured without the **no-ecmp-mode** keyword in an EIGRP topology. The ECMP mode provides information

about the path that is being advertised. If there is more than one successor, the top-most path is advertised as the default path over all the interfaces, and ECMP Mode: Advertise by default is displayed in the output. If any path other than the default path is advertised, ECMP Mode: Advertise out <Interface name> is displayed.

The topology table displays entries of routes for a particular prefix. The routes are sorted based on metric, next-hop, and infosource. In a Dynamic Multipoint VPN (DMVPN) scenario, routes with the same metric and next hop are sorted based on infosource. The top route in the ECMP is always advertised.

```
Device# show ip eigrp topology 192.168.10.0/24

EIGRP-IPv4 Topology Entry for AS(1)/ID(10.10.100.100) for 192.168.10.0/24
State is Passive, Query origin flag is 1, 2 Successor(s), FD is 284160
Descriptor Blocks:
  10.100.1.0 (Tunnel0), from 10.100.0.1, Send flag is 0x0
    Composite metric is (284160/281600), route is Internal
    Vector metric:
      Minimum bandwidth is 10000 Kbit
      Total delay is 1100 microseconds
      Reliability is 255/255
      Load is 1/55
      Minimum MTU is 1400
      Hop count is 1
      Originating router is 10.10.1.1
      ECMP Mode: Advertise by default
  10.100.0.2 (Tunnel1), from 10.100.0.2, Send flag is 0x0
    Composite metric is (284160/281600), route is Internal
    Vector metric:
      Minimum bandwidth is 10000 Kbit
      Total delay is 1100 microseconds
      Reliability is 255/255
      Load is 1/55
      Minimum MTU is 1400
      Hop count is 1
      Originating router is 10.10.2.2
      ECMP Mode: Advertise out Tunnel1
```

The following is a sample output from the **show ip eigrp topology all-links** command, and displays all the paths, including those that are not feasible:

```
Device# show ip eigrp topology all-links

EIGRP-IPv4 Topology Table for AS(1)/ID(10.0.0.1)
Codes: P - Passive, A - Active, U - Update, Q - Query, R - Reply,
       r - reply Status, s - sia Status
P 172.16.1.0/24, 1 successors, FD is 409600, serno 14
   via 10.10.1.2 (409600/128256), Ethernet0/0
   via 10.1.4.3 (2586111744/2585599744), Serial3/0, serno 18
```

The following is a sample output from the **show ip eigrp topology detail-links** command, and displays additional details about routes:

```
Device# show ip eigrp topology detail-links

EIGRP-IPv4 Topology Table for AS(1)/ID(10.0.0.1)
Codes: P - Passive, A - Active, U - Update, Q - Query, R - Reply,
       r - reply Status, s - sia Status
P 10.0.0.0/8, 1 successors, FD is 409600, serno 6
   via 10.10.1.2 (409600/128256), Ethernet0/0
P 172.16.1.0/24, 1 successors, FD is 409600, serno 14
   via 10.10.1.2 (409600/128256), Ethernet0/0
P 10.0.0.0/8, 1 successors, FD is 281600, serno 3
```

```

      via Summary (281600/0), Null0
P 10.1.1.0/24, 1 successors, FD is 281600, serno 1
      via Connected, Ethernet0/0

```

The following table describes the significant fields shown in the above examples:

**Table 158: show ip eigrp topology Field Descriptions**

| Field      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Codes      | <p>State of this topology table entry. Passive and Active refer to the EIGRP state with respect to the destination. Update, Query, and Reply refer to the type of packet that is being sent.</p> <ul style="list-style-type: none"> <li>• P - Passive: Indicates that no EIGRP computations are being performed for this route.</li> <li>• A - Active: Indicates that EIGRP computations are being performed for this route.</li> <li>• U - Update: Indicates that a pending update packet is waiting to be sent for this route.</li> <li>• Q - Query: Indicates that a pending query packet is waiting to be sent for this route.</li> <li>• R - Reply: Indicates that a pending reply packet is waiting to be sent for this route.</li> <li>• r - Reply status: Indicates that EIGRP has sent a query for the route and is waiting for a reply from the specified path.</li> <li>• s - sia status: Indicates that the EIGRP query packet is in stuck-in-active (SIA) status.</li> </ul> |
| successors | Number of successors. This number corresponds to the number of next hops in the IP routing table. If successors is capitalized, then the route or the next hop is in a transition state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| serno      | Serial number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| FD         | Feasible distance. This is the best metric to reach the destination or the best metric that was known when the route became active. This value is used in the feasibility condition check. If the reported distance of the device is less than the feasible distance, the feasibility condition is met and that route becomes a feasible successor. After the software determines that it has a feasible successor, the software need not send a query for that destination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| via        | Next-hop address that advertises the passive route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|-------------------------------------------|--------------------------------------------------------------|
| <b>show eigrp address-family topology</b> | Displays entries in the EIGRP address-family topology table. |

# show ip eigrp traffic

To display the number of Enhanced Interior Gateway Routing Protocol (EIGRP) packets sent and received, use the **show ip eigrp traffic** command in privileged EXEC mode.

**show ip eigrp** [**vrf** {*vrf-name* | \*}] [*autonomous-system-number*] **traffic**

## Syntax Description

|                                 |                                                          |
|---------------------------------|----------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i>      | (Optional) Displays information about the specified VRF. |
| <b>vrf</b> *                    | (Optional) Displays information about all VRFs.          |
| <i>autonomous-system-number</i> | (Optional) Autonomous system number.                     |

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

This command can be used to display information about EIGRP named configurations and EIGRP autonomous-system (AS) configurations.

This command displays the same information as the **show eigrp address-family traffic** command. Cisco recommends using the **show eigrp address-family traffic** command.

## Examples

The following is sample output from the **show ip eigrp traffic** command:

```
Device#show ip eigrp traffic
EIGRP-IPv4 Traffic Statistics for AS(60)
Hellos sent/received: 21429/2809
Updates sent/received: 22/17
Queries sent/received: 0/0
Replies sent/received: 0/0
Acks sent/received: 16/13
SIA-Queries sent/received: 0/0
SIA-Replies sent/received: 0/0
Hello Process ID: 204
PDM Process ID: 203
Socket Queue: 0/2000/2/0 (current/max/highest/drops)
Input Queue: 0/2000/2/0 (current/max/highest/drops)
```

The table below describes the significant fields shown in the display.

**Table 159: show ip eigrp traffic Field Descriptions**

| Field                 | Description                                 |
|-----------------------|---------------------------------------------|
| Hellos sent/received  | Number of hello packets sent and received.  |
| Updates sent/received | Number of update packets sent and received. |
| Queries sent/received | Number of query packets sent and received.  |

| Field                     | Description                                                 |
|---------------------------|-------------------------------------------------------------|
| Replies sent/received     | Number of reply packets sent and received.                  |
| Acks sent/received        | Number of acknowledgement packets sent and received.        |
| SIA-Queries sent/received | Number of stuck in active query packets sent and received.  |
| SIA-Replies sent/received | Number of stuck in active reply packets sent and received.  |
| Hello Process ID          | Hello process identifier.                                   |
| PDM Process ID            | Protocol-dependent module IOS process identifier.           |
| Socket Queue              | The IP to EIGRP Hello Process socket queue counters.        |
| Input queue               | The EIGRP Hello Process to EIGRP PDM socket queue counters. |

## Examples

The following is sample output from the **show ip ospf** command when entered without a specific OSPF process ID:

Device#**show ip ospf**

```

Routing Process "ospf 201" with ID 10.0.0.1 and Domain ID 10.20.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
LSA group pacing timer 100 secs
Interface flood pacing timer 55 msec
Retransmission pacing timer 100 msec
Number of external LSA 0. Checksum Sum 0x0
Number of opaque AS LSA 0. Checksum Sum 0x0
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 2. 2 normal 0 stub 0 nssa
External flood list length 0
  Area BACKBONE(0)
    Number of interfaces in this area is 2
    Area has message digest authentication
    SPF algorithm executed 4 times
    Area ranges are
      Number of LSA 4. Checksum Sum 0x29BEB
      Number of opaque link LSA 0. Checksum Sum 0x0
      Number of DCbitless LSA 3
      Number of indication LSA 0
      Number of DoNotAge LSA 0
      Flood list length 0
  Area 172.16.26.0
    Number of interfaces in this area is 0
    Area has no authentication
    SPF algorithm executed 1 times
    Area ranges are
      192.168.0.0/16 Passive Advertise
    Number of LSA 1. Checksum Sum 0x44FD
    Number of opaque link LSA 0. Checksum Sum 0x0
    Number of DCbitless LSA 1

```

```

Number of indication LSA 1
Number of DoNotAge LSA 0
Flood list length 0

```

### Cisco IOS Release 12.2(18)SXE, 12.0(31)S, and 12.4(4)T

The following is sample output from the **show ip ospf** command to verify that the BFD feature has been enabled for OSPF process 123. The relevant command output is shown in bold in the output.

Device#**show ip ospf**

```

Routing Process "ospf 123" with ID 172.16.10.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Initial SPF schedule delay 5000 msec
Minimum hold time between two consecutive SPF's 10000 msec
Maximum wait time between two consecutive SPF's 10000 msec
Incremental-SPF disabled
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msec
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msec
Retransmission pacing timer 66 msec
Number of external LSA 0. Checksum Sum 0x000000
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 1. 1 normal 0 stub 0 nssa
External flood list length 0
BFD is enabled
Area BACKBONE(0)
  Number of interfaces in this area is 2
  Area has no authentication
  SPF algorithm last executed 00:00:03.708 ago
  SPF algorithm executed 27 times
  Area ranges are
  Number of LSA 3. Checksum Sum 0x00AEF1
  Number of opaque link LSA 0. Checksum Sum 0x000000
  Number of DCbitless LSA 0
  Number of indication LSA 0
  Number of DoNotAge LSA 0
  Flood list length 0

```

The table below describes the significant fields shown in the display.

**Table 160: show ip ospf Field Descriptions**

| Field                                       | Description                                                      |
|---------------------------------------------|------------------------------------------------------------------|
| Routing process "ospf 201" with ID 10.0.0.1 | Process ID and OSPF router ID.                                   |
| Supports...                                 | Number of types of service supported (Type 0 only).              |
| SPF schedule delay                          | Delay time (in seconds) of SPF calculations.                     |
| Minimum LSA interval                        | Minimum interval (in seconds) between link-state advertisements. |

| Field                                          | Description                                                             |
|------------------------------------------------|-------------------------------------------------------------------------|
| LSA group pacing timer                         | Configured LSA group pacing timer (in seconds).                         |
| Interface flood pacing timer                   | Configured LSA flood pacing timer (in milliseconds).                    |
| Retransmission pacing timer                    | Configured LSA retransmission pacing timer (in milliseconds).           |
| Number of external LSA                         | Number of external link-state advertisements.                           |
| Number of opaque AS LSA                        | Number of opaque link-state advertisements.                             |
| Number of DCbitless external and opaque AS LSA | Number of demand circuit external and opaque link-state advertisements. |
| Number of DoNotAge external and opaque AS LSA  | Number of do not age external and opaque link-state advertisements.     |
| Number of areas in this router is              | Number of areas configured for the router.                              |
| External flood list length                     | External flood list length.                                             |
| BFD is enabled                                 | BFD has been enabled on the OSPF process.                               |

The following is an excerpt of output from the **show ip ospf** command when the OSPF Forwarding Address Suppression in Type-5 LSAs feature is configured:

```

Device#show ip ospf
.
.
.
Area 2
  Number of interfaces in this area is 4
  It is a NSSA area
  Perform type-7/type-5 LSA translation, suppress forwarding address
.
.
.
Routing Process "ospf 1" with ID 192.168.0.1
  Supports only single TOS(TOS0) routes
  Supports opaque LSA
  Supports Link-local Signaling (LLS)

  Number of DoNotAge external and opaque AS LSA 0
  Number of areas in this router is 0. 0 normal 0 stub 0 nssa
  External flood list length 0

```

The table below describes the significant fields shown in the display.

**Table 161: show ip ospf Field Descriptions**

| Field                                          | Description                                                                                                                                    |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Area                                           | OSPF area and tag.                                                                                                                             |
| Number of interfaces...                        | Number of interfaces configured in the area.                                                                                                   |
| It is...                                       | Possible types are internal, area border, or autonomous system boundary.                                                                       |
| Routing process “ospf 1” with ID 192.168.0.1   | Process ID and OSPF router ID.                                                                                                                 |
| Supports...                                    | Number of types of service supported (Type 0 only).                                                                                            |
| Initial SPF schedule delay                     | Delay time of SPF calculations at startup.                                                                                                     |
| Minimum hold time                              | Minimum hold time (in milliseconds) between consecutive SPF calculations.                                                                      |
| Maximum wait time                              | Maximum wait time (in milliseconds) between consecutive SPF calculations.                                                                      |
| Incremental-SPF                                | Status of incremental SPF calculations.                                                                                                        |
| Minimum LSA...                                 | Minimum time interval (in seconds) between link-state advertisements, and minimum arrival time (in milliseconds) of link-state advertisements, |
| LSA group pacing timer                         | Configured LSA group pacing timer (in seconds).                                                                                                |
| Interface flood pacing timer                   | Configured LSA flood pacing timer (in milliseconds).                                                                                           |
| Retransmission pacing timer                    | Configured LSA retransmission pacing timer (in milliseconds).                                                                                  |
| Number of...                                   | Number and type of link-state advertisements that have been received.                                                                          |
| Number of external LSA                         | Number of external link-state advertisements.                                                                                                  |
| Number of opaque AS LSA                        | Number of opaque link-state advertisements.                                                                                                    |
| Number of DCbitless external and opaque AS LSA | Number of demand circuit external and opaque link-state advertisements.                                                                        |
| Number of DoNotAge external and opaque AS LSA  | Number of do not age external and opaque link-state advertisements.                                                                            |
| Number of areas in this router is              | Number of areas configured for the router listed by type.                                                                                      |
| External flood list length                     | External flood list length.                                                                                                                    |

The following is sample output from the **show ip ospf** command. In this example, the user had configured the **redistribution maximum-prefix** command to set a limit of 2000 redistributed routes. SPF throttling was configured with the **timer throttlespf** command.

```
Device#show ip ospf 1
Routing Process "ospf 1" with ID 10.0.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
It is an autonomous system boundary router
Redistributing External Routes from,
    static, includes subnets in redistribution
    Maximum limit of redistributed prefixes 2000
    Threshold for warning message 75%
Initial SPF schedule delay 5000 msec
Minimum hold time between two consecutive SPF's 10000 msec
Maximum wait time between two consecutive SPF's 10000 msec
```

The table below describes the significant fields shown in the display.

**Table 162: show ip ospf Field Descriptions**

| Field                                           | Description                                                                                                                                                                                            |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Routing process "ospf 1" with ID 10.0.0.1       | Process ID and OSPF router ID.                                                                                                                                                                         |
| Supports ...                                    | Number of Types of Service supported.                                                                                                                                                                  |
| It is ...                                       | Possible types are internal, area border, or autonomous system boundary router.                                                                                                                        |
| Redistributing External Routes from             | Lists of redistributed routes, by protocol.                                                                                                                                                            |
| Maximum limit of redistributed prefixes         | Value set in the <b>redistribution maximum-prefix</b> command to set a limit on the number of redistributed routes.                                                                                    |
| Threshold for warning message                   | Percentage set in the <b>redistribution maximum-prefix</b> command for the threshold number of redistributed routes needed to cause a warning message. The default is 75 percent of the maximum limit. |
| Initial SPF schedule delay                      | Delay (in milliseconds) before initial SPF schedule for SPF throttling. Configured with the <b>timer throttlespf</b> command.                                                                          |
| Minimum hold time between two consecutive SPF's | Minimum hold time (in milliseconds) between two consecutive SPF calculations for SPF throttling. Configured with the <b>timer throttlespf</b> command.                                                 |
| Maximum wait time between two consecutive SPF's | Maximum wait time (in milliseconds) between two consecutive SPF calculations for SPF throttling. Configured with the <b>timer throttlespf</b> command.                                                 |
| Number of areas                                 | Number of areas in router, area addresses, and so on.                                                                                                                                                  |

The following is sample output from the **show ip ospf** command. In this example, the user had configured LSA throttling, and those lines of output are displayed in bold.

```

Device#show ip ospf 1
Routing Process "ospf 4" with ID 10.10.24.4
  Supports only single TOS(TOS0) routes
  Supports opaque LSA
  Supports Link-local Signaling (LLS)
  Initial SPF schedule delay 5000 msec
  Minimum hold time between two consecutive SPF calculations 10000 msec
  Maximum wait time between two consecutive SPF calculations 10000 msec
  Incremental-SPF disabled
  Initial LSA throttle delay 100 msec
  Minimum hold time for LSA throttle 10000 msec

Maximum wait time for LSA throttle 45000 msec
Minimum LSA arrival 1000 msec
  LSA group pacing timer 240 secs
  Interface flood pacing timer 33 msec
  Retransmission pacing timer 66 msec
  Number of external LSA 0. Checksum Sum 0x0
  Number of opaque AS LSA 0. Checksum Sum 0x0
  Number of DCbitless external and opaque AS LSA 0
  Number of DoNotAge external and opaque AS LSA 0
  Number of areas in this router is 1. 1 normal 0 stub 0 nssa
  External flood list length 0
    Area 24
      Number of interfaces in this area is 2
      Area has no authentication
      SPF algorithm last executed 04:28:18.396 ago
      SPF algorithm executed 8 times
      Area ranges are
      Number of LSA 4. Checksum Sum 0x23EB9
      Number of opaque link LSA 0. Checksum Sum 0x0
      Number of DCbitless LSA 0
      Number of indication LSA 0
      Number of DoNotAge LSA 0
      Flood list length 0

```

The following is sample **show ip ospf** command. In this example, the user had configured the **redistribution maximum-prefix** command to set a limit of 2000 redistributed routes. SPF throttling was configured with the **timer throttle spf** command.

```

Device#show ip ospf 1
Routing Process "ospf 1" with ID 192.168.0.0
  Supports only single TOS(TOS0) routes
  Supports opaque LSA
  Supports Link-local Signaling (LLS)
  It is an autonomous system boundary router
  Redistributing External Routes from,
    static, includes subnets in redistribution
    Maximum limit of redistributed prefixes 2000
    Threshold for warning message 75%
  Initial SPF schedule delay 5000 msec
  Minimum hold time between two consecutive SPF calculations 10000 msec
  Maximum wait time between two consecutive SPF calculations 10000 msec

```

The table below describes the significant fields shown in the display.

Table 163: show ip ospf Field Descriptions

| Field                                         | Description                                                                                                                                                                                           |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Routing process “ospf 1” with ID 192.168.0.0. | Process ID and OSPF router ID.                                                                                                                                                                        |
| Supports ...                                  | Number of TOS supported.                                                                                                                                                                              |
| It is ...                                     | Possible types are internal, area border, or autonomous system boundary routers.                                                                                                                      |
| Redistributing External Routes from           | Lists of redistributed routes, by protocol.                                                                                                                                                           |
| Maximum limit of redistributed prefixes       | Value set in the <b>redistributionmaximum-prefix</b> command to set a limit on the number of redistributed routes.                                                                                    |
| Threshold for warning message                 | Percentage set in the <b>redistributionmaximum-prefix</b> command for the threshold number of redistributed routes needed to cause a warning message. The default is 75 percent of the maximum limit. |
| Initial SPF schedule delay                    | Delay (in milliseconds) before the initial SPF schedule for SPF throttling. Configured with the <b>timersthrottlespf</b> command.                                                                     |
| Minimum hold time between two consecutive SPF | Minimum hold time (in milliseconds) between two consecutive SPF calculations for SPF throttling. Configured with the <b>timersthrottlespf</b> command.                                                |
| Maximum wait time between two consecutive SPF | Maximum wait time (in milliseconds) between two consecutive SPF calculations for SPF throttling. Configured with the <b>timersthrottlespf</b> command.                                                |
| Number of areas                               | Number of areas in router, area addresses, and so on.                                                                                                                                                 |

# show ip ospf border-routers

To display the internal Open Shortest Path First (OSPF) routing table entries to an Area Border Router (ABR) and Autonomous System Boundary Router (ASBR), use the **show ip ospf border-routers** command in privileged EXEC mode.

**show ip ospf border-routers**

## Syntax Description

This command has no arguments or keywords.

## Command Modes

Privileged EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

The following is sample output from the **show ip ospf border-routers** command:

```
Device#show ip ospf border-routers
OSPF Process 109 internal Routing Table
Codes: i - Intra-area route, I - Inter-area route
i 192.168.97.53 [10] via 172.16.1.53, Serial0, ABR, Area 0.0.0.3, SPF 3
i 192.168.103.51 [10] via 192.168.96.51, Serial0, ABR, Area 0.0.0.3, SPF 3
I 192.168.103.52 [22] via 192.168.96.51, Serial0, ASBR, Area 0.0.0.3, SPF 3
I 192.168.103.52 [22] via 172.16.1.53, Serial0, ASBR, Area 0.0.0.3, SPF 3
```

The table below describes the significant fields shown in the display.

**Table 164: show ip ospf border-routers Field Descriptions**

| Field           | Description                                                                                |
|-----------------|--------------------------------------------------------------------------------------------|
| 192.168.97.53   | Router ID of the destination.                                                              |
| [10]            | Cost of using this route.                                                                  |
| via 172.16.1.53 | Next hop toward the destination.                                                           |
| Serial0         | Interface type for the outgoing interface.                                                 |
| ABR             | The router type of the destination; it is either an ABR or ASBR or both.                   |
| Area            | The area ID of the area from which this route is learned.                                  |
| SPF 3           | The internal number of the shortest path first (SPF) calculation that installs this route. |

## show ip ospf database

To display lists of information related to the Open Shortest Path First (OSPF) database for a specific router, use the **show ip ospf database** command in EXEC mode.

```

show ip ospf [process-id area-id] database
show ip ospf [process-id area-id] database [adv-router [ip-address]]
show ip ospf [process-id area-id] database [asbr-summary] [link-state-id]
show ip ospf [process-id area-id] database [asbr-summary] [link-state-id] [adv-router [ip-address]]
show ip ospf [process-id area-id] database [asbr-summary] [link-state-id] [self-originate]
[link-state-id]
show ip ospf [process-id area-id] database [database-summary]
show ip ospf [process-id] database [external] [link-state-id]
show ip ospf [process-id] database [external] [link-state-id] [adv-router [ip-address]]
show ip ospf [process-id area-id] database [external] [link-state-id] [self-originate] [link-state-id]
show ip ospf [process-id area-id] database [network] [link-state-id]
show ip ospf [process-id area-id] database [network] [link-state-id] [adv-router [ip-address]]
show ip ospf [process-id area-id] database [network] [link-state-id] [self-originate] [link-state-id]
show ip ospf [process-id area-id] database [nssa-external] [link-state-id]
show ip ospf [process-id area-id] database [nssa-external] [link-state-id] [adv-router [ip-address]]
show ip ospf [process-id area-id] database [nssa-external] [link-state-id] [self-originate] [link-state-id]
show ip ospf [process-id area-id] database [router] [link-state-id]
show ip ospf [process-id area-id] database [router] [adv-router [ip-address]]
show ip ospf [process-id area-id] database [router] [self-originate] [link-state-id]
show ip ospf [process-id area-id] database [self-originate] [link-state-id]
show ip ospf [process-id area-id] database [summary] [link-state-id]
show ip ospf [process-id area-id] database [summary] [link-state-id] [adv-router [ip-address]]
show ip ospf [process-id area-id] database [summary] [link-state-id] [self-originate] [link-state-id]

```

### Syntax Description

|                                |                                                                                                                                                                                                  |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>process-id</i>              | (Optional) Internal identification. It is locally assigned and can be any positive integer. The number used here is the number assigned administratively when enabling the OSPF routing process. |
| <i>area-id</i>                 | (Optional) Area number associated with the OSPF address range defined in the <b>network</b> router configuration command used to define the particular area.                                     |
| <b>adv-router</b> [ip-address] | (Optional) Displays all the LSAs of the specified router. If no IP address is included, the information is about the local router itself (in this case, the same as <b>self-originate</b> ).     |

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>link-state-id</i>    | <p>(Optional) Portion of the Internet environment that is being described by the advertisement. The value entered depends on the advertisement's LS type. It must be entered in the form of an IP address.</p> <p>When the link state advertisement is describing a network, the <i>link-state-id</i> can take one of two forms:</p> <p>The network's IP address (as in type 3 summary link advertisements and in autonomous system external link advertisements).</p> <p>A derived address obtained from the link state ID. (Note that masking a network links advertisement's link state ID with the network's subnet mask yields the network's IP address.)</p> <p>When the link state advertisement is describing a router, the link state ID is always the described router's OSPF router ID.</p> <p>When an autonomous system external advertisement (LS Type = 5) is describing a default route, its link state ID is set to Default Destination (0.0.0.0).</p> |
| <b>asbr-summary</b>     | (Optional) Displays information only about the autonomous system boundary router summary LSAs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>database-summary</b> | (Optional) Displays how many of each type of LSA for each area there are in the database, and the total.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>external</b>         | (Optional) Displays information only about the external LSAs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>network</b>          | (Optional) Displays information only about the network LSAs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>nssa-external</b>    | (Optional) Displays information only about the NSSA external LSAs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>router</b>           | (Optional) Displays information only about the router LSAs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>self-originate</b>   | (Optional) Displays only self-originated LSAs (from the local router).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>summary</b>          | (Optional) Displays information only about the summary LSAs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Command Modes** EXEC

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The various forms of this command deliver information about different OSPF link state advertisements.

**Examples** The following is sample output from the **show ip ospf database** command when no arguments or keywords are used:

```

Device#show ip ospf database
OSPF Router with id(192.168.239.66) (Process ID 300)
      Displaying Router Link States(Area 0.0.0.0)
  Link ID        ADV Router    Age         Seq#         Checksum     Link count
172.16.21.6     172.16.21.6    1731       0x80002CFB   0x69BC       8

```

```

172.16.21.5    172.16.21.5    1112    0x800009D2    0xA2B8    5
172.16.1.2    172.16.1.2    1662    0x80000A98    0x4CB6    9
172.16.1.1    172.16.1.1    1115    0x800009B6    0x5F2C    1
172.16.1.5    172.16.1.5    1691    0x80002BC    0x2A1A    5
172.16.65.6    172.16.65.6    1395    0x80001947    0xEEE1    4
172.16.241.5    172.16.241.5    1161    0x8000007C    0x7C70    1
172.16.27.6    172.16.27.6    1723    0x80000548    0x8641    4
172.16.70.6    172.16.70.6    1485    0x80000B97    0xEB84    6
    Displaying Net Link States(Area 0.0.0.0)
    Link ID      ADV Router      Age      Seq#      Checksum
172.16.1.3    192.168.239.66    1245    0x800000EC    0x82E
    Displaying Summary Net Link States(Area 0.0.0.0)
    Link ID      ADV Router      Age      Seq#      Checksum
172.16.240.0    172.16.241.5    1152    0x80000077    0x7A05
172.16.241.0    172.16.241.5    1152    0x80000070    0xAEB7

```

The table below describes the significant fields shown in the display.

**Table 165: show ip ospf Database Field Descriptions**

| Field      | Description                                                                      |
|------------|----------------------------------------------------------------------------------|
| Link ID    | Router ID number.                                                                |
| ADV Router | Advertising router's ID.                                                         |
| Age        | Link state age.                                                                  |
| Seq#       | Link state sequence number (detects old or duplicate link state advertisements). |
| Checksum   | Fletcher checksum of the complete contents of the link state advertisement.      |
| Link count | Number of interfaces detected for router.                                        |

The following is sample output from the **show ip ospf database asbr-summary** command with the **asbr-summary** keyword:

```

Device#show ip ospf database asbr-summary
OSPF Router with id(192.168.239.66) (Process ID 300)
    Displaying Summary ASB Link States(Area 0.0.0.0)
    LS age: 1463
    Options: (No TOS-capability)
    LS Type: Summary Links(AS Boundary Router)
    Link State ID: 172.16.245.1 (AS Boundary Router address)
    Advertising Router: 172.16.241.5
    LS Seq Number: 80000072
    Checksum: 0x3548
    Length: 28
    Network Mask: 0.0.0.0 TOS: 0 Metric: 1

```

The table below describes the significant fields shown in the display.

**Table 166: show ip ospf database asbr-summary Field Descriptions**

| Field               | Description       |
|---------------------|-------------------|
| OSPF Router with id | Router ID number. |
| Process ID          | OSPF process ID.  |

| Field              | Description                                                                               |
|--------------------|-------------------------------------------------------------------------------------------|
| LS age             | Link state age.                                                                           |
| Options            | Type of service options (Type 0 only).                                                    |
| LS Type            | Link state type.                                                                          |
| Link State ID      | Link state ID (autonomous system boundary router).                                        |
| Advertising Router | Advertising router's ID.                                                                  |
| LS Seq Number      | Link state sequence (detects old or duplicate link state advertisements).                 |
| Checksum           | LS checksum (Fletcher checksum of the complete contents of the link state advertisement). |
| Length             | Length in bytes of the link state advertisement.                                          |
| Network Mask       | Network mask implemented.                                                                 |
| TOS                | Type of service.                                                                          |
| Metric             | Link state metric.                                                                        |

The following is sample output from the **show ip ospf database** command with the **external** keyword:

```
Device#show ip ospf database external
OSPF Router with id(192.168.239.66) (Autonomous system 300)
    Displaying AS External Link States
LS age: 280
Options: (No TOS-capability)
LS Type: AS External Link
Link State ID: 10.105.0.0 (External Network Number)
Advertising Router: 172.16.70.6
LS Seq Number: 80000AFD
Checksum: 0xC3A
Length: 36
Network Mask: 255.255.0.0
    Metric Type: 2 (Larger than any link state path)
    TOS: 0
    Metric: 1
    Forward Address: 0.0.0.0
    External Route Tag: 0
```

The table below describes the significant fields shown in the display.

**Table 167: show ip ospf database external Field Descriptions**

| Field               | Description                                      |
|---------------------|--------------------------------------------------|
| OSPF Router with id | Router ID number.                                |
| Autonomous system   | OSPF autonomous system number (OSPF process ID). |
| LS age              | Link state age.                                  |
| Options             | Type of service options (Type 0 only).           |

| Field              | Description                                                                                                                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LS Type            | Link state type.                                                                                                                                                                                                          |
| Link State ID      | Link state ID (external network number).                                                                                                                                                                                  |
| Advertising Router | Advertising router's ID.                                                                                                                                                                                                  |
| LS Seq Number      | Link state sequence number (detects old or duplicate link state advertisements).                                                                                                                                          |
| Checksum           | LS checksum (Fletcher checksum of the complete contents of the LSA).                                                                                                                                                      |
| Length             | Length in bytes of the link state advertisement.                                                                                                                                                                          |
| Network Mask       | Network mask implemented.                                                                                                                                                                                                 |
| Metric Type        | External Type.                                                                                                                                                                                                            |
| TOS                | Type of service.                                                                                                                                                                                                          |
| Metric             | Link state metric.                                                                                                                                                                                                        |
| Forward Address    | Forwarding address. Data traffic for the advertised destination will be forwarded to this address. If the forwarding address is set to 0.0.0.0, data traffic will be forwarded instead to the advertisement's originator. |
| External Route Tag | External route tag, a 32-bit field attached to each external route. This is not used by the OSPF protocol itself.                                                                                                         |

The following is sample output from the **show ip ospf database** command with the **network** keyword:

```

Device#show ip ospf database network
  OSPF Router with id(192.168.239.66) (Process ID 300)

| Summary Net                | Number of summary link state advertisements in that area.                                             |
| Summary ASBR               | Number of summary autonomous system boundary router (ASBR) link state advertisements in that area.    |
| Type-7 Ext                 | Type-7 LSA count.                                                                                     |
| Self-originated Type-7     | Self-originated Type-7 LSA.                                                                           |
| Opaque Link                | Type-9 LSA count.                                                                                     |
| Opaque Area                | Type-10 LSA count                                                                                     |
| Subtotal                   | Sum of LSAs for that area.                                                                            |
| Delete                     | Number of link state advertisements that are marked "Deleted" in that area.                           |
| Maxage                     | Number of link state advertisements that are marked "Maxaged" in that area.                           |
| Process 1 database summary | Database summary for the process.                                                                     |
| Count                      | Count of LSAs of the type identified in the first column.                                             |
| Router                     | Number of router link state advertisements in that process.                                           |
| Network                    | Number of network link state advertisements in that process.                                          |
| Summary Net                | Number of summary link state advertisements in that process.                                          |
| Summary ASBR               | Number of summary autonomous system boundary router (ASBR) link state advertisements in that process. |
| Type-7 Ext                 | Type-7 LSA count.                                                                                     |
| Opaque Link                | Type-9 LSA count.                                                                                     |
| Opaque Area                | Type-10 LSA count.                                                                                    |
| Type-5 Ext                 | Type-5 LSA count.                                                                                     |
| Self-Originated Type-5     | Self-originated Type-5 LSA count.                                                                     |
| Opaque AS                  | Type-11 LSA count.                                                                                    |
| Total                      | Sum of LSAs for that process.                                                                         |
| Delete                     | Number of link state advertisements that are marked "Deleted" in that process.                        |
| Maxage                     | Number of link state advertisements that are marked "Maxaged" in that process.                        |

# show ip ospf interface

To display interface information related to Open Shortest Path First (OSPF), use the **show ip ospf interface** command in user EXEC or privileged EXEC mode.

**show ip** [**ospf**] [*process-id*] **interface** [*type number*] [**brief**] [**multicast**] [**topology** {*topology-name* | **base**}]

## Syntax Description

|                                      |                                                                                                                                                      |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>process-id</i>                    | (Optional) Process ID number. If this argument is included, only information for the specified routing process is included. The range is 1 to 65535. |
| <i>type</i>                          | (Optional) Interface type. If the <i>type</i> argument is included, only information for the specified interface type is included.                   |
| <i>number</i>                        | (Optional) Interface number. If the <i>number</i> argument is included, only information for the specified interface number is included.             |
| <b>brief</b>                         | (Optional) Displays brief overview information for OSPF interfaces, states, addresses and masks, and areas on the device.                            |
| <b>multicast</b>                     | (Optional) Displays multicast information.                                                                                                           |
| <b>topology</b> <i>topology-name</i> | (Optional) Displays OSPF-related information about the named topology instance.                                                                      |
| <b>topology base</b>                 | (Optional) Displays OSPF-related information about the base topology.                                                                                |

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

The following is sample output from the **show ip ospf interface** command when Ethernet interface 0/0 is specified:

```
Device#show ip ospf interface ethernet 0/0
```

```
Ethernet0/0 is up, line protocol is up
Internet Address 192.168.254.202/24, Area 0
Process ID 1, Router ID 192.168.99.1, Network Type BROADCAST, Cost: 10
Topology-MTID      Cost      Disabled      Shutdown      Topology Name
   0                10          no            no              Base
Transmit Delay is 1 sec, State DR, Priority 1
Designated Router (ID) 192.168.99.1, Interface address 192.168.254.202
Backup Designated router (ID) 192.168.254.10, Interface address 192.168.254.10
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
  oob-resync timeout 40
  Hello due in 00:00:05
Supports Link-local Signaling (LLS)
Cisco NSF helper support enabled
```

```

IETF NSF helper support enabled
Index 1/1, flood queue length 0
Next 0x0(0)/0x0(0)
Last flood scan length is 1, maximum is 1
Last flood scan time is 0 msec, maximum is 0 msec
Neighbor Count is 1, Adjacent neighbor count is 1
  Adjacent with neighbor 192.168.254.10  (Backup Designated Router)
Suppress hello for 0 neighbor(s)

```

In Cisco IOS Release 12.2(33)SRB, the following sample output from the **show ip ospf interface brief topology VOICE** command shows a summary of information, including a confirmation that the Multitopology Routing (MTR) VOICE topology is configured in the interface configuration:

```
Device#show ip ospf interface brief topology VOICE
```

```

VOICE Topology (MTID 10)
Interface  PID  Area          IP Address/Mask  Cost  State Nbrs F/C
Lo0        1    0            10.0.0.2/32      1     LOOP  0/0
Se2/0      1    0            10.1.0.2/30      10    P2P   1/1

```

The following sample output from the **show ip ospf interface brief topology VOICE** command displays details of the MTR VOICE topology for the interface. When the command is entered without the **brief** keyword, more information is displayed.

```
Device#show ip ospf interface topology VOICE
```

```

                                VOICE Topology (MTID 10)
Loopback0 is up, line protocol is up
  Internet Address 10.0.0.2/32, Area 0
  Process ID 1, Router ID 10.0.0.2, Network Type LOOPBACK
  Topology-MTID    Cost    Disabled    Shutdown    Topology Name
    10             1      no         no          VOICE
  Loopback interface is treated as a stub Host Serial2/0 is up, line protocol is up
  Internet Address 10.1.0.2/30, Area 0
  Process ID 1, Router ID 10.0.0.2, Network Type POINT_TO_POINT
  Topology-MTID    Cost    Disabled    Shutdown    Topology Name
    10             10     no         no          VOICE
  Transmit Delay is 1 sec, State POINT_TO_POINT
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
    oob-resync timeout 40
    Hello due in 00:00:03
  Supports Link-local Signaling (LLS)
  Cisco NSF helper support enabled
  IETF NSF helper support enabled
  Index 1/1, flood queue length 0
  Next 0x0(0)/0x0(0)
  Last flood scan length is 1, maximum is 1
  Last flood scan time is 0 msec, maximum is 0 msec
  Neighbor Count is 1, Adjacent neighbor count is 1
    Adjacent with neighbor 10.0.0.1
  Suppress hello for 0 neighbor(s)

```

In Cisco IOS Release 12.2(33)SRC, the following sample output from the **show ip ospf interface** command displays details about the configured Time-to-Live (TTL) limits:

```
Device#show ip ospf interface ethernet 0
```

```

.
.
.
Strict TTL checking enabled
! or a message similar to the following is displayed
Strict TTL checking enabled, up to 4 hops allowed

```

.

.

.

The table below describes the significant fields shown in the displays.

**Table 172: show ip ospf interface Field Descriptions**

| Field                                             | Description                                                                                                                                                            |
|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ethernet                                          | Status of the physical link and operational status of the protocol.                                                                                                    |
| Process ID                                        | OSPF process ID.                                                                                                                                                       |
| Area                                              | OSPF area.                                                                                                                                                             |
| Cost                                              | Administrative cost assigned to the interface.                                                                                                                         |
| State                                             | Operational state of the interface.                                                                                                                                    |
| Nbrs F/C                                          | OSPF neighbor count.                                                                                                                                                   |
| Internet Address                                  | Interface IP address, subnet mask, and area address.                                                                                                                   |
| Topology-MTID                                     | MTR topology Multitopology Identifier (MTID). A number assigned so that the protocol can identify the topology associated with information that it sends to its peers. |
| Transmit Delay                                    | Transmit delay in seconds, interface state, and device priority.                                                                                                       |
| Designated Router                                 | Designated router ID and respective interface IP address.                                                                                                              |
| Backup Designated router                          | Backup designated router ID and respective interface IP address.                                                                                                       |
| Timer intervals configured                        | Configuration of timer intervals.                                                                                                                                      |
| Hello                                             | Number of seconds until the next hello packet is sent out this interface.                                                                                              |
| Strict TTL checking enabled                       | Only one hop is allowed.                                                                                                                                               |
| Strict TTL checking enabled, up to 4 hops allowed | A set number of hops has been explicitly configured.                                                                                                                   |
| Neighbor Count                                    | Count of network neighbors and list of adjacent neighbors.                                                                                                             |

# show ip ospf neighbor

To display Open Shortest Path First (OSPF) neighbor information on a per-interface basis, use the **show ip ospf neighbor** command in privileged EXEC mode.

**show ip ospf neighbor** [*interface-type interface-number*] [*neighbor-id*] [**detail**] [**summary**] [**per-instance**]

## Syntax Description

|                                        |                                                                                                                                           |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <i>interface-type interface-number</i> | (Optional) Type and number associated with a specific OSPF interface.                                                                     |
| <i>neighbor-id</i>                     | (Optional) Neighbor hostname or IP address in A.B.C.D format.                                                                             |
| <b>detail</b>                          | (Optional) Displays all neighbors given in detail (lists all neighbors).                                                                  |
| <b>summary</b>                         | (Optional) Displays total number summary of all neighbors.                                                                                |
| <b>per-instance</b>                    | (Optional) Displays total number of neighbors in each neighbor state. The output is printed for each configured OSPF instance separately. |

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

The following sample output from the **show ip ospf neighbor** command shows a single line of summary information for each neighbor:

```
Device#show ip ospf neighbor
```

```
Neighbor ID    Pri   State           Dead Time   Address           Interface
10.199.199.137 1     FULL/DR         0:00:31    192.168.80.37    Ethernet0
172.16.48.1    1     FULL/DROTHER    0:00:33    172.16.48.1      Fddi0
172.16.48.200  1     FULL/DROTHER    0:00:33    172.16.48.200    Fddi0
10.199.199.137 5     FULL/DR         0:00:33    172.16.48.189    Fddi0
```

The following is sample output showing summary information about the neighbor that matches the neighbor ID:

```
Device#show ip ospf neighbor 10.199.199.137
```

```
Neighbor 10.199.199.137, interface address 192.168.80.37
  In the area 0.0.0.0 via interface Ethernet0
  Neighbor priority is 1, State is FULL
  Options 2
  Dead timer due in 0:00:32
  Link State retransmission due in 0:00:04
Neighbor 10.199.199.137, interface address 172.16.48.189
  In the area 0.0.0.0 via interface Fddi0
  Neighbor priority is 5, State is FULL
  Options 2
  Dead timer due in 0:00:32
```

```
Link State retransmission due in 0:00:03
```

If you specify the interface along with the neighbor ID, the system displays the neighbors that match the neighbor ID on the interface, as in the following sample display:

```
Device#show ip ospf neighbor ethernet 0 10.199.199.137

Neighbor 10.199.199.137, interface address 192.168.80.37
  In the area 0.0.0.0 via interface Ethernet0
  Neighbor priority is 1, State is FULL
  Options 2
  Dead timer due in 0:00:37
  Link State retransmission due in 0:00:04
```

You can also specify the interface without the neighbor ID to show all neighbors on the specified interface, as in the following sample display:

```
Device#show ip ospf neighbor fddi 0
```

| ID             | Pri | State        | Dead Time | Address       | Interface |
|----------------|-----|--------------|-----------|---------------|-----------|
| 172.16.48.1    | 1   | FULL/DROTHER | 0:00:33   | 172.16.48.1   | Fddi0     |
| 172.16.48.200  | 1   | FULL/DROTHER | 0:00:32   | 172.16.48.200 | Fddi0     |
| 10.199.199.137 | 5   | FULL/DR      | 0:00:32   | 172.16.48.189 | Fddi0     |

The following is sample output from the **show ip ospf neighbor detail** command:

```
Device#show ip ospf neighbor detail

Neighbor 192.168.5.2, interface address 10.225.200.28
  In the area 0 via interface GigabitEthernet1/0/0
  Neighbor priority is 1, State is FULL, 6 state changes
  DR is 10.225.200.28 BDR is 10.225.200.30
  Options is 0x42
  LLS Options is 0x1 (LR), last OOB-Resync 00:03:08 ago
  Dead timer due in 00:00:36
  Neighbor is up for 00:09:46
  Index 1/1, retransmission queue length 0, number of retransmission 1
  First 0x0(0)/0x0(0) Next 0x0(0)/0x0(0)
  Last retransmission scan length is 1, maximum is 1
  Last retransmission scan time is 0 msec, maximum is 0 msec
```

The table below describes the significant fields shown in the displays.

**Table 173: show ip ospf neighbor detail Field Descriptions**

| Field             | Description                                                                                                                           |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Neighbor          | Neighbor router ID.                                                                                                                   |
| interface address | IP address of the interface.                                                                                                          |
| In the area       | Area and interface through which the OSPF neighbor is known.                                                                          |
| Neighbor priority | Router priority of the neighbor and neighbor state.                                                                                   |
| State             | OSPF state. If one OSPF neighbor has enabled TTL security, the other side of the connection will show the neighbor in the INIT state. |

| Field                           | Description                                                                                                                                                                                                                                                            |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| state changes                   | Number of state changes since the neighbor was created. This value can be reset using the <b>clearipospfcountersneighbor</b> command.                                                                                                                                  |
| DR is                           | Router ID of the designated router for the interface.                                                                                                                                                                                                                  |
| BDR is                          | Router ID of the backup designated router for the interface.                                                                                                                                                                                                           |
| Options                         | Hello packet options field contents. (E-bit only. Possible values are 0 and 2; 2 indicates area is not a stub; 0 indicates area is a stub.)                                                                                                                            |
| LLS Options..., last OOB-Resync | Link-Local Signaling and out-of-band (OOB) link-state database resynchronization performed hours:minutes:seconds ago. This is nonstop forwarding (NSF) information. The field indicates the last successful out-of-band resynchronization with the NSF-capable router. |
| Dead timer due in               | Expected time in hours:minutes:seconds before Cisco IOS software will declare the neighbor dead.                                                                                                                                                                       |
| Neighbor is up for              | Number of hours:minutes:seconds since the neighbor went into the two-way state.                                                                                                                                                                                        |
| Index                           | Neighbor location in the area-wide and autonomous system-wide retransmission queue.                                                                                                                                                                                    |
| retransmission queue length     | Number of elements in the retransmission queue.                                                                                                                                                                                                                        |
| number of retransmission        | Number of times update packets have been re-sent during flooding.                                                                                                                                                                                                      |
| First                           | Memory location of the flooding details.                                                                                                                                                                                                                               |
| Next                            | Memory location of the flooding details.                                                                                                                                                                                                                               |
| Last retransmission scan length | Number of link state advertisements (LSAs) in the last retransmission packet.                                                                                                                                                                                          |
| maximum                         | Maximum number of LSAs sent in any retransmission packet.                                                                                                                                                                                                              |
| Last retransmission scan time   | Time taken to build the last retransmission packet.                                                                                                                                                                                                                    |
| maximum                         | Maximum time, in milliseconds, taken to build any retransmission packet.                                                                                                                                                                                               |

The following is sample output from the **show ip ospf neighbor** command showing a single line of summary information for each neighbor. If one OSPF neighbor has enabled TTL security, the other side of the connection will show the neighbor in the INIT state.

Device#**show ip ospf neighbor**

| Neighbor ID    | Pri | State        | Dead Time | Address       | Interface |
|----------------|-----|--------------|-----------|---------------|-----------|
| 10.199.199.137 | 1   | FULL/DR      | 0:00:31   | 192.168.80.37 | Ethernet0 |
| 172.16.48.1    | 1   | FULL/DROTHER | 0:00:33   | 172.16.48.1   | Fddi0     |
| 172.16.48.200  | 1   | FULL/DROTHER | 0:00:33   | 172.16.48.200 | Fddi0     |

```

10.199.199.137 5 FULL/DR 0:00:33 172.16.48.189 Fddi0
172.16.1.201 1 INIT/DROTHER 00.00.35 10.1.1.201 Ethernet0/0

```

### Cisco IOS Release 15.1(3)S

The following sample output from the **show ip ospf neighbor** command shows the network from the neighbor's point of view:

```

Device#show ip ospf neighbor 192.0.2.1
      OSPF Router with ID (192.1.1.1) (Process ID 1)

      Area with ID (0)

Neighbor with Router ID 192.0.2.1:
  Reachable over:
    Ethernet0/0, IP address 192.0.2.1, cost 10

  SPF was executed 1 times, distance to computing router 10

  Router distance table:
    192.1.1.1 i [10]
    192.0.2.1 i [0]
    192.3.3.3 i [10]
    192.4.4.4 i [20]
    192.5.5.5 i [20]

  Network LSA distance table:
    192.2.12.2 i [10]
    192.2.13.3 i [20]
    192.2.14.4 i [20]
    192.2.15.5 i [20]

```

The following is sample output from the **show ip ospf neighbor summary** command:

```

Device#show ip ospf neighbor summary

  Neighbor summary for all OSPF processes

DOWN          0
ATTEMPT       0
INIT          0
2WAY          0
EXSTART       0
EXCHANGE      0
LOADING       0
FULL          1
Total count   1      (Undergoing NSF 0)

```

The following is sample output from the **show ip ospf neighbor summary per-instance** command:

```

Device#show ip ospf neighbor summary

      OSPF Router with ID (1.0.0.10) (Process ID 1)

DOWN          0
ATTEMPT       0
INIT          0
2WAY          0

```

```

EXSTART      0
EXCHANGE     0
LOADING      0
FULL         1
Total count  1      (Undergoing NSF 0)

Neighbor summary for all OSPF processes

Total count  1      (Undergoing NSF 0)

```

**Table 174: show ip ospf neighbor summary and show ip ospf neighbor summary per-instance Field Descriptions**

| Field    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DOWN     | No information (hellos) has been received from this neighbor, but hello packets can still be sent to the neighbor in this state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| ATTEMPT  | This state is only valid for manually configured neighbors in a Non-Broadcast Multi-Access (NBMA) environment. In Attempt state, the router sends unicast hello packets every poll interval to the neighbor, from which hellos have not been received within the dead interval.                                                                                                                                                                                                                                                                                                                                                                                                                |
| INIT     | This state specifies that the router has received a hello packet from its neighbor, but the receiving router's ID was not included in the hello packet. When a router receives a hello packet from a neighbor, it should list the sender's router ID in its hello packet as an acknowledgment that it received a valid hello packet.                                                                                                                                                                                                                                                                                                                                                           |
| 2WAY     | This state designates that bi-directional communication has been established between two routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| EXSTART  | This state is the first step in creating an adjacency between the two neighboring routers. The goal of this step is to decide which router is active, and to decide upon the initial DD sequence number. Neighbor conversations in this state or greater are called adjacencies.                                                                                                                                                                                                                                                                                                                                                                                                               |
| EXCHANGE | In this state, OSPF routers exchange database descriptor (DBD) packets. Database descriptors contain link-state advertisement (LSA) headers only and describe the contents of the entire link-state database. Each DBD packet has a sequence number which can be incremented only by the active router which is explicitly acknowledged by the secondary router. Routers also send link-state request packets and link-state update packets (which contain the entire LSA) in this state. The contents of the DBD received are compared to the information contained in the routers link-state database to check if new or more current link-state information is available with the neighbor. |

| Field   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LOADING | In this state, the actual exchange of link state information occurs. Based on the information provided by the DBDs, routers send link-state request packets. The neighbor then provides the requested link-state information in link-state update packets. During the adjacency, if a device receives an outdated or missing LSA, it requests that LSA by sending a link-state request packet. All link-state update packets are acknowledged.                                                                               |
| FULL    | <p>In this state, devices are fully adjacent with each other. All the device and network LSAs are exchanged and the devices' databases are fully synchronized.</p> <p>Full is the normal state for an OSPF device. If a device is stuck in another state, it's an indication that there are problems in forming adjacencies. The only exception to this is the 2-way state, which is normal in a broadcast network. Devices achieve the full state with their DR and BDR only. Neighbors always see each other as 2-way.</p> |

# show ip ospf virtual-links

To display parameters and the current state of Open Shortest Path First (OSPF) virtual links, use the **show ip ospf virtual-links** command in EXEC mode.

**show ip ospf virtual-links**

## Syntax Description

This command has no arguments or keywords.

## Command Modes

EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The information displayed by the **show ip ospf virtual-links** command is useful in debugging OSPF routing operations.

## Examples

The following is sample output from the **show ip ospf virtual-links** command:

```
Device#show ip ospf virtual-links
Virtual Link to router 192.168.101.2 is up
Transit area 0.0.0.1, via interface Ethernet0, Cost of using 10
Transmit Delay is 1 sec, State POINT_TO_POINT
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
Hello due in 0:00:08
Adjacency State FULL
```

The table below describes the significant fields shown in the display.

**Table 175: show ip ospf virtual-links Field Descriptions**

| Field                                      | Description                                                                  |
|--------------------------------------------|------------------------------------------------------------------------------|
| Virtual Link to router 192.168.101.2 is up | Specifies the OSPF neighbor, and if the link to that neighbor is up or down. |
| Transit area 0.0.0.1                       | The transit area through which the virtual link is formed.                   |
| via interface Ethernet0                    | The interface through which the virtual link is formed.                      |
| Cost of using 10                           | The cost of reaching the OSPF neighbor through the virtual link.             |
| Transmit Delay is 1 sec                    | The transmit delay (in seconds) on the virtual link.                         |
| State POINT_TO_POINT                       | The state of the OSPF neighbor.                                              |
| Timer intervals...                         | The various timer intervals configured for the link.                         |
| Hello due in 0:00:08                       | When the next hello is expected from the neighbor.                           |
| Adjacency State FULL                       | The adjacency state between the neighbors.                                   |

## summary-address (OSPF)

To create aggregate addresses for Open Shortest Path First (OSPF), use the **summary-address** command in router configuration mode. To restore the default, use the no form of this command.

**summary-address** **command**  
**summary-address** {*ip-address mask* | *prefix mask*} [**not-advertise**] [**tag tag**] [**nssa-only**]  
**no summary-address** {*ip-address mask* | *prefix mask*} [**not-advertise**] [**tag tag**] [**nssa-only**]

### Syntax Description

|                      |                                                                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip-address</i>    | Summary address designated for a range of addresses.                                                                                                                    |
| <i>mask</i>          | IP subnet mask used for the summary route.                                                                                                                              |
| <i>prefix</i>        | IP route prefix for the destination.                                                                                                                                    |
| <b>not-advertise</b> | (Optional) Suppresses routes that match the specified prefix/mask pair. This keyword applies to OSPF only.                                                              |
| <b>tag tag</b>       | (Optional) Specifies the tag value that can be used as a “match” value for controlling redistribution via route maps. This keyword applies to OSPF only.                |
| <b>nssa-only</b>     | (Optional) Sets the nssa-only attribute for the summary route (if any) generated for the specified prefix, which limits the summary to not-so-stubby-area (NSSA) areas. |

### Command Default

This command behavior is disabled by default.

### Command Modes

Router configuration

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

R outes learned from other routing protocols can be summarized. The metric used to advertise the summary is the lowest metric of all the more specific routes. This command helps reduce the size of the routing table.

Using this command for OSPF causes an OSPF Autonomous System Boundary Router (ASBR) to advertise one external route as an aggregate for all redistributed routes that are covered by the address. For OSPF, this command summarizes only routes from other routing protocols that are being redistributed into OSPF. Use the **area range** command for route summarization between OSPF areas.

OSPF does not support the **summary-address 0.0.0.0 0.0.0.0** command.

### Examples

In the following example, the summary address 10.1.0.0 includes address 10.1.1.0, 10.1.2.0, 10.1.3.0, and so on. Only the address 10.1.0.0 is advertised in an external link-state advertisement.

```
Device(config)#summary-address 10.1.0.0 255.255.0.0
```

**Related Commands**

| Command                           | Description                                                                                                     |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>area range</b>                 | Consolidates and summarizes routes at an area boundary.                                                         |
| <b>ip ospf authentication-key</b> | Assigns a password to be used by neighboring routers that are using the simple password authentication of OSPF. |
| <b>ip ospf message-digest-key</b> | Enables OSPF MD5 authentication.                                                                                |

## timers throttle spf

To turn on Open Shortest Path First (OSPF) shortest path first (SPF) throttling, use the **timers throttle spf** command in the appropriate configuration mode. To turn off OSPF SPF throttling, use the **no** form of this command.

**timers throttle spf** *spf-start spf-hold spf-max-wait*  
**no timers throttle spf** *spf-start spf-hold spf-max-wait*

| <b>Syntax Description</b>    | <table border="1"> <tr> <td><i>spf-start</i></td><td>Initial delay to schedule an SPF calculation after a change, in milliseconds. Range is from 1 to 600000. In OSPF for IPv6, the default value is 5000.</td></tr> <tr> <td><i>spf-hold</i></td><td>Minimum hold time between two consecutive SPF calculations, in milliseconds. Range is from 1 to 600000. In OSPF for IPv6, the default value is 10,000.</td></tr> <tr> <td><i>spf-max-wait</i></td><td>Maximum wait time between two consecutive SPF calculations, in milliseconds. Range is from 1 to 600000. In OSPF for IPv6, the default value is 10,000.</td></tr> </table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <i>spf-start</i> | Initial delay to schedule an SPF calculation after a change, in milliseconds. Range is from 1 to 600000. In OSPF for IPv6, the default value is 5000. | <i>spf-hold</i>              | Minimum hold time between two consecutive SPF calculations, in milliseconds. Range is from 1 to 600000. In OSPF for IPv6, the default value is 10,000. | <i>spf-max-wait</i> | Maximum wait time between two consecutive SPF calculations, in milliseconds. Range is from 1 to 600000. In OSPF for IPv6, the default value is 10,000. |

| <b>Usage Guidelines</b>      | <p>The first wait interval between SPF calculations is the amount of time in milliseconds specified by the <i>spf-start</i> argument. Each consecutive wait interval is two times the current hold level in milliseconds until the wait time reaches the maximum time in milliseconds as specified by the <i>spf-max-wait</i> argument. Subsequent wait times remain at the maximum until the values are reset or a link-state advertisement (LSA) is received between SPF calculations.</p> <p><b>Release 12.2(33)SRB</b></p> <p>If you plan to configure the Multi-Topology Routing (MTR) feature, you need to enter the <b>timers throttle spf</b> command in router address family topology configuration mode in order to make this OSPF router configuration command become topology-aware.</p> <p><b>Release 15.2(1)T</b></p> <p>When you configure the <b>ospfv3 network manet</b> command on any interface attached to the OSPFv3 process, the default values for the <i>spf-start</i>, <i>spf-hold</i>, and the <i>spf-max-wait</i> arguments are reduced to 1000 milliseconds, 1000 milliseconds, and 2000 milliseconds respectively.</p> |                  |                                                                                                                                                       |                              |                                                                                                                                                        |                     |                                                                                                                                                        |
| <b>Examples</b>              | <p>The following example shows how to configure a router with the delay, hold, and maximum interval values for the <b>timers throttle spf</b> command set at 5, 1000, and 90,000 milliseconds, respectively.</p> <pre>router ospf 1  router-id 10.10.10.2</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                  |                                                                                                                                                       |                              |                                                                                                                                                        |                     |                                                                                                                                                        |

```
log-adjacency-changes
timers throttle spf 5 1000 90000
redistribute static subnets
network 10.21.21.0 0.0.0.255 area 0
network 10.22.22.0 0.0.0.255 area 00
```

The following example shows how to configure a router using IPv6 with the delay, hold, and maximum interval values for the **timers throttle spf** command set at 500, 1000, and 10,000 milliseconds, respectively.

```
ipv6 router ospf 1
event-log size 10000 one-shot
log-adjacency-changes
timers throttle spf 500 1000 10000
```

## aaa accounting

To enable authentication, authorization, and accounting (AAA) accounting of requested services for billing or security purposes when you use RADIUS or TACACS+, use the **aaa accounting** command in global configuration mode. To disable AAA accounting, use the **no** form of this command.

```
aaa accounting {auth-proxy | system | network | exec | connections | commands level}
{default | list-name} {start-stop | stop-only | none} [broadcast] group group-name
no aaa accounting {auth-proxy | system | network | exec | connections | commands level}
{default | list-name} {start-stop | stop-only | none} [broadcast] group group-name
```

| Syntax Description               |                                                                                                                                                                                                                                                                                                               |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>auth-proxy</b>                | Provides information about all authenticated-proxy user events.                                                                                                                                                                                                                                               |
| <b>system</b>                    | Performs accounting for all system-level events not associated with users, such as reloads.                                                                                                                                                                                                                   |
| <b>network</b>                   | Runs accounting for all network-related service requests.                                                                                                                                                                                                                                                     |
| <b>exec</b>                      | Runs accounting for EXEC shell session. This keyword might return user profile information such as what is generated by the <b>autocommand</b> command.                                                                                                                                                       |
| <b>connection</b>                | Provides information about all outbound connections made from the network access server.                                                                                                                                                                                                                      |
| <b>commands level</b>            | Runs accounting for all commands at the specified privilege level. Valid privilege level entries are integers from 0 through 15.                                                                                                                                                                              |
| <b>default</b>                   | Uses the listed accounting methods that follow this argument as the default list of methods for accounting services.                                                                                                                                                                                          |
| <i>list-name</i>                 | Character string used to name the list of at least one of the accounting methods described in                                                                                                                                                                                                                 |
| <b>start-stop</b>                | Sends a "start" accounting notice at the beginning of a process and a "stop" accounting notice at the end of a process. The "start" accounting record is sent in the background. The requested user process begins regardless of whether the "start" accounting notice was received by the accounting server. |
| <b>stop-only</b>                 | Sends a "stop" accounting notice at the end of the requested user process.                                                                                                                                                                                                                                    |
| <b>none</b>                      | Disables accounting services on this line or interface.                                                                                                                                                                                                                                                       |
| <b>broadcast</b>                 | (Optional) Enables sending accounting records to multiple AAA servers. Simultaneously sends accounting records to the first server in each group. If the first server is unavailable, fail over occurs using the backup servers defined within that group.                                                    |
| <i>group</i><br><i>groupname</i> | At least one of the keywords described in the AAA Accounting Methods table.                                                                                                                                                                                                                                   |
| <b>Command Default</b>           | AAA accounting is disabled.                                                                                                                                                                                                                                                                                   |
| <b>Command Modes</b>             | Global configuration (config)                                                                                                                                                                                                                                                                                 |

**Command History**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

Use the **aaa accounting** command to enable accounting and to create named method lists defining specific accounting methods on a per-line or per-interface basis.

**Table 176: AAA Accounting Methods**

| Keyword                 | Description                                                                                                        |
|-------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>group radius</b>     | Uses the list of all RADIUS servers for authentication as defined by the <b>aaa group server radius</b> command.   |
| <b>group tacacs+</b>    | Uses the list of all TACACS+ servers for authentication as defined by the <b>aaa group server tacacs+</b> command. |
| <b>group group-name</b> | Uses a subset of RADIUS or TACACS+ servers for accounting as defined by the server group group-name.               |

In AAA Accounting Methods table, the **group radius** and **group tacacs+** methods refer to a set of previously defined RADIUS or TACACS+ servers. Use the **radius server** and **tacacs server** commands to configure the host servers. Use the **aaa group server radius** and **aaa group server tacacs+** commands to create a named group of servers.

Cisco IOS XE software supports the following two methods of accounting:

- **RADIUS**—The network access server reports user activity to the RADIUS security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server.
- **TACACS+**—The network access server reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server.

Method lists for accounting define the way accounting will be performed. Named accounting method lists enable you to designate a particular security protocol to be used on specific lines or interfaces for particular types of accounting services. Create a list by entering the *list-name* and the *method*, where *list-name* is any character string used to name this list (excluding the names of methods, such as radius or tacacs+) and *method* identifies the methods to be tried in sequence as given.

If the **aaa accounting** command for a particular accounting type is issued without a named method list specified, the default method list is automatically applied to all interfaces or lines (where this accounting type applies) except those that have a named method list explicitly defined. (A defined method list overrides the default method list.) If no default method list is defined, then no accounting takes place.

**Note**

System accounting does not use named accounting lists; you can only define the default list for system accounting.

For minimal accounting, include the **stop-only** keyword to send a stop record accounting notice at the end of the requested user process. For more accounting, you can include the **start-stop** keyword, so that RADIUS

or TACACS+ sends a start accounting notice at the beginning of the requested process and a stop accounting notice at the end of the process. Accounting is stored only on the RADIUS or TACACS+ server. The **none** keyword disables accounting services for the specified line or interface.

When AAA accounting is activated, the network access server monitors either RADIUS accounting attributes or TACACS+ AV pairs pertinent to the connection, depending on the security method you have implemented. The network access server reports these attributes as accounting records, which are then stored in an accounting log on the security server.

---

**Note** This command cannot be used with TACACS or extended TACACS.

---

This example defines a default commands accounting method list, where accounting services are provided by a TACACS+ security server, set for privilege level 15 commands with a stop-only restriction:

```
Device> enable
Device# configure terminal
Device(config)# aaa accounting commands 15 default stop-only group TACACS+
Device(config)# exit
```

This example defines a default auth-proxy accounting method list, where accounting services are provided by a TACACS+ security server with a stop-only restriction. The **aaa accounting** commands activates authentication proxy accounting.

```
Device> enable
Device# configure terminal
Device(config)# aaa new model
Device(config)# aaa authentication login default group TACACS+
Device(config)# aaa authorization auth-proxy default group TACACS+
Device(config)# aaa accounting auth-proxy default start-stop group TACACS+
Device(config)# exit
```

# aaa accounting dot1x

To enable authentication, authorization, and accounting (AAA) accounting and to create method lists defining specific accounting methods on a per-line or per-interface basis for IEEE 802.1x sessions, use the **aaa accounting dot1x** command in global configuration mode. To disable IEEE 802.1x accounting, use the **no** form of this command.

```
aaa accounting dot1x {name | default} start-stop {broadcast group {name | radius | tacacs+}
[group {name | radius | tacacs+} ... ] | group {name | radius | tacacs+} [group
{name | radius | tacacs+} ... ]}
no aaa accounting dot1x {name | default}
```

## Syntax Description

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>name</b>       | Name of a server group. This is optional when you enter it after the <b>broadcast group</b> and <b>group</b> keywords.                                                                                                                                                                                                                                                                                                                                                                      |
| <b>default</b>    | Specifies the accounting methods that follow as the default list for accounting services.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>start-stop</b> | Sends a start accounting notice at the beginning of a process and a stop accounting notice at the end of a process. The start accounting record is sent in the background. The requested user process begins regardless of whether or not the start accounting notice was received by the accounting server.                                                                                                                                                                                |
| <b>broadcast</b>  | Enables accounting records to be sent to multiple AAA servers and sends accounting records to the first server in each group. If the first server is unavailable, the device uses the list of backup servers to identify the first server.                                                                                                                                                                                                                                                  |
| <b>group</b>      | Specifies the server group to be used for accounting services. These are valid server group names: <ul style="list-style-type: none"> <li>• <b>name</b> — Name of a server group.</li> <li>• <b>radius</b> — Lists of all RADIUS hosts.</li> <li>• <b>tacacs+</b> — Lists of all TACACS+ hosts.</li> </ul> <p>The <b>group</b> keyword is optional when you enter it after the <b>broadcast group</b> and <b>group</b> keywords. You can enter more than optional <b>group</b> keyword.</p> |
| <b>radius</b>     | (Optional) Enables RADIUS accounting.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>tacacs+</b>    | (Optional) Enables TACACS+ accounting.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Command Default

AAA accounting is disabled.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

---

**Usage Guidelines**

This command requires access to a RADIUS server.

We recommend that you enter the **dot1x reauthentication** interface configuration command before configuring IEEE 802.1x RADIUS accounting on an interface.

This example shows how to configure IEEE 802.1x accounting:

```
Device> enable
Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa accounting dot1x default start-stop group radius
Device(config)# exit
```

# aaa accounting identity

To enable authentication, authorization, and accounting (AAA) accounting for IEEE 802.1x, MAC authentication bypass (MAB), and web authentication sessions, use the **aaa accounting identity** command in global configuration mode. To disable IEEE 802.1x accounting, use the **no** form of this command.

```
aaa accounting identity {name | default} start-stop {broadcast group {name | radius | tacacs+}
[group {name | radius | tacacs+} ... ] | group {name | radius | tacacs+} [group
{name | radius | tacacs+} ... ]}
no aaa accounting identity {name | default}
```

## Syntax Description

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>name</b>       | Name of a server group. This is optional when you enter it after the <b>broadcast group</b> and <b>group</b> keywords.                                                                                                                                                                                                                                                                                                                                                                      |
| <b>default</b>    | Uses the accounting methods that follow as the default list for accounting services.                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>start-stop</b> | Sends a start accounting notice at the beginning of a process and a stop accounting notice at the end of a process. The start accounting record is sent in the background. The requested-user process begins regardless of whether or not the start accounting notice was received by the accounting server.                                                                                                                                                                                |
| <b>broadcast</b>  | Enables accounting records to be sent to multiple AAA servers and send accounting records to the first server in each group. If the first server is unavailable, the switch uses the list of backup servers to identify the first server.                                                                                                                                                                                                                                                   |
| <b>group</b>      | Specifies the server group to be used for accounting services. These are valid server group names: <ul style="list-style-type: none"> <li>• <b>name</b> — Name of a server group.</li> <li>• <b>radius</b> — Lists of all RADIUS hosts.</li> <li>• <b>tacacs+</b> — Lists of all TACACS+ hosts.</li> </ul> <p>The <b>group</b> keyword is optional when you enter it after the <b>broadcast group</b> and <b>group</b> keywords. You can enter more than optional <b>group</b> keyword.</p> |
| <b>radius</b>     | (Optional) Enables RADIUS authorization.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>tacacs+</b>    | (Optional) Enables TACACS+ accounting.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Command Default

AAA accounting is disabled.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

To enable AAA accounting identity, you need to enable policy mode. To enable policy mode, enter the **authentication display new-style** command in privileged EXEC mode.

This example shows how to configure IEEE 802.1x accounting identity:

```
Device# authentication display new-style
```

Please note that while you can revert to legacy style configuration at any time unless you have explicitly entered new-style configuration, the following caveats should be carefully read and understood.

- (1) If you save the config in this mode, it will be written to NVRAM in NEW-style config, and if you subsequently reload the router without reverting to legacy config and saving that, you will no longer be able to revert.
- (2) In this and legacy mode, Webauth is not IPv6-capable. It will only become IPv6-capable once you have entered new-style config manually, or have reloaded with config saved in 'authentication display new' mode.

```
Device# configure terminal
```

```
Device(config)# aaa accounting identity default start-stop group radius
```

```
Device(config)# exit
```

# aaa authentication dot1x

To specify the authentication, authorization, and accounting (AAA) method to use on ports complying with the IEEE 802.1x authentication, use the **aaa authentication dot1x** command in global configuration mode. To disable authentication, use the **no** form of this command.

**aaa authentication dot1x** {**default**} *method1*  
**no aaa authentication dot1x** {**default**} *method1*

## aaa authorization

To set the parameters that restrict user access to a network, use the **aaa authorization** command in global configuration mode. To remove the parameters, use the **no** form of this command.

```
aaa authorization { auth-proxy | cache | commands level | config-commands | configuration
| console | credential-download | exec | multicast | network | reverse-access | template }
{ default | list_name } [method1 [ method2 . . . ] ]
no aaa authorization { auth-proxy | cache | commands level | config-commands | configuration
| console | credential-download | exec | multicast | network | reverse-access | template }
{ default | list_name } [method1 [ method2 . . . ] ]
```

### Syntax Description

|                                      |                                                                                                                                                                                           |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>auth-proxy</b>                    | Runs authorization for authentication proxy services.                                                                                                                                     |
| <b>cache</b>                         | Configures the authentication, authorization, and accounting (AAA) server.                                                                                                                |
| <b>commands</b>                      | Runs authorization for all commands at the specified privilege level.                                                                                                                     |
| <i>level</i>                         | Specific command level that should be authorized. Valid entries are 0 through 15.                                                                                                         |
| <b>config-commands</b>               | Runs authorization to determine whether commands entered in configuration mode are authorized.                                                                                            |
| <b>configuration</b>                 | Downloads the configuration from the AAA server.                                                                                                                                          |
| <b>console</b>                       | Enables the console authorization for the AAA server.                                                                                                                                     |
| <b>credential-download</b>           | Downloads EAP credential from Local/RADIUS/LDAP.                                                                                                                                          |
| <b>exec</b>                          | Enables the console authorization for the AAA server.                                                                                                                                     |
| <b>multicast</b>                     | Downloads the multicast configuration from the AAA server.                                                                                                                                |
| <b>network</b>                       | Runs authorization for all network-related service requests, including Serial Line Internet Protocol (SLIP), PPP, PPP Network Control Programs (NCPs), and AppleTalk Remote Access (ARA). |
| <b>reverse-access</b>                | Runs authorization for reverse access connections, such as reverse Telnet.                                                                                                                |
| <b>template</b>                      | Enables template authorization for the AAA server.                                                                                                                                        |
| <b>default</b>                       | Uses the listed authorization methods that follow this keyword as the default list of methods for authorization.                                                                          |
| <i>list_name</i>                     | Character string used to name the list of authorization methods.                                                                                                                          |
| <i>method1</i> [ <i>method2</i> ...] | (Optional) An authorization method or multiple authorization methods to be used for authorization. A method may be any one of the keywords listed in the table below.                     |

**Command Default** Authorization is disabled for all actions (equivalent to the method keyword **none**).

**Command Modes** Global configuration (config)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Use the **aaa authorization** command to enable authorization and to create named methods lists, which define authorization methods that can be used when a user accesses the specified function. Method lists for authorization define the ways in which authorization will be performed and the sequence in which these methods will be performed. A method list is a named list that describes the authorization methods (such as RADIUS or TACACS+) that must be used in sequence. Method lists enable you to designate one or more security protocols to be used for authorization, which ensures a backup system in case the initial method fails. Cisco IOS XE software uses the first method listed to authorize users for specific network services; if that method fails to respond, the Cisco IOS XE software selects the next method listed in the method list. This process continues until there is successful communication with a listed authorization method, or until all the defined methods are exhausted.

**Note** The Cisco IOS XE software attempts authorization with the next listed method only when there is no response from the previous method. If authorization fails at any point in this cycle--meaning that the security server or the local username database responds by denying the user services--the authorization process stops and no other authorization methods are attempted.

If the **aaa authorization** command for a particular authorization type is issued without a specified named method list, the default method list is automatically applied to all interfaces or lines (where this authorization type applies) except those that have a named method list explicitly defined. (A defined method list overrides the default method list.) If no default method list is defined, then no authorization takes place. The default authorization method list must be used to perform outbound authorization, such as authorizing the download of IP pools from the RADIUS server.

Use the **aaa authorization** command to create a list by entering the values for the *list-name* and the *method* arguments, where *list-name* is any character string used to name this list (excluding all method names) and *method* identifies the list of authorization methods tried in the given sequence.

**Note** In the table that follows, the **group***group-name*, **group ldap**, **group radius**, and **group tacacs+** methods refer to a set of previously defined RADIUS or TACACS+ servers. Use the **radius server** and **tacacs server** commands to configure the host servers. Use the **aaa group server radius**, **aaa group server ldap**, and **aaa group server tacacs+** commands to create a named group of servers.

This table describes the method keywords.

**Table 177: aaa authorization Methods**

| Keyword                        | Description                                  |
|--------------------------------|----------------------------------------------|
| <b>cache</b> <i>group-name</i> | Uses a cache server group for authorization. |

| Keyword                        | Description                                                                                                                                                                                                                                                |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>group</b> <i>group-name</i> | Uses a subset of RADIUS or TACACS+ servers for accounting as defined by the <b>server group</b> <i>group-name</i> command.                                                                                                                                 |
| <b>group ldap</b>              | Uses the list of all Lightweight Directory Access Protocol (LDAP) servers for authentication.                                                                                                                                                              |
| <b>group radius</b>            | Uses the list of all RADIUS servers for authentication as defined by the <b>aaa group server radius</b> command.                                                                                                                                           |
| <b>grouptacacs+</b>            | Uses the list of all TACACS+ servers for authentication as defined by the <b>aaa group server tacacs+</b> command.                                                                                                                                         |
| <b>if-authenticated</b>        | Allows the user to access the requested function if the user is authenticated.<br><br><b>Note</b> The <b>if-authenticated</b> method is a terminating method. Therefore, if it is listed as a method, any methods listed after it will never be evaluated. |
| <b>local</b>                   | Uses the local database for authorization.                                                                                                                                                                                                                 |
| <b>none</b>                    | Indicates that no authorization is performed.                                                                                                                                                                                                              |

Cisco IOS XE software supports the following methods for authorization:

- Cache Server Groups—The device consults its cache server groups to authorize specific rights for users.
- If-Authenticated—The user is allowed to access the requested function provided the user has been authenticated successfully.
- Local—The device consults its local database, as defined by the **username** command, to authorize specific rights for users. Only a limited set of functions can be controlled through the local database.
- None—The network access server does not request authorization information; authorization is not performed over this line or interface.
- RADIUS—The network access server requests authorization information from the RADIUS security server group. RADIUS authorization defines specific rights for users by associating attributes, which are stored in a database on the RADIUS server, with the appropriate user.
- TACACS+—The network access server exchanges authorization information with the TACACS+ security daemon. TACACS+ authorization defines specific rights for users by associating attribute-value (AV) pairs, which are stored in a database on the TACACS+ security server, with the appropriate user.

Method lists are specific to the type of authorization being requested. AAA supports five different types of authorization:

- Commands—Applies to the EXEC mode commands a user issues. Command authorization attempts authorization for all EXEC mode commands, including global configuration commands, associated with a specific privilege level.

- EXEC—Applies to the attributes associated with a user EXEC terminal session.
- Network—Applies to network connections. The network connections can include a PPP, SLIP, or ARA connection.
- Reverse Access—Applies to reverse Telnet sessions.
- Configuration—Applies to the configuration downloaded from the AAA server.

When you create a named method list, you are defining a particular list of authorization methods for the indicated authorization type.

Once defined, the method lists must be applied to specific lines or interfaces before any of the defined methods are performed.

The authorization command causes a request packet containing a series of AV pairs to be sent to the RADIUS or TACACS daemon as part of the authorization process. The daemon can do one of the following:

- Accept the request as is.
- Make changes to the request.
- Refuse the request and authorization.

For a list of supported RADIUS attributes, see the module RADIUS Attributes. For a list of supported TACACS+ AV pairs, see the module TACACS+ Attribute-Value Pairs.

**Note**

Five commands are associated with privilege level 0: **disable**, **enable**, **exit**, **help**, and **logout**. If you configure AAA authorization for a privilege level greater than 0, these five commands will not be included in the privilege level command set.

The following example shows how to define the network authorization method list named mygroup, which specifies that RADIUS authorization will be used on serial lines using PPP. If the RADIUS server fails to respond, local network authorization will be performed.

```
Device> enable
Device# configure terminal
Device(config)# aaa authorization network mygroup group radius local
Device(config)# exit
```

# aaa new-model

To enable the authentication, authorization, and accounting (AAA) access control model, issue the **aaa new-model** command in global configuration mode. To disable the AAA access control model, use the **no** form of this command.

**aaa new-model**  
**no aaa new-model**

|                           |                                            |
|---------------------------|--------------------------------------------|
| <b>Syntax Description</b> | This command has no arguments or keywords. |
|---------------------------|--------------------------------------------|

|                        |                     |
|------------------------|---------------------|
| <b>Command Default</b> | AAA is not enabled. |
|------------------------|---------------------|

|                      |                               |
|----------------------|-------------------------------|

|----------------------|-------------------------------|

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                     |
|-------------------------|-----------------------------------------------------|
| <b>Usage Guidelines</b> | This command enables the AAA access control system. |
|-------------------------|-----------------------------------------------------|

If the **login local** command is configured for a virtual terminal line (VTY), and the **aaa new-model** command is removed, you must reload the switch to get the default configuration or the **login** command. If the switch is not reloaded, the switch defaults to the **login local** command under the VTY.

|             |                                                                |
|-------------|----------------------------------------------------------------|
| <b>Note</b> | We do not recommend removing the <b>aaa new-model</b> command. |
|-------------|----------------------------------------------------------------|

## Examples

The following example initializes AAA:

```
Device> enable
Device# configure terminal
Device(config)# aaa new-model
Device(config)# exit
```

The following example shows a VTY configured and the **aaa new-model** command removed:

```
Device> enable
Device# configure terminal
Device(config)# aaa new-model
Device(config)# line vty 0 15
Device(config-line)# login local
Device(config-line)# exit
Device(config)# no aaa new-model
Device(config)# exit
Device# show running-config | b line vty

line vty 0 4
  login local  !<=== Login local instead of "login"
line vty 5 15
  login local
```

!

| <b>aaa authorization</b>                 | Sets parameters that restrict user access to a network.                                    |

# access-session mac-move deny

To disable MAC move on a device, use the **access-session mac-move deny** global configuration command. To return to the default setting, use the **no** form of this command.

**access-session mac-move deny**  
**no access-session mac-move deny**

**Syntax Description** This command has no arguments or keywords.

**Command Default** MAC move is enabled.

**Command Modes** Global configuration (config)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **no** form of this command enables authenticated hosts to move between any authentication-enabled ports (MAC authentication bypass [MAB], 802.1x, or Web-auth) on a device. For example, if there is a device between an authenticated host and port, and that host moves to another port, the authentication session is deleted from the first port, and the host is reauthenticated on the new port.

If MAC move is disabled, and an authenticated host moves to another port, it is not reauthenticated, and a violation error occurs.

This example shows how to enable MAC move on a device:

```
Device> enable
Device# configure terminal
Device(config)# no access-session mac-move deny
Device(config)# exit
```

| Related Commands | Command                            | Description                                                                                                                  |

| Syntax Description | <b>drop</b>                                                                                                                                                                                                                              | Drops the packet when the specified conditions are matched.    |
|                    | <b>forward</b>                                                                                                                                                                                                                           | Forwards the packet when the specified conditions are matched. |
| Command Default    | The default action is to forward packets.                                                                                                                                                                                                |                                                                |
| Command Modes      | Access-map configuration (config-access-map)                                                                                                                                                                                             |                                                                |
| Command History    | <b>Release</b>                                                                                                                                                                                                                           | <b>Modification</b>                                            |
|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                             | This command was introduced.                                   |
| Usage Guidelines   | You enter access-map configuration mode by using the <b>vlan access-map</b> global configuration command.                                                                                                                                |                                                                |
|                    | If the action is <b>drop</b> , you should define the access map, including configuring any access control list (ACL) names in match clauses, before applying the map to a VLAN, or all packets could be dropped.                         |                                                                |
|                    | In access-map configuration mode, use the <b>match access-map</b> configuration command to define the match conditions for a VLAN map. Use the <b>action</b> command to set the action that occurs when a packet matches the conditions. |                                                                |
|                    | The drop and forward parameters are not used in the <b>no</b> form of the command.                                                                                                                                                       |                                                                |
|                    | You can verify your settings by entering the <b>show vlan access-map</b> privileged EXEC command.                                                                                                                                        |                                                                |

## Examples

This example shows how to identify and apply a VLAN access map (vmap4) to VLANs 5 and 6 that causes the VLAN to forward an IP packet if the packet matches the conditions defined in access list al2:

```
Device> enable
Device# configure terminal
Device(config)# vlan access-map vmap4
Device(config-access-map)# match ip address al2
Device(config-access-map)# action forward
Device(config-access-map)# exit
Device(config)# vlan filter vmap4 vlan-list 5-6
Device(config)# exit
```

# authentication host-mode

To set the authorization manager mode on a port, use the **authentication host-mode** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

**authentication host-mode** { **multi-auth** | **multi-domain** | **multi-host** | **single-host** }  
**no authentication host-mode**

## Syntax Description

|                     |                                                                    |
|---------------------|--------------------------------------------------------------------|
| <b>multi-auth</b>   | Enables multiple-authorization mode (multi-auth mode) on the port. |
| <b>multi-domain</b> | Enables multiple-domain mode on the port.                          |
| <b>multi-host</b>   | Enables multiple-host mode on the port.                            |
| <b>single-host</b>  | Enables single-host mode on the port.                              |

## Command Default

Single host mode is enabled.

## Command Modes

Interface configuration (config-if)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Single-host mode should be configured if only one data host is connected. Do not connect a voice device to authenticate on a single-host port. Voice device authorization fails if no voice VLAN is configured on the port.

Multi-domain mode should be configured if data host is connected through an IP phone to the port. Multi-domain mode should be configured if the voice device needs to be authenticated.

Multi-auth mode should be configured to allow devices behind a hub to obtain secured port access through individual authentication. Only one voice device can be authenticated in this mode if a voice VLAN is configured.

Multi-host mode also offers port access for multiple hosts behind a hub, but multi-host mode gives unrestricted port access to the devices after the first user gets authenticated.

This example shows how to enable multi-auth mode on a port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/1
Device(config-if)# authentication host-mode multi-auth
Device(config-if)# end
```

This example shows how to enable multi-domain mode on a port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/1
Device(config-if)# authentication host-mode multi-domain
Device(config-if)# end
```

This example shows how to enable multi-host mode on a port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/1
Device(config-if)# authentication host-mode multi-host
Device(config-if)# end
```

This example shows how to enable single-host mode on a port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/1
Device(config-if)# authentication host-mode single-host
Device(config-if)# end
```

You can verify your settings by entering the **show authentication sessions interface *interface* details** privileged EXEC command.

# authentication logging verbose

To filter detailed information from authentication system messages, use the **authentication logging verbose** command in global configuration mode on the switch stack or on a standalone switch.

**authentication logging verbose**  
**no authentication logging verbose**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Detailed logging of system messages is not enabled.

**Command Modes** Global configuration (config)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** This command filters details, such as anticipated success, from authentication system messages. Failure messages are not filtered.

To filter verbose authentication system messages:

```
Device> enable
Device# configure terminal
Device(config)# authentication logging verbose
Device(config)# exit
```

You can verify your settings by entering the **show running-config** privileged EXEC command.

# authentication mac-move permit

To enable MAC move on a device, use the **authentication mac-move permit** command in global configuration mode. To disable MAC move, use the **no** form of this command.

**authentication mac-move permit**  
**no authentication mac-move permit**

**Syntax Description** This command has no arguments or keywords.

**Command Default** MAC move is disabled.

**Command Modes** Global configuration (config)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The command enables authenticated hosts to move between any authentication-enabled ports (MAC authentication bypass [MAB], 802.1x, or Web-auth) on a device. For example, if there is a device between an authenticated host and port, and that host moves to another port, the authentication session is deleted from the first port, and the host is reauthenticated on the new port.

If MAC move is disabled, and an authenticated host moves to another port, it is not reauthenticated, and a violation error occurs.

This example shows how to enable MAC move on a device:

```
Device> enable
Device# configure terminal
Device(config)# authentication mac-move permit
Device(config)# exit
```

|------------------|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
|                  | <b>access-session mac-move deny</b> | Disables MAC move on a device.                                                                                               |
|                  | <b>authentication event</b>         | Sets the action for specific authentication events.                                                                          |
|                  | <b>authentication fallback</b>      | Configures a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication. |
|                  | <b>authentication host-mode</b>     | Sets the authorization manager mode on a port.                                                                               |
|                  | <b>authentication open</b>          | Enables or disables open access on a port.                                                                                   |
|                  | <b>authentication order</b>         | Sets the order of authentication methods used on a port.                                                                     |
|                  | <b>authentication periodic</b>      | Enable or disables reauthentication on a port.                                                                               |

| Command                            | Description                                                                                                                                                                               |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>authentication port-control</b> | Enables manual control of the port authorization state.                                                                                                                                   |
| <b>authentication priority</b>     | Adds an authentication method to the port-priority list.                                                                                                                                  |
| <b>authentication timer</b>        | Configures the timeout and reauthentication parameters for an 802.1x-enabled port.                                                                                                        |
| <b>authentication violation</b>    | Configures the violation modes that occur when a new device connects to a port or when a new device connects to a port with the maximum number of devices already connected to that port. |
| <b>show authentication</b>         | Displays information about authentication manager events on the device.                                                                                                                   |

# authentication priority

To add an authentication method to the port-priority list, use the **authentication priority** command in interface configuration mode. To return to the default, use the **no** form of this command.

**authentication priority** [**dot1x** | **mab**] {**webauth**}  
**no authentication priority** [**dot1x** | **mab**] {**webauth**}

|                    |                                                                                                                                                                   |                                                                                         |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| Syntax Description | <b>dot1x</b>                                                                                                                                                      | (Optional) Adds 802.1x to the order of authentication methods.                          |
|                    | <b>mab</b>                                                                                                                                                        | (Optional) Adds MAC authentication bypass (MAB) to the order of authentication methods. |
|                    | <b>webauth</b>                                                                                                                                                    | Adds web authentication to the order of authentication methods.                         |
| Command Default    | The default priority is 802.1x authentication, followed by MAC authentication bypass and web authentication.                                                      |                                                                                         |
| Command Modes      | Interface configuration (config-if)                                                                                                                               |                                                                                         |
| Command History    | Release                                                                                                                                                           | Modification                                                                            |
|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                      | This command was introduced.                                                            |
| Usage Guidelines   | Ordering sets the order of methods that the device attempts when trying to authenticate a new device is connected to a port.                                      |                                                                                         |
|                    | When configuring multiple fallback methods on a port, set web authentication (webauth) last.                                                                      |                                                                                         |
|                    | Assigning priorities to different authentication methods allows a higher-priority method to interrupt an in-progress authentication method with a lower priority. |                                                                                         |

**Note** If a client is already authenticated, it might be reauthenticated if an interruption from a higher-priority method occurs.

The default priority of an authentication method is equivalent to its position in execution-list order: 802.1x authentication, MAC authentication bypass (MAB), and web authentication. Use the **dot1x**, **mab**, and **webauth** keywords to change this default order.

This example shows how to set 802.1x as the first authentication method and web authentication as the second authentication method:

```
Device(config-if)# authentication priority dot1x webauth
```

This example shows how to set MAB as the first authentication method and web authentication as the second authentication method:

```

Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 0/1/2
Device(config-if)# authentication priority mab webauth
Device(config-if)# end

```

| Command                                                      | Description                                                                                                                                            |
|--------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>authentication control-direction</b>                      | Configures the port mode as unidirectional or bidirectional.                                                                                           |
| <b>authentication event fail</b>                             | Specifies how the Auth Manager handles authentication failures as a result of unrecognized user credentials.                                           |
| <b>authentication event no-response action</b>               | Specifies how the Auth Manager handles authentication failures as a result of a nonresponsive host.                                                    |
| <b>authentication event server alive action reinitialize</b> | Reinitializes an authorized Auth Manager session when a previously unreachable authentication, authorization, and accounting server becomes available. |
| <b>authentication event server dead action authorize</b>     | Authorizes Auth Manager sessions when the authentication, authorization, and accounting server becomes unreachable.                                    |
| <b>authentication fallback</b>                               | Enables a web authentication fallback method.                                                                                                          |
| <b>authentication host-mode</b>                              | Allows hosts to gain access to a controlled port.                                                                                                      |
| <b>authentication open</b>                                   | Enables open access on a port.                                                                                                                         |
| <b>authentication order</b>                                  | Specifies the order in which the Auth Manager attempts to authenticate a client on a port.                                                             |
| <b>authentication periodic</b>                               | Enables automatic reauthentication on a port.                                                                                                          |
| <b>authentication port-control</b>                           | Configures the authorization state of a controlled port.                                                                                               |
| <b>authentication timer inactivity</b>                       | Configures the time after which an inactive Auth Manager session is terminated.                                                                        |
| <b>authentication timer reauthenticate</b>                   | Specifies the period of time between which the Auth Manager attempts to reauthenticate authorized ports.                                               |
| <b>authentication timer restart</b>                          | Specifies the period of time after which the Auth Manager attempts to authenticate an unauthorized port.                                               |
| <b>authentication violation</b>                              | Specifies the action to be taken when a security violation occurs on a port.                                                                           |
| <b>mab</b>                                                   | Enables MAC authentication bypass on a port.                                                                                                           |

| Command                                       | Description                                                                                      |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------|
| <b>show authentication registrations</b>      | Displays information about the authentication methods that are registered with the Auth Manager. |
| <b>show authentication sessions</b>           | Displays information about current Auth Manager sessions.                                        |
| <b>show authentication sessions interface</b> | Displays information about the Auth Manager for a given interface.                               |

# authentication timer reauthenticate

To specify the period of time between which the Auth Manager attempts to reauthenticate authorized ports, use the **authenticationtimerreauthenticate** command in interface configuration or template configuration mode. To reset the reauthentication interval to the default, use the **no** form of this command.

**authentication timer reauthenticate** { *seconds* | **server** }

**no authentication timer reauthenticate**

## Syntax Description

|                |                                                                                                                                                                                                |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>seconds</b> | The number of seconds between reauthentication attempts. The range is from 1 to 1073741823. The default is 3600 seconds.                                                                       |
| <b>server</b>  | Specifies that the interval between reauthentication attempts is defined by the Session-Timeout value (RADIUS Attribute 27) on the authentication, authorization, and accounting (AAA) server. |

## Command Default

The automatic reauthentication interval is set to 3600 seconds.

## Command Modes

Interface configuration (config-if)

## Command History

| Release                       | Modification                                                                        |
|-------------------------------|-------------------------------------------------------------------------------------|
| Cisco IOS XE Everest 16.5.1a  | This command was introduced                                                         |
| Cisco IOS XE Bengaluru 17.5.1 | The supported time-out range was increased from 65535 seconds to 1073741823 seconds |

## Usage Guidelines

Use the command **authenticationtimer reauthenticate** command to set the automatic reauthentication interval of an authorized port. If you use the **authenticationtimerinactivity** command to configure an inactivity interval, configure the reauthentication interval to be longer than the inactivity interval.

In releases prior to Cisco IOS XE Bengaluru 17.5.1, the supported timeout range is 1 to 65535 seconds. While downgrading from or releases after Cisco IOS XE Bengaluru 17.5.1 set the configuration timeout to supported values to avoid ISSD breakage.

## Examples

The following example shows how to set the reauthentication interval on a port to 1800 seconds:

```
Device >enable
Device #configure terminal
Device(config)#interface gigabitethernet2/0/1
Device(config-if)#authentication timer reauthenticate 1800
Device(config-if)#end
```

## Related Commands

| Command                              | Description                                                                   |
|--------------------------------------|-------------------------------------------------------------------------------|
| <b>authenticationperiodic</b>        | Enables automatic reauthentication.                                           |
| <b>authenticationtimerinactivity</b> | Specifies the interval after which the Auth Manager ends an inactive session. |

| Command                           | Description                                                                                        |
|-----------------------------------|----------------------------------------------------------------------------------------------------|
| <b>authenticationtimerrestart</b> | Specifies the interval after which the Auth Manager attempts to authenticate an unauthorized port. |

# authentication violation

To configure the violation modes that occur when a new device connects to a port or when a new device connects to a port after the maximum number of devices are connected to that port, use the **authentication violation** command in interface configuration mode.

```
authentication violation { protect | replace | restrict | shutdown }
no authentication violation { protect | replace | restrict | shutdown }
```

|                           |                                                                                                                               |                                                                                        |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>protect</b>                                                                                                                | Drops unexpected incoming MAC addresses. No syslog errors are generated.               |
|                           | <b>replace</b>                                                                                                                | Removes the current session and initiates authentication with the new host.            |
|                           | <b>restrict</b>                                                                                                               | Generates a syslog error when a violation error occurs.                                |
|                           | <b>shutdown</b>                                                                                                               | Error-disables the port or the virtual port on which an unexpected MAC address occurs. |
| <b>Command Default</b>    | Authentication violation shutdown mode is enabled.                                                                            |                                                                                        |
| <b>Command Modes</b>      | Interface configuration (config-if)                                                                                           |                                                                                        |
| <b>Command History</b>    | <b>Release</b>                                                                                                                | <b>Modification</b>                                                                    |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                  | This command was introduced.                                                           |
| <b>Usage Guidelines</b>   | Use the <b>authentication violation</b> command to specify the action to be taken when a security violation occurs on a port. |                                                                                        |

This example shows how to configure an IEEE 802.1x-enabled port as error-disabled and to shut down when a new device connects it:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/1
Device(config-if)# authentication violation shutdown
Device(config-if)# end
```

This example shows how to configure an 802.1x-enabled port to generate a system error message and to change the port to restricted mode when a new device connects to it:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/1
Device(config-if)# authentication violation restrict
Device(config-if)# end
```

This example shows how to configure an 802.1x-enabled port to ignore a new device when it connects to the port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/1
Device(config-if)# authentication violation protect
Device(config-if)# end
```

This example shows how to configure an 802.1x-enabled port to remove the current session and initiate authentication with a new device when it connects to the port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/1
Device(config-if)# authentication violation replace
Device(config-if)# end
```

You can verify your settings by entering the **show authentication** command.

# cisp enable

To enable Client Information Signaling Protocol (CISP) on a device so that it acts as an authenticator to a supplicant device and a supplicant to an authenticator device, use the **cisp enable** global configuration command.

**cisp enable**  
**no cisp enable**

**Syntax Description** This command has no arguments or keywords.

**Command Default** No default behavior or values.

**Command Modes** Global configuration (config)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The link between the authenticator and supplicant device is a trunk. When you enable VTP on both devices, the VTP domain name must be the same, and the VTP mode must be server.

To avoid the MD5 checksum mismatch error when you configure VTP mode, verify that:

- VLANs are not configured on two different devices, which can be caused by two VTP servers in the same domain.
- Both devices have different configuration revision numbers.

This example shows how to enable CISP:

```
Device> enable
Device# configure terminal
Device(config)# cisp enable
Device(config)# exit
```

## Related Commands

| Command                                      | Description                                          |
|----------------------------------------------|------------------------------------------------------|
| <b>dot1x credentialsprofile</b>              | Configures a profile on a supplicant device.         |
| <b>dot1x supplicant force-multicast</b>      | Forces 802.1X supplicant to send multicast packets.  |
| <b>dot1x supplicant controlled transient</b> | Configures controlled access by 802.1X supplicant.   |
| <b>show cisp</b>                             | Displays CISP information for a specified interface. |

# clear errdisable interface vlan

To reenable a VLAN that was error-disabled, use the **clear errdisable interface** command in privileged EXEC mode.

**clear errdisable interface** *interface-id* **vlan** [*vlan-list*]

|                           |                     |                                                                                                                      |
|---------------------------|---------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>interface-id</i> | Specifies an interface.                                                                                              |
|                           | <i>vlan list</i>    | (Optional) Specifies a list of VLANs to be reenabled. If a VLAN list is not specified, then all VLANs are reenabled. |

|                        |                                |
|------------------------|--------------------------------|
| <b>Command Default</b> | No default behavior or values. |
|------------------------|--------------------------------|

|                      |                     |
|----------------------|---------------------|
| <b>Command Modes</b> | Privileged EXEC (#) |
|----------------------|---------------------|

|                        |                              |                              |

|                         | <b>errdisable detect cause</b>             | Enables error-disabled detection for a specific cause or all causes.       |
|                         | <b>errdisable recovery</b>                 | Configures the recovery mechanism variables.                               |
|                         | <b>show errdisable detect</b>              | Displays error-disabled detection status.                                  |
|                         | <b>show errdisable recovery</b>            | Displays error-disabled recovery timer information.                        |
|                         | <b>show interfaces status err-disabled</b> | Displays interface status of a list of interfaces in error-disabled state. |

# clear fqdn

To clear fully qualified domain name (FQDN) local cache entries, use the **clear fqdn** command in privileged EXEC mode.

**clear fqdn** { **database** { **all** | **fqdn name** [ **ip address** ] } | **packet statistics** }

## Syntax Description

**database** {**all** | **fqdn name** [**ip address**]}

Clears the FQDN local cache entries.

- **all**: Clears all the FQDN local cache entries.
- **fqdn name** [**ip address**]: Clears the specified FQDN local cache entry or the particular IP binding matched to the FQDN name.

**packet statistics**

Resets all the FQDN packet statistics counters to 0.

## Command Default

No default behavior or values.

## Command Modes

Privileged EXEC (#)

## Command History

### Release

### Modification

Cisco IOS XE Bengaluru 17.5.1 This command was introduced.

## Examples

The following example shows how to clear all the FQDN local cache entries:

```
Device> enable
Device# clear fqdn database all
```

The following example shows how to clear a particular IP binding matched to an FQDN name:

```
Device> enable
Device# clear fqdn database fqdn 123.cisco.com ip 10.102.103.10
```

# clear mac address-table

To delete from the MAC address table a specific dynamic address, all dynamic addresses on a particular interface, all dynamic addresses on stack members, or all dynamic addresses on a particular VLAN, use the **clear mac address-table** command in privileged EXEC mode. This command also clears the MAC address notification global counters.

**clear mac address-table** {**dynamic** [**address** *mac-addr* | **interface** *interface-id* | **vlan** *vlan-id*] | **move update** | **notification**}

|                           |                                      |                                                                                              |
|---------------------------|--------------------------------------|----------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>dynamic</b>                       | Deletes all dynamic MAC addresses.                                                           |
|                           | <b>address</b> <i>mac-addr</i>       | (Optional) Deletes the specified dynamic MAC address.                                        |
|                           | <b>interface</b> <i>interface-id</i> | (Optional) Deletes all dynamic MAC addresses on the specified physical port or port channel. |
|                           | <b>vlan</b> <i>vlan-id</i>           | (Optional) Deletes all dynamic MAC addresses for the specified VLAN. The range is 1 to 4094. |
|                           | <b>move update</b>                   | Clears the MAC address table move-update counters.                                           |
|                           | <b>notification</b>                  | Clears the notifications in the history table and reset the counters.                        |

**Command Default** No default behavior or values.

**Command Modes** Privileged EXEC (#)

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** You can verify that the information was deleted by entering the **show mac address-table** command.

This example shows how to remove a specific MAC address from the dynamic address table:

```
Device> enable
Device# clear mac address-table dynamic address 0008.0070.0007
```

|                         |                                                                           |                                                         |

|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show mac address-table</b>              | Displays the MAC address table static and dynamic entries.                                                                                     |
| <b>show mac address-table move update</b>  | Displays the MAC address-table move update information on the device.                                                                          |
| <b>show mac address-table notification</b> | Displays the MAC address notification settings for all interfaces or on the specified interface when the <b>interface</b> keyword is appended. |
| <b>snmp trap mac-notification change</b>   | Enables the SNMP MAC address notification trap on a specific interface.                                                                        |

# confidentiality-offset

To enable MACsec Key Agreement protocol (MKA) to set the confidentiality offset for MACsec operations, use the **confidentiality-offset** command in MKA-policy configuration mode. To disable confidentiality offset, use the **no** form of this command.

**confidentiality-offset**  
**no confidentiality-offset**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Confidentiality offset is disabled.

**Command Modes** MKA-policy configuration (config-mka-policy)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

The following example shows how to enable the confidentiality offset:

```
Device> enable
Device# configure terminal
Device(config)# mka policy 2
Device(config-mka-policy)# confidentiality-offset
```

| Related Commands | Command                          | Description                                                    |
|------------------|----------------------------------|----------------------------------------------------------------|
|                  | <b>mka policy</b>                | Configures an MKA policy.                                      |
|                  | <b>delay-protection</b>          | Configures MKA to use delay protection in sending MKPDU.       |
|                  | <b>include-icv-indicator</b>     | Includes ICV indicator in MKPDU.                               |
|                  | <b>key-server</b>                | Configures MKA key-server options.                             |
|                  | <b>macsec-cipher-suite</b>       | Configures cipher suite for deriving SAK.                      |
|                  | <b>sak-rekey</b>                 | Configures the SAK rekey interval.                             |
|                  | <b>send-secure-announcements</b> | Configures MKA to send secure announcements in sending MKPDUs. |
|                  | <b>ssci-based-on-sci</b>         | Computes SSCI based on the SCI.                                |
|                  | <b>use-updated-eth-header</b>    | Uses the updated Ethernet header for ICV calculation.          |

# crypto pki trustpool import

To manually import (download) a certificate authority (CA) certificate bundle into a public key infrastructure (PKI) trustpool to update or replace an existing CA bundle, use the **crypto pki trustpool import** command in global configuration mode. To remove any of the configured parameters, use the **no** form of this command.

```
crypto pki trustpool import {ca-bundle | clean [{terminal | url url}] | terminal | url url}
no crypto pki trustpool import {ca-bundle | clean [{terminal | url url}] | terminal | url url}
```

## Syntax Description

|                  |                                                                                                                                                                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ca-bundle</b> | Imports a CA certificate bundle configured in the trustpool policy.                                                                                                                                                                                                                                |
| <b>clean</b>     | Removes all the downloaded PKI trustpool certificates before the new certificates are downloaded. Use the optional <b>terminal</b> keyword to remove the existing CA certificate bundle terminal setting, or the <b>url</b> keyword and <i>url</i> argument to remove the URL file system setting. |
| <b>terminal</b>  | Import a CA certificate bundle through the terminal (cut-and-paste) in privacy-enhanced mail (PEM) format.                                                                                                                                                                                         |
| <b>url url</b>   | Imports a CA certificate bundle through the specified URL.                                                                                                                                                                                                                                         |

## Command Default

The PKI trustpool feature is enabled. The device uses the built-in CA certificate bundle in the PKI trustpool, which is updated automatically.

## Command Modes

Global configuration (config)

## Command History

| Release                       | Modification                 |
|-------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

## Usage Guidelines

PKI trustpool certificates are automatically updated. When the PKI trustpool certificates are not current, use the **crypto pki trustpool import** command to update them from another location.

### Note

Security threats, as well as the cryptographic technologies that help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the [Next Generation Cryptography](#) white paper.

The *url* argument specifies or changes the URL file system of the CA. The following table lists the available URL file systems.

**Table 178: URL File Systems**

| File System     | Description                                           |
|-----------------|-------------------------------------------------------|
| <b>archive:</b> | Imports from the archive file system.                 |
| <b>cns:</b>     | Imports from the Cluster Namespace (CNS) file system. |
| <b>disk0:</b>   | Imports from the disc0 file system.                   |

| File System    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>disk1:</b>  | Imports from the disk1 file system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>ftp:</b>    | Imports from the FTP file system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>http:</b>   | Imports from the HTTP file system. The URL must be in the following formats: <ul style="list-style-type: none"> <li>• <code>http://CAname:80</code>, where <i>CAname</i> is the Domain Name System (DNS)</li> <li>• <code>http://ipv4-address:80</code>, for example: <code>http://10.10.10.1:80</code>.</li> <li>• <code>http://[ipv6-address]:80</code>, for example: <code>http://[2001:DB8:1:1::1]:80</code>. The IPv6 address is a hexadecimal notation, and must be enclosed within brackets in the URL.</li> </ul> |
| <b>https:</b>  | Imports from the HTTPS file system. The URL must use the same format as the HTTP: file system format.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>null:</b>   | Imports from the null file system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>nvr:</b>    | Imports from the NVRAM file system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>pram:</b>   | Imports from the Parameter Random-access Memory (PRAM) file system.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>rcp:</b>    | Imports from the remote copy protocol (RCP) file system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>scp:</b>    | Imports from the secure copy protocol (SCP) file system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>snmp:</b>   | Imports from the Simple Network Management Protocol (SNMP).                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>unix:</b>   | Imports from the UNIX file system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>xmodem:</b> | Imports from the xmodem simple file transfer protocol system.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>ymodem:</b> | Imports from the ymodem simple file transfer protocol system.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Examples

The following example shows how to remove all the downloaded PKI trustpool CA certificates and subsequently update the CA certificates in the PKI trustpool by downloading a new CA certification bundle:

```
Device> enable
Device# configure terminal
Device(config)# crypto pki trustpool import clean
```

The following example shows how to update all the CA certificates in the PKI trustpool by downloading a new CA certification bundle without removing all the downloaded PKI trustpool CA certificates:

```
Device(config)# crypto pki trustpool import url http://www.cisco.com/security/pki/trs/ios.p7b
```

|------------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>crypto pki trustpool policy</b> | Configures PKI trustpool policy parameters.                                                           |
| <b>show crypto pki trustpool</b>   | Displays the PKI trustpool certificates of the device, and optionally shows the PKI trustpool policy. |

# debug aaa dead-criteria transaction

To display authentication, authorization, and accounting (AAA) dead-criteria transaction values, use the **debugaaadead-criteriatransaction** command in privileged EXEC mode. To disable dead-criteria debugging, use the **no** form of this command.

**debug aaa dead-criteria transaction**  
**no debug aaa dead-criteria transaction**

## Syntax Description

This command has no arguments or keywords.

## Command Default

If the command is not configured, debugging is not turned on.

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Dead-criteria transaction values may change with every AAA transaction. Some of the values that can be displayed are estimated outstanding transaction, retransmit tries, and dead-detect intervals. These values are explained in the table below.

## Examples

The following example shows dead-criteria transaction information for a particular server group:

```
Device> enable
Device# debug aaa dead-criteria transaction

AAA Transaction debugs debugging is on
*Nov 14 23:44:17.403: AAA/SG/TRANSAC: Computed Retransmit Tries: 10, Current Tries: 3,
Current Max Tries: 10
*Nov 14 23:44:17.403: AAA/SG/TRANSAC: Computed Dead Detect Interval: 10s, Elapsed Time:
317s, Current Max Interval: 10s
*Nov 14 23:44:17.403: AAA/SG/TRANSAC: Estimated Outstanding Transaction: 6, Current Max
Transaction: 6
```

The table below describes the significant fields shown in the display.

**Table 179: debug aaa dead-criteria transaction Field Descriptions**

| Field                     | Description                                                                       |
|---------------------------|-----------------------------------------------------------------------------------|
| AAA/SG/TRANSAC            | AAA server-group transaction.                                                     |
| Computed Retransmit Tries | Currently computed number of retransmissions before the server is marked as dead. |
| Current Tries             | Number of successive failures since the last valid response.                      |
| Current Max Tries         | Maximum number of tries since the last successful transaction.                    |

| Field                             | Description                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Computed Dead Detect Interval     | Period of inactivity (the number of seconds since the last successful transaction) that can elapse before the server is marked as dead. The period of inactivity starts when a transaction is sent to a server that is considered live. The dead-detect interval is the period that the device waits for responses from the server before the device marks the server as dead. |
| Elapsed Time                      | Amount of time that has elapsed since the last valid response.                                                                                                                                                                                                                                                                                                                 |
| Current Max Interval              | Maximum period of inactivity since the last successful transaction.                                                                                                                                                                                                                                                                                                            |
| Estimated Outstanding Transaction | Estimated number of transaction that are associated with the server.                                                                                                                                                                                                                                                                                                           |
| Current Max Transaction           | Maximum transaction since the last successful transaction.                                                                                                                                                                                                                                                                                                                     |

|------------------------------------|---------------------------------------------------------------------------------------------------------|
| <b>radius-server dead-criteria</b> | Forces one or both of the criteria, used to mark a RADIUS server as dead, to be the indicated constant. |
| <b>show aaa dead-criteria</b>      | Displays dead-criteria detection information for an AAA server.                                         |

# debug umbrella

To enable debugging of the Cisco Umbrella Integration feature, use the **debug umbrella** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

**debug umbrella {config | device-registration | dnscrypt | redundancy}**  
**no debug umbrella {config | device-registration | dnscrypt | redundancy}**

## Syntax Description

|                            |                                        |
|----------------------------|----------------------------------------|
| <b>config</b>              | Enables configuration debugging.       |
| <b>device-registration</b> | Enables device registration debugging. |
| <b>dnscrypt</b>            | Enables DNSCrypt debugging.            |
| <b>redundancy</b>          | Enables redundancy debugging.          |

## Command Default

Debugging is disabled.

## Command Modes

Privileged EXEC (#)

## Command History

| Release                       | Modification                 |
|-------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

## Examples

The following example shows how to enable Cisco Umbrella configuration debugging:

```
Device> enable
Device# debug umbrella config
```

Umbrella config debugging is on

```
Device# configure terminal
Device(config)# interface gigabitethernet 1/0/12
Device(config-if)# umbrella in test
```

```
*Nov 27 08:34:41.088: UMBRELLA-CONFIG:Umbrella token configured, so set mode as TOKEN
*Nov 27 08:34:41.088: UMBRELLA-CONFIG:check user configured resolver count
*Nov 27 08:34:41.088: UMBRELLA-CONFIG:Umbrella interface with no direct cloud access

# delay-protection

To configure MKA to use delay protection in sending MACsec Key Agreement Protocol Data Units (MKPDUs), use the **delay-protection** command in MKA-policy configuration mode. To disable delay protection, use the **no** form of this command.

**delay-protection**  
**no delay-protection**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Delay protection for sending MKPDUs is disabled.

**Command Modes** MKA-policy configuration (config-mka-policy)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

The following example shows how to configure MKA to use delay protection in sending MKPDUs:

```
Device> enable
Device# configure terminal
Device(config)# mka policy 2
Device(config-mka-policy)# delay-protection
```

## Related Commands

| Command                          | Description                                                    |
|----------------------------------|----------------------------------------------------------------|
| <b>mka policy</b>                | Configures an MKA policy.                                      |
| <b>confidentiality-offset</b>    | Sets the confidentiality offset for MACsec operations.         |
| <b>include-icv-indicator</b>     | Includes ICV indicator in MKPDU.                               |
| <b>key-server</b>                | Configures MKA key-server options.                             |
| <b>macsec-cipher-suite</b>       | Configures cipher suite for deriving SAK.                      |
| <b>sak-rekey</b>                 | Configures the SAK rekey interval.                             |
| <b>send-secure-announcements</b> | Configures MKA to send secure announcements in sending MKPDUs. |
| <b>ssci-based-on-sci</b>         | Computes SSCI based on the SCI.                                |
| <b>use-updated-eth-header</b>    | Uses the updated Ethernet header for ICV calculation.          |

## deny (MAC access-list configuration)

To prevent non-IP traffic from being forwarded if the conditions are matched, use the **deny** command in MAC access-list extended configuration mode. To remove a deny condition from the named MAC access list, use the **no** form of this command.

```
deny {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr |
dst-MAC-addr mask} [type mask | aarp | amber | appletalk | dec-spanning | decnet-iv |
diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console
| mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp] [cos cos]
no deny {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr |
dst-MAC-addr mask} [type mask | aarp | amber | appletalk | dec-spanning | decnet-iv |
diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console
| mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp] [cos cos]
```

### Syntax Description

|                                                            |                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>any</b>                                                 | Denies any source or destination MAC address.                                                                                                                                                                                                                                                   |
| <b>host</b> <i>src-MAC-addr</i>   <i>src-MAC-addr mask</i> | Defines a host MAC address and optional subnet mask. If the source address for a packet matches the defined address, non-IP traffic from that address is denied.                                                                                                                                |
| <b>host</b> <i>dst-MAC-addr</i>   <i>dst-MAC-addr mask</i> | Defines a destination MAC address and optional subnet mask. If the destination address for a packet matches the defined address, non-IP traffic to that address is denied.                                                                                                                      |
| <i>type mask</i>                                           | (Optional) Specifies the EtherType number of a packet with Ethernet II or SNAP encapsulation to identify the protocol of the packet.<br><br>The type is 0 to 65535, specified in hexadecimal.<br><br>The mask is a mask of don't care bits applied to the EtherType before testing for a match. |
| <b>aarp</b>                                                | (Optional) Specifies EtherType AppleTalk Address Resolution Protocol that maps a data-link address to a network address.                                                                                                                                                                        |
| <b>amber</b>                                               | (Optional) Specifies EtherType DEC-Amber.                                                                                                                                                                                                                                                       |
| <b>appletalk</b>                                           | (Optional) Specifies EtherType AppleTalk/EtherTalk.                                                                                                                                                                                                                                             |
| <b>dec-spanning</b>                                        | (Optional) Specifies EtherType Digital Equipment Corporation (DEC) spanning tree.                                                                                                                                                                                                               |
| <b>decnet-iv</b>                                           | (Optional) Specifies EtherType DECnet Phase IV protocol.                                                                                                                                                                                                                                        |
| <b>diagnostic</b>                                          | (Optional) Specifies EtherType DEC-Diagnostic.                                                                                                                                                                                                                                                  |

|                                     |                                                                                                                                                                                                                                       |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dsm</b>                          | (Optional) Specifies EtherType DEC-DSM.                                                                                                                                                                                               |
| <b>etype-6000</b>                   | (Optional) Specifies EtherType 0x6000.                                                                                                                                                                                                |
| <b>etype-8042</b>                   | (Optional) Specifies EtherType 0x8042.                                                                                                                                                                                                |
| <b>lat</b>                          | (Optional) Specifies EtherType DEC-LAT.                                                                                                                                                                                               |
| <b>lavr-sca</b>                     | (Optional) Specifies EtherType DEC-LAVR-SCA.                                                                                                                                                                                          |
| <b>lsap</b> <i>lsap-number mask</i> | (Optional) Specifies the LSAP number (0 to 65535) of a packet with 802.2 encapsulation to identify the protocol of the packet.<br><br><i>mask</i> is a mask of don't care bits applied to the LSAP number before testing for a match. |
| <b>mop-console</b>                  | (Optional) Specifies EtherType DEC-MOP Remote Console.                                                                                                                                                                                |
| <b>mop-dump</b>                     | (Optional) Specifies EtherType DEC-MOP Dump.                                                                                                                                                                                          |
| <b>msdos</b>                        | (Optional) Specifies EtherType DEC-MSDOS.                                                                                                                                                                                             |
| <b>mumps</b>                        | (Optional) Specifies EtherType DEC-MUMPS.                                                                                                                                                                                             |
| <b>netbios</b>                      | (Optional) Specifies EtherType DEC- Network Basic Input/Output System (NetBIOS).                                                                                                                                                      |
| <b>vines-echo</b>                   | (Optional) Specifies EtherType Virtual Integrated Network Service (VINES) Echo from Banyan Systems.                                                                                                                                   |
| <b>vines-ip</b>                     | (Optional) Specifies EtherType VINES IP.                                                                                                                                                                                              |
| <b>xns-idp</b>                      | (Optional) Specifies EtherType Xerox Network Systems (XNS) protocol suite (0 to 65535), an arbitrary EtherType in decimal, hexadecimal, or octal.                                                                                     |
| <b>cos</b> <i>cos</i>               | (Optional) Specifies a class of service (CoS) number from 0 to 7 to set priority. Filtering on CoS can be performed only in hardware. A warning message reminds the user if the <b>cos</b> option is configured.                      |

**Command Default**

This command has no defaults. However, the default action for a MAC-named ACL is to deny.

**Command Modes**

MAC-access list extended configuration (config-ext-macl)

**Command History**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

You enter MAC-access list extended configuration mode by using the **mac access-list extended** global configuration command.

If you use the **host** keyword, you cannot enter an address mask; if you do not use the **host** keyword, you must enter an address mask.

When an access control entry (ACE) is added to an access control list, an implied **deny-any-any** condition exists at the end of the list. That is, if there are no matches, the packets are denied. However, before the first ACE is added, the list permits all packets.

To filter IPX traffic, you use the *type mask* or **lsap lsap mask** keywords, depending on the type of IPX encapsulation being used. Filter criteria for IPX encapsulation types as specified in Novell terminology and Cisco IOS XE terminology are listed in the table.

**Table 180: IPX Filtering Criteria**

| IPX Encapsulation Type |                | Filter Criterion |
|------------------------|----------------|------------------|
| Cisco IOS XE Name      | Novel Name     |                  |
| arpa                   | Ethernet II    | EtherType 0x8137 |
| snap                   | Ethernet-snap  | EtherType 0x8137 |
| sap                    | Ethernet 802.2 | LSAP 0xE0E0      |
| novell-ether           | Ethernet 802.3 | LSAP 0xFFFF      |

This example shows how to define the named MAC extended access list to deny NETBIOS traffic from any source to MAC address 00c0.00a0.03fa. Traffic matching this list is denied.

```
Device> enable
Device# configure terminal
Device(config)# mac access-list extended mac_layer
Device(config-ext-macl)# deny any host 00c0.00a0.03fa netbios.
Device(config-ext-macl)# end
```

This example shows how to remove the deny condition from the named MAC extended access list:

```
Device> enable
Device# configure terminal
Device(config)# mac access-list extended mac_layer
Device(config-ext-macl)# no deny any 00c0.00a0.03fa 0000.0000.0000 netbios.
Device(config-ext-macl)# end
```

The following example shows how to deny all packets with EtherType 0x4321:

```
Device> enable
Device# configure terminal
Device(config)# mac access-list extended mac_layer
Device(config-ext-macl)# deny any any 0x4321 0
Device(config-ext-macl)# end
```

You can verify your settings by entering the **show access-lists** privileged EXEC command.

| <b>mac access-list extended</b> | Creates an access list based on MAC addresses for non-IP traffic.                                                    |
| <b>permit</b>                   | Permits from the MAC access-list configuration.<br>Permits non-IP traffic to be forwarded if conditions are matched. |
| <b>show access-lists</b>        | Displays access control lists configured on a device.                                                                |

## device-role (IPv6 snooping)

To specify the role of the device attached to the port, use the **device-role** command in IPv6 snooping configuration mode. To remove the specification, use the **no** form of this command.

```
device-role {node | switch}
no device-role {node | switch}
```

### Syntax Description

**node** Sets the role of the attached device to node.

**switch** Sets the role of the attached device to device.

### Command Default

The device role is node.

### Command Modes

IPv6 snooping configuration (config-ipv6-snooping)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

The **device-role** command specifies the role of the device attached to the port. By default, the device role is node.

The **switch** keyword indicates that the remote device is a switch and that the local switch is now operating in multiswitch mode; binding entries learned from the port will be marked with trunk\_port preference level. If the port is configured as a trust-port, binding entries will be marked with trunk\_trusted\_port preference level.

This example shows how to define an IPv6 snooping policy name as policy1, place the device in IPv6 snooping configuration mode, and configure the device as the node:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)# device-role node
Device(config-ipv6-snooping)# end
```

# device-role (IPv6 nd inspection)

To specify the role of the device attached to the port, use the **device-role** command in neighbor discovery (ND) inspection policy configuration mode.

**device-role** { **host** | **switch** }

| Command History    | Release                                                                                                                                                                                                                                                                                                                                           | Modification                                    |
|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                      | This command was introduced.                    |
| Usage Guidelines   | The <b>device-role</b> command specifies the role of the device attached to the port. By default, the device role is host, and therefore all the inbound router advertisement and redirect messages are blocked.                                                                                                                                  |                                                 |
|                    | The <b>switch</b> keyword indicates that the remote device is a switch and that the local switch is now operating in multiswitch mode; binding entries learned from the port will be marked with trunk_port preference level. If the port is configured as a trust-port, binding entries will be marked with trunk_trusted_port preference level. |                                                 |
|                    | The following example defines a Neighbor Discovery Protocol (NDP) policy name as policy1, places the device in ND inspection policy configuration mode, and configures the device as the host:                                                                                                                                                    |                                                 |
|                    | <pre>Device&gt; enable Device# configure terminal Device(config)# ipv6 nd inspection policy policy1 Device(config-nd-inspection)# device-role host Device(config-nd-inspection)# end</pre>                                                                                                                                                        |                                                 |

# device-tracking policy

To configure a Switch Integrated Security Features (SISF)-based IP device tracking policy, use the **device-tracking** command in global configuration mode. To delete a device tracking policy, use the **no** form of this command.

**device-tracking policy** *policy-name*  
**no device-tracking policy** *policy-name*

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                              |

|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | This command was introduced. |
| <b>Usage Guidelines</b>   | <p>Use the SISF-based <b>device-tracking policy</b> command to create a device tracking policy. When the <b>device-tracking policy</b> command is enabled, the configuration mode changes to device-tracking configuration mode. In this mode, the administrator can configure the following first-hop security commands:</p> <ul style="list-style-type: none"> <li>• (Optional) <b>device-role</b> {<b>node</b>   <b>switch</b>}—Specifies the role of the device attached to the port. Default is <b>node</b>.</li> <li>• (Optional) <b>limit address-count</b> <i>value</i>—Limits the number of addresses allowed per target.</li> <li>• (Optional) <b>no</b>—Negates a command or sets it to defaults.</li> <li>• (Optional) <b>destination-glean</b> {<b>recovery</b>   <b>log-only</b>} [<b>dhcp</b>]}—Enables binding table recovery by data traffic source address gleaning.</li> <li>• (Optional) <b>data-glean</b> {<b>recovery</b>   <b>log-only</b>} [<b>dhcp</b>   <b>ndp</b>]}—Enables binding table recovery using source or data address gleaning.</li> <li>• (Optional) <b>security-level</b> {<b>glean</b>   <b>guard</b>   <b>inspect</b>}—Specifies the level of security enforced by the feature. Default is <b>guard</b>. <ul style="list-style-type: none"> <li><b>glean</b>—Gleans addresses from messages and populates the binding table without any verification.</li> <li><b>guard</b>—Gleans addresses and inspects messages. In addition, it rejects RA and DHCP server messages. This is the default option.</li> <li><b>inspect</b>—Gleans addresses, validates messages for consistency and conformance, and enforces address ownership.</li> </ul> </li> <li>• (Optional) <b>tracking</b> {<b>disable</b>   <b>enable</b>}—Specifies a tracking option.</li> <li>• (Optional) <b>trusted-port</b>—Sets up a trusted port. It disables the guard on applicable targets. Bindings learned through a trusted port have preference over bindings learned through any other port. A trusted port is given preference in case of a collision while making an entry in the table.</li> </ul> |                              |

This example shows how to configure an a device-tracking policy:

```
Device> enable
Device# configure terminal
Device(config)# device-tracking policy policy1
Device(config-device-tracking)# trusted-port
Device(config-device-tracking)# end
```

## dnscrypt (Parameter Map)

To enable Domain Name System (DNS) packet encryption for authenticating communications between a Cisco device and the Cisco Umbrella Integration feature, use the **dnscrypt** command in parameter-map type inspect configuration mode. To disable DNS packet encryption, use the **no** form of this command.

**dnscrypt**  
**no dnscrypt**

### Syntax Description

This command has no arguments or keywords.

### Command Default

DNS packet encryption for umbrella mode is not configured.

### Command Modes

Parameter-map type inspect configuration (config-profile)

### Command History

| Release                       | Modification                 |
|-------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

### Usage Guidelines

When DNSCrypt is used, the DNS request packets' size is more than 512 bytes. Ensure that these packets are allowed through the intermediary devices; otherwise, the response may not reach the intended recipients.

### Examples

The following example shows how to enable DNS packet encryption:

```
Device> enable
Device# configure terminal
Device(config)# parameter-map type umbrella global
Device(config-profile)# dnscrypt
```

|-------------------------------------------|---------------------------------------------------|
| <b>parameter-map type umbrella global</b> | Configures a parameter map type in umbrella mode. |

## dot1x critical (global configuration)

To configure the IEEE 802.1X critical authentication parameters, use the **dot1x critical** command in global configuration mode.

### dot1x critical eapol

|                    |                                                                                                                                    |                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| Syntax Description | <b>eapol</b> Specifies that the switch send an EAPOL-Success message when the device successfully authenticates the critical port. |                              |
| Command Default    | <b>eapol</b> is disabled                                                                                                           |                              |
| Command Modes      | Global configuration (config)                                                                                                      |                              |
| Command History    | Release                                                                                                                            | Modification                 |
|                    | Cisco IOS XE Everest 16.5.1a                                                                                                       | This command was introduced. |

This example shows how to specify that the device sends an EAPOL-Success message when the device successfully authenticates the critical port:

```
Device> enable
Device# configure terminal
Device(config)# dot1x critical eapol
Device(config)# exit
```

## dot1x logging verbose

To filter detailed information from 802.1x system messages, use the **dot1x logging verbose** command in global configuration mode on a device stack or on a standalone device.

**dot1x logging verbose**  
**no dot1x logging verbose**

|                           |                                            |

|                  | mab logging verbose            | Filters details from MAC authentication bypass (MAB) system messages. |

# dot1x max-start

To set the maximum number of Extensible Authentication Protocol over LAN (EAPOL) start frames that a supplicant sends (assuming that no response is received) to the client before concluding that the other end is 802.1X unaware, use the **dot1x max-start** command in interface configuration mode. To remove the maximum number-of-times setting, use the **no** form of this command.

**dot1x max-start** *number*  
**no dot1x max-start**

|                           |                                                                                                                                |                              |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <i>number</i> Maximum number of times that the router sends an EAPOL start frame. The value is from 1 to 10. The default is 3. |                              |
| <b>Command Default</b>    | The default maximum number setting is 3.                                                                                       |                              |
| <b>Command Modes</b>      | Interface configuration (config-if)                                                                                            |                              |
| <b>Command History</b>    | <b>Release</b>                                                                                                                 | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                   | This command was introduced. |

**Usage Guidelines** You must enter the **switchport mode access** command on a switch port before entering this command.

The following example shows that the maximum number of EAPOL Start requests has been set to 5:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 1/0/3
Device(config-if)# dot1x max-start 5
Device(config-if)# end
```

# dot1x pae

To set the Port Access Entity (PAE) type, use the **dot1x pae** command in interface configuration mode. To disable the PAE type that was set, use the **no** form of this command.

**dot1x pae** {supplicant | authenticator}  
**no dot1x pae** {supplicant | authenticator}

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>supplicant</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                             | The interface acts only as a supplicant and will not respond to messages that are meant for an authenticator. |
|                    | <b>authenticator</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                          | The interface acts only as an authenticator and will not respond to any messages meant for a supplicant.      |
| Command Default    | PAE type is not set.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                               |
| Command Modes      | Interface configuration (config-if)                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                               |
| Command History    | <b>Release</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>Modification</b>                                                                                           |
|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                                                  | This command was introduced.                                                                                  |
| Usage Guidelines   | <p>Use the <b>no dot1x pae</b> interface configuration command to disable IEEE 802.1x authentication on the port.</p> <p>When you configure IEEE 802.1x authentication on a port, such as by entering the <b>dot1x port-control</b> interface configuration command, the device automatically configures the port as an IEEE 802.1x authenticator. After the <b>no dot1x pae</b> interface configuration command is entered, the Authenticator PAE operation is disabled.</p> |                                                                                                               |

The following example shows that the interface has been set to act as a supplicant:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 1/0/3
Device(config-if)# dot1x pae supplicant
Device(config-if)# end
```

# dot1x supplicant controlled transient

To control access to an 802.1x supplicant port during authentication, use the **dot1x supplicant controlled transient** command in global configuration mode. To open the supplicant port during authentication, use the **no** form of this command

**dot1x supplicant controlled transient**  
**no dot1x supplicant controlled transient**

## Syntax Description

This command has no arguments or keywords.

## Command Default

Access is allowed to 802.1x supplicant ports during authentication.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

In the default state, when you connect a supplicant device to an authenticator switch that has BPCU guard enabled, the authenticator port could be error-disabled if it receives a Spanning Tree Protocol (STP) bridge protocol data unit (BPDU) packets before the supplicant switch has authenticated. You can control traffic exiting the supplicant port during the authentication period. Entering the **dot1x supplicant controlled transient** command temporarily blocks the supplicant port during authentication to ensure that the authenticator port does not shut down before authentication completes. If authentication fails, the supplicant port opens. Entering the **no dot1x supplicant controlled transient** command opens the supplicant port during the authentication period. This is the default behavior.

We recommend using the **dot1x supplicant controlled transient** command on a supplicant device when BPDU guard is enabled on the authenticator switch port with the **spanning-tree bpduguard enable** interface configuration command.

This example shows how to control access to 802.1x supplicant ports on a device during authentication:

```
Device> enable
Device# configure terminal
Device(config)# dot1x supplicant controlled transient
Device(config)# exit
```

## dot1x supplicant force-multicast

To force a supplicant switch to send only multicast Extensible Authentication Protocol over LAN (EAPOL) packets whenever it receives multicast or unicast EAPOL packets, use the **dot1x supplicant force-multicast** command in global configuration mode. To return to the default setting, use the **no** form of this command.

**dot1x supplicant force-multicast**  
**no dot1x supplicant force-multicast**

### Syntax Description

This command has no arguments or keywords.

### Command Default

The supplicant device sends unicast EAPOL packets when it receives unicast EAPOL packets. Similarly, it sends multicast EAPOL packets when it receives multicast EAPOL packets.

### Command Modes

Global configuration (config)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Enable this command on the supplicant device for Network Edge Access Topology (NEAT) to work in all host modes.

This example shows how force a supplicant device to send multicast EAPOL packets to the authenticator device:

```
Device> enable
Device# configure terminal
Device(config)# dot1x supplicant force-multicast
Device(config)# end
```

### Related Commands

|-----------------------------|--------------------------------------------------------------------------------------|
| <b>cisp enable</b>          | Enables CISP on a device so that it acts as an authenticator to a supplicant switch. |
| <b>dot1x credentials</b>    | Configures the 802.1x supplicant credentials on the port.                            |
| <b>dot1x pae supplicant</b> | Configures an interface to act only as a supplicant.                                 |

# dot1x test eapol-capable

To monitor IEEE 802.1x activity on all the switch ports and to display information about the devices that are connected to the ports that support IEEE 802.1x, use the **dot1x test eapol-capable** command in privileged EXEC mode.

**dot1x test eapol-capable** [**interface** *interface-id*]

# dot1x test timeout

To configure the timeout used to wait for EAPOL response from a port being queried for IEEE 802.1x readiness, use the **dot1x test timeout** command in global configuration mode.

**dot1x test timeout** *timeout*

| Syntax Description | <i>timeout</i> | Time in seconds to wait for an EAPOL response. The range is from 1 to 65535 seconds. |
|--------------------|----------------|--------------------------------------------------------------------------------------|
|--------------------|----------------|--------------------------------------------------------------------------------------|

| Command Default | The default setting is 10 seconds. |
|-----------------|------------------------------------|
|-----------------|------------------------------------|

| Command Modes | Global configuration (config) |
|---------------|-------------------------------|
|---------------|-------------------------------|

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

| Usage Guidelines | <p>Use this command to configure the timeout used to wait for EAPOL response.</p> <p>There is not a no form of this command.</p> |
|------------------|----------------------------------------------------------------------------------------------------------------------------------|
|------------------|----------------------------------------------------------------------------------------------------------------------------------|

This example shows how to configure the switch to wait 27 seconds for an EAPOL response:

```
Device> enable
Device# dot1x test timeout 27
```

You can verify the timeout configuration status by entering the **show running-config** command.

## dot1x timeout

To configure the value for retry timeouts, use the **dot1x timeout** command in global configuration or interface configuration mode. To return to the default value for retry timeouts, use the **no** form of this command.

**dot1x timeout** { **auth-period** *seconds* | **held-period** *seconds* | **quiet-period** *seconds* | **ratelimit-period** *seconds* | **server-timeout** *seconds* | **start-period** *seconds* | **supp-timeout** *seconds* | **tx-period** *seconds* }

| Syntax Description                     |  |                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------|--|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>auth-period</b> <i>seconds</i>      |  | Configures the time, in seconds for which a supplicant will stay in the HELD state (that is, the length of time it will wait before trying to send the credentials again after a failed attempt).<br><br>The range is from 1 to 65535. The default is 30.                                                                                                                                                                                               |
| <b>held-period</b> <i>seconds</i>      |  | Configures the time, in seconds for which a supplicant will stay in the HELD state (that is, the length of time it will wait before trying to send the credentials again after a failed attempt).<br><br>The range is from 1 to 65535. | <b>quiet-period</b> <i>seconds</i>     |  | Configures the time, in seconds, that the authenticator (server) remains quiet (in the HELD state) following a failed authentication exchange before trying to reauthenticate the client.<br><br>The range is from 1 to 65535. The default is 60                                                                                                                                                                                                        |
| <b>ratelimit-period</b> <i>seconds</i> |  | Throttles the EAP-START packets that are sent from misbehaving client PCs (for example, PCs that send EAP-START packets that result in the wasting of device processing power). <ul style="list-style-type: none"> <li>• The authenticator ignores EAPOL-Start packets from clients that have successfully authenticated for the rate-limit period duration.</li> <li>• The range is from 1 to 65535. By default, rate limiting is disabled.</li> </ul> |
| <b>server-timeout</b> <i>seconds</i>   |  | Configures the interval, in seconds, between two successive EAPOL-Start frames when they are being retransmitted. <ul style="list-style-type: none"> <li>• The range is from 1 to 65535. The default is 30.</li> </ul> <p>If the server does not send a response to an 802.1X packet within the specified period, the packet is sent again.</p>                                                                                                         |
| <b>start-period</b> <i>seconds</i>     |  | Configures the interval, in seconds, between two successive EAPOL-Start frames when they are being retransmitted.<br><br>The range is from 1 to 65535. The default is 30.                                                                                                                                                                                                                                                                               |

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>supp-timeout</b> <i>seconds</i> | Sets the authenticator-to-suppliant retransmission time for all EAP messages other than EAP Request ID.<br><br>The range is from 1 to 65535. The default is 30.                                                                                                                                                                                                                                                  |
| <b>tx-period</b> <i>seconds</i>    | Configures the number of seconds between retransmission of EAP request ID packets (assuming that no response is received) to the client.<br><br><ul style="list-style-type: none"> <li>• The range is from 1 to 65535. The default is 30.</li> <li>• If an 802.1X packet is sent to the supplicant and the supplicant does not send a response after the retry period, the packet will be sent again.</li> </ul> |

**Command Default** Periodic reauthentication and periodic rate-limiting are done.

**Command Modes** Global configuration (config)  
Interface configuration (config-if)

| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|------------------------|------------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

The **dot1x timeout reauth-period** interface configuration command affects the behavior of the device only if you have enabled periodic re-authentication by using the **dot1x reauthentication** interface configuration command.

During the quiet period, the device does not accept or initiate any authentication requests. If you want to provide a faster response time to the user, enter a number smaller than the default.

When the **ratelimit-period** is set to 0 (the default), the device does not ignore EAPOL packets from clients that have been successfully authenticated and forwards them to the RADIUS server.

The following example shows that various 802.1X retransmission and timeout periods have been set:

```
Device> enable
Device(config)# configure terminal
Device(config)# interface gigabitethernet 1/0/3
Device(config-if)# dot1x port-control auto
Device(config-if)# dot1x timeout auth-period 2000
Device(config-if)# dot1x timeout held-period 2400
Device(config-if)# dot1x timeout quiet-period 600
Device(config-if)# dot1x timeout start-period 90
Device(config-if)# dot1x timeout supp-timeout 300
Device(config-if)# dot1x timeout tx-period 60
Device(config-if)# dot1x timeout server-timeout 60
Device(config-if)# end
```

# dscp

To configure DSCP marking for authentication and accounting on RADIUS packets, use the **dscp** command. To disable DSCP marking for authentication and accounting on RADIUS packets, use the **no** form of this command

**dscp** { **acct** *dscp\_acct\_value* | **auth** *dscp\_auth\_value* }

**no dscp** { **acct** *dscp\_acct\_value* | **auth** *dscp\_auth\_value* }

## Syntax Description

|                                    |                                                                                                                   |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>acct</b> <i>dscp_acct_value</i> | Configures RADIUS DSCP marking value for accounting. The valid range is from 1 to 63. The default value is 0.     |
| <b>auth</b> <i>dscp_auth_value</i> | Configures RADIUS DSCP marking value for authentication. The valid range is from 1 to 63. The default value is 0. |

## Command Default

The DSCP marking on RADIUS packets is disabled by default.

## Command Modes

RADIUS server configuration (config-radius-server)  
RADIUS server group configuration (config-sg-radius)

## Command History

| Release                       | Modification                 |
|-------------------------------|------------------------------|
| Cisco IOS XE Bengaluru 17.5.1 | This command was introduced. |

## Example

This example shows how to configure DSCP marking for authentication and accounting on RADIUS packets for a RADIUS server:

```
Device(config)#radius server abc
Device(config-radius-server)#address ipv4 10.1.1.1 auth-port 1645 acct-port 1646
Device(config-radius-server)#dscp auth 10 acct 20
Device(config-radius-server)#key cisco123
Device(config-radius-server)#end
```

This example shows how to configure DSCP marking for authentication and accounting on RADIUS packets for a RADIUS server group:

```
Device(config)#aaa group server radius xyz
Device(config-sg-radius)#server name abc
Device(config-sg-radius)#ip radius source-interface Vlan18
Device(config-sg-radius)#dscp auth 30 acct 10
Device(config-sg-radius)#end
```

# dtls

To configure Datagram Transport Layer Security (DTLS) parameters, use the **dtls** command in radius server configuration mode. To return to the default setting, use the **no** form of this command.

```
dtls [{ connectiontimeout connection-timeout-value | idletimeout idle-timeout-value } [{ ip | ipv6 } ] {
radius source-interface interface-name | vrf forwarding forwarding-table-name } | match-server-identity
{ email-address email-address | hostname hostname | ip-address ip-address } | port port-number |
retries number-of-connection-retries | trustpoint { client trustpoint name | server trustpoint name } }
```

**no dtls**

## Syntax Description

|                                                                                                                                                     |                                                                          |
|-----------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| <b>connectiontimeout</b> <i>connection-timeout-value</i>                                                                                            | (Optional) Configures the DTLS connection timeout value.                 |
| <b>idletimeout</b> <i>idle-timeout-value</i>                                                                                                        | (Optional) Configures the DTLS idle timeout value.                       |
| [ <b>ip</b>   <b>ipv6</b> ] { <b>radius source-interface</b> <i>interface-name</i>   <b>vrf forwarding</b> <i>forwarding-table-name</i> }           | (Optional) Configures IP or IPv6 source parameters.                      |
| <b>match-server-identity</b> { <b>email-address</b> <i>email-address</i>   <b>hostname</b> <i>host-name</i>   <b>ip-address</b> <i>ip-address</i> } | Configures RadSec certification validation parameters.                   |
| <b>port</b> <i>port-number</i>                                                                                                                      | (Optional) Configures the DTLS port number.                              |
| <b>retries</b> <i>number-of-connection-retries</i>                                                                                                  | (Optional) Configures the number of DTLS connection retries.             |
| <b>trustpoint</b> { <b>client</b> <i>trustpoint name</i>   <b>server</b> <i>trustpoint name</i> }                                                   | (Optional) Configures the DTLS trustpoint for the client and the server. |

## Command Default

- The default value of DTLS connection timeout is 5 seconds.
- The default value of DTLS idle timeout is 60 seconds.
- The default DTLS port number is 2083.
- The default value of DTLS connection retries is 5.

## Command Modes

Radius server configuration (config-radius-server)

## Command History

| Release                        | Modification                                             |
|--------------------------------|----------------------------------------------------------|
| Cisco IOS XE Everest 16.6.1    | This command was introduced.                             |
| Cisco IOS XE Gibraltar 16.10.1 | The <b>match-server-identity</b> keyword was introduced. |
| Cisco IOS XE Amsterdam 17.1.1  | The <b>ipv6</b> keyword was introduced.                  |

### Usage Guidelines

We recommend that you use the same server type, either only Transport Layer Security (TLS) or only DTLS, under an Authentication, Authorization, and Accounting (AAA) server group.

### Examples

The following example shows how to configure the DTLS connection timeout value to 10 seconds:

```
Device> enable
Device# configure terminal
Device(config)# radius server R1
Device(config-radius-server)# dtls connectiontimeout 10
Device(config-radius-server)# end
```

|------------------------------------------|--------------------------------------------------|
| <b>show aaa servers</b>                  | Displays information related to the DTLS server. |
| <b>clear aaa counters servers radius</b> | Clears the RADIUS DTLS-specific statistics.      |
| <b>debug radius dtls</b>                 | Enables RADIUS DTLS-specific debugs.             |

# enable password

To set a local password to control access to various privilege levels, use the **enable password** command in global configuration mode. To remove control access of the local password, use the **no** form of this command.

**enable password** [**level** *level*] {[**0**] *unencrypted-password* | [*encryption-type*] *encrypted-password*}  
**no enable password** [**level** *level*]

|                           |                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                            |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>level</b> <i>level</i>                                                                                                                                                                                                                                                                                                                           | (Optional) Specifies the level for which the password is applicable. You can specify up to 16 privilege levels, using numbers 0 through 15. Level 1 is normal user EXEC mode user privileges. If <i>level</i> is not specified in the command or in the <b>no</b> form of the command, the privilege level defaults to 15. |
|                           | <b>0</b>                                                                                                                                                                                                                                                                                                                                            | (Optional) Specifies an unencrypted cleartext password. The password is converted to a Secure Hash Algorithm (SHA) 256 secret and is stored in the device.                                                                                                                                                                 |
|                           | <i>unencrypted-password</i>                                                                                                                                                                                                                                                                                                                         | Specifies the password to enter enable mode.                                                                                                                                                                                                                                                                               |
|                           | <i>encryption-type</i>                                                                                                                                                                                                                                                                                                                              | (Optional) Cisco-proprietary algorithm used to encrypt the password. If you specify <i>encryption-type</i> , the next argument that you supply must be an encrypted password (a password already encrypted by a Cisco device). You can specify type 7, which indicates that a hidden password follows.                     |
|                           | <i>encrypted-password</i>                                                                                                                                                                                                                                                                                                                           | Encrypted password copied from another device configuration.                                                                                                                                                                                                                                                               |
| <b>Command Default</b>    | No password is defined.                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                            |
| <b>Command Modes</b>      | Global configuration (config)                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                            |

|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                        | This command was introduced.                                                                                                                                                                                                                                                                                               |
| <b>Usage Guidelines</b>   | If neither the <b>enable password</b> command nor the <b>enable secret</b> command is configured, and if a line password is configured for the console, the console line password serves as the enable password for all VTY (Telnet and Secure Shell [SSH]) sessions.                                                                               |                                                                                                                                                                                                                                                                                                                            |
|                           | Use <b>enable password</b> command with the <b>level</b> option to define a password for a specific privilege level. After you specify the level and the password, share the password with users who need to access this level. Use the <b>privilege level</b> configuration command to specify the commands that are accessible at various levels. |                                                                                                                                                                                                                                                                                                                            |
|                           | Typically, you enter an encryption type only if you copy and paste a password that has already been encrypted by a Cisco device, into this command.                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                            |

**Caution**

If you specify an encryption type and then enter a cleartext password, you will not be able to re-enter enable mode. You cannot recover a lost password that has been encrypted earlier.

If the **service password-encryption** command is set, the encrypted form of the password you create with the **enable password** command is displayed when the **more nvram:startup-config** command is run.

You can enable or disable password encryption with the **service password-encryption** command.

An enable password is defined as follows:

- Must contain a combination of numerals from 1 to 25, and uppercase and lowercase alphanumeric characters.
- Can have leading spaces, but they are ignored. However, intermediate and trailing spaces are recognized.
- Can contain the question mark (?) character if you precede the question mark with the key combination Ctrl-V when you create the password, for example, to create the password *abc?123*, do the following:
  1. Enter **abc**.
  2. Press **Ctrl-v**.
  3. Enter **?123**.

**Note**

When the system prompts you to enter the **enable password** command, you need not precede the question mark with Ctrl-V; you can enter *abc?123* at the password prompt.

**Examples**

The following example shows how to enable the password *pswd2* for privilege level 2:

```
Device> enable
Device# configure terminal
Device(config)# enable password level 2 pswd2
```

The following example shows how to set the encrypted password *\$1\$i5Rkls3LoyxzS8t9*, which has been copied from a device configuration file, for privilege level 2 using encryption type 7:

```
Device> enable
Device# configure terminal
Device(config)# enable password level 2 5 $1$i5Rkls3LoyxzS8t9
```

# enable secret

To specify an additional layer of security over the **enable password** command, use the **enable secret** command in global configuration mode. To turn off the enable secret function, use the **no** form of this command.

**enable secret** [**level** *level*] {[**0**] *unencrypted-password* | *encryption-type encrypted-password*}

**no enable secret** [**level** *level*] [*encryption-type encrypted-password*]

| Syntax Description      | <b>level</b> <i>level</i>                                                                                                                                                                                                                                            | (Optional) Specifies the level for which the password is applicable. You can specify up to 15 privilege levels, using numerals 1 through 15. Level 1 is normal user EXEC mode privileges. If <i>level</i> is not specified in the command or in the <b>no</b> form of the command, the privilege level defaults to 15.                                              |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                         | <b>0</b>                                                                                                                                                                                                                                                             | (Optional) Specifies an unencrypted cleartext password. The password is converted to a Secure Hash Algorithm (SHA) 256 secret and is stored in the device.                                                                                                                                                                                                          |
|                         | <i>unencrypted-password</i>                                                                                                                                                                                                                                          | Specifies the password for users to enter enable mode. This password should be different from the password created with the <b>enable password</b> command.                                                                                                                                                                                                         |

|                         | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                         | This command was introduced.                                                                                                                                                                                                                                                                                                                                        |
| <b>Usage Guidelines</b> | If neither the <b>enable password</b> command or the <b>enable secret</b> command is configured, and if a line password is configured for the console, the console line password serves as the enable password for all vty (Telnet and Secure Shell [SSH]) sessions. |                                                                                                                                                                                                                                                                                                                                                                     |

Use the **enable secret** command to provide an additional layer of security over the **enable password** password. The **enable secret** command provides better security by storing the password using a nonreversible cryptographic function. The additional layer of security encryption is useful in environments where the password is sent to the network or is stored on a TFTP server.

Typically, you enter an encryption type only when you paste an encrypted password that you copied from a device configuration file, into this command.

**Caution**

If you specify an encryption type and then enter a cleartext password, you will not be able to reenter enable mode. You cannot recover a lost password that has been encrypted earlier.

If you use the same password for the **enable password** and **enable secret** commands, you receive an error message warning that this practice is not recommended, but the password will be accepted. By using the same password, however, you undermine the additional security the **enable secret** command provides.

**Note**

After you set a password using the **enable secret** command, a password set using the **enable password** command works only if the **enable secret** is disabled. Additionally, you cannot recover a lost password that has been encrypted by any method.

If the **service password-encryption** command is set, the encrypted form of the password you create is displayed when the **more nvram:startup-config** command is run.

You can enable or disable password encryption with the **service password-encryption** command.

An enable password is defined as follows:

- Must contain a combination of numerals from 1 to 25, and uppercase and lowercase alphanumeric characters.
- Can have leading spaces, but they are ignored. However, intermediate and trailing spaces are recognized.
- Can contain the question mark (?) character if you precede the question mark with the key combination Ctrl-v when you create the password; for example, to create the password *abc?123*, do the following:
  1. Enter **abc**.
  2. Press **Ctrl-v**.
  3. Enter **?123**.

**Note**

When the system prompts you to enter the **enable password** command, you need not precede the question mark with Ctrl-v; you can enter **abc?123** at the password prompt.

**Examples**

The following example shows how to specify a password with the **enable secret** command:

```
Device> enable
Device# configure terminal
```

```
Device(config)# enable secret password
```

After specifying a password with the **enable secret** command, users must enter this password to gain access. Otherwise, passwords set using the **enable password** command will no longer work.

```
Password: password
```

The following example shows how to enable the encrypted password \$1\$FaD0\$Xyti5Rkls3LoyxzS8, which has been copied from a device configuration file, for privilege level 2, using the encryption type 4:

```
Device> enable
Device# configure terminal
Device(config)# enable password level 2 4 $1$FaD0$Xyti5Rkls3LoyxzS8
```

The following example shows the warning message that is displayed when a user enters the **enable secret 4 encrypted-password** command:

```
Device> enable
Device# configure terminal
Device(config)# enable secret 4 tnhtc92DXBhelxjYk8LWJrPV36S2i4ntXrpb4RFmfqY

WARNING: Command has been added to the configuration but Type 4 passwords have been
deprecated.
Migrate to a supported password type

Device(config)# end
Device# show running-config | inc secret

enable secret 4 tnhtc92DXBhelxjYk8LWJrPV36S2i4ntXrpb4RFmfqY
```

|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | Use this command to configure an open directive that allows hosts without an authorization policy to access ports configured with a static ACL. If you do not configure this command, the port applies the policies of the configured ACL to the traffic. If no static ACL is configured on a port, both the default and open directives allow access to the port. |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

You can verify your settings by entering the **show running-config** command.

This example shows how to configure an open directive.

```
Device> enable
Device# configure terminal
Device(config)# epm access-control open
Device(config)# exit
```

The range is from 1 to 300. |
|                    | <b>infinite</b>                                                                                                                                                                                                                                                                                                                                             | The FQDN entry stays forever.                                 |
| Command Default    | The default TTL timeout factor is 10.                                                                                                                                                                                                                                                                                                                       |                                                               |
| Command Modes      | Global configuration (config)                                                                                                                                                                                                                                                                                                                               |                                                               |
| Command History    | Release                                                                                                                                                                                                                                                                                                                                                     | Modification                                                  |
|                    | Cisco IOS XE Bengaluru 17.5.1                                                                                                                                                                                                                                                                                                                               | The command was introduced.                                   |
| Usage Guidelines   | The local TTL value for the cached FQDN entry is calculated based on the TTL value received in the DNS response packet multiplied by the configured TTL timeout factor. For example, if the received DNS response has a TTL value of 100 seconds and multiplication factor is set to 10, then the local TTL for the cached FQDN entry will be 1000 seconds. |                                                               |

**Examples**

The following example shows how to set the FQDN TTL timeout factor:

```

Device> enable
Device# configure terminal
Device(config)# fqdn ttl-timeout-factor 100
  
```

# include-icv-indicator

To include the integrity check value (ICV) indicator in MKPDU, use the **include-icv-indicator** command in MKA-policy configuration mode. To disable the ICV indicator, use the **no** form of this command.

**include-icv-indicator**  
**no include-icv-indicator**

**Syntax Description** This command has no arguments or keywords.

**Command Default** ICV indicator is included.

**Command Modes** MKA-policy configuration (config-mka-policy)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

The following example shows how to include the ICV indicator in MKPDU:

```
Device> enable
Device# configure terminal
Device(config)# mka policy 2
Device(config-mka-policy)# include-icv-indicator
```

| <b>sak-rekey</b>                 | Configures the SAK rekey interval.                             |
| <b>send-secure-announcements</b> | Configures MKA to send secure announcements in sending MKPDUs. |
| <b>ssci-based-on-sci</b>         | Computes SSCI based on the SCI.                                |
| <b>use-updated-eth-header</b>    | Uses the updated Ethernet header for ICV calculation.          |

## ip access-list

To define an IP access list or object-group access control list (ACL) by name or number or to enable filtering for packets with IP helper-address destinations, use the **ip access-list** command in global configuration mode. To remove the IP access list or object-group ACL or to disable filtering for packets with IP helper-address destinations, use the **no** form of this command.

**ip access-list** { **extended** | **resequence** | **standard** } { *access-list-number* *access-list-name* } | **helper egress check** | **log-update threshold** *threshold-number* | **logging** { **hash-generation** | **interval** *time* } | **persistent** | **role-based** *access-list-name* | **fqdn** *access-list-name* }

**no ip access-list** { { **extended** | **resequence** | **standard** } { *access-list-number* *access-list-name* } | **helper egress check** | **log-update threshold** | **logging** { **hash-generation** | **interval** } | **persistent** | **role-based** *access-list-name* | **fqdn** *access-list-name* }

### Syntax Description

|                                             |                                                                                                                                                                                                                           |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>standard</b>                             | Specifies a standard IP access list.                                                                                                                                                                                      |
| <b>resequence</b>                           | Specifies a resequenced IP access list.                                                                                                                                                                                   |
| <b>extended</b>                             | Specifies an extended IP access list. Required for object-group ACLs.                                                                                                                                                     |
| <i>access-list-name</i>                     | Name of the IP access list or object-group ACL. Names cannot contain a space or quotation mark, and must begin with an alphabetic character to prevent ambiguity with numbered access lists.                              |
| <i>access-list-number</i>                   | Number of the access list. <ul style="list-style-type: none"> <li>• A standard IP access list is in the ranges 1-99 or 1300-1999.</li> <li>• An extended IP access list is in the ranges 100-199 or 2000-2699.</li> </ul> |
| <b>helper egress check</b>                  | Enables permit or deny matching capability for an outbound access list that is applied to an interface, for traffic that is relayed via the IP helper feature to a destination server address.                            |
| <b>log-update</b>                           | Controls the access list log updates.                                                                                                                                                                                     |
| <b>threshold</b><br><i>threshold-number</i> | Sets the access list logging threshold. The range is 0 to 2147483647.                                                                                                                                                     |
| <b>logging</b>                              | Controls the access list logging.                                                                                                                                                                                         |
| <b>hash-generation</b>                      | Enables syslog hash code generation.                                                                                                                                                                                      |
| <b>interval</b> <i>time</i>                 | Sets the access list logging interval in milliseconds. The range is 0 to 2147483647.                                                                                                                                      |
| <b>persistent</b>                           | Access control entry (ACE) sequence numbers are persistent across reloads.<br><b>Note</b> This is enabled by default and cannot be disabled.                                                                              |
| <b>role-based</b>                           | Specifies a role-based IP access list.                                                                                                                                                                                    |

|             |                                       |
|-------------|---------------------------------------|
| <b>fqdn</b> | Specifies a FQDN IP access list.      |
| <b>Note</b> | The name must start with an alphabet. |

**Command Default** No IP access list or object-group ACL is defined, and outbound ACLs do not match and filter IP helper relayed traffic.

**Command Modes** Global configuration (config)

| <b>Command History</b> | <b>Release</b>                | <b>Modification</b>                     |
|------------------------|-------------------------------|-----------------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a  | This command was introduced.            |
|                        | Cisco IOS XE Bengaluru 17.5.1 | The <b>fqdn</b> keyword was introduced. |

**Usage Guidelines** Use this command to configure a named or numbered IP access list or an object-group ACL. This command places the device in access-list configuration mode, where you must define the denied or permitted access conditions by using the **deny** and **permit** commands.

Specifying the **standard** or **extended** or **fqdn** keyword with the **ip access-list** command determines the prompt that appears when you enter access-list configuration mode. You must use the **extended** keyword when defining object-group ACLs.

You can create object groups and IP access lists or object-group ACLs independently, which means that you can use object-group names that do not yet exist.

Use the **ip access-group** command to apply the access list to an interface.

The **ip access-list helper egress check** command enables outbound ACL matching for permit or deny capability on packets with IP helper-address destinations. When you use an outbound extended ACL with this command, you can permit or deny IP helper relayed traffic based on source or destination User Datagram Protocol (UDP) ports. The **ip access-list helper egress check** command is disabled by default; outbound ACLs will not match and filter IP helper relayed traffic.

## Examples

The following example defines a standard access list named Internetfilter:

```
Device> enable
Device# configure terminal
Device(config)# ip access-list standard Internetfilter
Device(config-std-nacl)# permit 192.168.255.0 0.0.0.255
Device(config-std-nacl)# permit 10.88.0.0 0.0.255.255
Device(config-std-nacl)# permit 10.0.0.0 0.255.255.255
```

The following example shows how to set the FQDN TTL timeout factor and create an FQDN ACL named facl.

```
Device> enable
Device# configure terminal
Device(config)# fqdn ttl-timeout-factor 100
Device(config)# ip access-list fqdn facl
Device(config-fqdn-acl)# 100 permit ip any any
Device(config-fqdn-acl)# 10 permit ip host 1.1.1.1 host dynamic www.google.com
Device(config-fqdn-acl)# end
```

The following example shows how to create an object-group ACL that permits packets from the users in `my_network_object_group` if the protocol ports match the ports specified in `my_service_object_group`:

```
Device> enable
Device# configure terminal
Device(config)# ip access-list extended my_ogacl_policy
Device(config-ext-nacl)# permit tcp object-group my_network_object_group portgroup
my_service_object_group any
Device(config-ext-nacl)# deny tcp any any
```

The following example shows how to enable outbound ACL filtering on packets with helper-address destinations:

```
Device> enable
Device# configure terminal
Device(config)# ip access-list helper egress check
```

#### Related Commands

| Command                     | Description                                                                                   |
|-----------------------------|-----------------------------------------------------------------------------------------------|
| <b>deny</b>                 | Sets conditions in a named IP access list or in an object-group ACL that will deny packets.   |
| <b>ip access-group</b>      | Applies an ACL or an object-group ACL to an interface or a service policy map.                |
| <b>object-group network</b> | Defines network object groups for use in object-group ACLs.                                   |
| <b>object-group service</b> | Defines service object groups for use in object-group ACLs.                                   |
| <b>permit</b>               | Sets conditions in a named IP access list or in an object-group ACL that will permit packets. |
| <b>show ip access-list</b>  | Displays the contents of IP access lists or object-group ACLs.                                |
| <b>show object-group</b>    | Displays information about object groups that are configured.                                 |

## ip access-list role-based

To create a role-based (security group) access control list (RBACL) and enter role-based ACL configuration mode, use the **ip access-list role-based** command in global configuration mode. To remove the configuration, use the **no** form of this command.

```
ip access-list role-based access-list-name
no ip access-list role-based access-list-name
```

|                           |                                                                                 |
|---------------------------|---------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>access-list-name</i> Name of the security group access control list (SGACL). |

|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                                             |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | For SGACL logging, you must configure the <b>permit ip log</b> command. Also, this command must be configured in Cisco Identity Services Engine (ISE) to enable logging for dynamic SGACLs. |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The following example shows how to define an SGACL that can be applied to IPv4 traffic and enter role-based access list configuration mode:

```
Device> enable
Device# configure terminal
Device(config)# ip access-list role-based rbac11
Device(config-rb-acl)# permit ip log
Device(config-rb-acl)# end
```

|                         | <b>permit ip log</b>       | Permits logging that matches the configured entry. |
|                         | <b>show ip access-list</b> | Displays contents of all current IP access lists.  |

# ip admission

To enable web authentication, use the **ip admission** command in interface configuration mode or fallback-profile configuration mode. To disable web authentication, use the **no** form of this command.

**ip admission** *rule*  
**no ip admission** *rule*

## Syntax Description

*rule* IP admission rule name.

## Command Default

Web authentication is disabled.

## Command Modes

Interface configuration (config-if)

Fallback-profile configuration (config-fallback-profile)

## Command History

### Release

### Modification

Cisco IOS XE Everest 16.5.1a

This command was introduced.

## Usage Guidelines

The **ip admission** command applies a web authentication rule to a switch port.

This example shows how to apply a web authentication rule to a switchport:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip admission rule1
Device(config-if)# end
```

This example shows how to apply a web authentication rule to a fallback profile for use on an IEEE 802.1x enabled switch port.

```
Device> enable
Device# configure terminal
Device(config)# fallback profile profile1
Device(config-fallback-profile)# ip admission rule1
Device(config-fallback-profile)# end
```

## ip admission name

To enable web authentication, use the **ip admission name** command in global configuration mode. To disable web authentication, use the **no** form of this command.

**ip admission name** *name* {**consent** | **proxy http**} [**absolute timer** *minutes* | **inactivity-time** *minutes* | **list** {*acl* | *acl-name*} | **service-policy type tag** *service-policy-name*]  
**no ip admission name** *name* {**consent** | **proxy http**} [**absolute timer** *minutes* | **inactivity-time** *minutes* | **list** {*acl* | *acl-name*} | **service-policy type tag** *service-policy-name*]

| Syntax Description                    |                                                                                                                                                                                                                                     |                              |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <i>name</i>                           | Name of network admission control rule.                                                                                                                                                                                             |                              |
| <b>consent</b>                        | Associates an authentication proxy consent web page with the IP admission rule specified using the <i>admission-name</i> argument.                                                                                                  |                              |
| <b>proxy http</b>                     | Configures web authentication custom page.                                                                                                                                                                                          |                              |
| <b>absolute-timer</b> <i>minutes</i>  | (Optional) Elapsed time, in minutes, before the external server times out.                                                                                                                                                          |                              |
| <b>inactivity-time</b> <i>minutes</i> | (Optional) Elapsed time, in minutes, before the external file server is deemed unreachable.                                                                                                                                         |                              |
| <b>list</b>                           | (Optional) Associates the named rule with an access control list (ACL).                                                                                                                                                             |                              |
| <i>acl</i>                            | Applies a standard, extended list to a named admission control rule. The value ranges from 1 through 199, or from 1300 through 2699 for expanded range.                                                                             |                              |
| <i>acl-name</i>                       | Applies a named access list to a named admission control rule.                                                                                                                                                                      |                              |
| <b>service-policy type tag</b>        | (Optional) A control plane service policy is to be configured.                                                                                                                                                                      |                              |
| <i>service-policy-name</i>            | Control plane tag service policy that is configured using the <b>policy-map type control tag</b> <i>policyname</i> command, keyword, and argument. This policy map is used to apply the actions on the host when a tag is received. |                              |
| <b>Command Default</b>                | Web authentication is disabled.                                                                                                                                                                                                     |                              |
| <b>Command Modes</b>                  | Global configuration (config)                                                                                                                                                                                                       |                              |
| <b>Command History</b>                | <b>Release</b>                                                                                                                                                                                                                      | <b>Modification</b>          |
|                                       | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                        | This command was introduced. |

## Usage Guidelines

The **ip admission name** command globally enables web authentication on a switch.

After you enable web authentication on a switch, use the **ip access-group in** and **ip admission web-rule** interface configuration commands to enable web authentication on a specific interface.

## Examples

This example shows how to configure only web authentication on a switch port:

```
Device> enable
Device# configure terminal
Device(config) ip admission name http-rule proxy http
Device(config) # interface gigabitethernet1/0/1
Device(config-if) # ip access-group 101 in
Device(config-if) # ip admission rule
Device(config-if) # end
```

This example shows how to configure IEEE 802.1x authentication with web authentication as a fallback mechanism on a switch port:

```
Device> enable
Device# configure terminal
Device(config) # ip admission name rule2 proxy http
Device(config) # fallback profile profile1
Device(config) # ip access group 101 in
Device(config) # ip admission name rule2
Device(config) # interface gigabitethernet1/0/1
Device(config-if) # dot1x port-control auto
Device(config-if) # dot1x fallback profile1
Device(config-if) # end
```

| <b>show authentication sessions interface <i>interface</i> detail</b> | Displays information about the web authentication session status.                                                            |
| <b>show ip admission</b>                                              | Displays information about NAC cached entries or the NAC configuration.                                                      |

# ip dhcp snooping database

To configure the Dynamic Host Configuration Protocol (DHCP)-snooping database, use the **ip dhcp snooping database** command in global configuration mode. To disable the DHCP-snooping database, use the **no** form of this command.

```
ip dhcp snooping database { crashinfo: url | flash: url | ftp: url | http: url | https: url
| rcp: url | scp: url | tftp: url | timeout seconds | usbflash0: url | write-delay
seconds }
no ip dhcp snooping database [ timeout | write-delay ]
abor
```

| Syntax Description |                        |                                                                                  |
|--------------------|------------------------|----------------------------------------------------------------------------------|
|                    | <b>crashinfo: url</b>  | Specifies the database URL for storing entries using crashinfo.                  |
|                    | <b>flash: url</b>      | Specifies the database URL for storing entries using flash.                      |
|                    | <b>ftp: url</b>        | Specifies the database URL for storing entries using FTP.                        |
|                    | <b>http: url</b>       | Specifies the database URL for storing entries using HTTP.                       |
|                    | <b>https: url</b>      | Specifies the database URL for storing entries using secure HTTP (https).        |
|                    | <b>rcp: url</b>        | Specifies the database URL for storing entries using remote copy (rcp).          |
|                    | <b>scp: url</b>        | Specifies the database URL for storing entries using Secure Copy (SCP).          |
|                    | <b>tftp: url</b>       | Specifies the database URL for storing entries using TFTP.                       |
|                    | <b>timeout seconds</b> | Specifies the cancel timeout interval; valid values are from 0 to 86400 seconds. |
|                    | <b>usbflash0: url</b>  | Specifies the database URL for storing entries using USB flash.                  |

---

**write-delay** *seconds*

---

Specifies the amount of time before writing the DHCP-snooping entries to an external server after a change is seen in the local DHCP-snooping database; valid values are from 15 to 86400 seconds.

---

---

**Command Default** The DHCP-snooping database is not configured.

---

**Command Modes** Global configuration (config)

---

**Usage Guidelines** You must enable DHCP snooping on the interface before entering this command. Use the **ip dhcp snooping** command to enable DHCP snooping.

This example shows how to specify the database URL using TFTP:

```
Device> enable
Device# configure terminal
Device(config)# ip dhcp snooping database tftp://10.90.90.90/snooping-rp2
Device(config)# exit
```

This example shows how to specify the amount of time before writing DHCP snooping entries to an external server:

```
Device> enable
Device# configure terminal
Device(config)# ip dhcp snooping database write-delay 15
Device(config)# exit
```

# ip dhcp snooping information option format remote-id

To configure the option-82 remote-ID suboption, use the **ip dhcp snooping information option format remote-id** command in global configuration mode on the device to configure the option-82 remote-ID suboption. To configure the default remote-ID suboption, use the **no** form of this command.

**ip dhcp snooping information option format remote-id** {hostname | string string}  
**no ip dhcp snooping information option format remote-id** {hostname | string string}

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                       |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
| Syntax Description | <b>hostname</b>                                                                                                                                                                                                                                                                                                                                                                                                            | Specify the device hostname as the remote ID.                         |
|                    | <b>string string</b>                                                                                                                                                                                                                                                                                                                                                                                                       | Specify a remote ID, using from 1 to 63 ASCII characters (no spaces). |
| Command Default    | The device MAC address is the remote ID.                                                                                                                                                                                                                                                                                                                                                                                   |                                                                       |
| Command Modes      | Global configuration (config)                                                                                                                                                                                                                                                                                                                                                                                              |                                                                       |
| Command History    | <b>Release</b>                                                                                                                                                                                                                                                                                                                                                                                                             | <b>Modification</b>                                                   |
|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                               | This command was introduced.                                          |
| Usage Guidelines   | <p>You must globally enable DHCP snooping by using the <b>ip dhcp snooping</b> global configuration command for any DHCP snooping configuration to take effect.</p> <p>When the option-82 feature is enabled, the default remote-ID suboption is the device MAC address. This command allows you to configure either the device hostname or a string of up to 63 ASCII characters (but no spaces) to be the remote ID.</p> |                                                                       |

**Note** If the hostname exceeds 63 characters, it will be truncated to 63 characters in the remote-ID configuration.

This example shows how to configure the option- 82 remote-ID suboption:

```
Device> enable
Device# configure terminal
Device(config)# ip dhcp snooping information option format remote-id hostname
Device(config)# exit
```

# ip dhcp snooping verify no-relay-agent-address

To disable the DHCP snooping feature from verifying that the relay agent address (giaddr) in a DHCP client message matches the client hardware address on an untrusted port, use the **ip dhcp snooping verify no-relay-agent-address** command in global configuration mode. To enable verification, use the **no** form of this command.

**ip dhcp snooping verify no-relay-agent-address**  
**no ip dhcp snooping verify no-relay-agent-address**

## Syntax Description

This command has no arguments or keywords.

## Command Default

The DHCP snooping feature verifies that the relay-agent IP address (giaddr) field in DHCP client message on an untrusted port is 0.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

By default, the DHCP snooping feature verifies that the relay-agent IP address (giaddr) field in DHCP client message on an untrusted port is 0; the message is dropped if the giaddr field is not 0. Use the **ip dhcp snooping verify no-relay-agent-address** command to disable the verification. Use the **no ip dhcp snooping verify no-relay-agent-address** to reenale verification.

This example shows how to enable verification of the giaddr in a DHCP client message:

```
Device> enable
Device# configure terminal
Device(config)# no ip dhcp snooping verify no-relay-agent-address
Device(config)# exit
```

## ip http access-class

To specify the access list that should be used to restrict access to the HTTP server, use the **ip http access-class** command in global configuration mode. To remove a previously configured access list association, use the **no** form of this command.

```
ip http access-class { access-list-number | ipv4 { access-list-number | access-list-name } |  
ipv6 access-list-name }  
no ip http access-class { access-list-number | ipv4 { access-list-number | access-list-name }  
| ipv6 access-list-name }
```

### Syntax Description

|                           |                                                                                                                            |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>access-list-number</i> | Standard IP access list number in the range 0 to 99, as configured by the <b>access-list</b> global configuration command. |
| <b>ipv4</b>               | Specifies the IPv4 access list to restrict access to the secure HTTP server.                                               |
| <i>access-list-name</i>   | Name of a standard IPv4 access list, as configured by the <b>ip access-list</b> command.                                   |
| <b>ipv6</b>               | Specifies the IPv6 access list to restrict access to the secure HTTP server.                                               |

### Command Default

No access list is applied to the HTTP server.

### Command Modes

Global configuration (config)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

If this command is configured, the specified access list is assigned to the HTTP server. Before the HTTP server accepts a connection, it checks the access list. If the check fails, the HTTP server does not accept the request for a connection.

### Examples

The following example shows how to define an access list as 20 and assign it to the HTTP server:

```
Device> enable  
Device(config)# ip access-list standard 20  
Device(config-std-nacl)# permit 209.165.202.130 0.0.0.255  
Device(config-std-nacl)# permit 209.165.201.1 0.0.255.255  
Device(config-std-nacl)# permit 209.165.200.225 0.255.255.255  
Device(config-std-nacl)# exit  
Device(config)# ip http access-class 20  
Device(config-std-nacl)# exit
```

The following example shows how to define an IPv4 named access list as and assign it to the HTTP server.

```
Device> enable  
Device(config)# ip access-list standard Internet_filter  
Device(config-std-nacl)# permit 1.2.3.4  
Device(config-std-nacl)# exit
```

```
Device(config)# ip http access-class ipv4 Internet_filter
Device(config)# exit
```

**Related Commands**

| Command               | Description                                                                  |
|-----------------------|------------------------------------------------------------------------------|
| <b>ip access-list</b> | Assigns an ID to an access list and enters access list configuration mode.   |
| <b>ip http server</b> | Enables the HTTP 1.1 server, including the Cisco web browser user interface. |

## ip radius source-interface

To force RADIUS to use the IP address of a specified interface for all outgoing RADIUS packets, use the **ip radius source-interface** command in global configuration mode. To prevent RADIUS from using the IP address of a specified interface for all outgoing RADIUS packets, use the no form of this command.

**ip radius source-interface** *interface-name* [**vrf** *vrf-name*]  
**no ip radius source-interface**

|                           |                            |                                                                         |
|---------------------------|----------------------------|-------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>interface-name</i>      | Name of the interface that RADIUS uses for all of its outgoing packets. |
|                           | <b>vrf</b> <i>vrf-name</i> | (Optional) Per virtual route forwarding (VRF) configuration.            |

**Command Default** No default behavior or values.

**Command Modes** Global configuration (config)

| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|------------------------|------------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Use this command to set the IP address of an interface to be used as the source address for all outgoing RADIUS packets. The IP address is used as long as the interface is in the *up* state. The RADIUS server can use one IP address entry for every network access client instead of maintaining a list of IP addresses. Radius uses the IP address of the interface that it is associated to, regardless of whether the interface is in the *up* or *down* state.

The **ip radius source-interface** command is especially useful in cases where the router has many interfaces and you want to ensure that all RADIUS packets from a particular router have the same IP address.

The specified interface should have a valid IP address and should be in the *up* state for a valid configuration. If the specified interface does not have a valid IP address or is in the *down* state, RADIUS selects a local IP that corresponds to the best possible route to the AAA server. To avoid this, add a valid IP address to the interface or bring the interface to the *up* state.

Use the **vrf** *vrf-name* keyword and argument to configure this command per VRF, which allows multiple disjointed routing or forwarding tables, where the routes of one user have no correlation with the routes of another user.

### Examples

The following example shows how to configure RADIUS to use the IP address of interface s2 for all outgoing RADIUS packets:

```
ip radius source-interface s2
```

The following example shows how to configure RADIUS to use the IP address of interface Ethernet0 for VRF definition:

```
ip radius source-interface Ethernet0 vrf vrf1
```

# ip source binding

To add a static IP source binding entry, use the **ip source binding** command. Use the **no** form of this command to delete a static IP source binding entry

**ip source binding** *mac-address* **vlan** *vlan-id* *ip-address* **interface** *interface-id*  
**no ip source binding** *mac-address* **vlan** *vlan-id* *ip-address* **interface** *interface-id*

|                           |                                      |                                                                             |
|---------------------------|--------------------------------------|-----------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>mac-address</i>                   | Binding MAC address.                                                        |
|                           | <b>vlan</b> <i>vlan-id</i>           | Specifies the Layer 2 VLAN identification; valid values are from 1 to 4094. |
|                           | <i>ip-address</i>                    | Binding IP address.                                                         |
|                           | <b>interface</b> <i>interface-id</i> | ID of the physical interface.                                               |

**Command Default** No IP source bindings are configured.

**Command Modes** Global configuration (config)

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** You can use this command to add a static IP source binding entry only.

The **no** format deletes the corresponding IP source binding entry. It requires the exact match of all required parameter in order for the deletion to be successful. Note that each static IP binding entry is keyed by a MAC address and a VLAN number. If the command contains the existing MAC address and VLAN number, the existing binding entry is updated with the new parameters instead of creating a separate binding entry.

This example shows how to add a static IP source binding entry:

```
Device> enable
Device# configure terminal
Device(config) ip source binding 0100.0230.0002 vlan 11 10.0.0.4 interface
gigabitethernet1/0/1
Device(config)# exit
```

## ip ssh source-interface

To specify the IP address of an interface as the source address for a Secure Shell (SSH) client device, use the **ip ssh source-interface** command in global configuration mode. To remove the IP address as the source address, use the **no** form of this command.

**ip ssh source-interface** *interface*  
**no ip ssh source-interface** *interface*

### Syntax Description

|                  |                                                                               |
|------------------|-------------------------------------------------------------------------------|
| <i>interface</i> | The interface whose address is used as the source address for the SSH client. |
|------------------|-------------------------------------------------------------------------------|

### Command Default

The address of the closest interface to the destination is used as the source address (the closest interface is the output interface through which the SSH packet is sent).

### Command Modes

Global configuration (config)

### Command History

| Release                        | Modification                 |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |
| Cisco IOS XE Gibraltar 16.11.1 |                              |

### Usage Guidelines

By specifying this command, you can force the SSH client to use the IP address of the source interface as the source address.

### Examples

In the following example, the IP address assigned to GigabitEthernet interface 1/0/1 is used as the source address for the SSH client:

```
Device> enable
Device# configure terminal
Device(config)# ip ssh source-interface GigabitEthernet 1/0/1
Device(config)# exit
```

# ip verify source

To enable IP source guard on an interface, use the **ip verify source** command in interface configuration mode. To disable IP source guard, use the **no** form of this command.

**ip verify source** [**mac-check**] [**tracking**]  
**no ip verify source**

|                  |                                                                                    |
|------------------|------------------------------------------------------------------------------------|
| <b>mac-check</b> | (Optional) Enables IP source guard with MAC address verification.                  |
| <b>tracking</b>  | (Optional) Enables IP port security to learn static IP address learning on a port. |

**Command Default** IP source guard is disabled.

**Command Modes** Interface configuration (config-if)

| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|------------------------|------------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** To enable IP source guard with source IP address filtering, use the **ip verify source** interface configuration command.

To enable IP source guard with source IP address filtering and MAC address verification, use the **ip verify source mac-check** interface configuration command.

## Examples

This example shows how to enable IP source guard with source IP address filtering on an interface:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip verify source
Device(config-if)# end
```

This example shows how to enable IP source guard with MAC address verification:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip verify source mac-check
Device(config-if)# end
```

You can verify your settings by entering the **show ip verify source** command.

# ipv6 access-list

To define an IPv6 access list and to place the device in IPv6 access list configuration mode, use the **ipv6 access-list** command in global configuration mode. To remove the access list, use the **no** form of this command.

**ipv6 access-list** *access-list-name* | **match-local-traffic** | **log-update threshold** *threshold-in-msgs* | **role-based** *list-name*  
**noipv6 access-list** *access-list-name* | **client** *permit-control-packets* | **log-update** *threshold* | **role-based** *list-name*

## Syntax Description

|                                                      |                                                                                                                                                                                                                                          |
|------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ipv6</b> <i>access-list-name</i>                  | Creates a named IPv6 ACL (up to 64 characters in length) and enters IPv6 ACL configuration mode.<br><br><i>access-list-name</i> : Name of the IPv6 access list. Names cannot contain a space or quotation mark, or begin with a numeric. |
| <b>match-local-traffic</b>                           | Enables matching for locally-generated traffic.                                                                                                                                                                                          |
| <b>log-update threshold</b> <i>threshold-in-msgs</i> | Determines how syslog messages are generated after the initial packet match.<br><br><i>threshold-in-msgs</i> - Number of packets generated.                                                                                              |
| <b>role-based</b> <i>list-name</i>                   | Creates a role-based IPv6 ACL.                                                                                                                                                                                                           |

## Command Default

No IPv6 access list is defined.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

IPv6 ACLs are defined by using the **ipv6 access-list** command in global configuration mode and their permit and deny conditions are set by using the **deny** and **permit** commands in IPv6 access list configuration mode. Configuring the **ipv6 access-list** command places the device in IPv6 access list configuration mode. From IPv6 access list configuration mode, permit and deny conditions can be set for the defined IPv6 ACL.

### Note

IPv6 ACLs are defined by a unique name (IPv6 does not support numbered ACLs). An IPv4 ACL and an IPv6 ACL cannot share the same name.

IPv6 is automatically configured as the protocol type in **permit any any** and **deny any any** statements that are translated from global configuration mode to IPv6 access list configuration mode.

Every IPv6 ACL has implicit **permit icmp any any nd-na**, **permit icmp any any nd-ns**, and **deny ipv6 any any** statements as its last match conditions. (The former two match conditions allow for ICMPv6 neighbor discovery.) An IPv6 ACL must contain at least one entry for the implicit **deny ipv6 any any** statement to take

effect. The IPv6 neighbor discovery process makes use of the IPv6 network layer service; therefore, by default, IPv6 ACLs implicitly allow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, makes use of a separate data link layer protocol; therefore, by default, IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface.

Use the **ipv6 traffic-filter** interface configuration command with the *access-list-name* argument to apply an IPv6 ACL to an IPv6 interface. Use the **ipv6 access-class** line configuration command with the *access-list-name* argument to apply an IPv6 ACL to incoming and outgoing IPv6 virtual terminal connections to and from the device.

An IPv6 ACL applied to an interface with the **ipv6 traffic-filter** command filters traffic that is forwarded, not originated, by the device.

## Examples

The example configures the IPv6 ACL list named list1 and places the device in IPv6 access list configuration mode.

```
Device> enable
Device# configure terminal
Device(config)# ipv6 access-list list1
Device(config-ipv6-acl)# end
```

The following example configures the IPv6 ACL named list2 and applies the ACL to outbound traffic on Ethernet interface 0. Specifically, the first ACL entry keeps all packets from the network FEC0:0:0:2::/64 (packets that have the site-local prefix FEC0:0:0:2 as the first 64 bits of their source IPv6 address) from exiting from GigabitEthernet interface 0/1/2. The second entry in the ACL permits all other traffic to exit out of Ethernet interface 0. The second entry is necessary because an implicit deny all condition is at the end of each IPv6 ACL.

```
Device> enable
Device# configure terminal
Device(config)# ipv6 access-list list2 deny FEC0:0:0:2::/64 any
Device(config)# ipv6 access-list list2 permit any any
Device(config)# interface gigabitethernet 0/1/2
Device(config-if)# ipv6 traffic-filter list2 out
Device(config-if)# end
```

# ipv6 snooping policy

To configure an IPv6 snooping policy and enter IPv6 snooping configuration mode, use the **ipv6 snooping policy** command in global configuration mode. To delete an IPv6 snooping policy, use the **no** form of this command.

**ipv6 snooping policy** *snooping-policy*  
**no ipv6 snooping policy** *snooping-policy*

|                           |                                                                                                                                                            |                              |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <i>snooping-policy</i> User-defined name of the snooping policy. The policy name can be a symbolic string (such as Engineering) or an integer (such as 0). |                              |
| <b>Command Default</b>    | An IPv6 snooping policy is not configured.                                                                                                                 |                              |
| <b>Command Modes</b>      | Global configuration (config)                                                                                                                              |                              |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                             | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                               | This command was introduced. |

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | <p>Use the <b>ipv6 snooping policy</b> command to create an IPv6 snooping policy. When the <b>ipv6 snooping policy</b> command is enabled, the configuration mode changes to IPv6 snooping configuration mode. In this mode, the administrator can configure the following IPv6 first-hop security commands:</p> <ul style="list-style-type: none"> <li>• The <b>device-role</b> command specifies the role of the device attached to the port.</li> <li>• The <b>limit address-count</b> <i>maximum</i> command limits the number of IPv6 addresses allowed to be used on the port.</li> <li>• The <b>protocol</b> command specifies that addresses should be gleaned with Dynamic Host Configuration Protocol (DHCP) or Neighbor Discovery Protocol (NDP).</li> <li>• The <b>security-level</b> command specifies the level of security enforced.</li> <li>• The <b>tracking</b> command overrides the default tracking policy on a port.</li> <li>• The <b>trusted-port</b> command configures a port to become a trusted port; that is, limited or no verification is performed when messages are received.</li> </ul> |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

This example shows how to configure an IPv6 snooping policy:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)# end
```

# key chain macsec

To configure a MACsec key chain name on a device interface to fetch a Pre Shared Key (PSK), use the **key chain macsec** command in global configuration mode. To disable it, use the **no** form of this command.

**key chain** *name* **macsec**  
**no key chain** *name* [**macsec** ]

| <b>Syntax Description</b>    | <i>name</i> Name of a key chain to be used to get keys.                                                                                               |         |              |                              |                              |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|------------------------------|
| <b>Command Default</b>       | Key chain macsec is disabled.                                                                                                                         |         |              |                              |                              |
| <b>Command Modes</b>         | Global configuration (config)                                                                                                                         |         |              |                              |                              |
| <b>Command History</b>       | <table> <tr> <th>Release</th><th>Modification</th></tr> <tr> <td>Cisco IOS XE Everest 16.5.1a</td><td>This command was introduced.</td></tr> </table> | Release | Modification | Cisco IOS XE Everest 16.5.1a | This command was introduced. |
| Release                      | Modification                                                                                                                                          |         |              |                              |                              |
| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                          |         |              |                              |                              |

This example shows how to configure MACsec key chain to fetch a 128-bit Pre Shared Key (PSK):

```
Device> enable
Device# configure terminal
Device(config)# key chain kc1 macsec
Device(config-keychain-macsec)# key 1000
Device(config-keychain-macsec)# cryptographic-algorithm aes-128-cmac
Device(config-keychain-macsec-key)# key-string fb63e0269e2768c49bab8ee9a5c2258f
Device(config-keychain-macsec-key)# end
Device#
```

This example shows how to configure MACsec key chain to fetch a 256-bit Pre Shared Key (PSK):

```
Device> enable
Device# configure terminal
Device(config)# key chain kc1 macsec
Device(config-keychain-macsec)# key 2000
Device(config-keychain-macsec)# cryptographic-algorithm aes-256-cmac
Device(config-keychain-macsec-key)# key-string c865632acb269022447c417504a1b
f5db1c296449b52627ba01f2ba2574c2878
Device(config-keychain-macsec-key)# end
Device#
```

# key config-key password-encrypt

To store a type 6 encryption key in private NVRAM, use the **key config-key password-encrypt** command in global configuration mode. To disable the encryption, use the **no** form of this command.

**key config-key password-encrypt** [*text*]

**no key config-key password-encrypt** [*text*]

## Syntax Description

*text* (Optional) **Password** or **master** key.

**Note** We recommended that you do not use the *text* argument, and instead use interactive mode (using the **Enter** key after you enter the **key config-key password-encrypt** command) so that the preshared key is not printed anywhere and, therefore, cannot be seen.

## Command Default

Type 6 password encryption key is not stored in private NVRAM.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

You can securely store plain text passwords in type 6 format in NVRAM using a CLI. Type 6 passwords are encrypted. Although the encrypted passwords can be seen or retrieved, it is difficult to decrypt them to find out the actual password. Use the **key config-key password-encrypt** command along with the **password encryption aes** command to configure and enable the password (symmetric cipher Advanced Encryption Standard [AES] is used to encrypt the keys). The password (key) configured using the **key config-key password-encrypt** command is the master encryption key that is used to encrypt all other keys in the device.

If you configure the **password encryption aes** command without configuring the **key config-key password-encrypt** command, the following message is displayed at startup or during a nonvolatile generation (NVGEN) process, such as when the **show running-config** or **copy running-config startup-config** commands are configured:

```
"Can not encrypt password. Please configure a configuration-key with 'key config-key'"
```

### Changing a Password

If the password (master key) is changed or reencrypted, use the **key config-key password-encrypt** command for the list registry to pass the old key and the new key to the application modules that are using type 6 encryption.

### Deleting a Password

If the master key that was configured using the **key config-key password-encrypt** command is deleted from the system, a warning is displayed (and a confirm prompt is issued) stating that all type 6 passwords will become useless. As a security measure, after the passwords are encrypted, they will never be decrypted in the Cisco IOS software. However, passwords can be re-encrypted, as explained in the previous paragraph.

**Caution**

If the password that is configured using the **key config-key password-encrypt** command is lost, it cannot be recovered. We, therefore, recommend that you store the password in a safe location.

**Unconfiguring Password Encryption**

If you unconfigure password encryption using the **no password encryption aes** command, all the existing type 6 passwords are left unchanged, and as long as the password (master key) that was configured using the **key config-key password-encrypt** command exists, the type 6 passwords will be decrypted as and when required by the application.

**Storing Passwords**

Because no one can *read* the password (configured using the **key config-key password-encrypt** command), there is no way that the password can be retrieved from the device. Existing management stations cannot *know* what it is unless the stations are enhanced to include this key somewhere, in which case, the password needs to be stored securely within the management system. If configurations are stored using TFTP, the configurations are not standalone, meaning that they cannot be loaded onto a device. Before or after the configurations are loaded onto a device, the password must be manually added (using the **key config-key password-encrypt** command). The password can be manually added to the stored configuration. However we do not recommend this because adding the password manually allows anyone to decrypt all the passwords in that configuration.

**Configuring New or Unknown Passwords**

If you enter or cut and paste ciphertext that does not match the master key, or if there is no master key, the ciphertext is accepted or saved, but an alert message is displayed:

```
"ciphertext>[for username bar] is incompatible with the configured master key."
```

If a new master key is configured, all plain keys are encrypted and made type 6 keys. The existing type 6 keys are not encrypted. The existing type 6 keys are left as is.

If the old master key is lost or is unknown, you have the option of deleting the master key using the **no key config-key password-encrypt** command. Deleting the master key causes the existing encrypted passwords to remain encrypted in the device configuration. The passwords cannot be decrypted.

**Examples**

The following example shows how a type 6 encryption key is stored in NVRAM:

```
Device> enable
Device# configure terminal
Device (config)# key config-key password-encrypt
```

| <b>mka policy</b>                | Configures an MKA policy.                                      |
| <b>confidentiality-offset</b>    | Sets the confidentiality offset for MACsec operations.         |
| <b>delay-protection</b>          | Configures MKA to use delay protection in sending MKPDU.       |
| <b>include-icv-indicator</b>     | Includes ICV indicator in MKPDU.                               |
| <b>macsec-cipher-suite</b>       | Configures cipher suite for deriving SAK)                      |
| <b>sak-rekey</b>                 | Configures the SAK rekey interval.                             |
| <b>send-secure-announcements</b> | Configures MKA to send secure announcements in sending MKPDUs. |
| <b>ssci-based-on-sci</b>         | Computes SSCI based on the SCI.                                |
| <b>use-updated-eth-header</b>    | Uses the updated Ethernet header for ICV calculation.          |

# limit address-count

To limit the number of IPv6 addresses allowed to be used on the port, use the **limit address-count** command in Neighbor Discovery Protocol (NDP) inspection policy configuration mode or IPv6 snooping configuration mode. To return to the default, use the **no** form of this command.

**limit address-count** *maximum*  
**no limit address-count**

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                              |

|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | This command was introduced. |
| <b>Usage Guidelines</b>   | <p>The <b>limit address-count</b> command limits the number of IPv6 addresses allowed to be used on the port on which the policy is applied. Limiting the number of IPv6 addresses on a port helps limit the binding table size. The range is from 1 to 10000.</p> <p>This example shows how to define an NDP policy name as policy1, and limit the number of IPv6 addresses allowed on the port to 25:</p> <pre>Device&gt; enable Device# configure terminal Device(config)# ipv6 nd inspection policy policy1 Device(config-nd-inspection)# limit address-count 25 Device(config-nd-inspection)# end</pre> <p>This example shows how to define an IPv6 snooping policy name as policy1, and limit the number of IPv6 addresses allowed on the port to 25:</p> <pre>Device&gt; enable Device# configure terminal Device(config)# ipv6 snooping policy policy1 Device(config-ipv6-snooping)# limit address-count 25 Device(config-ipv6-snooping)# end</pre> |                              |

# local-domain (Parameter Map)

To configure a local domain for the Cisco Umbrella Integration feature, use the **local-domain** command in parameter-map type inspect configuration mode. To remove a local domain, use the **no** form of this command.

**local-domain** *regex\_param\_map\_name*

**no local-domain** *regex\_param\_map\_name*

## Syntax Description

|                             |                                               |
|-----------------------------|-----------------------------------------------|
| <i>regex_param_map_name</i> | Name of the regular expression parameter map. |
|-----------------------------|-----------------------------------------------|

## Command Default

No local domain is created for the parameter map.

## Command Modes

Parameter-map type inspect configuration (config-profile)

## Command History

| Release                       | Modification                 |
|-------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

## Usage Guidelines

A maximum of 64 local domains can be configured, and the allowed domain name length is 100 characters.

## Examples

The following example shows how to configure a local domain:

```
Device> enable
Device# configure terminal
Device(config)# parameter-map type umbrella global
Device(config-profile)# local-domain dns_bypass
```

|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                     |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | This command filters details, such as anticipated success, from MAC authentication bypass (MAB) system messages. Failure messages are not filtered. |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|

To filter verbose MAB system messages:

```
Device> enable
Device# configure terminal
Device(config)# mab logging verbose
Device(config)# exit
```

You can verify your settings by entering the **show running-config** command.

# mab request format attribute 32

To enable VLAN ID-based MAC authentication on a device, use the **mab request format attribute 32 vlan access-vlan** command in global configuration mode. To return to the default setting, use the **no** form of this command.

**mab request format attribute 32 vlan access-vlan**  
**no mab request format attribute 32 vlan access-vlan**

| <b>Syntax Description</b>    | This command has no arguments or keywords                                                                                                                                                                           |         |              |                              |                              |

| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                                                        |         |              |                              |                              |
| <b>Usage Guidelines</b>      | Use this command to allow a RADIUS server to authenticate a new user based on the host MAC address and VLAN. Use this feature on networks with the Microsoft IAS RADIUS server. The Cisco ACS ignores this command. |         |              |                              |                              |

This example shows how to enable VLAN-ID based MAC authentication on a device:

```
Device> enable
Device# configure terminal
Device(config)# mab request format attribute 32 vlan access-vlan
Device(config)# exit
```

| <b>authentication order</b>        | Sets the order of authentication methods used on a port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |                             |                                                     |                                |                                                                                                                              |                                 |                                                |                            |                                            |                             |                                                          |                                |                                                 |                                    |                                                         |                                |                                                          |
| <b>authentication periodic</b>     | Enables or disables reauthentication on a port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |         |             |                             |                                                     |                                |                                                                                                                              |                                 |                                                |                            |                                            |                             |                                                          |                                |                                                 |                                    |                                                         |                                |                                                          |
| <b>authentication port-control</b> | Enables manual control of the port authorization state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |         |             |                             |                                                     |                                |                                                                                                                              |                                 |                                                |                            |                                            |                             |                                                          |                                |                                                 |                                    |                                                         |                                |                                                          |
| <b>authentication priority</b>     | Adds an authentication method to the port-priority list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |                             |                                                     |                                |                                                                                                                              |                                 |                                                |                            |                                            |                             |                                                          |                                |                                                 |                                    |                                                         |                                |                                                          |

| Command                         | Description                                                                                                                                                                               |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>authentication timer</b>     | Configures the timeout and reauthentication parameters for an 802.1x-enabled port.                                                                                                        |
| <b>authentication violation</b> | Configures the violation modes that occur when a new device connects to a port or when a new device connects to a port with the maximum number of devices already connected to that port. |
| <b>mab</b>                      | Enables MAC-based authentication on a port.                                                                                                                                               |
| <b>mab eap</b>                  | Configures a port to use the Extensible Authentication Protocol (EAP).                                                                                                                    |
| <b>show authentication</b>      | Displays information about authentication manager events on the device.                                                                                                                   |

# macsec-cipher-suite

To configure cipher suite for deriving Security Association Key (SAK), use the **macsec-cipher-suite** command in MKA-policy configuration mode. To disable cipher suite for SAK, use the **no** form of this command.

**macsec-cipher-suite** {gcm-aes-128 | gcm-aes-256 | gcm-aes-xpn-128 | gcm-aes-xpn-256}  
**no macsec-cipher-suite** {gcm-aes-128 | gcm-aes-256 | gcm-aes-xpn-128 | gcm-aes-xpn-256}

## Syntax Description

|                        |                                                                                                       |
|------------------------|-------------------------------------------------------------------------------------------------------|
| <b>gcm-aes-128</b>     | Configures cipher suite for deriving SAK with 128-bit encryption.                                     |
| <b>gcm-aes-256</b>     | Configures cipher suite for deriving SAK with 256-bit encryption.                                     |
| <b>gcm-aes-xpn-128</b> | Configures cipher suite for deriving SAK with 128-bit encryption for Extended Packet Numbering (XPN). |
| <b>gcm-aes-xpn-256</b> | Configures cipher suite for deriving SAK with 256-bit encryption for XPN.                             |

## Command Default

GCM-AES-128 encryption is enabled.

## Command Modes

MKA-policy configuration (config-mka-policy)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

If the device supports both GCM-AES-128 and GCM-AES-256 ciphers, it is highly recommended to define and use a user-defined MKA policy to include both or only 256 bits cipher, based on your requirements..

## Examples

The following example shows how to configure MACsec cipher suite for deriving SAK with 256-bit encryption:

```
Device> enable
Device# configure terminal
Device(config)# mka policy 2
Device(config-mka-policy)# macsec-cipher-suite gcm-aes-256
```

|-------------------------------|----------------------------------------------------------|
| <b>mka policy</b>             | Configures an MKA policy.                                |
| <b>confidentiality-offset</b> | Sets the confidentiality offset for MACsec operations.   |
| <b>delay-protection</b>       | Configures MKA to use delay protection in sending MKPDU. |
| <b>include-icv-indicator</b>  | Includes ICV indicator in MKPDU.                         |
| <b>key-server</b>             | Configures MKA key-server options.                       |
| <b>sak-rekey</b>              | Configures the SAK rekey interval.                       |

| Command                          | Description                                                    |
|----------------------------------|----------------------------------------------------------------|
| <b>send-secure-announcements</b> | Configures MKA to send secure announcements in sending MKPDUs. |
| <b>ssci-based-on-sci</b>         | Computes SSCI based on the SCI.                                |
| <b>use-updated-eth-header</b>    | Uses the updated Ethernet header for ICV calculation.          |

# macsec network-link

To enable MACsec Key Agreement protocol (MKA) configuration on the uplink interfaces, use the **macsec network-link** command in interface configuration mode. To disable it, use the **no** form of this command.

**macsec network-link**

**no macsec network-link**

|                    |                                                                                                                         |                              |
|--------------------|-------------------------------------------------------------------------------------------------------------------------|------------------------------|
| Syntax Description | <b>macsec network-link</b> Enables MKA MACsec configuration on device interfaces using EAP-TLS authentication protocol. |                              |
| Command Default    | MACsec network-link is disabled.                                                                                        |                              |
| Command Modes      | Interface configuration (config-if)                                                                                     |                              |
| Command History    | Release                                                                                                                 | Modification                 |
|                    | Cisco IOS XE Everest 16.5.1a                                                                                            | This command was introduced. |

This example shows how to configure MACsec MKA on an interface using the EAP-TLS authentication protocol:

```

Device> enable
Device# configure terminal
Device(config)# interface GigabitEthernet 1/0/20
Device(config-if)# macsec network-link
Device(config-if)# end
Device#

```

# match (access-map configuration)

To set the VLAN map to match packets against one or more access lists, use the **match** command in access-map configuration mode. To remove the match parameters, use the **no** form of this command.

```
match {ip address {namenum} [{namenum}] [{namenum}]... | ipv6 address {namenum}
[{namenum}] [{namenum}]... | mac address {name} [{name}] [{name}]...}
no match {ip address {namenum} [{namenum}] [{namenum}]... | ipv6 address
{namenum} [{namenum}] [{namenum}]... | mac address {name} [{name}] [{name}]...}
```

## Syntax Description

|                     |                                                                                                    |
|---------------------|----------------------------------------------------------------------------------------------------|
| <b>ip address</b>   | Sets the access map to match packets against an IP address access list.                            |
| <b>ipv6 address</b> | Sets the access map to match packets against an IPv6 address access list.                          |
| <b>mac address</b>  | Sets the access map to match packets against a MAC address access list.                            |
| <i>name</i>         | Name of the access list to match packets against.                                                  |
| <i>number</i>       | Number of the access list to match packets against. This option is not valid for MAC access lists. |

## Command Default

The default action is to have no match parameters applied to a VLAN map.

## Command Modes

Access-map configuration (config-access-map)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

You enter access-map configuration mode by using the **vlan access-map** global configuration command.

You must enter one access list name or number; others are optional. You can match packets against one or more access lists. Matching any of the lists counts as a match of the entry.

In access-map configuration mode, use the **match** command to define the match conditions for a VLAN map applied to a VLAN. Use the **action** command to set the action that occurs when the packet matches the conditions.

Packets are matched only against access lists of the same protocol type; IP packets are matched against IP access lists, IPv6 packets are matched against IPv6 access lists, and all other packets are matched against MAC access lists.

IP, IPv6, and MAC addresses can be specified for the same map entry.

## Examples

This example shows how to define and apply a VLAN access map vmap4 to VLANs 5 and 6 that will cause the interface to drop an IP packet if the packet matches the conditions defined in access list al2:

```
Device> enable
Device(config)# vlan access-map vmap4
Device(config-access-map)# match ip address al2
Device(config-access-map)# action drop
```

```
Device(config-access-map)# exit  
Device(config)# vlan filter vmap4 vlan-list 5-6  
Device(config)# exit
```

You can verify your settings by entering the **show vlan access-map** command.

# mka pre-shared-key

To configure MACsec Key Agreement (MKA) MACsec on a device interface using a Pre Shared Key (PSK), use the **mka pre-shared-key key-chain** *key-chain name* command in interface configuration mode. To disable it, use the **no** form of this command.

**mka pre-shared-key key-chain** *key-chain-name*  
**no mka pre-shared-key key-chain** *key-chain-name*

|                    |                                                                                                        |                              |
|--------------------|--------------------------------------------------------------------------------------------------------|------------------------------|
| Syntax Description | <b>mka pre-shared-key key-chain</b> Enables MACsec MKA configuration on device interfaces using a PSK. |                              |
| Command Default    | MKA pre-shared-key is disabled.                                                                        |                              |
| Command Modes      | Interface configuration (config-if)                                                                    |                              |
| Command History    | Release                                                                                                | Modification                 |
|                    | Cisco IOS XE Everest 16.5.1a                                                                           | This command was introduced. |

This example shows how to configure MKA MACsec on an interface using a PSK:

```
Device> enable
Device# configure terminal
Device(config)# interface GigabitEthernet 1/0/20
Device(config-if)# mka pre-shared-key key-chain kc1
Device(config-if)# end
Device#
```

# mka suppress syslogs sak-rekey

To suppress MACsec Key Agreement (MKA) secure association key (SAK) rekey messages during logging, use the **mka suppress syslogs sak-rekey** command in global configuration mode. To enable MKA SAK rekey message logging, use the **no** form of this command.

**mka suppress syslogs sak-rekey**  
**no mka suppress syslogs sak-rekey**

This command has no arguments or keywords.

| Command Default  | All MKA SAK syslog messages are displayed on the console.                                                                                                                                                            |                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| Command Modes    | Global configuration (config)                                                                                                                                                                                        |                              |
| Command History  | Release                                                                                                                                                                                                              | Modification                 |
|                  | Cisco IOS XE Gibraltar 16.9.1                                                                                                                                                                                        | This command was introduced. |
| Usage Guidelines | MKA SAK syslogs are continuously generated at every rekey interval, and when MKA is configured on multiple interfaces, the amount of syslog generated is too high. Use this command to suppress the MKA SAK syslogs. |                              |

## Example

The following example shows show to suppress MKA SAK syslog logging:

```
Device> enable
Device# configure terminal
Device(config)# mka suppress syslogs sak-rekey
```

## parameter-map type regex

To configure a parameter-map type with a regular expression to match a specific traffic pattern, use the **parameter-map type regex** command in global configuration mode. To delete a parameter-map type with a regular expression, use the **no** form of this command.

**parameter-map type regex** *parameter-map-name*  
**no parameter-map type regex**

|                           |                           |                                                                                                                                                                                  |
|---------------------------|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>parameter-map-name</i> | Name of the parameter map. The name can have a maximum of 228 alphanumeric characters.                                                                                           |
|                           | <b>Note</b>               | We do not recommend the use of blank spaces. The system interprets the first blank space as the end of the parameter-map name unless the string is delimited by quotation marks. |

|                        |                                          |
|------------------------|------------------------------------------|
| <b>Command Default</b> | A regex parameter map is not configured. |
|------------------------|------------------------------------------|

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

|                        |                               |                              |
|------------------------|-------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>                | <b>Modification</b>          |
|                        | Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

**Usage Guidelines**

You can enter a regular expression to match text strings either as an exact string or by using metacharacters to match multiple variants of a text string. You can use a regular expression to match the content of certain application traffic. For example, you can match a uniform resource identifier (URI) string inside an HTTP packet using the **match request regex** command under an HTTP inspection class map.

Press **Ctrl-V** to ignore all of the special characters in the CLI, such as a question mark (?) or a tab. For example, press **d[Ctrl-V]g** to enter **d?g** in the configuration.

The following table lists the metacharacters that have special meanings.

**Table 181: regex Metacharacters**

| Character | Description   | Notes                                                                                                                                                                                                                                                                                                                                                                  |
|-----------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| .         | Dot           | Matches any single character. For example, <b>d.g</b> matches dog, dag, dtg, and any word that contains those characters.                                                                                                                                                                                                                                              |
| ( xxx )   | Subexpression | Segregates characters from surrounding characters so that you can use other metacharacters on the subexpression. For example, <b>d(o a)g</b> matches dog and dag, but <b>do ag</b> matches do and ag. A subexpression can also be used with repeat quantifiers to differentiate the characters meant for repetition. For example, <b>ab(xy){3}z</b> matches abxyxyxyz. |
|           | Alternation   | Matches either of the expressions that it separates. For example, <b>dog cat</b> matches dog or cat.                                                                                                                                                                                                                                                                   |

| Character   | Description               | Notes                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ?           | Question mark             | Indicates that there are 0 or 1 occurrence of the previous expression. For example, <b>lo?se</b> matches lse or lose.<br><br><b>Note</b> You must enter <b>Ctrl-V</b> and then a question mark. Otherwise, the Help function is invoked.                                                                                                                                                            |
| *           | Asterisk                  | Indicates that there are 0, 1, or any number of occurrences of the previous expression. For example, <b>lo*se</b> matches lse, lose, loose, and so on.                                                                                                                                                                                                                                              |
| +           | Plus                      | Indicates that there is at least one occurrence of the previous expression. For example, <b>lo+se</b> matches lose and loose, but not lse.                                                                                                                                                                                                                                                          |
| { x }       | Repeat quantifier         | Repeats exactly x times. For example, <b>ab(xy){3}z</b> matches abxyxyxyz.                                                                                                                                                                                                                                                                                                                          |
| { x , }     | Minimum repeat quantifier | Repeats at least x times. For example, <b>ab(xy){2,}z</b> matches abxyxyz, abxyxyxyz, and so on.                                                                                                                                                                                                                                                                                                    |
| [ abc ]     | Character class           | Matches any character in the bracket. For example, <b>[abc]</b> matches a, b, or c.                                                                                                                                                                                                                                                                                                                 |
| [^ abc ]    | Negated character class   | Matches a single character that is not contained within brackets. For example, <b>[^abc]</b> matches any character other than a, b, or c, and <b>[^A-Z]</b> matches any single character that is not an uppercase letter.                                                                                                                                                                           |
| [ a - c ]   | Character range class     | Matches any character in the specified range. <b>[a-z]</b> matches any lowercase letter. You can mix characters and ranges. For example, <b>[abcq-z]</b> matches a, b, c, q, r, s, t, u, v, w, x, y, z, and so does <b>[a-cq-z]</b> .<br><br><b>Note</b> The dash (-) character is literal only if it is the last or first character within brackets, for example, <b>[abc-]</b> or <b>[-abc]</b> . |
| " "         | Quotation marks           | Preserves trailing or leading spaces in the string. For example, <b>"test"</b> preserves the leading space when it looks for a match.                                                                                                                                                                                                                                                               |
| ^           | Caret                     | Specifies the beginning of a line.                                                                                                                                                                                                                                                                                                                                                                  |
| \           | Escape character          | When preceding a literal character, matches the literal character. For example, <b>\[</b> matches the left square bracket.                                                                                                                                                                                                                                                                          |
| <i>char</i> | Character                 | When the character is not a metacharacter, matches the literal character.                                                                                                                                                                                                                                                                                                                           |
| \r          | Carriage return           | Matches the carriage return 0x0d.                                                                                                                                                                                                                                                                                                                                                                   |
| \n          | New line                  | Matches the new line 0x0a.                                                                                                                                                                                                                                                                                                                                                                          |
| \t          | Tab                       | Matches the tab 0x09.                                                                                                                                                                                                                                                                                                                                                                               |
| \f          | Formfeed                  | Matches the form feed 0x0c.                                                                                                                                                                                                                                                                                                                                                                         |

| Character | Description                | Notes                                                                                                                           |
|-----------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| \x nn     | Escaped hexadecimal number | Matches an ASCII character using hexadecimal numbers (exactly two digits).                                                      |
| \ nnn     | Escaped octal number       | Matches an ASCII character as an octal number (exactly three digits). For example, the character <b>040</b> represents a space. |

## Examples

The following example shows how to configure and apply a regex parameter map to an HTTP application firewall parameter-map type whose URI matches any of the following regular expressions:

- `.*cmd.exe`
- `.*money`
- `.*shopping`

```
Device> enable
Device# configure terminal
Device(config)# parameter-map type regex uri-regex-cm
Device(config-profile)# pattern ".*cmd.exe"
Device(config-profile)# pattern ".*money"
Device(config-profile)# pattern ".*shopping"
Device(config-profile)# exit
Device(config)# class-map type inspect http uri-check-cm
Device(config-cmap)# match request uri regex uri-regex-cm
Device(config-cmap)# exit
Device(config)# policy-map type inspect http uri-check-pm
Device(config-pmap)# class type inspect http uri-check-cm
Device(config-pmap-c)# reset
```

The following example shows how to configure a regex parameter map whose case-insensitive pattern matches multiple variants of the string hello:

```
Device# configure terminal
Device(config)# parameter-map type regex body_regex
Device(config-profile)# pattern ".*[Hh][Ee][Ll][Ll][Oo]"
Device(config-profile)# end
```

|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>class-map type inspect</b>  | Creates a Layer 3 and Layer 4 or a Layer 7 (application-specific) inspect-type class map.                                                                                  |
| <b>class type inspect</b>      | Specifies the traffic (class) on which an action is to be performed.                                                                                                       |
| <b>match request regex</b>     | Configures an HTTP firewall policy to permit or deny HTTP traffic on the basis of request messages whose URI or arguments (parameters) match a defined regular expression. |
| <b>parameter-map type</b>      | Creates or modifies a parameter map.                                                                                                                                       |
| <b>policy-map type inspect</b> | Creates a Layer 3 and Layer 4 or a Layer 7 (application-specific) inspect-type policy map.                                                                                 |

# parameter-map type umbrella global

To configure a parameter-map type in umbrella mode, use the **parameter-map type umbrella global** command in global configuration mode. To delete a parameter-map type in umbrella mode, use the **no** form of this command.

**parameter-map type umbrella global**  
**no parameter-map type umbrella**

|                           |                                            |

|                         | <b>parameter-map type</b> | Creates or modifies a parameter map. |

# password encryption aes

To enable a type 6 encrypted preshared key, use the **password encryption aes** command in global configuration mode. To disable password encryption, use the **no** form of this command.

**password encryption aes**  
**no password encryption aes**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Preshared keys are not encrypted.

**Command Modes** Global configuration (config)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** You can securely store plain text passwords in type 6 format in NVRAM using a CLI. Type 6 passwords are encrypted. Although the encrypted passwords can be seen or retrieved, it is difficult to decrypt them to find out the actual password. Use the **key config-key password-encrypt** command along with the **password encryption aes** command to configure and enable the password (symmetric cipher Advanced Encryption Standard [AES] is used to encrypt the keys). The password (key) that is configured using the **key config-key password-encrypt** command is the master encryption key that is used to encrypt all other keys in the router.

If you configure the **password encryption aes** command without configuring the **key config-key password-encrypt** command, the following message is displayed at startup or during a nonvolatile generation (NVGEN) process, such as when the **show running-config** or **copy running-config startup-config** commands are run:

```
"Can not encrypt password. Please configure a configuration-key with 'key config-key'"
```

## Changing a Password

If the password (master key) is changed or re-encrypted using the **key config-key password-encrypt** command, the list registry passes the old key and the new key to the application modules that are using type 6 encryption.

## Deleting a Password

If the master key that was configured using the **key config-key password-encrypt** command is deleted from the system, a warning is displayed (and a confirm prompt is issued) that states that all type 6 passwords will no longer be applicable. As a security measure, after the passwords are encrypted, they will never be decrypted in the Cisco IOS software. However, passwords can be re-encrypted as explained in the previous paragraph.

### Caution

If a password that is configured using the **key config-key password-encrypt** command is lost, it cannot be recovered. Therefore, the password should be stored in a safe location.

## Unconfiguring Password Encryption

If you unconfigure password encryption using the **no password encryption aes** command, all the existing type 6 passwords are left unchanged. As long as the password (master key) that was configured using the **key config-key password-encrypt** command exists, the type 6 passwords are decrypted as and when required by the application.

### Storing Passwords

Because no one can *read* the password (configured using the **key config-key password-encrypt** command), there is no way that the password can be retrieved from the router. Existing management stations cannot *know* what it is unless the stations are enhanced to include this key somewhere. Therefore, the password needs to be stored securely within the management system. If configurations are stored using TFTP, the configurations are not standalone, meaning that they cannot be loaded onto a router. Before or after the configurations are loaded onto a router, the password must be manually added (using the **key config-key password-encrypt** command). The password can be manually added to the stored configuration, but we do not recommend this because adding the password manually allows anyone to decrypt all the passwords in that configuration.

### Configuring New or Unknown Passwords

If you enter or cut and paste ciphertext that does not match the master key, or if there is no master key, the ciphertext is accepted or saved, but the following alert message is displayed:

```
"ciphertext>[for username bar>] is incompatible with the configured master key."
```

If a new master key is configured, all the plain keys are encrypted and converted to type 6 keys. The existing type 6 keys are not encrypted. The existing type 6 keys are left as is.

If the old master key is lost or unknown, you have the option of deleting the master key using the **no key config-key password-encrypt** command. This causes the existing encrypted passwords to remain encrypted in the router configuration. The passwords will not be decrypted.

### Examples

The following example shows how a type 6 encrypted preshared key is enabled:

```
Device> enable
Device# configure terminal
Device (config)# password encryption aes
```

### Related Commands

| Command                                | Description                                      |
|----------------------------------------|--------------------------------------------------|
| <b>key config-key password-encrypt</b> | Stores a type 6 encryption key in private NVRAM. |

## pattern (Parameter Map)

To configure a matching pattern that specifies a list of domains, URL keywords, or URL metacharacters that must be allowed or blocked by the local URL filtering, use the **pattern** command in parameter-map type inspect configuration mode. To remove the matching pattern, use the **no** form of this command.

**pattern** *expression*  
**no pattern** *expression*

|                           |                                                           |                                                                                                                                                    |

|                           | Cisco IOS XE Amsterdam 17.1.1                             | This command was introduced.                                                                                                                       |

**Usage Guidelines** A matching pattern expression is configured for a parameter map created by the **parameter-map type regex** command.

In a pattern expression, the characters /, {, and } are not allowed. The question mark (?) character is not allowed because it is reserved for the CLI Help function. The asterisk (\*) character is not allowed at the beginning of a pattern.

For URL pattern matching, the period (.) character is interpreted as a dot, and not as a wildcard entry that represents a single character, as is the case with regular expression pattern matching. Any character in the host or domain name can be allowed or blocked through URL filtering.

A URL keyword is a complete word that comes after the domain name and is between the forward slash (/) path delimiters. For example, in the URL `http://www.example.com/hack/123.html`, only **hack** is treated as a keyword. The entire keyword in the URL must match a pattern. For example, if you have configured a pattern named **hack**, the URL `www.example.com/hacksite/123.html` will not match the pattern. To match the URL, your pattern must have **hacksite**.

URL metacharacters allow pattern matching of single characters or ranges of characters to URLs, similar to the way a UNIX glob expression works. URL metacharacters are described in the following table.

**Table 182: URL Metacharacters for URL Pattern Matching**

| Character | Description                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------|
| *         | Asterisk: Matches any sequence of 0 or more characters.                                                                                     |
| [ abc ]   | Character class: Matches any character within brackets. Character matching is case sensitive. For example, <b>[abc]</b> matches a, b, or c. |

| Character | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [ a-c ]   | <p>Character range class: Matches any character in a specified range. Character matching is case sensitive. For example, <b>[a-z]</b> matches any lowercase letter. You can also mix characters and ranges. For example, <b>[abcq-z]</b> matches a, b, c, q, r, s, t, u, v, w, x, y, z, and so does <b>[a-cq-z]</b>.</p> <p><b>Note</b> The dash (-) character is matched only if it is the last or the first character within brackets, for example, <b>[abc-]</b> or <b>[-abc]</b>.</p> |
| [ 0-9 ]   | Numerical range class: Matches any number within brackets. For example, <b>[0-9]</b> matches 0, 1, 2, 3, 4, 5, 6, 7, 8, or 9.                                                                                                                                                                                                                                                                                                                                                             |

URL metacharacters are combined with domain names and URL keywords for pattern matching. For example, the pattern `www.example[0-9][0-9].com` can be used to block `www.example01.com`, `www.example33.com`, `www.example99.com`, and so on. You can combine a keyword and a metacharacter and create a matching pattern to block a URL. For example, you can use pattern `hack*` to block `www.example.com/hacksite/123.html`.

When you configure the **parameter-map type regex** command and then the **pattern** command, patterns that are specified in the **pattern** command are used as filters in General Packet Radio Service (GPRS) Tunneling Protocol (GTP) classes.

## Examples

The following example shows how to configure a matching pattern for a specified URL:

```
Device(config)# parameter-map type regex dns_bypass
Device(config-profile)# pattern www.example.com
```

The following example shows how to specify a case-insensitive pattern that matches multiple variants of the string `hello`:

```
Device> enable
Device# configure terminal
Device(config)# parameter-map type regex body-regex
Device(config-profile)# pattern ".*[Hh][Ee][Ll][Ll][Oo]"
```

The following example shows an error message that appears on the console when an asterisk (\*) character is specified at the beginning of a pattern:

```
Device(config)# parameter-map type regex gtp-map
Device(config-profile)# pattern *.gprs.com
%Invalid first char + or * in regex pattern
```

## Related Commands

| Command                         | Description                                                                                                                                   |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>parameter-map type regex</b> | Configures a regex parameter map that matches a specific regular expression pattern and enters parameter-map type inspect configuration mode. |

## permit (MAC access-list configuration)

To allow non-IP traffic to be forwarded if the conditions are matched, use the **permit** command in MAC access-list configuration mode. To remove a permit condition from the extended MAC access list, use the **no** form of this command.

```
{permit {any | hostsrc-MAC-addr | src-MAC-addr mask} {any | hostdst-MAC-addr |
dst-MAC-addr mask} [type mask | aarp | amber | appletalk | dec-spanning | decnet-iv |
diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsaplsap mask | mop-console
| mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp] [coscos]
nopermit {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr |
dst-MAC-addr mask} [type mask | aarp | amber | appletalk | dec-spanning | decnet-iv |
diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console
| mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp] [coscos]}
```

### Syntax Description

|                                                            |                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>any</b>                                                 | Denies any source or destination MAC address.                                                                                                                                                                                                                                                                                                             |
| <b>host</b> <i>src-MAC-addr</i>   <i>src-MAC-addr mask</i> | Specifies a host MAC address and optional subnet mask. If the source address for a packet matches the defined address, non-IP traffic from that address is denied.                                                                                                                                                                                        |
| <b>host</b> <i>dst-MAC-addr</i>   <i>dst-MAC-addr mask</i> | Specifies a destination MAC address and optional subnet mask. If the destination address for a packet matches the defined address, non-IP traffic to that address is denied.                                                                                                                                                                              |
| <i>type mask</i>                                           | <p>(Optional) Specifies the EtherType number of a packet with Ethernet II or SNAP encapsulation to identify the protocol of the packet.</p> <ul style="list-style-type: none"> <li><i>type</i> is 0 to 65535, specified in hexadecimal.</li> <li><i>mask</i> is a mask of don't care bits applied to the EtherType before testing for a match.</li> </ul> |
| <b>aarp</b>                                                | (Optional) Specifies EtherType AppleTalk Address Resolution Protocol that maps a data-link address to a network address.                                                                                                                                                                                                                                  |
| <b>amber</b>                                               | (Optional) Specifies EtherType DEC-Amber.                                                                                                                                                                                                                                                                                                                 |
| <b>appletalk</b>                                           | (Optional) Specifies EtherType AppleTalk/EtherTalk.                                                                                                                                                                                                                                                                                                       |
| <b>dec-spanning</b>                                        | (Optional) Specifies EtherType Digital Equipment Corporation (DEC) spanning tree.                                                                                                                                                                                                                                                                         |
| <b>decnet-iv</b>                                           | (Optional) Specifies EtherType DECnet Phase IV protocol.                                                                                                                                                                                                                                                                                                  |
| <b>diagnostic</b>                                          | (Optional) Specifies EtherType DEC-Diagnostic.                                                                                                                                                                                                                                                                                                            |

|                                     |                                                                                                                                                                                                                                           |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dsm</b>                          | (Optional) Specifies EtherType DEC-DSM.                                                                                                                                                                                                   |
| <b>etype-6000</b>                   | (Optional) Specifies EtherType 0x6000.                                                                                                                                                                                                    |
| <b>etype-8042</b>                   | (Optional) Specifies EtherType 0x8042.                                                                                                                                                                                                    |
| <b>lat</b>                          | (Optional) Specifies EtherType DEC-LAT.                                                                                                                                                                                                   |
| <b>lavr-sca</b>                     | (Optional) Specifies EtherType DEC-LAVR-SCA.                                                                                                                                                                                              |
| <b>lsap</b> <i>lsap-number mask</i> | (Optional) Specifies the LSAP number (0 to 65535) of a packet with 802.2 encapsulation to identify the protocol of the packet.<br><br>The <i>mask</i> is a mask of don't care bits applied to the LSAP number before testing for a match. |
| <b>mop-console</b>                  | (Optional) Specifies EtherType DEC-MOP Remote Console.                                                                                                                                                                                    |
| <b>mop-dump</b>                     | (Optional) Specifies EtherType DEC-MOP Dump.                                                                                                                                                                                              |
| <b>msdos</b>                        | (Optional) Specifies EtherType DEC-MSDOS.                                                                                                                                                                                                 |
| <b>mumps</b>                        | (Optional) Specifies EtherType DEC-MUMPS.                                                                                                                                                                                                 |
| <b>netbios</b>                      | (Optional) Specifies EtherType DEC- Network Basic Input/Output System (NetBIOS).                                                                                                                                                          |
| <b>vines-echo</b>                   | (Optional) Specifies EtherType Virtual Integrated Network Service (VINES) Echo from Banyan Systems.                                                                                                                                       |
| <b>vines-ip</b>                     | (Optional) Specifies EtherType VINES IP.                                                                                                                                                                                                  |
| <b>xns-idp</b>                      | (Optional) Specifies EtherType Xerox Network Systems (XNS) protocol suite.                                                                                                                                                                |
| <b>cos</b> <i>cos</i>               | (Optional) Specifies an arbitrary class of service (CoS) number from 0 to 7 to set priority. Filtering on CoS can be performed only in hardware. A warning message appears if the <b>cos</b> option is configured.                        |

**Command Default**

This command has no defaults. However, the default action for a MAC-named ACL is to deny.

**Command Modes**

MAC-access list configuration

**Command History**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

Though visible in the command-line help strings, **appletalk** is not supported as a matching condition.

You enter MAC access-list configuration mode by using the **mac access-list extended** global configuration command.

If you use the **host** keyword, you cannot enter an address mask; if you do not use the **any** or **host** keywords, you must enter an address mask.

After an access control entry (ACE) is added to an access control list, an implied **deny-any-any** condition exists at the end of the list. That is, if there are no matches, the packets are denied. However, before the first ACE is added, the list permits all packets.

To filter IPX traffic, you use the *type mask* or **lsap lsap mask** keywords, depending on the type of IPX encapsulation being used. Filter criteria for IPX encapsulation types as specified in Novell terminology and Cisco IOS XE terminology are listed in the following table.

**Table 183: IPX Filtering Criteria**

| IPX Encapsulation Type |                | Filter Criterion |
|------------------------|----------------|------------------|
| Cisco IOS Name         | Novell Name    |                  |
| arpa                   | Ethernet II    | EtherType 0x8137 |
| snap                   | Ethernet-snap  | EtherType 0x8137 |
| sap                    | Ethernet 802.2 | LSAP 0xE0E0      |
| novell-ether           | Ethernet 802.3 | LSAP 0xFFFF      |

This example shows how to define the MAC-named extended access list to allow NetBIOS traffic from any source to MAC address 00c0.00a0.03fa. Traffic matching this list is allowed.

```
Device> enable
Device# configure terminal
Device(config)# mac access-list extended
Device(config-ext-macl)# permit any host 00c0.00a0.03fa netbios
Device(config-ext-macl)# end
```

This example shows how to remove the permit condition from the MAC-named extended access list:

```
Device> enable
Device# configure terminal
Device(config)# mac access-list extended
Device(config-ext-macl)# no permit any 00c0.00a0.03fa 0000.0000.0000 netbios
Device(config-ext-macl)# end
```

This example permits all packets with EtherType 0x4321:

```
Device> enable
Device# configure terminal
Device(config)# mac access-list extended
Device(config-ext-macl)# permit any any 0x4321 0
Device(config-ext-macl)# end
```

You can verify your settings by entering the **show access-lists** command.

|---------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>deny</b>                     | Denies from the MAC access-list configuration. Denies non-IP traffic to be forwarded if conditions are matched. |
| <b>mac access-list extended</b> | Creates an access list based on MAC addresses for non-IP traffic.                                               |
| <b>show access-lists</b>        | Displays access control lists configured on a device.                                                           |

# protocol (IPv6 snooping)

s

To specify that addresses should be gleaned with Dynamic Host Configuration Protocol (DHCP) or Neighbor Discovery Protocol (NDP), or to associate the protocol with an IPv6 prefix list, use the **protocol** command in IPv6 snooping configuration mode. To disable address gleaned with DHCP or NDP, use the **no** form of the command.

**protocol** { **dhcp** | **ndp** }  
**no protocol** { **dhcp** | **ndp** }

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                              |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <p><b>dhcp</b> Specifies that addresses should be gleaned in Dynamic Host Configuration Protocol (DHCP) packets.</p> <p><b>ndp</b> Specifies that addresses should be gleaned in Neighbor Discovery Protocol (NDP) packets.</p>                                                                                                                                                                                                                                                                                                                                                                                                |                              |
| <b>Command Default</b>    | Snooping and recovery are attempted using both DHCP and NDP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                              |
| <b>Command Modes</b>      | IPv6 snooping configuration mode (config-ipv6-snooping)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                              |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | This command was introduced. |
| <b>Usage Guidelines</b>   | <p>If an address does not match the prefix list associated with DHCP or NDP, then control packets will be dropped and recovery of the binding table entry will not be attempted with that protocol.</p> <ul style="list-style-type: none"> <li>• Using the <b>no protocol</b> { <b>dhcp</b>   <b>ndp</b> } command indicates that a protocol will not be used for snooping or gleaned.</li> <li>• If the <b>no protocol dhcp</b> command is used, DHCP can still be used for binding table recovery.</li> <li>• Data glean can recover with DHCP and NDP, though destination guard will only recovery through DHCP.</li> </ul> |                              |

This example shows how to define an IPv6 snooping policy name as policy1, and configure the port to use DHCP to glean addresses:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)# protocol dhcp
Device(config-ipv6-snooping)# end
```

# radius server

To configure the RADIUS server parameters, including the RADIUS accounting and authentication, use the **radius server** command in global configuration mode. Use the **no** form of this command to return to the default settings.

**radius server** *name*  
**address** {**ipv4** | **ipv6**} *ip{address | hostname}* **auth-port** *udp-port* **acct-port** *udp-port*  
**key** *string*  
**automate tester** *name* | **retransmit** *value* | **timeout** *seconds*  
**no radius server** *name*

## Syntax Description

|                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>address</b> { <b>ipv4</b>   <b>ipv6</b> }<br><i>ip{address   hostname}</i> | Specifies the IP address of the RADIUS server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>auth-port</b> <i>udp-port</i>                                              | (Optional) Specifies the UDP port for the RADIUS authentication server. The range is from 0 to 65536.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>acct-port</b> <i>udp-port</i>                                              | (Optional) Specifies the UDP port for the RADIUS accounting server. The range is from 0 to 65536.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>key</b> <i>string</i>                                                      | (Optional) Specifies the authentication and encryption key for all RADIUS communication between the device and the RADIUS daemon.<br><br><b>Note</b> The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in this command. Leading spaces are ignored, but spaces within and at the end of the key are used. If there are spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key. |
| <b>automate tester</b> <i>name</i>                                            | (Optional) Enables automatic server testing of the RADIUS server status, and specify the username to be used.                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>retransmit</b> <i>value</i>                                                | (Optional) Specifies the number of times a RADIUS request is resent when the server is not responding or responding slowly. The range is 1 to 100. This setting overrides the radius-server retransmit global configuration command setting.                                                                                                                                                                                                                                                                        |
| <b>timeout</b> <i>seconds</i>                                                 | (Optional) Specifies the time interval that the device waits for the RADIUS server to reply before sending a request again. The range is 1 to 1000. This setting overrides the <b>radius-server timeout</b> command.                                                                                                                                                                                                                                                                                                |

## Command Default

- The UDP port for the RADIUS accounting server is 1646.
- The UDP port for the RADIUS authentication server is 1645.
- Automatic server testing is disabled.
- The timeout is 60 minutes (1 hour).
- When the automatic testing is enabled, testing occurs on the accounting and authentication UDP ports.

- The authentication and encryption key ( string) is not configured.

**Command Modes**

Global configuration (config)

**Command History**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

- We recommend that you configure the UDP port for the RADIUS accounting server and the UDP port for the RADIUS authentication server to non-default values.
- You can configure the authentication and encryption key by using the **key string** command in RADIUS server configuration mode. Always configure the key as the last item in this command.
- Use the **automate-tester name** keywords to enable automatic server testing of the RADIUS server status and to specify the username to be used.

This example shows how to configure 1645 as the UDP port for the authentication server and 1646 as the UDP port for the accounting server, and configure a key string:

```
Device> enable
Device# configure terminal
Device(config)# radius server ISE
Device(config-radius-server)# address ipv4 10.1.1 auth-port 1645 acct-port 1646
Device(config-radius-server)# key cisco123
Device(config-radius-server)# end
```

# radius-server dscp

To configure DSCP marking for authentication and accounting on RADIUS servers, use the **radius-server** command. To disable DSCP marking for authentication and accounting on RADIUS servers, use the **no** form of the command.

```
radius-server dscp { acct dscp_acct_value | auth dscp_auth_value }
```

| Syntax Description            | <div> <b>acct</b> <i>dscp_acct_value</i> Configures RADIUS DSCP marking value for accounting. The valid range is from 1 to 63. The default value is 0. </div> <div> <b>auth</b> <i>dscp_auth_value</i> Configures RADIUS DSCP marking value for authentication. The valid range is from 1 to 63. The default value is 0. </div> |         |              |                               |                              |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|-------------------------------|------------------------------|
| Command Default               | The DSCP marking on RADIUS packets is disabled by default.                                                                                                                                                                                                                                                                      |         |              |                               |                              |
| Command Modes                 | Global configuration (config)                                                                                                                                                                                                                                                                                                   |         |              |                               |                              |

| Cisco IOS XE Bengaluru 17.5.1 | This command was introduced.                                                                                                                                                                                                                                                                                                    |         |              |                               |                              |

## Example

This example shows how to configure DSCP marking for authentication and accounting on RADIUS packets:

```
Device# configure terminal
Device(config)# radius-server dscp auth 10 acct 20
```

## radius-server dead-criteria

To force one or both of the criteria, used to mark a RADIUS server as dead, to be the indicated constant, use the **radius-server dead-criteria** command in global configuration mode. To disable the criteria that were set, use the **no** form of this command.

**radius-server dead-criteria** [**time** *seconds*] [**tries** *number-of-tries*]

**no radius-server dead-criteria** [{**time** *seconds* | **tries** *number-of-tries*}]

### Syntax Description

|                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>time</b> <i>seconds</i>          | (Optional) Minimum amount of time, in seconds, that must elapse from the time that the device last received a valid packet from the RADIUS server to the time the server is marked as dead. If a packet has not been received since the device booted, and there is a timeout, the time criterion will be treated as though it has been met. You can configure the time to be from 1 through 120 seconds. <ul style="list-style-type: none"><li>If the <i>seconds</i> argument is not configured, the number of seconds will range from 10 to 60 seconds, depending on the transaction rate of the server.</li></ul> <b>Note</b> Both the time criterion and the tries criterion must be met for the server to be marked as dead.                                                                                                                               |
| <b>tries</b> <i>number-of-tries</i> | (Optional) Number of consecutive timeouts that must occur on the device before the RADIUS server is marked as dead. If the server performs both authentication and accounting, both types of packets will be included in the number. Improperly constructed packets will be counted as though they were timeouts. All transmissions, including the initial transmit and all retransmits, will be counted. You can configure the number of timeouts to be from 1 through 100. <ul style="list-style-type: none"><li>If the <i>number-of-tries</i> argument is not configured, the number of consecutive timeouts will range from 10 to 100, depending on the transaction rate of the server and the number of configured retransmissions.</li></ul> <b>Note</b> Both the time criterion and the tries criterion must be met for the server to be marked as dead. |

### Command Default

The number of seconds and number of consecutive timeouts that occur before the RADIUS server is marked as dead will vary, depending on the transaction rate of the server and the number of configured retransmissions.

### Command Modes

Global configuration (config)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

### Note

Both the time criterion and the tries criterion must be met for the server to be marked as dead.

The **no** form of this command has the following cases:

- If neither the *seconds* nor the *number-of-tries* argument is specified with the **no radius-server dead-criteria** command, both time and tries will be reset to their defaults.
- If the *seconds* argument is specified using the originally set value, the time will be reset to the default value range (10 to 60).
- If the *number-of-tries* argument is specified using the originally set value, the number of tries will be reset to the default value range (10 to 100).

## Examples

The following example shows how to configure the device so that it will be considered dead after 5 seconds and 4 tries:

```
Device> enable
Device# configure terminal
Device(config)# radius-server dead-criteria time 5 tries 4
```

The following example shows how to disable the time and number-of-tries criteria that were set for the **radius-server dead-criteria** command.

```
Device(config)# no radius-server dead-criteria
```

The following example shows how to disable the time criterion that was set for the **radius-server dead-criteria** command.

```
Device(config)# no radius-server dead-criteria time 5
```

The following example shows how to disable the number-of-tries criterion that was set for the **radius-server dead-criteria** command.

```
Device(config)# no radius-server dead-criteria tries 4
```

## Related Commands

| Command                                     | Description                                                                             |
|---------------------------------------------|-----------------------------------------------------------------------------------------|
| <b>debug aaa dead-criteria transactions</b> | Displays AAA dead-criteria transaction values.                                          |
| <b>show aaa dead-criteria</b>               | Displays dead-criteria information for a AAA server.                                    |
| <b>show aaa server-private</b>              | Displays the status of all private RADIUS servers.                                      |
| <b>show aaa servers</b>                     | Displays information about the number of packets sent to and received from AAA servers. |

# radius-server deadline

To improve RADIUS response time when some servers might be unavailable and to skip unavailable servers immediately, use the **radius-server deadline** command in global configuration mode. To set deadline to 0, use the **no** form of this command.

**radius-server deadline** *minutes*  
**no radius-server deadline**

|                           |                |                                                                                                                                              |
|---------------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>minutes</i> | Length of time, in minutes (up to a maximum of 1440 minutes or 24 hours), for which a RADIUS server is skipped over by transaction requests. |
|---------------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------|

**Command Default** Dead time is set to 0.

**Command Modes** Global configuration (config)

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Use this command to enable the Cisco IOS software to mark as *dead* any RADIUS servers that fail to respond to authentication requests, thus avoiding the wait for the request to time out before trying the next configured server. A RADIUS server marked as *dead* is skipped by additional requests for the specified duration (in minutes) or unless there are no servers not marked as *dead*.

**Note** If a RADIUS server that is marked as *dead* receives a directed-request, the directed-request is not omitted by the RADIUS server. The RADIUS server continues to process the directed-request because the request is directly sent to the RADIUS server.

The RADIUS server will be marked as dead if both of the following conditions are met:

1. A valid response has not been received from the RADIUS server for any outstanding transaction for at least the timeout period that is used to determine whether to retransmit to that server, and
2. At least the requisite number of retransmits plus one (for the initial transmission) have been sent consecutively across all transactions being sent to the RADIUS server without receiving a valid response from the server within the requisite timeout.

## Examples

The following example specifies five minutes of deadline for RADIUS servers that fail to respond to authentication requests:

```
Device> enable
Device# configure terminal
Device(config)# aaa new-model
Device(config)# radius-server deadline 5
```

**Related Commands**

|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>deadline (server-group configuration)</b> | Configures deadline within the context of RADIUS server groups.                                                      |
| <b>radius-server host</b>                    | Specifies a RADIUS server host.                                                                                      |
| <b>radius-server retransmit</b>              | Specifies the number of times that the Cisco IOS software searches the list of RADIUS server hosts before giving up. |
| <b>radius-server timeout</b>                 | Sets the interval for which a device waits for a server host to reply.                                               |

# radius-server directed-request

To allow users to log in to a Cisco network access server (NAS) and select a RADIUS server for authentication, use the **radius-server directed-request** command in global configuration mode. To disable the directed-request function, use the **no** form of this command.

**radius-server directed-request [restricted]**  
**no radius-server directed-request [restricted]**

|                           |                                                                                                                                |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>restricted</b> (Optional) Prevents the user from being sent to a secondary server if the specified server is not available. |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------|

**Command Default** The User cannot log in to a Cisco NAS and select a RADIUS server for authentication.

**Command Modes** Global configuration (config)

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **radius-server directed-request** command sends only the portion of the username before the “@” symbol to the host specified after the “@” symbol. In other words, with this command enabled, you can direct a request to any of the configured servers, and only the username is sent to the specified server.

**Note** If a private RADIUS server is used as the group server by configuring the **server-private** (RADIUS) command, then the **radius-server directed-request** command cannot be configured.

The following is the sequence of events to send a message to RADIUS servers:

- If the **radius-server directed-request** command is configured:
  - A request is sent to the directed server. If there are more servers with the same IP address, the request is sent only to the first server with same IP address.
  - If a response is not received, requests will be sent to all servers listed in the first method list.
  - If no response is received with the first method, the request is sent to all servers listed in the second method list until the end of the method list is reached.

**Note** To select the directed server, search the first server group in the method list for a server with the IP address provided in a directed request. If it is not available, the first server group with the same IP address from the global pool is considered.

- If the **radius-server directed-request restricted** command is configured for every server group in the method list, until the response is received from the directed server or the end of method list is reached, the following actions occur:
  - The first server with an IP address of the directed server will be used to send the request.
  - If a server with the same IP address is not found in the server group, then the first server in the global pool with the IP address of the directed-server will be used.

If the **radius-server directed-request** command is disabled using the **no radius-server directed-request** command, the entire string, both before and after the “@” symbol, is sent to the default RADIUS server. The router queries the list of servers, starting with the first one in the list. It sends the whole string, and accepts the first response from the server.

Use the **radius-server directed-request restricted** command to limit the user to the RADIUS server identified as part of the username.

If the user request has a server IP address, then the directed server forwards it to a specific server before forwarding it to the group. For example, if a user request such as user@10.0.0.1 is sent to the directed server, and if the IP address specified in this user request is the IP address of a server, the directed server forwards the user request to the specific server.

If a directed server is configured both on the server group and on the host server, and if the user request with the configured server name is sent to the directed server, the directed server forwards the user request to the host server before forwarding it to the server group. For example, if a user request of user@10.0.0.1 is sent to the directed server and 10.0.0.1 is the host server address, then the directed server forwards the user request to the host server before forwarding the request to the server group.

#### Note

When the **no radius-server directed-request restricted** command is entered, only the restricted flag is removed, and the directed-request flag is retained. To disable the directed-request function, you must also enter the **no radius-server directed-request** command.

## Examples

The following example shows how to configure the directed-request function:

```
Device> enable
Device# configure terminal
Device(config)# radius server rad-1
Device(config-radius-server)# address ipv4 10.1.1.2
Device(config-radius-server)# key dummy123
Device(config-radius-server)# exit
Device(config)# radius-server directed-request
```

## Related Commands

| Command                        | Description                                                                  |
|--------------------------------|------------------------------------------------------------------------------|
| <b>aaa group server</b>        | Groups different server hosts into distinct lists and distinct methods.      |
| <b>aaa new-model</b>           | Enables the AAA access control model.                                        |
| <b>server-private (RADIUS)</b> | Configures the IP address of the private RADIUS server for the group server. |

## radius-server domain-stripping

To configure a network access server (NAS) to strip suffixes, or to strip both suffixes and prefixes from the username before forwarding the username to the remote RADIUS server, use the **radius-server domain-stripping** command in global configuration mode. To disable a stripping configuration, use the **no** form of this command.

**Note** The **ip vrf default** command must be configured in global configuration mode before the **radius-server domain-stripping** command is configured to ensure that the default VRF name is a NULL value until the default vrf name is configured.

```
radius-server domain-stripping [{ [right-to-left] [prefix-delimiter character [character2
. . . character7]] [delimiter character [character2 . . . character7]] | strip-suffix
suffix }] [vrf vrf-name]
no radius-server domain-stripping [{ [right-to-left] [prefix-delimiter character [character2
. . . character7]] [delimiter character [character2 . . . character7]] | strip-suffix
suffix }] [vrf vrf-name]
```

### Syntax Description

|                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>right-to-left</b>                                                           | (Optional) Specifies that the NAS will apply the stripping configuration at the first delimiter found when parsing the full username from right to left. The default is for the NAS to apply the stripping configuration at the first delimiter found when parsing the full username from left to right.                                                                                                                                                                                                                                   |
| <b>prefix-delimiter</b> <i>character</i><br>[ <i>character2...character7</i> ] | (Optional) Enables prefix stripping and specifies the character or characters that will be recognized as a prefix delimiter. Valid values for the <i>character</i> argument are @, /, \$, %, \, #, and -. Multiple characters can be entered without intervening spaces. Up to seven characters can be defined as prefix delimiters, which is the maximum number of valid characters. If a \ is entered as the final or only value for the <i>character</i> argument, it must be entered as \\. No prefix delimiter is defined by default. |
| <b>delimiter</b> <i>character</i><br>[ <i>character2...character7</i> ]        | (Optional) Specifies the character or characters that will be recognized as a suffix delimiter. Valid values for the <i>character</i> argument are @, /, \$, %, \, #, and -. Multiple characters can be entered without intervening spaces. Up to seven characters can be defined as suffix delimiters, which is the maximum number of valid characters. If a \ is entered as the final or only value for the <i>character</i> argument, it must be entered as \\. The default suffix delimiter is the @ character.                        |
| <b>strip-suffix</b> <i>suffix</i>                                              | (Optional) Specifies a suffix to strip from the username.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>vrf</b> <i>vrf-name</i>                                                     | (Optional) Restricts the domain stripping configuration to a Virtual Private Network (VPN) routing and forwarding (VRF) instance. The <i>vrf-name</i> argument specifies the name of a VRF.                                                                                                                                                                                                                                                                                                                                                |

### Command Default

Stripping is disabled. The full username is sent to the RADIUS server.

**Command Modes**

Global configuration (config)

**Command History**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

Use the **radius-server domain-stripping** command to configure the NAS to strip the domain from a username before forwarding the username to the RADIUS server. If the full username is `user1@cisco.com`, enabling the **radius-server domain-stripping** command results in the username “user1” being forwarded to the RADIUS server.

Use the **right-to-left** keyword to specify that the username should be parsed for a delimiter from right to left, rather than from left to right. This allows strings with two instances of a delimiter to strip the username at either delimiter. For example, if the username is `user@cisco.com@cisco.net`, the suffix could be stripped in two ways. The default direction (left to right) would result in the username “user” being forwarded to the RADIUS server. Configuring the **right-to-left** keyword would result in the username “user@cisco.com” being forwarded to the RADIUS server.

Use the **prefix-delimiter** keyword to enable prefix stripping and to specify the character or characters that will be recognized as a prefix delimiter. The first configured character that is parsed will be used as the prefix delimiter, and any characters before that delimiter will be stripped.

Use the **delimiter** keyword to specify the character or characters that will be recognized as a suffix delimiter. The first configured character that is parsed will be used as the suffix delimiter, and any characters after that delimiter will be stripped.

Use **strip-suffix suffix** to specify a particular suffix to strip from usernames. For example, configuring the **radius-server domain-stripping strip-suffix cisco.net** command would result in the username `user@cisco.net` being stripped, while the username `user@cisco.com` will not be stripped. You may configure multiple suffixes for stripping by issuing multiple instances of the **radius-server domain-stripping** command. The default suffix delimiter is the `@` character.

**Note**

Issuing the **radius-server domain-stripping strip-suffix suffix** command disables the capacity to strip suffixes from all domains. Both the suffix delimiter and the suffix must match for the suffix to be stripped from the full username. The default suffix delimiter of `@` will be used if you do not specify a different suffix delimiter or set of suffix delimiters using the **delimiter** keyword.

To apply a domain-stripping configuration only to a specified VRF, use the **vrf vrf-name** option.

The interactions between the different types of domain stripping configurations are as follows:

- You may configure only one instance of the **radius-server domain-stripping[**right-to-left** [**prefix-delimiter** character [character2...character7]] [**delimiter** character [character2...character7]]** command.
- You may configure multiple instances of the **radius-server domain-stripping[**right-to-left** [**prefix-delimiter** character [character2...character7]] [**delimiter** character [character2...character7]] [**vrf** vrf-name]** command with unique values for **vrf vrf-name**.
- You may configure multiple instances of the **radius-server domain-stripping strip-suffix suffix[**vrf** per-vrf]** command to specify multiple suffixes to be stripped as part of a global or per-VRF ruleset.

- Issuing any version of the **radius-server domain-stripping** command automatically enables suffix stripping using the default delimiter character @ for that ruleset, unless a different delimiter or set of delimiters is specified.
- Configuring a per-suffix stripping rule disables generic suffix stripping for that ruleset. Only suffixes that match the configured suffix or suffixes will be stripped from usernames.

## Examples

The following example configures the router to parse the username from right to left and sets the valid suffix delimiter characters as @, \, and \$. If the full username is cisco/user@cisco.com\$cisco.net, the username “cisco/user@cisco.com” will be forwarded to the RADIUS server because the \$ character is the first valid delimiter encountered by the NAS when parsing the username from right to left.

```
radius-server domain-stripping right-to-left delimiter @\ $
```

The following example configures the router to strip the domain name from usernames only for users associated with the VRF instance named abc. The default suffix delimiter @ will be used for generic suffix stripping.

```
radius-server domain-stripping vrf abc
```

The following example enables prefix stripping using the character / as the prefix delimiter. The default suffix delimiter character @ will be used for generic suffix stripping. If the full username is cisco/user@cisco.com, the username “user” will be forwarded to the RADIUS server.

```
radius-server domain-stripping prefix-delimiter /
```

The following example enables prefix stripping, specifies the character / as the prefix delimiter, and specifies the character # as the suffix delimiter. If the full username is cisco/user@cisco.com#cisco.net, the username “user@cisco.com” will be forwarded to the RADIUS server.

```
radius-server domain-stripping prefix-delimiter / delimiter #
```

The following example enables prefix stripping, configures the character / as the prefix delimiter, configures the characters \$, @, and # as suffix delimiters, and configures per-suffix stripping of the suffix cisco.com. If the full username is cisco/user@cisco.com, the username “user” will be forwarded to the RADIUS server. If the full username is cisco/user@cisco.com#cisco.com, the username “user@cisco.com” will be forwarded.

```
radius-server domain-stripping prefix-delimiter / delimiter $@#  
radius-server domain-stripping strip-suffix cisco.com
```

The following example configures the router to parse the username from right to left and enables suffix stripping for usernames with the suffix cisco.com. If the full username is cisco/user@cisco.net@cisco.com, the username “cisco/user@cisco.net” will be forwarded to the RADIUS server. If the full username is cisco/user@cisco.com@cisco.net, the full username will be forwarded.

```
radius-server domain-stripping right-to-left  
radius-server domain-stripping strip-suffix cisco.com
```

The following example configures a set of global stripping rules that will strip the suffix cisco.com using the delimiter @, and a different set of stripping rules for usernames associated with the VRF named myvrf:

```
radius-server domain-stripping strip-suffix cisco.com  
!  
radius-server domain-stripping prefix-delimiter # vrf myvrf  
radius-server domain-stripping strip-suffix cisco.net vrf myvrf
```

| <b>tacacs-server domain-stripping</b> | Configures a router to strip a prefix or suffix from the username before forwarding the username to the TACACS+ server. |

# sak-rekey

To configure the Security Association Key (SAK) rekey time interval for a defined MKA policy, use the **sak-rekey** command in MKA-policy configuration mode. To stop the SAK rekey timer, use the **no** form of this command.

**sak-rekey** {*interval time-interval* | **on-live-peer-loss**}  
**no sak-rekey** {*interval* | **on-live-peer-loss**}

## Syntax Description

|                          |                                                      |
|--------------------------|------------------------------------------------------|
| <b>interval</b>          | SAK rekey interval in seconds.                       |
| <i>time-interval</i>     | The range is from 30 to 65535, and the default is 0. |
| <b>on-live-peer-loss</b> | Peer loss from the live membership.                  |

## Command Default

The SAK rekey timer is disabled. The default is 0.

## Command Modes

MKA-policy configuration (config-mka-policy)

## Command History

| Release                   | Modification                 |
|---------------------------|------------------------------|
| Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

## Examples

The following example shows how to configure the SAK rekey interval:

```
Device> enable
Device# configure terminal
Device(config)# mka policy 2
Device(config-mka-policy)# sak-rekey interval 300
```

| <b>ssci-based-on-sci</b>         | Computes SSCI based on the SCI.                                |
| <b>use-updated-eth-header</b>    | Uses the updated Ethernet header for ICV calculation.          |

# security level (IPv6 snooping)

To specify the level of security enforced, use the **security-level** command in IPv6 snooping policy configuration mode.

**security level** {**glean** | **guard** | **inspect**}

| Syntax Description           | <div> <b>glean</b> <div>Extracts addresses from the messages and installs them into the binding table without performing any verification.</div> </div> <div> <b>guard</b> <div>Performs both glean and inspect. Additionally, RA, and DHCP server messages are rejected unless they are received on a trusted port or another policy authorizes them.</div> </div> <div> <b>inspect</b> <div>Validates messages for consistency and conformance; in particular, address ownership is enforced. Invalid messages are dropped.</div> </div> |         |              |                              |                              |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|------------------------------|
| Command Default              | The default security level is guard.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |              |                              |                              |
| Command Modes                | IPv6 snooping configuration (config-ipv6-snooping)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |         |              |                              |                              |

| Release                      | Modification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |              |                              |                              |
| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |              |                              |                              |

This example shows how to define an IPv6 snooping policy name as policy1 and configure the security level as inspect:

```

Device> enable
Device# configure terminal
Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)# security-level inspect
Device(config-ipv6-snooping)# end

```

## security passthru

To modify the IPsec pass-through, use the **security passthru** command. To disable, use the no form of the command.

```
security passthru ip-address  
no security passthru
```

| <b>Syntax Description</b>    | <i>ip-address</i> IP address of the IPsec gateway that is terminating the VPN tunnel.                                                            |         |              |                              |                              |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|------------------------------|
| <b>Command Default</b>       | None.                                                                                                                                            |         |              |                              |                              |

| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                     |         |              |                              |                              |

This example shows how to modify IPsec pass-through.

```
Device> enable  
Device# configure terminal  
Device(config)# security passthrough 10.1.1.1
```

# send-secure-announcements

To enable MKA to send secure announcements in MACsec Key Agreement Protocol Data Units (MKPDUs), use the **send-secure-announcements** command in MKA-policy configuration mode. To disable sending of secure announcements, use the **no** form of this command.

**send-secure-announcements**  
**no send-secure-announcements**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Secure announcements in MKPDUs is disabled.

**Command Modes** MKA-policy configuration (config-mka-policy)

| Command History | Release                  | Modification                 |
|-----------------|--------------------------|------------------------------|
|                 | Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

**Usage Guidelines** Secure announcements revalidate the MACsec Cipher Suite capabilities which were shared previously through unsecure announcements.

**Examples** The following example shows how to enable sending of secure announcements:

```
Device> enable
Device# configure terminal
Device(config)# mka policy 2
Device(config-mka-policy)# send-secure-announcements
```

| Related Commands | Command                       | Description                                              |
|------------------|-------------------------------|----------------------------------------------------------|
|                  | <b>mka policy</b>             | Configures an MKA policy.                                |
|                  | <b>confidentiality-offset</b> | Sets the confidentiality offset for MACsec operations.   |
|                  | <b>delay-protection</b>       | Configures MKA to use delay protection in sending MKPDU. |
|                  | <b>include-icv-indicator</b>  | Includes ICV indicator in MKPDU.                         |
|                  | <b>key-server</b>             | Configures MKA key-server options.                       |
|                  | <b>macsec-cipher-suite</b>    | Configures cipher suite for deriving SAK.                |
|                  | <b>sak-rekey</b>              | Configures the SAK rekey interval.                       |
|                  | <b>ssci-based-on-sci</b>      | Computes SSCI based on the SCI.                          |
|                  | <b>use-updated-eth-header</b> | Uses the updated ethernet header for ICV calculation.    |

## server-private (RADIUS)

To configure the IP address of the private RADIUS server for the group server, use the **server-private** command in RADIUS server-group configuration mode. To remove the associated private server from the authentication, authorization, and accounting (AAA) group server, use the **no** form of this command.

**server-private** *ip-address* [{**auth-port** *port-number* | **acct-port** *port-number*}] [**non-standard**] [**timeout** *seconds*] [**retransmit** *retries*] [**key** *string*]  
**no server-private** *ip-address* [{**auth-port** *port-number* | **acct-port** *port-number*}] [**non-standard**] [**timeout** *seconds*] [**retransmit** *retries*] [**key** *string*]

### Syntax Description

|                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip-address</i>                   | IP address of the private RADIUS server host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>auth-port</b> <i>port-number</i> | (Optional) User Datagram Protocol (UDP) destination port for authentication requests. The default value is 1645.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>acct-port</b> <i>port-number</i> | (Optional) UDP destination port for accounting requests. The default value is 1646.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>non-standard</b>                 | (Optional) RADIUS server is using vendor-proprietary RADIUS attributes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>timeout</b> <i>seconds</i>       | (Optional) Time interval (in seconds) that the device waits for the RADIUS server to reply before retransmitting. This setting overrides the global value of the <b>radius-server timeout</b> command. If no timeout value is specified, the global value is used.                                                                                                                                                                                                                                                                                        |
| <b>retransmit</b> <i>retries</i>    | (Optional) Number of times a RADIUS request is resent to a server, if that server is not responding or responding slowly. This setting overrides the global setting of the <b>radius-server retransmit</b> command.                                                                                                                                                                                                                                                                                                                                       |
| <b>key</b> <i>string</i>            | (Optional) Authentication and encryption key used between the device and the RADIUS daemon running on the RADIUS server. This key overrides the global setting of the <b>radius-server key</b> command. If no key string is specified, the global value is used.<br><br>The <i>string</i> can be <b>0</b> (specifies that an unencrypted key follows), <b>6</b> (specifies that an advanced encryption scheme [AES] encrypted key follows), <b>7</b> (specifies that a hidden key follows), or a line specifying the unencrypted (clear-text) server key. |

### Command Default

If server-private parameters are not specified, global configurations will be used; if global configurations are not specified, default values will be used.

### Command Modes

RADIUS server-group configuration (config-sg-radius)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Use the **server-private** command to associate a particular private server with a defined server group. To prevent possible overlapping of private addresses between virtual route forwarding (VRF) instances, private

servers (servers with private addresses) can be defined within the server group and remain hidden from other groups, while the servers in the global pool (default "radius" server group) can still be referred to by IP addresses and port numbers. Thus, the list of servers in server groups includes references to the hosts in the global configuration and the definitions of private servers.

**Note**

- If the **radius-server directed-request** command is configured, then a private RADIUS server cannot be used as the group server by configuring the **server-private** (RADIUS) command.
- Creating or updating AAA server statistics record for private RADIUS servers are not supported. If private RADIUS servers are used, then error messages and tracebacks will be encountered, but these error messages or tracebacks do not have any impact on the AAA RADIUS functionality. To avoid these error messages and tracebacks, configure public RADIUS server instead of private RADIUS server.

Use the **password encryption aes** command to configure type 6 AES encrypted keys.

**Examples**

The following example shows how to define the sg\_water RADIUS group server and associate private servers with it:

```
Device> enable
Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa group server radius sg_water
Device(config-sg-radius)# server-private 10.1.1.1 timeout 5 retransmit 3 key xyz
Device(config-sg-radius)# server-private 10.2.2.2 timeout 5 retransmit 3 key xyz
Device(config-sg-radius)# end
```

**Related Commands**

| Command                               | Description                                                                          |
|---------------------------------------|--------------------------------------------------------------------------------------|
| <b>aaa group server</b>               | Groups different server hosts into distinct lists and distinct methods.              |
| <b>aaa new-model</b>                  | Enables the AAA access control model.                                                |
| <b>password encryption aes</b>        | Enables a type 6 encrypted preshared key.                                            |
| <b>radius-server host</b>             | Specifies a RADIUS server host.                                                      |
| <b>radius-server directed-request</b> | Allows users to log in to a Cisco NAS and select a RADIUS server for authentication. |

## server-private (TACACS+)

To configure the IPv4 or IPv6 address of the private TACACS+ server for the group server, use the **server-private** command in server-group configuration mode. To remove the associated private server from the authentication, authorization, and accounting (AAA) group server, use the **no** form of this command.

```
server-private { ipv4-address | ipv6-address | fqdn } [ nat ] [ single-connection ] [ port port-number ] [ timeout seconds ] key [ { 0 | 7 } ] string
no server-private
```

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                           | <b>timeout seconds</b>                                                                                                                                                                                                                                                                                                                                                                                                                                 | (Optional) Specifies a timeout value for the server response. This value overrides the global timeout value set with the <b>tacacs-server timeout</b> command for this server only.                                                                                                                                                                                                                                             |
|                           | <b>port port-number</b>                                                                                                                                                                                                                                                                                                                                                                                                                                | (Optional) Specifies a server port number. This option overrides the default, which is port 49.                                                                                                                                                                                                                                                                                                                                 |
|                           | <b>key [ 0   7 ] string</b>                                                                                                                                                                                                                                                                                                                                                                                                                            | (Optional) Specifies an authentication and encryption key. This key must match the key used by the TACACS+ daemon. Specifying this key overrides the key set by the global <b>tacacs-server key</b> command for this server only.<br><br>If no number or 0 is entered, the <i>string</i> that is entered is considered to be plain text. If 7 is entered, the <i>string</i> that is entered is considered to be encrypted text. |
| <b>Command Default</b>    | If server-private parameters are not specified, global configurations will be used; if global configurations are not specified, default values will be used.                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Command Modes</b>      | TACACS+ server-group configuration (config-sg-tacacs+)                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>Modification</b>                                                                                                                                                                                                                                                                                                                                                                                                             |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                           | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Usage Guidelines</b>   | Use the <b>server-private</b> command to associate a particular private server with a defined server group. To prevent possible overlapping of private addresses between virtual route forwardings (VRFs), private servers (servers with private addresses) can be defined within the server group and remain hidden from other groups, while the servers in the global pool (default "TACACS+" server group) can still be referred to by IP addresses |                                                                                                                                                                                                                                                                                                                                                                                                                                 |

and port numbers. Thus, the list of servers in server groups includes references to the hosts in the global configuration and the definitions of private servers.

The following example shows how to define the tacacs1 TACACS+ group server and associate private servers with it:

```
Device> enable
Device# configure terminal
Device(config)# aaa group server tacacs+ tacacs1
Device(config-sg-tacacs+)# server-private 10.1.1.1 port 19 key cisco
Device(config-sg-tacacs+)# exit
Device(config)# ip vrf cisco
Device(config-vrf)# rd 100:1
Device(config-vrf)# exit
Device(config)# interface Loopback0
Device(config-if)# ip address 10.0.0.2 255.0.0.0
Device(config-if)# ip vrf forwarding cisco
```

  reauthenticate: 0, bounce-host-port: 0
  disable-host-port: 0, update-rbac: 0
  update-ssl: 0, update-cts-policies: 0
  invalid commands: 0
  async message not sent: 0
```

## show aaa dead-criteria

To display dead-criteria detection information for an authentication, authorization, and accounting (AAA) server, use the **show aaa dead-criteria** command in privileged EXEC mode.

```
show aaa dead-criteria {security-protocol ip-address} [auth-port port-number] [acct-port port-number][server-group-name]
```

### Syntax Description

|                          |                                                                                                                            |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>security-protocol</b> | Security protocol of the specified AAA server. Currently, the only protocol that is supported is RADIUS.                   |
| <i>ip-address</i>        | IP address of the specified AAA server.                                                                                    |
| <b>auth-port</b>         | (Optional) Authentication port for the RADIUS server that was specified.                                                   |
| <i>port-number</i>       | (Optional) Number of the authentication port. The default is 1645 (for a RADIUS server).                                   |
| <b>acct-port</b>         | (Optional) Accounting port for the RADIUS server that was specified.                                                       |
| <i>port-number</i>       | (Optional) Number of the accounting port. The default is 1646 (for a RADIUS server).                                       |
| <i>server-group-name</i> | (Optional) Server group with which the specified server is associated. The default is <i>radius</i> (for a RADIUS server). |

### Command Default

Currently, the *port-number* argument for the **auth-port** keyword and the *port-number* argument for the **acct-port** keyword default to 1645 and 1646, respectively. The default for the *server-group-name* argument is *radius*.

### Command Modes

Privileged EXEC (#)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Multiple RADIUS servers having the same IP address can be configured on a device. The **auth-port** and **acct-port** keywords are used to differentiate the servers. The dead-detect interval of a server that is associated with a specified server group can be obtained by using the **server-group-name** keyword. (The dead-detect interval and retransmit values of a RADIUS server are set on the basis of the server group to which the server belongs. The same server can be part of multiple server groups.)

### Examples

The following example shows that dead-criteria-detection information has been requested for a RADIUS server at the IP address 172.19.192.80:

```
Device# show aaa dead-criteria radius 172.19.192.80 radius

RADIUS Server Dead Criteria:
=====
Server Details:
  Address : 172.19.192.80
```

```

Auth Port : 1645
Acct Port : 1646
Server Group : radius
Dead Criteria Details:
  Configured Retransmits : 62
  Configured Timeout : 27
  Estimated Outstanding Transactions: 5
  Dead Detect Time : 25s
  Computed Retransmit Tries: 22
  Statistics Gathered Since Last Successful Transaction
=====
Max Computed Outstanding Transactions: 5
Max Computed Dead Detect Time: 25s
Max Computed Retransmits : 22

```

The **Max Computed Dead Detect Time** is displayed in seconds. The other fields shown in the display are self-explanatory.

|---------------------------------------------|---------------------------------------------------------------------------------------------------------|
| <b>debug aaa dead-criteria transactions</b> | Displays AAA dead-criteria transaction values.                                                          |
| <b>radius-server dead-criteria</b>          | Forces one or both of the criteria, used to mark a RADIUS server as dead, to be the indicated constant. |
| <b>show aaa server-private</b>              | Displays the status of all private RADIUS servers.                                                      |
| <b>show aaa servers</b>                     | Displays information about the number of packets sent to and received from AAA servers.                 |

# show aaa local

To display authentication, authorization, and accounting (AAA) local method options, use the **show aaa local** command.

**show aaa local** { **netuser** { *name* | **all** } | **statistics** | **user lockout** }

## Syntax Description

|                     |                                                         |
|---------------------|---------------------------------------------------------|
| <b>netuser</b>      | Specifies the AAA local network or guest user database. |
| <i>name</i>         | Network user name.                                      |
| <b>all</b>          | Specifies the network and guest user information.       |
| <b>statistics</b>   | Displays statistics for local authentication.           |
| <b>user lockout</b> | Specifies the AAA local locked-out user.                |

## Command Modes

User EXEC (>)  
Privileged EXEC (#)

| Syntax Description | <b>detailed</b>              | (Optional) Displays private AAA servers as seen by the AAA server MIB. |
|                    | <b>public</b>                | (Optional) Displays public AAA servers as seen by the AAA server MIB.  |
|                    | <b>detailed</b>              | (Optional) Displays detailed AAA server statistics.                    |
| Command Modes      | User EXEC (>)                |                                                                        |
|                    | Privileged EXEC (>)          |                                                                        |
| Command History    | <b>Release</b>               | <b>Modification</b>                                                    |
|                    | Cisco IOS XE Everest 16.5.1a | This command was introduced.                                           |
|                    | Cisco IOS XE Fuji 16.9.1     | The output of the command was updated.                                 |

## Examples

The following is a sample output from the **show aaa servers** command:

```
Device# show aaa servers

Bad authenticators: 0
RADSEC: Packet count since last idletimeout 0,
Send handshake count 0,
Handshake Success 0,
Total Packets Transmitted 0,
Total Packets Received 0,
Total Connection Resets 9,
Connection Reset due to idle timeout 0,
Connection Reset due to No Response 0,
Connection Reset due to Malformed packet 0,
Connection Reset by Peer 0,
```

# show aaa sessions

To display authentication, authorization, and accounting (AAA) sessions as seen by the AAA Session MIB, use the **show aaa sessions** command.

## show aaa sessions

|                           |                                            |
|---------------------------|--------------------------------------------|
| <b>Syntax Description</b> | This command has no arguments or keywords. |
|---------------------------|--------------------------------------------|

|                      |                                      |
|----------------------|--------------------------------------|
| <b>Command Modes</b> | User EXEC (>)<br>Privileged EXEC (#) |
|----------------------|--------------------------------------|

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

The following is sample output from the **show aaa sessions** command:

```
Device# show aaa sessions

Total sessions since last reload: 7
Session Id: 4007
  Unique Id: 4025
  User Name: *not available*
  IP Address: 0.0.0.0
  Idle Time: 0
  CT Call Handle: 0
```

# show authentication brief

To display brief information about authentication sessions for a given interface, use the **show authentication brief** command in either user EXEC or privileged EXEC mode.

```
show authentication brief [switch {switch-number | active | standby} {R0}]
```

|                           |                              |                                                                     |
|---------------------------|------------------------------|---------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>switch-number</b>         | Valid values for the <i>switch-number</i> variable are from 1 to 9. |
|                           | <b>R0</b>                    | Displays information about the Route Processor (RP) slot 0.         |
|                           | <b>active</b>                | Specifies the active instance.                                      |
|                           | <b>standby</b>               | Specifies the standby instance.                                     |
| <b>Command Modes</b>      | Privileged EXEC (#)          |                                                                     |
|                           | User EXEC (>)                |                                                                     |
| <b>Command History</b>    | <b>Release</b>               | <b>Modification</b>                                                 |
|                           | Cisco IOS XE Everest 16.5.1a | This command was introduced.                                        |

The following is a sample output from the **show authentication brief** command:

```
Device# show authentication brief
```

| Interface | MAC Address    | AuthC     | AuthZ   | Eg | Uptime |

The following is a sample output from the **show authentication brief** command for standby instances:

Device# **show authentication brief switch standby R0**

No sessions currently exist

The table below describes the significant fields shown in the displays.

**Table 184: show authentication brief Field Descriptions**

| Field       | Description                                          |
|-------------|------------------------------------------------------|
| Interface   | The type and number of the authentication interface. |
| MAC Address | The MAC address of the client.                       |
| AuthC       | Indicates authentication status.                     |
| AuthZ       | Indicates authorization status.                      |

| Field  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fg     | Flag indicates the current status. The valid values are: <ul style="list-style-type: none"><li>• A—Applying policy (multi-line status for details)</li><li>• D—Awaiting removal</li><li>• F—Final removal in progress</li><li>• I—Awaiting IIF ID allocation</li><li>• P—Pushed session</li><li>• R—Removing user profile (multi-line status for details)</li><li>• U—Applying user profile (multi-line status for details)</li><li>• X—Unknown blocker</li></ul> |
| Uptime | Indicates the duration since which the session came up                                                                                                                                                                                                                                                                                                                                                                                                            |

# show authentication history

To display the authenticated sessions alive on a device, use the **show authentication history** command in user EXEC or privileged EXEC mode.

**show authentication history** [**min-uptime** *seconds*]

|                    |                                                                                                                                                                                                          |                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| Syntax Description | <b>min-uptime</b> <i>seconds</i> (Optional) Displays sessions within the minimum uptime. The range is from 1 through 4294967295 seconds.                                                                 |                              |
| Command Modes      | User EXEC (>)<br>Privileged EXEC (#)                                                                                                                                                                     |                              |
| Command History    | Release                                                                                                                                                                                                  | Modification                 |
|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                             | This command was introduced. |
| Usage Guidelines   | Use the <b>show authentication history</b> command to display the authenticated sessions alive on the device.<br><br>The following is sample output from the <b>show authentication history</b> command: |                              |

```

Device# show authentication history

Interface  MAC Address      Method  Domain  Status  Uptime

## Syntax Description

|                                     |                                                                                                                                                                                                                                |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>database</b>                     | (Optional) Shows only data stored in session database.                                                                                                                                                                         |
| <b>handle</b> <i>handle-id</i>      | (Optional) Specifies the particular handle for which Auth Manager information is to be displayed.                                                                                                                              |
| <b>details</b>                      | (Optional) Shows detailed information.                                                                                                                                                                                         |
| <b>interface</b> <i>type number</i> | (Optional) Specifies a particular interface type and number for which Auth Manager information is to be displayed.                                                                                                             |
| <b>mac</b> <i>mac-address</i>       | (Optional) Specifies the particular MAC address for which you want to display information.                                                                                                                                     |
| <b>method</b> <i>method-name</i>    | (Optional) Specifies the particular authentication method for which Auth Manager information is to be displayed. If you specify a method ( <b>dot1x</b> , <b>mab</b> , or <b>webauth</b> ), you may also specify an interface. |
| <b>session-id</b> <i>session-id</i> | (Optional) Specifies the particular session for which Auth Manager information is to be displayed.                                                                                                                             |

## Command Modes

User EXEC (>)  
Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **show authentication sessions** command to display information about all current Auth Manager sessions. To display information about specific Auth Manager sessions, use one or more of the keywords.

This table shows the possible operating states for the reported authentication sessions.

**Table 185: Authentication Method States**

| State       | Description                                                                |
|-------------|----------------------------------------------------------------------------|
| Not run     | The method has not run for this session.                                   |
| Running     | The method is running for this session.                                    |
| Failed over | The method has failed and the next method is expected to provide a result. |

| State        | Description                                                                 |
|--------------|-----------------------------------------------------------------------------|
| Success      | The method has provided a successful authentication result for the session. |
| Authc Failed | The method has provided a failed authentication result for the session.     |

This table shows the possible authentication methods.

**Table 186: Authentication Method States**

| State   | Description               |
|---------|---------------------------|
| dot1x   | 802.1X                    |
| mab     | MAC authentication bypass |
| webauth | web authentication        |

The following example shows how to display all authentication sessions on the device:

Device# **show authentication sessions**

```

Interface    MAC Address    Method  Domain  Status      Session ID
Gi1/0/48     0015.63b0.f676 dot1x    DATA   Authz Success 0A3462B1000000102983C05C
Gi1/0/5      000f.23c4.a401 mab      DATA   Authz Success 0A3462B10000000D24F80B58
Gi1/0/5      0014.bf5d.d26d dot1x    DATA   Authz Success 0A3462B10000000E29811B94

```

The following example shows how to display all authentication sessions on an interface:

Device# **show authentication sessions interface gigabitethernet2/0/47**

```

|---------------------------|--------------------------------------------------------------------------|
| <b>clear eap sessions</b> | Clears EAP session information for the device or for the specified port. |

# show fqdn

To display the resolved IP addresses for the FQDN entries from the local cache database, use the **show fqdn** command in either user EXEC or privileged EXEC mode.

```
show fqdn { database [{ dump | fqdn name [ ip address ] | statistics }] | packet statistics | summary }
```

## Syntax Description

|                          |                                                                                                                              |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>database</b>          | Displays the FQDN to IP address bindings, along with the time-to-live (TTL) for that binding, and the status of the binding. |
| <b>dump</b>              | (Optional) Displays all cached and transient FQDN entries from the database.                                                 |
| <b>fqdn name</b>         | (Optional) Displays cached entries from the database for the specified FQDN.                                                 |
| <b>ip address</b>        | (Optional) Displays cached entries from the database for the specified IP address.                                           |
| <b>statistics</b>        | (Optional) Displays FQDN database statistics.                                                                                |
| <b>packet statistics</b> | Displays FQDN packet statistics.                                                                                             |
| <b>summary</b>           | Displays FQDN TTL timeout factor and a summary of the registered FQDNs.                                                      |

## Command Modes

User EXEC (>)  
Privileged EXEC (#)

## Command History

| Release                       | Modification                 |
|-------------------------------|------------------------------|
| Cisco IOS XE Bengaluru 17.5.1 | This command was introduced. |

## Examples

The following is a sample output from the **show fqdn summary** command:

```
Device# show fqdn summary

Registered FQDNs:
FQDN: host1.9k.com
Registered Module IDs: FQDN ACL Mgr,
FQDN: host2.9k.com
Registered Module IDs: FQDN ACL Mgr,
FQDN: host3.9k.com
Registered Module IDs: FQDN ACL Mgr,
FQDN: host4.9k.com
Registered Module IDs: FQDN ACL Mgr,
```

The following is a sample output from the **show fqdn database** command:

```
Device# show fqdn database

===== MAIN DB =====
FQDN Name: example.cisco.com
IP Address Type TTL
10.11.224.132 IPv4 313/370
```

```
10.11.112.150 IPv4 313/370
```

The following is a sample output from the **show fqdn packet statistics** command:

```
Device# show fqdn packet statistics

Total DNS Pkts Rcvd : 5
Total DNS Pkts Injected : 4
DNS Pkts Injected by Ack : 1
DNS Pkts with parse error : 0
DNS Pkts with no answer : 1
DNS Pkts with no A/AAAA Record : 0
DNS Pkts with FQDN not registered : 2
DNS Pkts with FQDN already cached : 0
Total DNS Pkts Dropped by Nack : 1
Average Input rate - 1 min : 0 pps
Average Input rate - 5 min : 0 pps

|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **show ip access-lists** command provides output identical to the **show access-lists** command, except that it is IP-specific and allows you to specify a particular access list.

The output of the **show ip access-lists interface** command does not display dACL or ACL filter IDs. This is because the ACLs are attached to the virtual ports created by multidomain authentication for each authentication session; instead of the physical interface. To display dACL or ACL filter IDs, use the **show ip access-lists access-list-name** command. The *access-list-name* should be taken from the **show access-session interface interface-name detail** command output. The *access-list-name* is case sensitive.

## Examples

The following is a sample output from the **show ip access-lists** command when all access lists are requested:

Device# **show ip access-lists**

```
Extended IP access list 101
  deny udp any any eq nntp
  permit tcp any any
  permit udp any any eq tftp
  permit icmp any any
  permit udp any any eq domain
Role-based IP access list r1
  10 permit tcp dst eq telnet
  20 permit udp
FQDN IP access list facl
  10 permit ip host 10.1.1.1 host dynamic www.google.com
  20 permit tcp 10.10.0.0 0.255.255.255 eq ftp host dynamic www.cisco.com log
  30 permit udp host dynamic www.youtube.com any
  40 permit ip 10.3.4.0 0.0.0.255 any
Extended Resolved IP access list facl
  200000 permit tcp 10.0.0.0 0.255.255.255 eq ftp host 10.10.10.1 log
  200001 permit tcp 10.0.0.0 0.255.255.255 eq ftp host 10.10.10.2 log
  300000 permit udp host dynamic 10.11.11.11 any
  300001 permit udp host dynamic 10.11.11.12 any
  400000 permit ip 10.3.4.0 0.0.0.255 any
```

The table below describes the significant fields shown in the display.

**Table 187: show ip access-lists Field Descriptions**

| Field                            | Description                            |
|----------------------------------|----------------------------------------|
| Extended IP access list          | Extended IP access-list name/number.   |
| Role-based IP access list        | Role-based IP access-list name.        |
| FQDN IP access list              | FQDN IP access-list name.              |
| Extended Resolved IP access list | Extended resolved IP access-list name. |
| deny                             | Packets to reject.                     |
| udp                              | User Datagram Protocol.                |
| any                              | Source host or destination host.       |
| eq                               | Packets on a given port number.        |
| nntp                             | Network News Transport Protocol.       |
| permit                           | Packets to forward.                    |
| dynamic                          | Dynamically resolves domain name.      |
| tcp                              | Transmission Control Protocol.         |
| tftp                             | Trivial File Transfer Protocol.        |
| icmp                             | Internet Control Message Protocol.     |
| domain                           | Domain name service.                   |

The following is a sample output from the **show ip access-lists** command when the name of a specific access list is requested:

```
Device# show ip access-lists Internetfilter

Extended IP access list Internetfilter
  permit tcp any 192.0.2.0 255.255.255.255 eq telnet
  deny tcp any any
  deny udp any 192.0.2.0 255.255.255.255 lt 1024
  deny ip any any log
```

The following is a sample output from the **show ip access-lists** command using the **dynamic** keyword:

```
Device# show ip access-lists dynamic CM_SF#1

Extended IP access list CM_SF#1
  10 permit udp any any eq 5060 (650 matches)
  20 permit tcp any any eq 5060
  30 permit udp any any dscp ef (806184 matches)
```

|----------------------------------|------------------------------------------------------------------------------|
| <b>deny</b>                      | Sets conditions in a named IP access list or OGACL that will deny packets.   |
| <b>ip access-group</b>           | Applies an ACL or OGACL to an interface or a service policy map.             |
| <b>ip access-list</b>            | Defines an IP access list or OGACL by name or number.                        |
| <b>object-group network</b>      | Defines network object groups for use in OGACLs.                             |
| <b>object-group service</b>      | Defines service object groups for use in OGACLs.                             |
| <b>permit</b>                    | Sets conditions in a named IP access list or OGACL that will permit packets. |
| <b>show object-group</b>         | Displays information about object groups that are configured.                |
| <b>show run interfaces cable</b> | Displays statistics on the cable modem.                                      |

# show ip dhcp snooping statistics

To display DHCP snooping statistics in summary or detail form, use the **show ip dhcp snooping statistics** command in user EXEC or privileged EXEC mode.

**show ip dhcp snooping statistics** [**detail** ]

| <b>Syntax Description</b>    | <b>detail</b> (Optional) Displays detailed statistics information.                                                                                    |         |              |                              |                              |

| Release                      | Modification                                                                                                                                          |         |              |                              |                              |
| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                          |         |              |                              |                              |
| <b>Usage Guidelines</b>      | In a device stack, all statistics are generated on the stack's active switch. If a new active device is elected, the statistics counters reset.       |         |              |                              |                              |

The following is sample output from the **show ip dhcp snooping statistics** command:

```
Device> show ip dhcp snooping statistics

Packets Forwarded                = 0
Packets Dropped                  = 0
Packets Dropped From untrusted ports = 0
```

The following is sample output from the **show ip dhcp snooping statistics detail** command:

```
Device> show ip dhcp snooping statistics detail

Packets Processed by DHCP Snooping          = 0
Packets Dropped Because
  IDB not known                             = 0
  Queue full                                = 0
  Interface is in errdisabled                 = 0
  Rate limit exceeded                        = 0
  Received on untrusted ports                 = 0
  Nonzero giaddr                             = 0
  Source mac not equal to chaddr              = 0
  Binding mismatch                           = 0
  Insertion of opt82 fail                     = 0
  Interface Down                             = 0
  Unknown output interface                   = 0
  Reply output port equal to input port       = 0
  Packet denied by platform                  = 0
```

This table shows the DHCP snooping statistics and their descriptions:

**Table 188: DHCP Snooping Statistics**

| DHCP Snooping Statistic               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Packets Processed by DHCP Snooping    | Total number of packets handled by DHCP snooping, including forwarded and dropped packets.                                                                                                                                                                                                                                                                                                                                                         |
| Packets Dropped Because IDB not known | Number of errors when the input interface of the packet cannot be determined.                                                                                                                                                                                                                                                                                                                                                                      |
| Queue full                            | Number of errors when an internal queue used to process the packets is full. This might happen if DHCP packets are received at an excessively high rate and rate limiting is not enabled on the ingress ports.                                                                                                                                                                                                                                     |
| Interface is in errdisabled           | Number of times a packet was received on a port that has been marked as error disabled. This might happen if packets are in the processing queue when a port is put into the error-disabled state and those packets are subsequently processed.                                                                                                                                                                                                    |
| Rate limit exceeded                   | Number of times the rate limit configured on the port was exceeded and the interface was put into the error-disabled state.                                                                                                                                                                                                                                                                                                                        |
| Received on untrusted ports           | Number of times a DHCP server packet (OFFER, ACK, NAK, or LEASEQUERY) was received on an untrusted port and was dropped.                                                                                                                                                                                                                                                                                                                           |
| Nonzero giaddr                        | Number of times the relay agent address field (giaddr) in the DHCP packet received on an untrusted port was not zero, or the <b>no ip dhcp snooping information option allow-untrusted</b> global configuration command is not configured and a packet received on an untrusted port contained option-82 data.                                                                                                                                     |
| Source mac not equal to chaddr        | Number of times the client MAC address field of the DHCP packet (chaddr) does not match the packet source MAC address and the <b>ip dhcp snooping verify mac-address</b> global configuration command is configured.                                                                                                                                                                                                                               |
| Binding mismatch                      | Number of times a RELEASE or DECLINE packet was received on a port that is different than the port in the binding for that MAC address-VLAN pair. This indicates someone might be trying to spoof the real client, or it could mean that the client has moved to another port on the device and issued a RELEASE or DECLINE. The MAC address is taken from the chaddr field of the DHCP packet, not the source MAC address in the Ethernet header. |
| Insertion of opt82 fail               | Number of times the option-82 insertion into a packet failed. The insertion might fail if the packet with the option-82 data exceeds the size of a single physical packet on the internet.                                                                                                                                                                                                                                                         |

| DHCP Snooping Statistic               | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Down                        | Number of times the packet is a reply to the DHCP relay agent, but the SVI interface for the relay agent is down. This is an unlikely error that occurs if the SVI goes down between sending the client request to the DHCP server and receiving the response.                                                                                                                                                                |
| Unknown output interface              | Number of times the output interface for a DHCP reply packet cannot be determined by either option-82 data or a lookup in the MAC address table. The packet is dropped. This can happen if option 82 is not used and the client MAC address has aged out. If IPSG is enabled with the port-security option and option 82 is not enabled, the MAC address of the client is not learned, and the reply packets will be dropped. |
| Reply output port equal to input port | Number of times the output port for a DHCP reply packet is the same as the input port, causing a possible loop. Indicates a possible network misconfiguration or misuse of trust settings on ports.                                                                                                                                                                                                                           |
| Packet denied by platform             | Number of times the packet has been denied by a platform-specific registry.                                                                                                                                                                                                                                                                                                                                                   |

# show platform software dns-umbrella statistics

To display the Domain Name System (DNS) umbrella statistics of a device, use the **show platform software dns-umbrella statistics** command in privileged EXEC mode.

## show platform software dns-umbrella statistics

### Syntax Description

This command has no arguments or keywords.

### Command Modes

Privileged EXEC (>)

### Command History

| Release                       | Modification                 |
|-------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

### Examples

The following is a sample output of the **show platform software dns-umbrella statistics** command:

```
Device> enable
Device# show platform software dns-umbrella statistics

=====
Umbrella Statistics
=====
Total Packets : 7848
DNSEncrypt queries : 3940
DNSEncrypt responses : 0
DNS queries : 0
DNS bypassed queries(Regex) : 0
DNS responses(Umbrella) : 0
DNS responses(Other) : 3906
Aged queries : 34
Dropped pkts : 0
```

# show platform software umbrella switch F0

To display umbrella configuration of Embedded Service Processor (ESP) slot 0, use the **show platform software umbrella switch** *{switch\_number | active | standby}* **F0** command in privileged EXEC mode.

**show platform software umbrella switch** *{switch\_number | active | standby}* **F0** *{config | interface-info | local-domain}*

## Syntax Description

**switch** *{switch\_number | active | standby}* Specifies the switch.

- *switch\_number*: ID of the switch. The range is from 1 to 8.
- **active**: Specifies the active switch.
- **standby**: Specifies the standby switch.

**config** Displays global configurations of ESP slot 0.

**interface-info** Displays interface-related configuration of ESP slot 0.

**local-domain** Displays local domain-related configuration of ESP slot 0.

## Command Modes

Privileged EXEC (>)

## Command History

### Release

Cisco IOS XE Amsterdam 17.1.1

### Modification

This command was introduced.

## Examples

The following is a sample output of the **show platform software umbrella switch active F0 config** command:

```
Device> show platform software umbrella switch active F0 config
```

```
+++ Umbrella Config +++
```

```
Umbrella feature:

# show radius server-group

To display properties for the RADIUS server group, use the **show radius server-group** command in user EXEC or privileged EXEC mode.

**show radius server-group** {*name* | **all**}

|                    |             |                                                                                                                                                    |
|--------------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <i>name</i> | Name of the server group. The character string used to name the group of servers must be defined using the <b>aaa group server radius</b> command. |
|                    | <b>all</b>  | Displays properties for all of the server groups.                                                                                                  |

|               |                     |
|---------------|---------------------|
| Command Modes | User EXEC (>)       |
|               | Privileged EXEC (#) |

|                 |                              |                              |
|-----------------|------------------------------|------------------------------|
| Command History | Release                      | Modification                 |
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Use the **show radius server-group** command to display the server groups that you defined by using the **aaa group server radius** command.

The following is sample output from the **show radius server-group all** command:

```
Device# show radius server-group all

Server group radius
  Sharecount = 1   sg_unconfigured = FALSE
  Type = standard  Memlocks = 1
```

This table describes the significant fields shown in the display.

**Table 189: show radius server-group command Field Descriptions**

| Field           | Description                                                                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Server group    | Name of the server group.                                                                                                                                                                                                       |
| Sharecount      | Number of method lists that are sharing this server group. For example, if one method list uses a particular server group, the sharecount would be 1. If two method lists use the same server group, the sharecount would be 2. |
| sg_unconfigured | Server group has been unconfigured.                                                                                                                                                                                             |

| Field    | Description                                                                                                                                                                                                                                                           |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type     | The type can be either standard or nonstandard. The type indicates whether the servers in the group accept nonstandard attributes. If all servers within the group are configured with the nonstandard option, the type will be shown as "nonstandard".               |
| Memlocks | An internal reference count for the server-group structure that is in memory. The number represents how many internal data structure packets or transactions are holding references to this server group. Memlocks is used internally for memory management purposes. |

# show storm-control

To display broadcast, multicast, or unicast storm control settings on the device or on the specified interface or to display storm-control history, use the **show storm-control** command in user EXEC or privileged EXEC mode.

**show storm-control** [{*interface-id*}] [{**broadcast** | **multicast** | **unicast**}]

## Syntax Description

|                     |                                                                                                                                     |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <i>interface-id</i> | (Optional) Interface ID for the physical port (including type, stack member for stacking-capable devices, module, and port number). |
| <b>broadcast</b>    | (Optional) Displays broadcast storm threshold setting.                                                                              |
| <b>multicast</b>    | (Optional) Displays multicast storm threshold setting.                                                                              |
| <b>unicast</b>      | (Optional) Displays unicast storm threshold setting.                                                                                |

## Command Modes

User EXEC (>)

Privileged EXEC (>)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

When you enter an interface ID, the storm control thresholds appear for the specified interface. If you do not enter an interface ID, settings appear for one traffic type for all ports on the device. If you do not enter a traffic type, settings appear for broadcast storm control.

The following is sample partial output from the **show storm-control** command when no keywords are entered. Because no traffic-type keyword was entered, the broadcast storm control settings appear.

```
Device> show storm-control
```

```
Interface Filter State  Upper      Lower      Current
-----
Gi1/0/1   Forwarding   20 pps     10 pps     5 pps
Gi1/0/2   Forwarding   50.00%     40.00%     0.00%
<output truncated>
```

The following is sample output from the **show storm-control** command for a specified interface. Because no traffic-type keyword was entered, the broadcast storm control settings appear.

```
Device> show storm-control gigabitethernet 1/0/1
```

```
Interface Filter State  Upper      Lower      Current
-----
Gi1/0/1   Forwarding   20 pps     10 pps     5 pps
```

The following table describes the fields in the show storm-control display:

**Table 190: show storm-control Field Descriptions**

| Field        | Description                                                                                                                                                                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface    | Displays the ID of the interface.                                                                                                                                                                                                                                           |
| Filter State | Displays the status of the filter: <ul style="list-style-type: none"><li>• Blocking—Storm control is enabled, and a storm has occurred.</li><li>• Forwarding—Storm control is enabled, and no storms have occurred.</li><li>• Inactive—Storm control is disabled.</li></ul> |
| Upper        | Displays the rising suppression level as a percentage of total available bandwidth in packets per second or in bits per second.                                                                                                                                             |
| Lower        | Displays the falling suppression level as a percentage of total available bandwidth in packets per second or in bits per second.                                                                                                                                            |
| Current      | Displays the bandwidth usage of broadcast traffic or the specified traffic type (broadcast, multicast, or unicast) as a percentage of total available bandwidth. This field is only valid when storm control is enabled.                                                    |

# show tech-support acl

To display access control list (ACL)-related information for technical support, use the **show tech-support acl** command in privileged EXEC mode.

## show tech-support acl

### Syntax Description

This command has no arguments or keywords.

### Command Modes

Privileged EXEC (#)

### Command History

| Release                        | Modification                 |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |
| Cisco IOS XE Gibraltar 16.11.1 |                              |

### Usage Guidelines

The output of the **show tech-support acl** command is very long. To better manage this output, you can redirect the output to an external file (for example, **show tech-support acl | redirect flash:show\_tech\_acl.txt**) in the local writable storage file system or remote file system.

The output of this command displays the following commands:

#### Note

On stackable platforms, these commands are executed on every switch in the stack. On modular platforms, like Catalyst 9400 Series Switches, these commands are run only on the active switch.

#### Note

The following list of commands is a sample of the commands available in the output; these may differ based on the platform.

- **show clock**
- **show version**
- **show running-config**
- **show module**
- **show interface**
- **show access-lists**
- **show logging**
- **show platform software fed switch *switch-number* acl counters hardware**
- **show platform software fed switch *switch-number* ifm mapping**
- **show platform hardware fed switch *switch-number* fwd-asic drops exceptions**
- **show platform software fed switch *switch-number* acl info**

- **show platform software fed switch *switch-number* acl**
- **show platform software fed switch *switch-number* acl usage**
- **show platform software fed switch *switch-number* acl policy intftype all cam**
- **show platform software fed switch *switch-number* acl cam brief**
- **show platform software fed switch *switch-number* acl policy intftype all vcu**
- **show platform hardware fed switch *switch-number* acl resource usage**
- **show platform hardware fed switch *switch-number* fwd-asic resource tcam table acl**
- **show platform hardware fed switch *switch-number* fwd-asic resource tcam utilization**
- **show platform software fed switch *switch-number* acl counters hardware**
- **show platform software classification switch *switch-number* all F0 class-group-manager class-group**
- **show platform software process database forwarding-manager switch *switch-number* R0 summary**
- **show platform software process database forwarding-manager switch *switch-number* F0 summary**
- **show platform software object-manager switch *switch-number* F0 pending-ack-update**
- **show platform software object-manager switch *switch-number* F0 pending-issue-update**
- **show platform software object-manager switch *switch-number* F0 error-object**
- **show platform software peer forwarding-manager switch *switch-number* F0**
- **show platform software access-list switch *switch-number* f0 statistics**
- **show platform software access-list switch *switch-number* r0 statistics**
- **show platform software trace message fed switch *switch-number***
- **show platform software trace message forwarding-manager switch *switch-number* F0**
- **show platform software trace message forwarding-manager switch R0 *switch-number* R0**

# show tech-support identity

To display identity/802.1x-related information for technical support, use the **show tech-support identity** command in privileged EXEC mode.

**show tech-support identity mac** *mac-address* **interface** *interface-name*

|                    |                                        |                                                    |
|--------------------|----------------------------------------|----------------------------------------------------|
| Syntax Description | <b>mac</b> <i>mac-address</i>          | Displays information about the client MAC address. |
|                    | <b>interface</b> <i>interface-name</i> | Displays information about the client interface.   |

|               |                     |
|---------------|---------------------|
| Command Modes | Privileged EXEC (#) |
|---------------|---------------------|

| Command History | Release                        | Modification                 |
|-----------------|--------------------------------|------------------------------|
|                 | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |
|                 | Cisco IOS XE Gibraltar 16.11.1 |                              |

**Usage Guidelines**

The output of the **show tech-support platform** command is very long. To better manage this output, you can redirect the output to an external file (for example, **show tech-support identity mac** *mac-address* **interface** *interface-name* | **redirect flash:filename**) in the local writable storage file system or remote file system.

The output of this command displays the following commands:

- **show clock**
- **show module**
- **show version**
- **show switch**
- **show redundancy**
- **show dot1x statistics**
- **show ip access-lists**
- **show interface**
- **show ip interface brief**
- **show vlan brief**
- **show running-config**
- **show logging**
- **show interface controller**
- **show platform authentication sbinf** interface

- show platform host-access-table
- show platform pm port-data
- show spanning-tree interface
- show access-session mac detail
- show platform authentication session mac

# show umbrella

To display the Cisco Umbrella Integration feature-related configuration, use the **show umbrella** command in user EXEC or privileged EXEC mode.

**show umbrella** { **config** | **deviceid** [**detailed**] | **dnscrypt** }

## Syntax Description

|                 |                                               |
|-----------------|-----------------------------------------------|
| <b>config</b>   | Displays global configurations of the device. |
| <b>deviceid</b> | Displays device registration details.         |
| <b>dnscrypt</b> | Displays DNSCrypt-related configurations.     |

## Command Modes

User EXEC (>)  
Privileged EXEC (>)

## Command History

| Release                       | Modification                 |
|-------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

## Examples

The following is a sample output of the **show umbrella config** command:

```
Device> show umbrella config
```

```
Umbrella Configuration
```

```
=====
```

```
Token: 0C6ED7E376DD4D2E04492CE7EDFF1A7C00250986
API-KEY: NONE
OrganizationID: 2427270
Local Domain Regex parameter-map name: NONE
DNSCrypt: Enabled
Public-key: B735:1140:206F:225D:3E2B:D822:D7FD:691E:A1C3:3CC8:D666:8D0C:BE04:BFAB:CA43:FB79
```

```
UDP Timeout: 5 seconds
```

```
Resolver address:
```

1. 208.67.220.220
2. 208.67.222.222
3. 2620:119:53::53
4. 2620:119:35::35

```
Umbrella Interface Config:
```

```
Number of interfaces with "umbrella out" config: 1
```

1. GigabitEthernet1/0/48
  - Mode : OUT
  - VRF : global(Id: 0)

```
Number of interfaces with "umbrella in" config: 1
```

1. GigabitEthernet1/0/1
  - Mode : IN
  - DCA : Disabled
  - Tag : test
  - Device-id : 010a2c41b8ab019c
  - VRF : global(Id: 0)

```
Configured Umbrella Parameter-maps:
```

1. global

The following is a sample output of the **show umbrella deviceid detailed** command:

```
Device> show umbrella deviceid detailed
```

```
Device registration details
 1.GigabitEthernet1/0/2
   Tag                : guest
   Device-id          : 010a6aef0b443f0f
   Description        : Device Id received successfully
   WAN interface      : GigabitEthernet1/0/1
   WAN VRF used       : global(Id: 0)
```

The following is a sample output of the **show umbrella dnscrypt** command:

```
Device> show umbrella dnscrypt
```

```
DNSCrypt: Enabled
Public-key: B735:1140:206F:225D:3E2B:D822:D7FD:691E:A1C3:3CC8:D666:8D0C:BE04:BFAB:CA43:FB79

# show vlan access-map

To display information about a particular VLAN access map or for all VLAN access maps, use the **show vlan access-map** command in privileged EXEC mode.

**show vlan access-map** [*map-name*]

|                           |                                                                |
|---------------------------|----------------------------------------------------------------|
| <b>Syntax Description</b> | <i>map-name</i> (Optional) Name of a specific VLAN access map. |
|---------------------------|----------------------------------------------------------------|

|                      |                     |
|----------------------|---------------------|
| <b>Command Modes</b> | Privileged EXEC (#) |
|----------------------|---------------------|

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

The following is sample output from the **show vlan access-map** command:

```
Device# show vlan access-map

Vlan access-map "vmap4" 10
  Match clauses:
    ip address: a12
  Action:
    forward
Vlan access-map "vmap4" 20
  Match clauses:
    ip address: a12
  Action:
    forward
```

# show vlan filter

To display information about all VLAN filters or about a particular VLAN or VLAN access map, use the **show vlan filter** command in privileged EXEC mode.

**show vlan filter** {**access-map** *name* | **vlan** *vlan-id*}

|                           |                               |                                                                                           |
|---------------------------|-------------------------------|-------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>access-map</b> <i>name</i> | (Optional) Displays filtering information for the specified VLAN access map.              |
|                           | <b>vlan</b> <i>vlan-id</i>    | (Optional) Displays filtering information for the specified VLAN. The range is 1 to 4094. |
| <b>Command Modes</b>      | Privileged EXEC (#)           |                                                                                           |
| <b>Command History</b>    | <b>Release</b>                | <b>Modification</b>                                                                       |
|                           | Cisco IOS XE Everest 16.5.1a  | This command was introduced.                                                              |

## Examples

The following is sample output from the **show vlan filter** command:

```
Device# show vlan filter
```

```
VLAN Map map_1 is filtering VLANs:
 20-22
```

# show vlan group

To display the VLANs that are mapped to VLAN groups, use the **show vlan group** command in privileged EXEC mode.

```
show vlan group [{group-name vlan-group-name [user_count]}]
```

|                    |                                                                                                                                                                                                                                                       |                                                                                        |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| Syntax Description | <b>group-name</b> <i>vlan-group-name</i>                                                                                                                                                                                                              | (Optional) Displays the VLANs mapped to the specified VLAN group.                      |
|                    | <b>user_count</b>                                                                                                                                                                                                                                     | (Optional) Displays the number of users in each VLAN mapped to a specified VLAN group. |
| Command Modes      | Privileged EXEC (#)                                                                                                                                                                                                                                   |                                                                                        |
| Command History    | <b>Release</b>                                                                                                                                                                                                                                        | <b>Modification</b>                                                                    |
|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                          | This command was introduced.                                                           |
| Usage Guidelines   | The <b>show vlan group</b> command displays the existing VLAN groups and lists the VLANs and VLAN ranges that are members of each VLAN group. If you enter the <b>group-name</b> keyword, only the members of the specified VLAN group are displayed. |                                                                                        |

## Examples

This example shows how to display the members of a specified VLAN group:

```
Device# show vlan group group-name group2
vlan group group1 :40-45
```

This example shows how to display number of users in each of the VLANs in a group:

```
Device# show vlan group group-name group2 user_count
```

```

VLAN      : Count
-----
40         : 5
41         : 8
42         : 12
43         : 2
44         : 9
45         : 0
```

## ssci-based-on-sci

To compute the Short Secure Channel Identifier (SSCI) value based on the Secure Channel Identifier (SCI) value, use the **ssci-based-on-sci** command in MKA-policy configuration mode. To disable SSCI computation based on SCI, use the **no** form of this command.

**ssci-based-on-sci**  
**no ssci-based-on-sci**

**Syntax Description** This command has no arguments or keywords.

**Command Default** SSCI value computation based on SCI value is disabled.

**Command Modes** MKA-policy configuration (config-mka-policy)

**Command History**

| Release                        | Modification                 |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.12.3 | This command was introduced. |

**Usage Guidelines** The higher the SCI value, the lower is the SSCI value.

**Examples**

The following example shows how to enable the SSCI computation based on SCI:

```
Device> enable
Device# configure terminal
Device(config)# mka policy 2
Device(config-mka-policy)# ssci-based-on-sci
```

**Related Commands**

| Command                          | Description                                                    |
|----------------------------------|----------------------------------------------------------------|
| <b>mka policy</b>                | Configures an MKA policy.                                      |
| <b>confidentiality-offset</b>    | Sets the confidentiality offset for MACsec operations.         |
| <b>delay-protection</b>          | Configures MKA to use delay protection in sending MKPDU.       |
| <b>include-icv-indicator</b>     | Includes ICV indicator in MKPDU.                               |
| <b>key-server</b>                | Configures MKA key-server options.                             |
| <b>macsec-cipher-suite</b>       | Configures cipher suite for deriving SAK.                      |
| <b>sak-rekey</b>                 | Configures the SAK rekey interval.                             |
| <b>send-secure-announcements</b> | Configures MKA to send secure announcements in sending MKPDUs. |
| <b>use-updated-eth-header</b>    | Uses the updated Ethernet header for ICV calculation.          |

## storm-control

To enable broadcast, multicast, or unicast storm control and to set threshold levels on an interface, use the **storm-control** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

```
storm-control {action {shutdown | trap} | {broadcast | multicast | unicast | unknown-unicast} level
{level [level-low] | bps bps [bps-low] | pps pps [pps-low]}}
no storm-control {action {shutdown | trap} | {broadcast | multicast | unicast | unknown-unicast}
level}
```

| Syntax Description     |  |                                                                                                                                                                                                                                                                     |
|------------------------|--|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>action</b>          |  | Specifies the action taken when a storm occurs on a port. The default action is to filter traffic and to not send an Simple Network Management Protocol (SNMP) trap.                                                                                                |
| <b>shutdown</b>        |  | Disables the port during a storm.                                                                                                                                                                                                                                   |
| <b>trap</b>            |  | Sends an SNMP trap when a storm occurs.                                                                                                                                                                                                                             |
| <b>broadcast</b>       |  | Enables broadcast storm control on the interface.                                                                                                                                                                                                                   |
| <b>multicast</b>       |  | Enables multicast storm control on the interface.                                                                                                                                                                                                                   |
| <b>unicast</b>         |  | Enables unicast storm control on the interface.                                                                                                                                                                                                                     |
| <b>unknown-unicast</b> |  | Enables unknown unicast storm control on an interface.                                                                                                                                                                                                              |
| <b>level</b>           |  | Specifies the rising and falling suppression levels as a percentage of total bandwidth of the port.                                                                                                                                                                 |
| <i>level</i>           |  | Rising suppression level, up to two decimal places. The range is 0.00 to 100.00. Block the flooding of storm packets when the value specified for level is reached.                                                                                                 |
| <i>level-low</i>       |  | (Optional) Falling suppression level, up to two decimal places. The range is 0.00 to 100.00. This value must be less than or equal to the rising suppression value. If you do not configure a falling suppression level, it is set to the rising suppression level. |
| <b>level bps</b>       |  | Specifies the rising and falling suppression levels as a rate in bits per second at which traffic is received on the port.                                                                                                                                          |
| <i>bps</i>             |  | Rising suppression level, up to 1 decimal place. The range is 0.0 to 10000000000.0. Block the flooding of storm packets when the value specified for bps is reached.<br><br>You can use metric suffixes such as k, m, and g for large number thresholds.            |
| <i>bps-low</i>         |  | (Optional) Falling suppression level, up to 1 decimal place. The range is 0.0 to 10000000000.0. This value must be equal to or less than the rising suppression value.<br><br>You can use metric suffixes such as k, m, and g for large number thresholds.          |
| <b>level pps</b>       |  | Specifies the rising and falling suppression levels as a rate in packets per second at which traffic is received on the port.                                                                                                                                       |

|                |                                                                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>pps</i>     | Rising suppression level, up to 1 decimal place. The range is 0.0 to 10000000000.0. Block the flooding of storm packets when the value specified for pps is reached.<br><br>You can use metric suffixes such as k, m, and g for large number thresholds.   |
| <i>pps-low</i> | (Optional) Falling suppression level, up to 1 decimal place. The range is 0.0 to 10000000000.0. This value must be equal to or less than the rising suppression value.<br><br>You can use metric suffixes such as k, m, and g for large number thresholds. |

**Command Default**

Broadcast, multicast, and unicast storm control are disabled.  
The default action is to filter traffic and to not send an SNMP trap.

**Command Modes**

Interface configuration (config-if)

**Command History**

| Release                        | Modification                                                             |
|--------------------------------|--------------------------------------------------------------------------|
| Cisco IOS XE Everest 16.5.1a   | This command was introduced.                                             |
| Cisco IOS XE Gibraltar 16.11.1 | This command was modified. The <b>unknown-unicast</b> keyword was added. |

**Usage Guidelines**

The storm-control suppression level can be entered as a percentage of total bandwidth of the port, as a rate in packets per second at which traffic is received, or as a rate in bits per second at which traffic is received.

When specified as a percentage of total bandwidth, a suppression value of 100 percent means that no limit is placed on the specified traffic type. A value of **level 0 0** means that all broadcast, multicast, or unicast traffic on that port is blocked. Storm control is enabled only when the rising suppression level is less than 100 percent. If no other storm-control configuration is specified, the default action is to filter the traffic causing the storm and to send no SNMP traps.

**Note**

When the storm control threshold for multicast traffic is reached, all multicast traffic except control traffic, such as bridge protocol data unit (BDPU) and Cisco Discovery Protocol (CDP) frames, are blocked. However, the device does not differentiate between routing updates, such as Open Shortest Path First (OSPF) and regular multicast data traffic, so both types of traffic are blocked.

The **trap** and **shutdown** options are independent of each other.

If you configure the action to be taken as shutdown (the port is error-disabled during a storm) when a packet storm is detected, you must use the **no shutdown** interface configuration command to bring the interface out of this state. If you do not specify the **shutdown** action, specify the action as **trap** (the device generates a trap when a storm is detected).

When a storm occurs and the action is to filter traffic, if the falling suppression level is not specified, the device blocks all traffic until the traffic rate drops below the rising suppression level. If the falling suppression level is specified, the device blocks traffic until the traffic rate drops below this level.

**Note** Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.

When a broadcast storm occurs and the action is to filter traffic, the device blocks only broadcast traffic.

For more information, see the software configuration guide for this release.

This example shows how to enable broadcast storm control with a 75.5-percent rising suppression level:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 1/0/1
Device(config-if)# storm-control broadcast level 75.5
Device(config-if)# end
```

This example shows how to enable unicast storm control on a port with a 87-percent rising suppression level and a 65-percent falling suppression level:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 1/0/1
Device(config-if)# storm-control unicast level 87 65
Device(config-if)# end
```

This example shows how to enable multicast storm control on a port with a 2000-packets-per-second rising suppression level and a 1000-packets-per-second falling suppression level:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 1/0/1
Device(config-if)# storm-control multicast level pps 2k 1k
Device(config-if)# end
```

This example shows how to enable the **shutdown** action on a port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 1/0/1
Device(config-if)# storm-control action shutdown
Device(config-if)# end
```

You can verify your settings by entering the **show storm-control** command.

# switchport port-security aging

To set the aging time and type for secure address entries or to change the aging behavior for secure addresses on a particular port, use the **switchport port-security aging** command in interface configuration mode. To disable port security aging or to set the parameters to their default states, use the **no** form of this command.

**switchport port-security aging** {static | time *time* | type {absolute | inactivity}}  
**no switchport port-security aging** {static | time | type}

## Syntax Description

|                            |                                                                                                                                                                          |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>static</b>              | Enables aging for statically configured secure addresses on this port.                                                                                                   |
| <b>time</b><br><i>time</i> | Specifies the aging time for this port. The range is 0 to 1440 minutes. If the time is 0, aging is disabled for this port.                                               |
| <b>type</b>                | Sets the aging type.                                                                                                                                                     |
| <b>absolute</b>            | Sets absolute aging type. All the secure addresses on this port age out exactly after the time (minutes) specified and are removed from the secure address list.         |
| <b>inactivity</b>          | Sets the inactivity aging type. The secure addresses on this port age out only if there is no data traffic from the secure source address for the specified time period. |

## Command Default

The port security aging feature is disabled. The default time is 0 minutes.  
 The default aging type is absolute.  
 The default static aging behavior is disabled.

## Command Modes

Interface configuration (config-if)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

To enable secure address aging for a particular port, set the aging time to a value other than 0 for that port.

To allow limited time access to particular secure addresses, set the aging type as **absolute**. When the aging time lapses, the secure addresses are deleted.

To allow continuous access to a limited number of secure addresses, set the aging type as **inactivity**. This removes the secure address when it become inactive, and other addresses can become secure.

To allow unlimited access to a secure address, configure it as a secure address, and disable aging for the statically configured secure address by using the **no switchport port-security aging static** interface configuration command.

This example sets the aging time as 2 hours for absolute aging for all the secure addresses on the port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# switchport port-security aging time 120
```

```
Device(config-if)# end
```

This example sets the aging time as 2 minutes for inactivity aging type with aging enabled for configured secure addresses on the port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport port-security aging time 2
Device(config-if)# switchport port-security aging type inactivity
Device(config-if)# switchport port-security aging static
Device(config-if)# end
```

This example shows how to disable aging for configured secure addresses:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# no switchport port-security aging static
Device(config-if)# end
```

# switchport port-security mac-address

To configure secure MAC addresses or sticky MAC address learning, use the **switchport port-security mac-address** interface configuration command. To return to the default setting, use the **no** form of this command.

**switchport port-security mac-address** {*mac-address* [{**vlan** {*vlan-id* {**access** | **voice**}}]} | **sticky** [{*mac-address* | **vlan** {*vlan-id* {**access** | **voice**}}]}]  
**no switchport port-security mac-address** {*mac-address* [{**vlan** {*vlan-id* {**access** | **voice**}}]} | **sticky** [{*mac-address* | **vlan** {*vlan-id* {**access** | **voice**}}]}]

## Syntax Description

|                            |                                                                                                                                                                                                                                                |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mac-address</b>         | A secure MAC address for the interface by entering a 48-bit MAC address. You can add additional secure MAC addresses up to the maximum value configured.                                                                                       |
| <b>vlan</b> <i>vlan-id</i> | (Optional) On a trunk port only, specifies the VLAN ID and the MAC address. If no VLAN ID is specified, the native VLAN is used.                                                                                                               |
| <b>vlan access</b>         | (Optional) On an access port only, specifies the VLAN as an access VLAN.                                                                                                                                                                       |
| <b>vlan voice</b>          | (Optional) On an access port only, specifies the VLAN as a voice VLAN.<br><br><b>Note</b> The <b>voice</b> keyword is available only if voice VLAN is configured on a port and if that port is not the access VLAN.                            |
| <b>sticky</b>              | Enables the interface for sticky learning. When sticky learning is enabled, the interface adds all secure MAC addresses that are dynamically learned to the running configuration and converts these addresses to sticky secure MAC addresses. |
| <i>mac-address</i>         | (Optional) A MAC address to specify a sticky secure MAC address.                                                                                                                                                                               |

## Command Default

No secure MAC addresses are configured.  
Sticky learning is disabled.

## Command Modes

Interface configuration (config-if)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

A secure port has the following limitations:

- A secure port can be an access port or a trunk port; it cannot be a dynamic access port.
- A secure port cannot be a routed port.
- A secure port cannot be a protected port.
- A secure port cannot be a destination port for Switched Port Analyzer (SPAN).
- A secure port cannot belong to a Gigabit or 10-Gigabit EtherChannel port group.

- You cannot configure static secure or sticky secure MAC addresses in the voice VLAN.
- When you enable port security on an interface that is also configured with a voice VLAN, set the maximum allowed secure addresses on the port to two. When the port is connected to a Cisco IP phone, the IP phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but is not learned on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure enough secure addresses to allow one for each PC and one for the Cisco IP phone.
- Voice VLAN is supported only on access ports and not on trunk ports.

Sticky secure MAC addresses have these characteristics:

- When you enable sticky learning on an interface by using the **switchport port-security mac-address sticky** interface configuration command, the interface converts all the dynamic secure MAC addresses, including those that were dynamically learned before sticky learning was enabled, to sticky secure MAC addresses and adds all sticky secure MAC addresses to the running configuration.
- If you disable sticky learning by using the **no switchport port-security mac-address sticky** interface configuration command or the running configuration is removed, the sticky secure MAC addresses remain part of the running configuration but are removed from the address table. The addresses that were removed can be dynamically reconfigured and added to the address table as dynamic addresses.
- When you configure sticky secure MAC addresses by using the **switchport port-security mac-address sticky mac-address** interface configuration command, these addresses are added to the address table and the running configuration. If port security is disabled, the sticky secure MAC addresses remain in the running configuration.
- If you save the sticky secure MAC addresses in the configuration file, when the device restarts or the interface shuts down, the interface does not need to relearn these addresses. If you do not save the sticky secure addresses, they are lost. If sticky learning is disabled, the sticky secure MAC addresses are converted to dynamic secure addresses and are removed from the running configuration.
- If you disable sticky learning and enter the **switchport port-security mac-address sticky mac-address** interface configuration command, an error message appears, and the sticky secure MAC address is not added to the running configuration.

You can verify your settings by using the **show port-security** command.

This example shows how to configure a secure MAC address and a VLAN ID on a port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/2
Device(config-if)# switchport mode trunk
Device(config-if)# switchport port-security
Device(config-if)# switchport port-security mac-address 1000.2000.3000 vlan 3
Device(config-if)# end
```

This example shows how to enable sticky learning and to enter two sticky secure MAC addresses on a port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/2
Device(config-if)# switchport port-security mac-address sticky
Device(config-if)# switchport port-security mac-address sticky 0000.0000.4141
```

```
Device(config-if)# switchport port-security mac-address sticky 0000.0000.000f  
Device(config-if)# end
```

# switchport port-security maximum

To configure the maximum number of secure MAC addresses, use the **switchport port-security maximum** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

**switchport port-security maximum** *value* [**vlan** [{*vlan-list* | [{**access** | **voice**}]}]]  
**no switchport port-security maximum** *value* [**vlan** [{*vlan-list* | [{**access** | **voice**}]}]]

## Syntax Description

|                  |                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>value</b>     | Sets the maximum number of secure MAC addresses for the interface.<br><br>The default setting is 1.                                                                            |
| <b>vlan</b>      | (Optional) For trunk ports, sets the maximum number of secure MAC addresses on a VLAN or range of VLANs. If the <b>vlan</b> keyword is not entered, the default value is used. |
| <b>vlan-list</b> | (Optional) Range of VLANs separated by a hyphen or a series of VLANs separated by commas. For nonspecified VLANs, the per-VLAN maximum value is used.                          |
| <b>access</b>    | (Optional) On an access port only, specifies the VLAN as an access VLAN.                                                                                                       |
| <b>voice</b>     | (Optional) On an access port only, specifies the VLAN as a voice VLAN.                                                                                                         |
| <b>Note</b>      | The <b>voice</b> keyword is available only if voice VLAN is configured on a port and if that port is not the access VLAN.                                                      |

## Command Default

When port security is enabled and no keywords are entered, the default maximum number of secure MAC addresses is 1.

## Command Modes

Interface configuration (config-if)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The maximum number of secure MAC addresses that you can configure on a device is set by the maximum number of available MAC addresses allowed in the system. This number is determined by the active Switch Database Management (SDM) template. See the **sdm prefer** command. This number represents the total of available MAC addresses, including those used for other Layer 2 functions and any other secure MAC addresses configured on interfaces.

A secure port has the following limitations:

- A secure port can be an access port or a trunk port; it cannot be a dynamic access port.
- A secure port cannot be a routed port.
- A secure port cannot be a protected port.
- A secure port cannot be a destination port for Switched Port Analyzer (SPAN).
- A secure port cannot belong to a Fast EtherChannel or Gigabit EtherChannel or 10-Gigabit EtherChannel port group.

- When you enable port security on an interface that is also configured with a voice VLAN, set the maximum allowed secure addresses on the port to two. When the port is connected to a Cisco IP phone, the IP phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but is not learned on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure enough secure addresses to allow one for each PC and one for the Cisco IP phone.

Voice VLAN is supported only on access ports and not on trunk ports.

- When you enter a maximum secure address value for an interface, if the new value is greater than the previous value, the new value overrides the previously configured value. If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.

Setting a maximum number of addresses to one and configuring the MAC address of an attached device ensures that the device has the full bandwidth of the port.

When you enter a maximum secure address value for an interface, this occurs:

- If the new value is greater than the previous value, the new value overrides the previously configured value.
- If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.

You can verify your settings by using the **show port-security** command.

This example shows how to enable port security on a port and to set the maximum number of secure addresses to 5. The violation mode is the default, and no secure MAC addresses are configured.

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/2
Device(config-if)# switchport mode access
Device(config-if)# switchport port-security
Device(config-if)# switchport port-security maximum 5
Device(config-if)# end
```

# switchport port-security violation

To configure secure MAC address violation mode or the action to be taken if port security is violated, use the **switchport port-security violation** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

**switchport port-security violation** {protect | restrict | shutdown | shutdown vlan}  
**no switchport port-security violation** {protect | restrict | shutdown | shutdown vlan}

| <b>Syntax Description</b>    | <table> <tr> <td><b>protect</b></td><td>Sets the security violation protect mode.</td></tr> <tr> <td><b>restrict</b></td><td>Sets the security violation restrict mode.</td></tr> <tr> <td><b>shutdown</b></td><td>Sets the security violation shutdown mode.</td></tr> <tr> <td><b>shutdown vlan</b></td><td>Sets the security violation mode to per-VLAN shutdown.</td></tr> </table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>protect</b> | Sets the security violation protect mode. | <b>restrict</b>              | Sets the security violation restrict mode. | <b>shutdown</b> | Sets the security violation shutdown mode. | <b>shutdown vlan</b> | Sets the security violation mode to per-VLAN shutdown. |

| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                |                                           |                              |                                            |                 |                                            |                      |                                                        |
| <b>Usage Guidelines</b>      | <p>In the security violation protect mode, when the number of port secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. You are not notified that a security violation has occurred.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                |                                           |                              |                                            |                 |                                            |                      |                                                        |
| <b>Note</b>                  | <p>We do not recommend configuring the protect mode on a trunk port. The protect mode disables learning when any VLAN reaches its maximum limit, even if the port has not reached its maximum limit.</p> <p>In the security violation restrict mode, when the number of secure MAC addresses reaches the limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses or increase the number of maximum allowable addresses. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.</p> <p>In the security violation shutdown mode, the interface is error-disabled when a violation occurs and the port LED turns off. An SNMP trap is sent, a syslog message is logged, and the violation counter increments. When a secure port is in the error-disabled state, you can bring it out of this state by entering the <b>errdisable recovery cause psecure-violation</b> global configuration command, or you can manually re-enable it by entering the <b>shutdown</b> and <b>no shutdown</b> interface configuration commands.</p> <p>When the security violation mode is set to per-VLAN shutdown, only the VLAN on which the violation occurred is error-disabled.</p> |                |                                           |                              |                                            |                 |                                            |                      |                                                        |

A secure port has the following limitations:

- A secure port can be an access port or a trunk port; it cannot be a dynamic access port.
- A secure port cannot be a routed port.
- A secure port cannot be a protected port.
- A secure port cannot be a destination port for Switched Port Analyzer (SPAN).
- A secure port cannot belong to a Fast EtherChannel or Gigabit EtherChannel or 10-Gigabit EtherChannel port group.

A security violation occurs when the maximum number of secure MAC addresses are in the address table and a station whose MAC address is not in the address table attempts to access the interface or when a station whose MAC address is configured as a secure MAC address on another secure port attempts to access the interface.

When a secure port is in the error-disabled state, you can bring it out of this state by entering the **errdisable recovery cause psecure-violation** global configuration command. You can manually re-enable the port by entering the **shutdown** and **no shutdown** interface configuration commands or by using the **clear errdisable interface** privileged EXEC command.

You can verify your settings by using the **show port-security** privileged EXEC command.

This example shows how to configure a port to shut down only the VLAN if a MAC security violation occurs:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet2/0/2
Device(config)# switchport port-security violation shutdown vlan
Device(config)# exit
```

## tacacs server

To configure the TACACS+ server for IPv6 or IPv4 and enter TACACS+ server configuration mode, use the **tacacs server** command in global configuration mode. To remove the configuration, use the **no** form of this command.

**tacacs server** *name*  
**no tacacs server**

### Syntax Description

|             |                                          |
|-------------|------------------------------------------|
| <i>name</i> | Name of the private TACACS+ server host. |
|-------------|------------------------------------------|

### Command Default

No TACACS+ server is configured.

### Command Modes

Global configuration (config)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

The **tacacs server** command configures the TACACS server using the *name* argument and enters TACACS+ server configuration mode. The configuration is applied once you have finished configuration and exited TACACS+ server configuration mode.

### Examples

The following example shows how to configure the TACACS server using the name `server1` and enter TACACS+ server configuration mode to perform further configuration:

```
Device> enable
Device# configure terminal
Device(config)# tacacs server server1
Device(config-server-tacacs)# end
```

### Related Commands

| Command                            | Description                                                                             |
|------------------------------------|-----------------------------------------------------------------------------------------|
| <b>address ipv6 (TACACS+)</b>      | Configures the IPv6 address of the TACACS+ server.                                      |
| <b>key (TACACS+)</b>               | Configures the per-server encryption key on the TACACS+ server.                         |
| <b>port (TACACS+)</b>              | Specifies the TCP port to be used for TACACS+ connections.                              |
| <b>send-nat-address (TACACS+)</b>  | Sends a client's post-NAT address to the TACACS+ server.                                |
| <b>single-connection (TACACS+)</b> | Enables all TACACS packets to be sent to the same server using a single TCP connection. |
| <b>timeout(TACACS+)</b>            | Configures the time to wait for a reply from the specified TACACS server.               |

# tls

To configure Transport Layer Security (TLS) parameters, use the **tls** command in radius server configuration mode. To return to the default setting, use the **no** form of this command.

```
tls [{ connectiontimeout connection-timeout-value | idletimeout idle-timeout-value | [{ ip | ipv6 }] {
radius source-interface interface-name | vrf forwarding forwarding-table-name } | match-server-identity
{ email-address email-address | hostname hostname | ip-address ip-address } | port port-number |
retries number-of-connection-retries | trustpoint { client trustpoint name | server trustpoint name } }]
```

**no** **tls**

## Syntax Description

|                                                                                                                                                     |                                                                          |
|-----------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| <b>connectiontimeout</b> <i>connection-timeout-value</i>                                                                                            | (Optional) Configures the DTLS connection timeout value.                 |
| <b>idletimeout</b> <i>idle-timeout-value</i>                                                                                                        | (Optional) Configures the DTLS idle timeout value.                       |
| [ <b>ip</b>   <b>ipv6</b> ] { <b>radius source-interface</b> <i>interface-name</i>   <b>vrf forwarding</b> <i>forwarding-table-name</i> }           | (Optional) Configures IP or IPv6 source parameters.                      |
| <b>match-server-identity</b> { <b>email-address</b> <i>email-address</i>   <b>hostname</b> <i>host-name</i>   <b>ip-address</b> <i>ip-address</i> } | Configures RadSec certification validation parameters.                   |
| <b>port</b> <i>port-number</i>                                                                                                                      | (Optional) Configures the DTLS port number.                              |
| <b>retries</b> <i>number-of-connection-retries</i>                                                                                                  | (Optional) Configures the number of DTLS connection retries.             |
| <b>trustpoint</b> { <b>client</b> <i>trustpoint name</i>   <b>server</b> <i>trustpoint name</i> }                                                   | (Optional) Configures the DTLS trustpoint for the client and the server. |

## Command Default

- The default value of TLS connection timeout is 5 seconds.
- The default value of TLS idle timeout is 60 seconds.
- The default TLS port number is 2083.
- The default value of TLS connection retries is 5.

## Command Modes

Radius server configuration mode (config-radius-server)

## Command History

| Release                        | Modification                                             |
|--------------------------------|----------------------------------------------------------|
| Cisco IOS XE Fuji 16.9.1       | This command was introduced.                             |
| Cisco IOS XE Gibraltar 16.10.1 | The <b>match-server-identity</b> keyword was introduced. |
| Cisco IOS XE Amsterdam 17.1.1  | The <b>ipv6</b> keyword was introduced.                  |

### Usage Guidelines

We recommended that you use the same server type, either only TLS or only Datagram Transport Layer Security (DTLS), under a authentication, authorization, and accounting (AAA) server group.

### Examples

The following example shows how to configure the TLS idle timeout value to 5 seconds:

```
Device> enable
Device# configure terminal
Device(config)# radius server R1
Device(config-radius-server)# tls idletimeout 5
Device(config-radius-server)# end
```

|------------------------------------------|-------------------------------------------------|
| <b>show aaa servers</b>                  | Displays information related to the TLS server. |
| <b>clear aaa counters servers radius</b> | Clears the RADIUS TLS-specific statistics.      |
| <b>debug radius radsec</b>               | Enables RADIUS TLS-specific debugs.             |

# token (Parameter Map)

To configure the application programming interface (API) key used for authorization during device registration, use the **token** command in parameter-map type inspect configuration mode. To remove the unique identifier, use the **no** form of this command.

**token** *value*  
**no token**

|                           |                                                                                                                                                                                                                                                        |                                                          |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Syntax Description</b> | <i>value</i><br>The API token. You can obtain this from the Cisco Umbrella registration server.                                                                                                                                                        |                                                          |
| <b>Command Default</b>    | No token is created for the parameter map.                                                                                                                                                                                                             |                                                          |
| <b>Command Modes</b>      | Parameter-map type inspect configuration (config-profile)                                                                                                                                                                                              |                                                          |

|                           | Cisco IOS XE Amsterdam 17.1.1                                                                                                                                                                                                                          | This command was introduced.                             |
| <b>Usage Guidelines</b>   | The <b>token</b> command is a mandatory configuration for the <b>umbrella in</b> and <b>umbrella out</b> commands.                                                                                                                                     |                                                          |
|                           | To change an existing token to a new token, remove the <b>umbrella in</b> command and reconfigure it on the interface for policies of the new token to be applied.                                                                                     |                                                          |
| <b>Examples</b>           | <p>The following example shows how to configure a Cisco Umbrella token:</p> <pre> Device&gt; enable Device# configure terminal Device(config)# parameter-map type umbrella global Device(config-profile)# token AADDD5FF6E510B28921A20C9B98EEFF </pre> |                                                          |
| <b>Related Commands</b>   | <b>Command</b>                                                                                                                                                                                                                                         | <b>Description</b>                                       |
|                           | <b>parameter-map type umbrella global</b>                                                                                                                                                                                                              | Configures a parameter-map type in umbrella mode.        |
|                           | <b>umbrella</b>                                                                                                                                                                                                                                        | Configures the Cisco Umbrella Connector on an interface. |

# tracking (IPv6 snooping)

To override the default tracking policy on a port, use the **tracking** command in IPv6 snooping policy configuration mode.

**tracking** { **enable** [**reachable-lifetime** { *value* | **infinite** } ] | **disable** [**stale-lifetime** { *value* | **infinite** } ] }

|                    |                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>enable</b>                                      | Enables tracking.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|                    | <b>reachable-lifetime</b>                          | (Optional) Specifies the maximum amount of time a reachable entry is considered to be directly or indirectly reachable without proof of reachability. <ul style="list-style-type: none"><li>• The <b>reachable-lifetime</b> keyword can be used only with the <b>enable</b> keyword.</li><li>• Use of the <b>reachable-lifetime</b> keyword overrides the global reachable lifetime configured by the <b>ipv6 neighbor binding reachable-lifetime</b> command.</li></ul> |
|                    | <i>value</i>                                       | Lifetime value, in seconds. The range is from 1 to 86400, and the default is 300.                                                                                                                                                                                                                                                                                                                                                                                        |
|                    | <b>infinite</b>                                    | Keeps an entry in a reachable or stale state for an infinite amount of time.                                                                                                                                                                                                                                                                                                                                                                                             |
|                    | <b>disable</b>                                     | Disables tracking.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|                    | <b>stale-lifetime</b>                              | (Optional) Keeps the time entry in a stale state, which overwrites the global stale-lifetime configuration. <ul style="list-style-type: none"><li>• The stale lifetime is 86,400 seconds.</li><li>• The <b>stale-lifetime</b> keyword can be used only with the <b>disable</b> keyword.</li><li>• Use of the <b>stale-lifetime</b> keyword overrides the global stale lifetime configured by the <b>ipv6 neighbor binding stale-lifetime</b> command.</li></ul>          |
| Command Default    | The time entry is kept in a reachable state.       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Command Modes      | IPv6 snooping configuration (config-ipv6-snooping) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                    | Cisco IOS XE Everest 16.5.1a                       | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                             |

### Usage Guidelines

The **tracking** command overrides the default tracking policy set by the **ipv6 neighbor tracking** command on the port on which this policy applies. This function is useful on trusted ports where, for example, you may not want to track entries but want an entry to stay in the binding table to prevent it from being stolen.

The **reachable-lifetime** keyword is the maximum time an entry will be considered reachable without proof of reachability, either directly through tracking or indirectly through IPv6 snooping. After the **reachable-lifetime** value is reached, the entry is moved to stale. Use of the **reachable-lifetime** keyword with the tracking command overrides the global reachable lifetime configured by the **ipv6 neighbor binding reachable-lifetime** command.

The **stale-lifetime** keyword is the maximum time an entry is kept in the table before it is deleted or the entry is proven to be reachable, either directly or indirectly. Use of the **reachable-lifetime** keyword with the **tracking** command overrides the global stale lifetime configured by the **ipv6 neighbor binding stale-lifetime** command.

This example shows how to define an IPv6 snooping policy name as `policy1` and configures an entry to stay in the binding table for an infinite length of time on a trusted port:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)# tracking disable stale-lifetime infinite
Device(config-ipv6-snooping)# end
```

# trusted-port

To configure a port to become a trusted port, use the **trusted-port** command in IPv6 snooping policy mode or ND inspection policy configuration mode. To disable this function, use the **no** form of this command.

**trusted-port**  
**no trusted-port**

|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                                                | This command was introduced. |
| <b>Usage Guidelines</b>   | <p>When the <b>trusted-port</b> command is enabled, limited or no verification is performed when messages are received on ports that have this policy. However, to protect against address spoofing, messages are analyzed so that the binding information that they carry can be used to maintain the binding table. Bindings discovered from these ports will be considered more trustworthy than bindings received from ports that are not configured to be trusted.</p> |                              |

This example shows how to define an NDP policy name as policy1, and configures the port to be trusted:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 nd inspection policy1
Device(config-nd-inspection)# trusted-port
Device(config-nd-inspection)# end
```

This example shows how to define an IPv6 snooping policy name as policy1, and configures the port to be trusted:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)# trusted-port
Device(config-ipv6-snooping)# end
```

# umbrella

To configure the Cisco Umbrella Connector on an interface, use the **umbrella** command in interface configuration mode. To remove this configuration, use the **no** form of this command.

**umbrella** {**in** *tag-name* | **out**}

**no umbrella** {**in** | **out**}

## Syntax Description

**in** Configures the Cisco Umbrella Connector on an interface that is connected to a client.

*tag-name* The interface tag name.

The length should not exceed 49 characters.

**out** Configures the Cisco Umbrella Connector on an interface that is used to reach the umbrella server.

## Command Default

No default behavior or values.

## Command Modes

Interface configuration (config-if)

## Command History

### Release

Cisco IOS XE Amsterdam 17.1.1

### Modification

This command was introduced.

## Usage Guidelines

You should configure the **umbrella out** command before you configure the **umbrella in** command. Registration is successful only when port 443 is in Open state and allows traffic to pass through the existing firewall.

The **umbrella in** and **umbrella out** commands cannot be configured on the same interface.

## Examples

The following example shows how to configure the Cisco Umbrella Connector on an interface:

```
Device> enable
Device# configure terminal
Device(config)# interface GigabitEthernet 1/0/1
Device(config-if)# umbrella out
Device(config-if)# exit
Device(config)# interface GigabitEthernet 1/0/2
Device(config-if)# umbrella in mydevice_tag
```

| <b>show umbrella config</b> | Displays the Cisco Umbrella Integration configurations of the device. |

## use-updated-eth-header

To enable interoperability between devices and any port on a device that includes the updated Ethernet header in MACsec Key Agreement Protocol Data Units (MKPDUs) for integrity check value (ICV) calculation, use the **ssci-based-on-sci** command in MKA-policy configuration mode. To disable the updated ethernet header in MKPDUs for ICV calculation, use the **no** form of this command.

**use-updated-eth-header**  
**no use-updated-eth-header**

### Syntax Description

This command has no arguments or keywords.

### Command Default

The Ethernet header for ICV calculation is disabled.

### Command Modes

MKA-policy configuration (config-mka-policy)

### Command History

| Release                        | Modification                 |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.12.1 | This command was introduced. |

### Usage Guidelines

The updated Ethernet header is non-standard. Enabling this option ensures that an MACsec Key Agreement (MKA) session between the devices can be set up.

### Examples

The following example shows how to enable the updated Ethernet header in MKPDUs for ICV calculation:

```
Device> enable
Device# configure terminal
Device(config)# mka policy 2
Device(config-mka-policy)# use-updated-eth-header
```

| <b>mka policy</b>                | Configures an MKA policy.                                      |
| <b>confidentiality-offset</b>    | Sets the confidentiality offset for MACsec operations.         |
| <b>delay-protection</b>          | Configures MKA to use delay protection in sending MKPDU.       |
| <b>include-icv-indicator</b>     | Includes ICV indicator in MKPDU.                               |
| <b>key-server</b>                | Configures MKA key-server options.                             |
| <b>macsec-cipher-suite</b>       | Configures cipher suite for deriving SAK.                      |
| <b>sak-rekey</b>                 | Configures the SAK rekey interval.                             |
| <b>send-secure-announcements</b> | Configures MKA to send secure announcements in sending MKPDUs. |
| <b>ssci-based-on-sci</b>         | Computes SSCI based on the SCI.                                |

# username

To establish the username-based authentication system, use the **username** command in global configuration mode. To remove an established username-based authentication, use the **no** form of this command.

```
username name [aaa attribute list aaa-list-name]
username name [access-class access-list-number]
username name [algorithm-type {md5 | scrypt | sha256}]
username name [autocommand command]
username name [callback-dialstring telephone-number]
username name [callback-line [tty ]line-number [ending-line-number]]
username name [callback-rotary rotary-group-number]
username name [common-criteria-policy policy-name]
username name [dnis]
username name [mac]
username name [nocallback-verify]
username name [noescape]
username name [nohangup]
username name [{nopassword | password password | password encryption-type encrypted-password}]
username name [one-time {password {0 | 6 | 7 | password} | secret {0 | 5 | 8 | 9 | password}}]
username name [password secret]
username name [privilege level]
username name [secret {0 | 5 | password}]
username name [serial-number]
username name [user-maxlinks number]
username name [view view-name]
no username name
```

## Syntax Description

|                                                   |                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>name</i>                                       | Hostname, server name, user ID, or command name. The <i>name</i> argument can be only one word. Blank spaces and quotation marks are not allowed.                                                                                                                                                                                                                            |
| <b>aaa attribute list</b><br><i>aaa-list-name</i> | (Optional) Uses the specified authentication, authorization, and accounting (AAA) method list.                                                                                                                                                                                                                                                                               |
| <b>access-class</b><br><i>access-list-number</i>  | (Optional) Specifies an outgoing access list that overrides the access list specified in the <b>access-class</b> command that is available in line configuration mode. It is used for the duration of the user's session.                                                                                                                                                    |
| <b>algorithm-type</b>                             | (Optional) Specifies the algorithm to use for hashing the plaintext secret for the user. <ul style="list-style-type: none"> <li>• <b>md5</b>: Encodes the password using the MD5 algorithm.</li> <li>• <b>scrypt</b>: Encodes the password using the SCRYPT hashing algorithm.</li> <li>• <b>sha256</b>: Encodes the password using the PBKDF2 hashing algorithm.</li> </ul> |

|                                                       |                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>autocommand</b> <i>command</i>                     | (Optional) Causes the specified <b>autocommand</b> command to be issued automatically after the user logs in. When the specified <b>autocommand</b> command is complete, the session is terminated. Because the command can be of any length and can contain embedded spaces, commands using the <b>autocommand</b> keyword must be the last option on the line. |
| <b>callback-dialstring</b><br><i>telephone-number</i> | (Optional) Permits you to specify a telephone number to pass to the Data Circuit-terminating Equipment (DCE) device; for asynchronous callback only.                                                                                                                                                                                                             |
| <b>callback-line</b> <i>line-number</i>               | (Optional) Specifies relative number of the terminal line (or the first line in a contiguous group) on which you enable a specific username for callback; for asynchronous callback only. Numbering begins with zero.                                                                                                                                            |
| <i>ending-line-number</i>                             | (Optional) Relative number of the last line in a contiguous group on which you want to enable a specific username for callback. If you omit the keyword (such as <b>tty</b> ), then line number and ending line number are absolute rather than relative line numbers.                                                                                           |
| <b>tty</b>                                            | (Optional) Specifies standard asynchronous line; for asynchronous callback only.                                                                                                                                                                                                                                                                                 |
| <b>callback-rotary</b><br><i>rotary-group-number</i>  | (Optional) Permits you to specify a rotary group number on which you want to enable a specific username for callback; for asynchronous callback only. The next available line in the rotary group is selected. Range: 1 to 100.                                                                                                                                  |
| <b>common-criteria-policy</b>                         | (Optional) Specifies the name of the common criteria policy.                                                                                                                                                                                                                                                                                                     |
| <b>dnis</b>                                           | (Optional) Does not require a password when obtained through the Dialed Number Identification Service (DNIS).                                                                                                                                                                                                                                                    |
| <b>mac</b>                                            | (Optional) Allows a MAC address to be used as the username for MAC filtering done locally.                                                                                                                                                                                                                                                                       |
| <b>nocallback-verify</b>                              | (Optional) Specifies that authentication is not required for EXEC callback on the specified line.                                                                                                                                                                                                                                                                |
| <b>noescape</b>                                       | (Optional) Prevents the user from using an escape character on the host to which that user is connected.                                                                                                                                                                                                                                                         |
| <b>nohangup</b>                                       | (Optional) Prevents Cisco IOS software from disconnecting the user after an automatic command (set up with the <b>autocommand</b> keyword) is run. Instead, the user gets another user EXEC prompt.                                                                                                                                                              |
| <b>nopassword</b>                                     | (Optional) No password is required for the user to log in. This is usually the most useful keyword to use in combination with the <b>autocommand</b> keyword.                                                                                                                                                                                                    |
| <b>password</b>                                       | (Optional) Specifies a password to access the <i>name</i> argument. The password must be from 1 to 25 characters, can contain embedded spaces, and must be the last option specified in the <b>username</b> command.                                                                                                                                             |
| <i>password</i>                                       | Password that the user enters.                                                                                                                                                                                                                                                                                                                                   |

|                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>encryption-type</i>                  | Single-digit number that defines whether the text immediately following the <b>password</b> is encrypted, and if so, what type of encryption is used. Defined encryption types are 0, which means that the text immediately following the <b>password</b> is not encrypted, and 6 and 7, which means that the text is encrypted using a Cisco-defined encryption algorithm.                                                                                                                                                                                                                                                                                                        |
| <i>encrypted-password</i>               | Encrypted password that the user enters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>one-time</b>                         | (Optional) Specifies that the username and password is valid for only one time. This configuration is used to prevent default credentials from remaining in user configurations. <ul style="list-style-type: none"> <li>• <b>0</b>: Specifies that an unencrypted password or secret (depending on the configuration) follows.</li> <li>• <b>6</b>: Specifies that an encrypt password follows.</li> <li>• <b>7</b>: Specifies that a hidden password follows.</li> <li>• <b>5</b>: Specifies that a MD5 HASHED secret follows.</li> <li>• <b>8</b>: Specifies that a PBKDF2 HASHED secret follows.</li> <li>• <b>9</b>: Specifies that a SCRYPT HASHED secret follows.</li> </ul> |
| <b>secret</b>                           | (Optional) Specifies a secret for the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <i>secret</i>                           | For Challenge Handshake Authentication Protocol (CHAP) authentication. Specifies the secret for the local device or the remote device. The secret is encrypted when it is stored on the local device. The secret can consist of any string of up to 11 ASCII characters. There is no limit to the number of username and password combinations that can be specified, allowing any number of remote devices to be authenticated.                                                                                                                                                                                                                                                   |
| <b>privilege</b> <i>privilege-level</i> | (Optional) Sets the privilege level for the user. Range: 1 to 15.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>serial-number</b>                    | (Optional) Specifies the serial number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>user-maxlinks</b> <i>number</i>      | (Optional) Specifies the maximum number of inbound links allowed for the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>view</b> <i>view-name</i>            | (Optional) Associates a CLI view name, which is specified with the <b>parser view</b> command, with the local AAA database; for CLI view only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Command Default** No username-based authentication system is established.

**Command Modes** Global configuration (config)

| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|------------------------|------------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **username** command provides username or password authentication, or both, for login purposes only. Multiple **username** commands can be used to specify options for a single user.

Add a username entry for each remote system with which the local device communicates, and from which it requires authentication. The remote device must have a username entry for the local device. This entry must have the same password as the local device's entry for that remote device.

This command can be useful for defining usernames that get special treatment. For example, you can use this command to define an *info* username that does not require a password, but connects the user to a general purpose information service.

The **username** command is required as part of the configuration for CHAP. Add a username entry for each remote system from which the local device requires authentication.

To enable the local device to respond to remote CHAP challenges, one **username name** entry must be the same as the **hostname** entry that has already been assigned to the other device. To avoid the situation of a privilege level 1 user entering into a higher privilege level, configure a per-user privilege level other than 1, for example, 0 or 2 through 15. Per-user privilege levels override virtual terminal privilege levels.

### CLI and Lawful Intercept Views

Both CLI views and lawful intercept views restrict access to specified commands and configuration information. A lawful intercept view allows the user to secure access to lawful intercept commands that are held within the TAP-MIB, which is a special set of SNMP commands that store information about calls and users.

Users who are specified via the **lawful-intercept** keyword are placed in the lawful-intercept view by default if no other privilege level or view name is explicitly specified.

If no value is specified for the *secret* argument, and the **debug serial-interface** command is enabled, an error is displayed when a link is established and the CHAP challenge is not implemented. The CHAP debugging information is available using the **debug ppp negotiation**, **debug serial-interface**, and **debug serial-packet** commands.

## Examples

The following example shows how to implement a service similar to the UNIX **who** command, which can be entered at the login prompt, and lists the current users of the device:

```
Device> enable
Device# configure terminal
Device(config)# username who nopassword nohangup autocommand show users
```

The following example shows how to implement an information service that does not require a password to be used:

```
Device> enable
Device# configure terminal
Device(config)# username info nopassword noescape autocommand telnet nic.ddn.mil
```

The following example shows how to implement an ID that works even if all the TACACS+ servers break:

```
Device> enable
Device# configure terminal
Device(config)# username superuser password superpassword
```

The following example shows how to enable CHAP on interface serial 0 of server\_1. It also defines a password for a remote server named server\_r.

```
hostname server_1
username server_r password theirsystm
interface serial 0
```

```
encapsulation ppp
ppp authentication chap
```

The following is a sample output from the **show running-config** command displaying the passwords that are encrypted:

```
hostname server_1
username server_r password 7 121F0A18
interface serial 0
 encapsulation ppp
 ppp authentication chap
```

The following example shows how a privilege level 1 user is denied access to privilege levels higher than 1:

```
Device> enable
Device# configure terminal
Device(config)# username user privilege 0 password 0 cisco
Device(config)# username user2 privilege 2 password 0 cisco
```

The following example shows how to remove username-based authentication for user2:

```
Device> enable
Device# configure terminal
Device(config)# no username user2
```

#### Related Commands

| Command                       | Description                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>debug ppp negotiation</b>  | Displays PPP packets sent during PPP startup, where PPP options are negotiated.                                                    |
| <b>debug serial-interface</b> | Displays information about a serial connection failure.                                                                            |
| <b>debug serial-packet</b>    | Displays more detailed serial interface debugging information than you can obtain using the <b>debug serial interface</b> command. |

```
Device> enable
Device# configure terminal
Device(config)# vlan access-map vac1
Device(config-access-map)# match ip address acl1
Device(config-access-map)# action forward
Device(config-access-map)# end
```

This example shows how to delete VLAN map vac1:

```
Device> enable
Device# configure terminal
Device(config)# no vlan access-map vac1
Device(config)# exit
```

# vlan dot1Q tag native

To enable dot1q (IEEE 802.1Q) tagging for a native VLAN on a trunk port, use the **vlan dot1Q tag native** command in global configuration mode.

To disable this function, use the **no** form of this command.

**vlan dot1Q tag native**  
**no vlan dot1Q tag native**

|                           |                                            |
|---------------------------|--------------------------------------------|
| <b>Syntax Description</b> | This command has no arguments or keywords. |
|---------------------------|--------------------------------------------|

|                        |          |
|------------------------|----------|
| <b>Command Default</b> | Disabled |
|------------------------|----------|

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                  |
|-------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | Typically, you configure 802.1Q trunks with a native VLAN ID which strips tagging from all packets on that VLAN. |
|-------------------------|------------------------------------------------------------------------------------------------------------------|

To maintain the tagging on the native VLAN and drop untagged traffic, use the **vlan dot1q tag native** command. The device will tag the traffic received on the native VLAN and admit only 802.1Q-tagged frames, dropping any untagged traffic, including untagged traffic in the native VLAN.

Control traffic continues to be accepted as untagged on the native VLAN on a trunked port, even when the **vlan dot1q tag native** command is enabled.

|             |                                                                                                                             |
|-------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>Note</b> | If the <b>dot1q tag vlan native</b> command is configured at global level, dot1x reauthentication will fail on trunk ports. |
|-------------|-----------------------------------------------------------------------------------------------------------------------------|

This example shows how to enable dot1q (IEEE 802.1Q) tagging for native VLANs on all trunk ports on a device:

```
Device(config)# vlan dot1q tag native  
Device(config)#
```

| Related Commands | Command                           | Description                                        |
|------------------|-----------------------------------|----------------------------------------------------|
|                  | <b>show vlan dot1q tag native</b> | Displays the status of tagging on the native VLAN. |

# vlan filter

To apply a VLAN map to one or more VLANs, use the **vlan filter** command in global configuration mode. Use the **no** form of this command to remove the map.

**vlan filter** *mapname* **vlan-list** {*list* | **all**}  
**no vlan filter** *mapname* **vlan-list** {*list* | **all**}

## Syntax Description

|                  |                                                                                                                                             |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <i>mapname</i>   | Name of the VLAN map entry.                                                                                                                 |
| <b>vlan-list</b> | Specifies which VLANs to apply the map to.                                                                                                  |
| <i>list</i>      | The list of one or more VLANs in the form tt, uu-vv, xx, yy-zz, where spaces around commas and dashes are optional. The range is 1 to 4094. |
| <b>all</b>       | Adds the map to all VLANs.                                                                                                                  |

## Command Default

There are no VLAN filters.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

To avoid accidentally dropping too many packets and disabling connectivity in the middle of the configuration process, we recommend that you completely define the VLAN access map before applying it to a VLAN.

## Examples

This example applies VLAN map entry map1 to VLANs 20 and 30:

```
Device> enable
Device# configure terminal
Device(config)# vlan filter map1 vlan-list 20, 30
Device(config)# exit
```

This example shows how to delete VLAN map entry mac1 from VLAN 20:

```
Device> enable
Device# configure terminal
Device(config)# no vlan filter map1 vlan-list 20
Device(config)# exit
```

You can verify your settings by entering the **show vlan filter** command.

# vlan group

To create or modify a VLAN group, use the **vlan group** command in global configuration mode. To remove a VLAN list from the VLAN group, use the **no** form of this command.

**vlan group** *group-name* **vlan-list** *vlan-list*  
**no vlan group** *group-name* **vlan-list** *vlan-list*

## Syntax Description

|                                   |                                                                                                                                                                                                                        |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>group-name</i>                 | Name of the VLAN group. The group name may contain up to 32 characters and must begin with a letter.                                                                                                                   |
| <b>vlan-list</b> <i>vlan-list</i> | Specifies one or more VLANs to be added to the VLAN group. The <i>vlan-list</i> argument can be a single VLAN ID, a list of VLAN IDs, or VLAN ID range. Multiple entries are separated by a hyphen (-) or a comma (,). |

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

If the named VLAN group does not exist, the **vlan group** command creates the group and maps the specified VLAN list to the group. If the named VLAN group exists, the specified VLAN list is mapped to the group.

The **no** form of the **vlan group** command removes the specified VLAN list from the VLAN group. When you remove the last VLAN from the VLAN group, the VLAN group is deleted.

A maximum of 100 VLAN groups can be configured, and a maximum of 4094 VLANs can be mapped to a VLAN group.

## Examples

This example shows how to map VLANs 7 through 9 and 11 to a VLAN group:

```
Device> enable
Device# configure terminal
Device(config)# vlan group group1 vlan-list 7-9,11
Device(config)# exit
```

This example shows how to remove VLAN 7 from the VLAN group:

```
Device> enable
Device# configure terminal
Device(config)# no vlan group group1 vlan-list 7
Device(config)# exit
```

# debug platform stack-manager

To enable debugging of the stack manager software, use the **debug platform stack-manager** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

```
debug platform stack-manager {all | rpc | sdp | sim | ssm | trace}
no debug platform stack-manager {all | rpc | sdp | sim | ssm | trace}
```

|                    |              |                                                                          |
|--------------------|--------------|--------------------------------------------------------------------------|
| Syntax Description | <b>all</b>   | Displays all stack manager debug messages.                               |
|                    | <b>rpc</b>   | Displays stack manager remote procedure call (RPC) usage debug messages. |
|                    | <b>sdp</b>   | Displays the Stack Discovery Protocol (SDP) debug messages.              |
|                    | <b>sim</b>   | Displays the stack information module debug messages.                    |
|                    | <b>ssm</b>   | Displays the stack state-machine debug messages.                         |
|                    | <b>trace</b> | Traces the stack manager entry and exit debug messages.                  |

**Command Default** Debugging is disabled.

**Command Modes** Privileged EXEC

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** This command is supported only on stacking-capable switches.

The **undebug platform stack-manager** command is the same as the **no debug platform stack-manager** command.

When you enable debugging on a switch stack, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the **session switch-number EXEC** command. Enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command stack-member-number LINE EXEC** command on the stack master switch to enable debugging on a member switch without first starting a session.

# maintenance-template

To create a maintenance template, use the **maintenance-template** *template\_name* command in the global configuration mode. To delete the template, use the **no** form of the command.

**maintenance-template** *template\_name*  
**no maintenance-template** *template\_name*

|                    |                               |                                                  |
|--------------------|-------------------------------|--------------------------------------------------|
| Syntax Description | <b>maintenance-template</b>   | Creates a template for GIR with a specific name. |
|                    | <i>template_name</i>          | Name of the maintenance template.                |
| Command Default    | Disabled.                     |                                                  |
| Command Modes      | Global configuration (config) |                                                  |
| Command History    | <b>Release</b>                | <b>Modification</b>                              |
|                    | Cisco IOS XE Everest 16.6.1   | This command was introduced.                     |

## Example:

The following example shows how to configure a maintenance template with the name g1:

```
Device(config)# maintenance template g1
```

# main-cpu

To enter the redundancy main configuration submode and enable the standby switch, use the **main-cpu** command in redundancy configuration mode.

## main-cpu

### Syntax Description

This command has no arguments or keywords.

### Command Default

None

### Command Modes

Redundancy configuration (config-red)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

From the redundancy main configuration submode, use the **standby console enable** command to enable the standby switch.

This example shows how to enter the redundancy main configuration submode and enable the standby switch:

```
Device(config)# redundancy
Device(config-red)# main-cpu
Device(config-r-mc)# standby console enable
Device#
```

# mode sso

To set the redundancy mode to stateful switchover (SSO), use the **mode sso** command in redundancy configuration mode.

**mode sso**

|                           |                                            |
|---------------------------|--------------------------------------------|
| <b>Syntax Description</b> | This command has no arguments or keywords. |
|---------------------------|--------------------------------------------|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                          |
|----------------------|--------------------------|
| <b>Command Modes</b> | Redundancy configuration |
|----------------------|--------------------------|

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                            |
|-------------------------|--------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The <b>mode sso</b> command can be entered only from within redundancy configuration mode. |
|-------------------------|--------------------------------------------------------------------------------------------|

Follow these guidelines when configuring your system to SSO mode:

- You must use identical Cisco IOS images on the switches in the stack to support SSO mode. Redundancy may not work due to differences between the Cisco IOS releases.
- If you perform an online insertion and removal (OIR) of the module, the switch resets during the stateful switchover and the port states are restarted only if the module is in a transient state (any state other than Ready).
- The forwarding information base (FIB) tables are cleared on a switchover. Routed traffic is interrupted until route tables reconverge.

This example shows how to set the redundancy mode to SSO:

```
Device(config)# redundancy
Device(config-red)# mode sso
Device(config-red)#
```

# policy config-sync prc reload

To reload the standby switch if a parser return code (PRC) failure occurs during configuration synchronization, use the **policy config-sync reload** command in redundancy configuration mode. To specify that the standby switch is not reloaded if a parser return code (PRC) failure occurs, use the **no** form of this command.

**policy config-sync {bulk | lbl} prc reload**  
**no policy config-sync {bulk | lbl} prc reload**

|                    |                                       |                                                  |
|--------------------|---------------------------------------|--------------------------------------------------|
| Syntax Description | <b>bulk</b>                           | Specifies bulk configuration mode.               |
|                    | <b>lbl</b>                            | Specifies line-by-line (lbl) configuration mode. |
| Command Default    | The command is enabled by default.    |                                                  |
| Command Modes      | Redundancy configuration (config-red) |                                                  |
| Command History    | <b>Release</b>                        | <b>Modification</b>                              |
|                    | Cisco IOS XE Everest 16.5.1a          | This command was introduced.                     |

This example shows how to specify that the standby switch is not reloaded if a parser return code (PRC) failure occurs during configuration synchronization:

```
Device(config-red)# no policy config-sync bulk prc reload
```

# redundancy

To enter redundancy configuration mode, use the **redundancy** command in global configuration mode.

## redundancy

|                           |                                            |
|---------------------------|--------------------------------------------|
| <b>Syntax Description</b> | This command has no arguments or keywords. |
|---------------------------|--------------------------------------------|

|                        |      |
|------------------------|------|
| <b>Command Default</b> | None |
|------------------------|------|

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

| <b>Command History</b> | Release                      | Modification                 |
|------------------------|------------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                      |
|-------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The redundancy configuration mode is used to enter the main CPU submode, which is used to enable the standby switch. |
|-------------------------|----------------------------------------------------------------------------------------------------------------------|

To enter the main CPU submode, use the **main-cpu** command while in redundancy configuration mode.

From the main CPU submode, use the **standby console enable** command to enable the standby switch.

Use the **exit** command to exit redundancy configuration mode.

This example shows how to enter redundancy configuration mode:

```
(config)# redundancy
(config-red)#
```

This example shows how to enter the main CPU submode:

```
(config)# redundancy
(config-red)# main-cpu
(config-r-mc)#
```

|                         |  |
|-------------------------|--|
| <b>Related Commands</b> |  |

| Command                | Description                               |
|------------------------|-------------------------------------------|
| <b>show redundancy</b> | Displays redundancy facility information. |

# redundancy config-sync mismatched-commands

To allow the standby switch to join the stack if a configuration mismatch occurs between the active and standby switches, use the **redundancy config-sync mismatched-commands** command in privileged EXEC mode.

**redundancy config-sync {ignore | validate} mismatched-commands**

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                  |

| Syntax Description | <b>ignore</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Ignores the mismatched command list.                                             |
|                    | <b>validate</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Revalidates the mismatched command list with the modified running-configuration. |
| Command Default    | None                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                  |
| Command Modes      | Privileged EXEC                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                  |
| Command History    | <b>Release</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>Modification</b>                                                              |
|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | This command was introduced.                                                     |
| Usage Guidelines   | <p>If the command syntax check in the running configuration of the active switch fails while the standby switch is booting, use the <b>redundancy config-sync mismatched-commands</b> command to display the Mismatched Command List (MCL) on the active switch and to reboot the standby switch.</p> <p>The following is a log entry example for mismatched commands:</p> <pre>00:06:31: Config Sync: Bulk-sync failure due to Servicing Incompatibility. Please check full list of mismatched commands via: show redundancy config-sync failures mcl 00:06:31: Config Sync: Starting lines from MCL file: interface GigabitEthernet7/7 ! &lt;submode&gt; "interface" - ip address 192.0.2.0 255.255.255.0 ! &lt;/submode&gt; "interface"</pre> |                                                                                  |

To display all mismatched commands, use the **show redundancy config-sync failures mcl** command.

To clean the MCL, follow these steps:

1. Remove all mismatched commands from the running configuration of the active switch.
2. Revalidate the MCL with a modified running configuration by using the **redundancy config-sync validate mismatched-commands** command.
3. Reload the standby switch.

You can ignore the MCL by doing the following:

1. Enter the **redundancy config-sync ignore mismatched-commands** command.
2. Reload the standby switch; the system changes to SSO mode.

---

**Note** If you ignore the mismatched commands, the out-of-sync configuration at the active switch and the standby switch still exists.

---

3. Verify the ignored MCL with the **show redundancy config-sync ignored mcl** command.

If SSO mode cannot be established between the active and standby switches because of an incompatibility in the configuration file, a mismatched command list (MCL) is generated at the active switch and a reload into route processor redundancy (RPR) mode is forced for the standby switch.

This example shows how to revalidate the mismatched command list with the modified configuration:

```
# redundancy config-sync validate mismatched-commands
#
```

# redundancy force-switchover

To force a switchover from the active switch to the standby switch, use the **redundancy force-switchover** command in privileged EXEC mode on a switch stack.

**redundancy force-switchover**

**Syntax Description** This command has no arguments or keywords.

**Command Default** None

**Command Modes** Privileged EXEC

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Use the **redundancy force-switchover** command to manually switch over to the redundant switch. The redundant switch becomes the new active switch that runs the Cisco IOS image, and the modules are reset to their default settings.

The old active switch reboots with the new image and joins the stack.

If you use the **redundancy force-switchover** command on the active switch, the switchports on the active switch to go down.

If you use this command on a switch that is in a partial ring stack, the following warning message appears:

```
# redundancy force-switchover
Stack is in Half ring setup; Reloading a switch might cause stack split
This will reload the active unit and force switchover to standby[confirm]
```

This example shows how to manually switch over from the active to the standby supervisor engine:

```
# redundancy force-switchover
#
```

# redundancy reload

To force a reload of one or all of the switches in the stack, use the **redundancy reload** command in privileged EXEC mode.

**redundancy reload {peer | shelf}**

## Syntax Description

**peer** Reloads the peer unit.

**shelf** Reboots all switches in the stack.

## Command Default

None

## Command Modes

Privileged EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Before using this command, see the “Performing a Software Upgrade” section of the for additional information.

Use the **redundancy reload shelf** command to reboot all the switches in the stack.

This example shows how to manually reload all switches in the stack:

```
# redundancy reload shelf
#
```

# reload

To reload the stack member and to apply a configuration change, use the **reload** command in privileged EXEC mode.

**reload** [{/noverify | /verify}] [{LINE | at | cancel | in | slot *stack-member-number* | standby-cpu}]

|                    |                            |                                                                                  |
|--------------------|----------------------------|----------------------------------------------------------------------------------|
| Syntax Description | <b>/noverify</b>           | (Optional) Specifies to not verify the file signature before the reload.         |
|                    | <b>/verify</b>             | (Optional) Verifies the file signature before the reload.                        |
|                    | <i>LINE</i>                | (Optional) Reason for the reload.                                                |
|                    | <b>at</b>                  | (Optional) Specifies the time in hh:mm for the reload to occur.                  |
|                    | <b>cancel</b>              | (Optional) Cancels the pending reload.                                           |
|                    | <b>in</b>                  | (Optional) Specifies a time interval for reloads to occur.                       |
|                    | <b>slot</b>                | (Optional) Saves the changes on the specified stack member and then restarts it. |
|                    | <i>stack-member-number</i> |                                                                                  |
|                    | <b>standby-cpu</b>         | (Optional) Reloads the standby route processor (RP).                             |

**Command Default** Immediately reloads the stack member and puts a configuration change into effect.

**Command Modes** Privileged EXEC

|                 |                              |                              |
|-----------------|------------------------------|------------------------------|
| Command History | <b>Release</b>               | <b>Modification</b>          |
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** If there is more than one switch in the switch stack, and you enter the **reload slot *stack-member-number*** command, you are not prompted to save the configuration.

## Examples

This example shows how to reload the switch stack:

```
Device# reload
System configuration has been modified. Save? [yes/no]: y
Proceed to reload the whole Stack? [confirm] y
```

This example shows how to reload a specific stack member:

```
Device# reload slot 6
Proceed with reload? [confirm] y
```

This example shows how to reload a single-switch switch stack (there is only one member switch):

```
Device# reload slot 3
System configuration has been modified. Save? [yes/no]: y
Proceed to reload the whole Stack? [confirm] y
```

# router routing protocol shutdown l2

To create instances that should be isolated within a maintenance template, use the **router routing\_protocol instance\_id | shutdown l2** command in the maintenance template configuration mode. To delete the instance, use the **no** form of the command.

```
{ router routing_protocol instance_id | shutdown l2 }
no{ router routing_protocol instance_id | shutdown l2 }
```

|                    |                                                              |                                                       |
|--------------------|--------------------------------------------------------------|-------------------------------------------------------|
| Syntax Description | <b>router</b>                                                | Configures instance associated with routing protocol. |
|                    | <i>routing_protocol</i>                                      | Routing protocol defined for the template.            |
|                    | <i>instance_id</i>                                           | Instance ID associated with the routing protocol.     |
|                    | <b>shutdown l2</b>                                           | Configures instance to shut down layer 2 interfaces.  |
| Command Default    | Disabled.                                                    |                                                       |
| Command Modes      | Maintenance template configuration (config-maintenance-temp) |                                                       |
| Command History    | <b>Release</b>                                               | <b>Modification</b>                                   |
|                    | Cisco IOS XE Everest 16.6.1                                  | This command was introduced.                          |

**Example:**

The following example shows how to create an instance for ISIS with an instance ID of one under maintenance template temp1:

```
Device(config)# maintenance template g1
Device(config-maintenance-templ)# router isis 1
```

The following example shows how to create an instance for shutting down layer 2 interfaces under maintenance template g1:

```
Device(config)# maintenance template g1
Device(config-maintenance-templ)# shutdown l2
```

# session

To access a specific stack member use the **session** command in privileged EXEC mode on the stack master.

**session** *stack-member-number*

## Syntax Description

|                            |                                          |
|----------------------------|------------------------------------------|
| <i>stack-member-number</i> | Stack member number to access from the . |
|----------------------------|------------------------------------------|

## Command Default

None

## Command Modes

Privileged EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

When you access the member, its member number is appended to the system prompt.

Use the **session** command from the master to access a member

Use the **session** command with **processor 1** from the master or a standalone switch to access the internal controller. A standalone is always member 1.

## Examples

This example shows how to access stack member 3:

```
# session 3
-3#
```

# show redundancy

To display redundancy facility information, use the **show redundancy** command in privileged EXEC mode

```
show redundancy [{clients | config-sync | counters | history [{reload | reverse}]] | slaves[slave-name]
{clients | counters} | states | switchover history [domain default]]]
```

|                    |                              |                                                                                                                                                                                                  |
|--------------------|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | clients                      | (Optional) Displays information about the redundancy facility client.                                                                                                                            |
|                    | config-sync                  | (Optional) Displays a configuration synchronization failure or the ignored mismatched command list (MCL).                                                                                        |
|                    | counters                     | (Optional) Displays information about the redundancy facility counter.                                                                                                                           |
|                    | history                      | (Optional) Displays a log of past status and related information for the redundancy facility.                                                                                                    |
|                    | history reload               | (Optional) Displays a log of past reload information for the redundancy facility.                                                                                                                |
|                    | history reverse              | (Optional) Displays a reverse log of past status and related information for the redundancy facility.                                                                                            |
|                    | slaves                       | (Optional) Displays all standby switches in the redundancy facility.                                                                                                                             |
|                    | slave-name                   | (Optional) The name of the redundancy facility standby switch to display specific information for. Enter additional keywords to display all clients or counters in the specified standby switch. |
|                    | clients                      | Displays all redundancy facility clients in the specified secondary switch.                                                                                                                      |
|                    | counters                     | Displays all counters in the specified standby switch.                                                                                                                                           |
|                    | states                       | (Optional) Displays information about the redundancy facility state, such as disabled, initialization, standby or active.                                                                        |
|                    | switchover history           | (Optional) Displays information about the redundancy facility switchover history.                                                                                                                |
|                    | domain default               | (Optional) Displays the default domain as the domain to display switchover history for.                                                                                                          |
| Command Default    | None                         |                                                                                                                                                                                                  |
| Command Modes      | Privileged EXEC (#)          |                                                                                                                                                                                                  |
| Command History    | Release                      | Modification                                                                                                                                                                                     |
|                    | Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                                     |

This example shows how to display information about the redundancy facility:

```
Device# show redundancy
```

```

Redundant System Information :
-----
    Available system uptime = 6 days, 5 hours, 28 minutes
    Switchovers system experienced = 0
        Standby failures = 0
    Last switchover reason = none

    Hardware Mode = Duplex
    Configured Redundancy Mode = sso
    Operating Redundancy Mode = sso
    Maintenance Mode = Disabled
    Communications = Up

Current Processor Information :
-----
    Active Location = slot 5
    Current Software state = ACTIVE
    Uptime in current state = 6 days, 5 hours, 28 minutes
        Image Version = Cisco IOS Software, Catalyst L3 Switch Software
        (CAT9K_IOSXE), Experimental Version 16.x.x [S2C-build-v16x_throttle-4064-/
        nobackup/mcpre/BLD-BLD_V16x_THROTTLE_LATEST 102]
    Copyright (c) 1986-201x by Cisco Systems, Inc.
    Compiled Mon 07-Oct-xx 03:57 by mcpre
        BOOT = bootflash:packages.conf;
    Configuration register = 0x102

Peer Processor Information :
-----
    Standby Location = slot 6
    Current Software state = STANDBY HOT
    Uptime in current state = 6 days, 5 hours, 25 minutes
        Image Version = Cisco IOS Software, Catalyst L3 Switch Software
        (CAT9K_IOSXE), Experimental Version 16.x.x [S2C-build-v16x_throttle-4064-/
        nobackup/mcpre/BLD-BLD_V16x_THROTTLE_LATEST_20191007_000645 102]
    Copyright (c) 1986-201x by Cisco Systems, Inc.
    Compiled Mon 07-Oct-xx 03:57 by mcpre
        BOOT = bootflash:packages.conf;
        CONFIG_FILE =
    Configuration register = 0x102
Device#

```

This example shows how to display redundancy facility client information:

Device# **show redundancy clients**

```

Group ID =      1
clientID = 29      clientSeq = 60      Redundancy Mode RF
clientID = 139     clientSeq = 62      IfIndex
clientID = 25      clientSeq = 71      CHKPT RF
clientID = 10001   clientSeq = 85      QEMU Platform RF
clientID = 77      clientSeq = 87      Event Manager
clientID = 1340    clientSeq = 104     RP Platform RF
clientID = 1501    clientSeq = 105     CWAN HA
clientID = 78      clientSeq = 109     TSPTUN HA
clientID = 305     clientSeq = 110     Multicast ISSU Consolidation RF
clientID = 304     clientSeq = 111     IP multicast RF Client
clientID = 22      clientSeq = 112     Network RF Client
clientID = 88      clientSeq = 113     HSRP
clientID = 114     clientSeq = 114     GLBP
clientID = 225     clientSeq = 115     VRRP
clientID = 4700    clientSeq = 118     COND_DEBUG RF
clientID = 1341    clientSeq = 119     IOSXE DPIDX
clientID = 1505    clientSeq = 120     IOSXE SPA TSM
clientID = 75      clientSeq = 130     Tableid HA

```

```
clientID = 501      clientSeq = 137      LAN-Switch VTP VLAN
```

<output truncated>

The output displays the following information:

- clientID displays the client's ID number.
- clientSeq displays the client's notification sequence number.
- Current redundancy facility state.

This example shows how to display the redundancy facility counter information:

Device# **show redundancy counters**

```
Redundancy Facility OMs
    comm link up = 0
    comm link down = 0

    invalid client tx = 0
    null tx by client = 0
    tx failures = 0
    tx msg length invalid = 0

    client not rxing msgs = 0
    rx peer msg routing errors = 0
    null peer msg rx = 0
    errored peer msg rx = 0

    buffers tx = 135884
    tx buffers unavailable = 0
    buffers rx = 135109
    buffer release errors = 0

    duplicate client registers = 0
    failed to register client = 0
    Invalid client syncs = 0
```

Device#

This example shows how to display redundancy facility history information:

Device# **show redundancy history**

```
00:00:04 client added: Redundancy Mode RF(29) seq=60
00:00:04 client added: IfIndex(139) seq=62

<output truncated>

This example shows how to display information about the redundancy facility standby switches:

Device# **show redundancy slaves**

```
Group ID = 1
Slave/Process ID = 6107 Slave Name = [installer]
Slave/Process ID = 6109 Slave Name = [eicored]
Slave/Process ID = 6128 Slave Name = [snmp_subagent]
Slave/Process ID = 8897 Slave Name = [wcm]
Slave/Process ID = 8898 Slave Name = [table_mgr]
Slave/Process ID = 8901 Slave Name = [iosd]
```

Device#

This example shows how to display information about the redundancy facility state:

Device# **show redundancy states**

```
my state = 13 -ACTIVE
peer state = 8 -STANDBY HOT
Mode = Duplex
Unit = Primary
Unit ID = 5
```

```
Redundancy Mode (Operational) = sso
Redundancy Mode (Configured) = sso
Redundancy State = sso
Maintenance Mode = Disabled
Manual Swact = enabled
Communications = Up
```

```
client count = 115
client_notification_TMR = 30000 milliseconds
RF debug mask = 0x0
```

Device#

# show redundancy config-sync

To display a configuration synchronization failure or the ignored mismatched command list (MCL), if any, use the **show redundancy config-sync** command in EXEC mode.

**show redundancy config-sync {failures {bem | mcl | prc} | ignored failures mcl}**

| <b>Syntax Description</b>    | <table> <tr> <td data-bbox="336 499 597 583"><b>failures</b></td><td data-bbox="597 499 1503 583">Displays MCL entries or best effort method (BEM)/Parser Return Code (PRC) failures.</td></tr> <tr> <td data-bbox="336 583 597 646"><b>bem</b></td><td data-bbox="597 583 1503 646">Displays a BEM failed command list, and forces the standby switch to reboot.</td></tr> <tr> <td data-bbox="336 646 597 772"><b>mcl</b></td><td data-bbox="597 646 1503 772">Displays commands that exist in the switch's running configuration but are not supported by the image on the standby switch, and forces the standby switch to reboot.</td></tr> <tr> <td data-bbox="336 772 597 825"><b>prc</b></td><td data-bbox="597 772 1503 825">Displays a PRC failed command list and forces the standby switch to reboot.</td></tr> <tr> <td data-bbox="336 825 597 884"><b>ignored failures mcl</b></td><td data-bbox="597 825 1503 884">Displays the ignored MCL failures.</td></tr> </table>                                                                                                                                                                                                                                                        | <b>failures</b> | Displays MCL entries or best effort method (BEM)/Parser Return Code (PRC) failures. | <b>bem</b>                   | Displays a BEM failed command list, and forces the standby switch to reboot. | <b>mcl</b> | Displays commands that exist in the switch's running configuration but are not supported by the image on the standby switch, and forces the standby switch to reboot. | <b>prc</b> | Displays a PRC failed command list and forces the standby switch to reboot. | <b>ignored failures mcl</b> | Displays the ignored MCL failures. |

| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                 |                                                                                     |                              |                                                                              |            |                                                                                                                                                                       |            |                                                                             |                             |                                    |
| <b>Usage Guidelines</b>      | <p>When two versions of Cisco IOS images are involved, the command sets supported by two images might differ. If any of those mismatched commands are executed on the active switch, the standby switch might not recognize those commands, which causes a configuration mismatch condition. If the syntax check for the command fails on the standby switch during a bulk synchronization, the command is moved into the MCL and the standby switch is reset. To display all the mismatched commands, use the <b>show redundancy config-sync failures mcl</b> command.</p> <p>To clean the MCL, follow these steps:</p> <ol style="list-style-type: none"> <li>1. Remove all mismatched commands from the active switch's running configuration.</li> <li>2. Revalidate the MCL with a modified running configuration by using the <b>redundancy config-sync validate mismatched-commands</b> command.</li> <li>3. Reload the standby switch.</li> </ol> <p>Alternatively, you could ignore the MCL by following these steps:</p> <ol style="list-style-type: none"> <li>1. Enter the <b>redundancy config-sync ignore mismatched-commands</b> command.</li> <li>2. Reload the standby switch; the system transitions to SSO mode.</li> </ol> |                 |                                                                                     |                              |                                                                              |            |                                                                                                                                                                       |            |                                                                             |                             |                                    |

**Note** If you ignore the mismatched commands, the out-of-synchronization configuration on the active switch and the standby switch still exists.

3. You can verify the ignored MCL with the **show redundancy config-sync ignored mcl** command.

Each command sets a return code in the action function that implements the command. This return code indicates whether or not the command successfully executes. The active switch maintains the PRC after executing a command. The standby switch executes the command and sends the PRC back to the active switch. A PRC failure occurs if these two PRCs do not match. If a PRC error occurs at the standby switch either during bulk synchronization or line-by-line (LBL) synchronization, the standby switch is reset. To display all PRC failures, use the **show redundancy config-sync failures prc** command.

To display best effort method (BEM) errors, use the **show redundancy config-sync failures bem** command.

This example shows how to display the BEM failures:

```
Device> show redundancy config-sync failures bem
BEM Failed Command List
-----

The list is Empty
```

This example shows how to display the MCL failures:

```
Device> show redundancy config-sync failures mcl
Mismatched Command List
-----

The list is Empty
```

This example shows how to display the PRC failures:

```
Device# show redundancy config-sync failures prc
PRC Failed Command List
-----

The list is Empty
```

# show switch

To display information that is related to the stack member or the switch stack, use the **show switch** command in EXEC mode.

| Command Default               | None                                                                                                                                                                                                                                                                                                  |         |              |                              |                              |                               |                                                                                        |

| Cisco IOS XE Everest 16.5.1a  | This command was introduced.                                                                                                                                                                                                                                                                          |         |              |                              |                              |                               |                                                                                        |
| Cisco IOS XE Amsterdam 17.3.1 | Added the keyword <b>detail</b> to the command – <b>show switch stack-ports detail</b>                                                                                                                                                                                                                |         |              |                              |                              |                               |                                                                                        |

## Examples

This example shows how to display the member 6 summary information:

```
Device# show switch 6
Switch#  Role      Mac Address      Priority    State
-----
6      Member      0003.e31a.1e00    1          Ready
```

This example shows how to display the neighbor information for a stack:

```
Device# show switch neighbors
Switch #    Port A    Port B
-----
6          None      8
8          6        None
```

This example shows how to display stack-port information:

```
Device# show switch stack-ports
Switch #    Port A    Port B
-----
6          Down     Ok
8          Ok       Down
```

This is an example output from the **show switch stack-ports detail** command.

```
Device# show switch stack-ports detail
1/1 is OK Loopback No
Cable Length 50cm      Neighbor 2

The port can send traffic over this link.</li> </ul>                                                                                          |
| Sync OK             | Whether the link partner sends valid protocol messages to the stack port. <ul style="list-style-type: none"> <li>• No: The link partner does not send valid protocol messages to the stack port.</li> <li>• Yes: The link partner sends valid protocol messages to the port.</li> </ul>                                                                                                                         |
| # Changes to LinkOK | The relative stability of the link.<br><br>If a large number of changes occur in a short period of time, link flapping can occur.                                                                                                                                                                                                                                                                               |

| Field                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Five minute input rate  | The average rate (calculated over a five minute period) at which packets are received, measured in packets/sec.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Five minute output rate | The average rate (calculated over a five minute period) at which packets are transmitted, measured in packets/sec.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| CRC Errors              | <p>Different types of Cyclic Redundancy Check (CRC) errors that are seen on a stack interface:</p> <ul style="list-style-type: none"> <li>• <b>Data CRC</b>: Stack interface data CRC error</li> <li>• <b>Ringword CRC</b>: Stack interface ring word CRC error</li> <li>• <b>InvRingWord</b>: Stack interface invalid ring word error</li> <li>• <b>PcsCodeWord</b>: Stack interface Physical Coding Sublayer (PCS) error</li> </ul> <p>These errors normally occur when a stack interface state changes due to a switchover or a switch reload. You can ignore such errors.</p> <p>But when these error counters increase significantly or when they increase continuously over a period of time, check the stack cable for issues.</p> <p>Use the <b>clear counters</b> command to clear the stack counters for all ports.</p> |

# show switch stack-mode

To display and verify the current stack mode on a device, use the **show switch stack-mode** command in privileged EXEC mode.

## show switch stack-mode

### Command Default

None

### Command Modes

privileged EXEC

### Command History

| Release                     | Modification                 |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

### Usage Guidelines

The **show switch stack-mode** command displays detailed status of the currently running stack mode. Fields displayed for each one of the devices in the stack include: the role of the device, its MAC address, the stack mode after reboot, the current stack mode, and so on.

```
Device# show switch stack-mode
Switch  Role    Mac Address      Version  Mode    Configured  State
-----
1        Member  3c5e.c357.c880           1+1 '    Active'    Ready
*2        Active  547c.69de.cd00    V05     1+1 '    Standby'   Ready

```

The Mode field indicates the current stack mode

The Configured field refers to the device state expected after a reboot.

Single quotation marks ( ' ) indicate that the stack mode has been changed.

# show switch stack-bandwidth

to display the current switch stack bandwidth and the bandwidth after the next reload, use the **show switch stack-bandwidth** command in the Privileged EXEC mode.

**show switch stack-bandwidth**

|                           |                               |                                                                                      |
|---------------------------|-------------------------------|--------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>stack-bandwidth</b>        | Displays the current switch stack bandwidth and the bandwidth after the next reload. |
| <b>Command Default</b>    | None.                         |                                                                                      |
| <b>Command Modes</b>      | Privileged EXEC               |                                                                                      |
| <b>Command History</b>    | <b>Release</b>                | <b>Modification</b>                                                                  |
|                           | Cisco IOS XE Bengaluru 17.5.1 | This command was introduced.                                                         |

The following example shows the sample output for **show switch stack-bandwidth** command.

```
Device#show switch stack-bandwidth
Stack Current Next-boot
Switch# Role Bandwidth State Bandwidth
-----
*1 Active 480G Ready 1000G
2 Standby 480G Ready 1000G
3 Member 480G Ready 1000G
```

# show switch stack-ring speed

To display the current switch stack ring speed and the speed after the next reload, use the **show switch stack-speed** command in the Privileged EXEC mode.

**show switch stack-ring speed**

|                           |                               |                                                                                   |
|---------------------------|-------------------------------|-----------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>speed</b>                  | Displays the current switch stack ring speed and the speed after the next reload. |
| <b>Command Default</b>    | None                          |                                                                                   |
| <b>Command Modes</b>      | Privileged EXEC               |                                                                                   |
| <b>Command History</b>    | <b>Release</b>                | <b>Modification</b>                                                               |
|                           | Cisco IOS XE Bengaluru 17.5.1 | This command was introduced.                                                      |

The following example shows a sample output for the **switch stack-ring speed** command.

```
Device#show switch stack-ring speed
Stack Ring Speed : 1000G
Stack Ring Configuration: Full
Stack Ring Protocol : StackWise
Stack Ring Next-boot Speed: 1000G.
```

# show tech-support stack

To display all switch stack-related information for use by technical support, use the **show tech-support stack** command in privileged EXEC mode.

## show tech-support stack

|                 |                                |                                                                                     |
|-----------------|--------------------------------|-------------------------------------------------------------------------------------|
| Command Modes   | Privileged EXEC (#)            |                                                                                     |
| Command History | Release                        | Modification                                                                        |
|                 | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced.                                                        |
|                 | Cisco IOS XE Gibraltar 16.12.1 | The output for this command was enhanced to include more stack-related information. |

**Usage Guidelines**

The **show tech-support stack** command captures the snapshot of stacking states and information for debug issues. Use this command, when stacking issues (such as stack cable issue, silent reload, switch not coming to ready state, stack crash, and so on) occur.

The output of the **show tech-support stack** command is very long. To better manage this output, you can redirect the output to a file (for example, **show tech-support stack | redirect flash:filename**) in the local writable storage file system or remote file system.

The output of the **show tech stack** command displays the output of the following commands:

### Cisco Catalyst 9300 Series Switches

- **show clock**
- **show version**
- **show running-config**
- **show redundancy switchover history**
- **show switch stack-ports summary**
- **show switch stack-mode**
- **show switch stack-ring speed**
- **show switch stack-bandwidth**
- **show switch detail**
- **show switch neighbors**

The following commands are only available on stacked switches in ready state

- **show platform software stack-mgr switch**
- **show platform software sif switch**
- **show platform hardware fed switch**

- **dir crashinfo:**
- **dir flash:/core**

The following commands are only available on non-stackable switches in ready state:

- **show redundancy switchover history**
- **show platform software fed switch active**
- **show platform software fed switch standby**
- **show stackwise-virtual bandwidth**
- **show stackwise-virtual dual-active-detection**
- **show stackwise-virtual link**
- **show stackwise-virtual neighbors**
- **dir crashinfo:**
- **dir flash:/core**

## Examples

The following is sample output from the **show tech-support stack** command:

```
Device# show tech-support stack
```

```
.
.
.
```

```
-----show switch stack-ports summary -----
```

| Sw#/Port# | Port Status | Neighbor | Cable Length | Link OK | Link Active | Sync OK | #Changes to LinkOK |
|-----------|-------------|----------|--------------|---------|-------------|---------|--------------------|

# stack-mac persistent timer

To enable the persistent MAC address feature, use the **stack-mac persistent timer** command in global configuration mode on the switch stack or on a standalone switch. To disable the persistent MAC address feature, use the **no** form of this command.

**stack-mac persistent timer** [{0time-value}]  
**no stack-mac persistent timer**

| <b>Syntax Description</b>                                                                          | <div> <b>0</b> (Optional) Continues using the MAC address of the current stack's active switch after a new stack's active switch takes over. </div> <hr/> <div> <i>time-value</i> (Optional) Time period in minutes before the stack MAC address changes to that of the new active. The range is 1 to 60 minutes. </div>                                                                                                                                                                                                                                                                                                                                                                             |         |              |                              |                              |

| Release                                                                                            | Modification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |         |              |                              |                              |
| Cisco IOS XE Everest 16.5.1a                                                                       | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |         |              |                              |                              |
| <b>Usage Guidelines</b>                                                                            | <p>By default, the stack MAC address will always be the MAC address of the first active switch, even if a new active switch takes over. The same behavior occurs when you enter the <b>stack-mac persistent timer</b> command or the <b>stack-mac persistent timer 0</b> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                |         |              |                              |                              |
| <br><b>Note</b> | <p>To avoid PAGP flaps, the stack MAC persistent wait timer should be configured as indefinite using the <b>stack-mac persistent timer 0</b>.</p> <hr/> <p>When you enter the <b>stack-mac persistent timer</b> command with a <i>time-value</i>, the stack MAC address will change to that of the new active switch after the period of time that you entered whenever a new switch becomes the active switch. If the previous active switch rejoins the stack during that time period, the stack retains its MAC address for as long as the switch that has that MAC address is in the stack.</p> <p>If the whole stack reloads the MAC address of the active switch is the stack MAC address.</p> |         |              |                              |                              |
| <br><b>Note</b> | <p>If you do not change the stack MAC address, Layer 3 interface flapping does not occur. This also means that a foreign MAC address (a MAC address that does not belong to any of the switches in the stack) could be the stack MAC address. If the switch with this foreign MAC address joins another stack as the active switch, two stacks will have the same stack MAC address. You must use the <b>stack-mac update force</b> command to resolve the conflict.</p>                                                                                                                                                                                                                             |         |              |                              |                              |
| <b>Examples</b>                                                                                    | This example shows how to enable a persistent MAC address:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |              |                              |                              |

```
Device(config)# stack-mac persistent timer
```

You can verify your settings by entering the **show running-config** privileged EXEC command. If enabled, **stack-mac persistent timer** is shown in the output.

# stack-mac update force

To update the stack MAC address to the MAC address of the active switch, use the **stack-mac update force** command in EXEC mode on the active switch.

## stack-mac update force

| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                              |         |              |                              |                              |

|                         |                                                                                                                                                                                                                                                                            |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | By default, the stack MAC address is not changed to the MAC address of the new active switch during a high availability (HA) failover. Use the <b>stack-mac update force</b> command to force the stack MAC address to change to the MAC address of the new active switch. |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

If the switch with the same MAC address as the stack MAC address is currently a member of the stack, the **stack-mac update force** command has no effect. (It does not change the stack MAC address to the MAC address of the active switch.)

### Note

If you do not change the stack MAC address, Layer 3 interface flapping does not occur. It also means that a foreign MAC address (a MAC address that does not belong to any of the switches in the stack) could be the stack MAC address. If the switch with this foreign MAC address joins another stack as the active switch, two stacks will have the same stack MAC address. You must use the **stack-mac update force** command to resolve the conflict.

This example shows how to update the stack MAC address to the MAC address of the active switch:

```
> stack-mac update force
>
```

You can verify your settings by entering the **show switch** privileged EXEC command. The stack MAC address includes whether the MAC address is local or foreign.

# standby console enable

To enable access to the standby console switch, use the **standby console enable** command in redundancy main configuration submode. To disable access to the standby console switch, use the **no** form of this command.

**standby console enable**  
**no standby console enable**

| <b>Syntax Description</b>    | This command has no arguments or keywords.                                                                                                                                                  |         |              |                              |                              |  |

| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                                |         |              |                              |                              |  |
| <b>Usage Guidelines</b>      | This command is used to collect and review specific data about the standby console. The command is useful primarily for Cisco technical support representatives troubleshooting the switch. |         |              |                              |                              |  |

# start maintenance

To put the system into maintenance mode, use the **start maintenance** command in the privileged EXEC mode.

**start maintenance**

|                    |                             |                                        |
|--------------------|-----------------------------|----------------------------------------|
| Syntax Description | start maintenance           | Puts the system into maintenance mode. |
| Command Default    | Disabled.                   |                                        |
| Command Modes      | Privileged EXEC             |                                        |
| Command History    | Release                     | Modification                           |
|                    | Cisco IOS XE Everest 16.6.1 | This command was introduced.           |

**Example:**

The following example shows how to start maintenance mode:

```
Device# start maintenance
```

# stop maintenance

To put the system out of maintenance mode, use the **stop maintenance** command in the privileged EXEC mode.

## stop maintenance

|                 |           |
|-----------------|-----------|
| Command Default | Disabled. |
|-----------------|-----------|

|               |                 |
|---------------|-----------------|
| Command Modes | Privileged EXEC |
|---------------|-----------------|

|                 |                             |                              |
|-----------------|-----------------------------|------------------------------|
| Command History | Release                     | Modification                 |
|                 | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

### Example:

The following example shows how to stop maintenance mode:

```
Device# stop maintenance
```

# switch clear stack-mode

To change the stack mode to N+1 and remove the active and standby assignments of the 1:1 mode, use the **switch clear stack-mode** command in privileged EXEC mode.

## switch clear stack-mode

|                  |                                                                                    |                              |
|------------------|------------------------------------------------------------------------------------|------------------------------|
| Command Default  | None                                                                               |                              |
| Command Modes    | priviledged EXEC                                                                   |                              |
| Command History  | Release                                                                            | Modification                 |
|                  | Cisco IOS XE Everest 16.6.1                                                        | This command was introduced. |
| Usage Guidelines | Use this command to disable the 1:1 redundancy mode and set the stack to N+1 mode. |                              |

```

Device> enable
Device# switch clear stack-mode
WARNING: Clearing the chassis HA configuration will result in the chassis coming up in Stand
Alone mode after reboot.The HA configuration will remain the same on other chassis. Do you
wish to continue? [y/n]? [yes]:

```

# switch priority

To change the stack member priority value, use the **switch priority** command in mode on the .

**switch** *stack-member-number* **priority** *new-priority-value*

## Syntax Description

*stack-member-number*

*new-priority-value*    New stack member priority value. The range is 1 to 15.

## Command Default

The default priority value is 1.

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The new priority value is a factor when a new is elected. When you change the priority value the is not changed immediately.

## Examples

This example shows how to change the priority value of stack member 6 to 8:

```
switch 6 priority 8
Changing the Switch Priority of Switch Number 6 to 8
Do you want to continue?[confirm]
```

# switch provision

To supply a configuration to a new switch before it joins the switch stack, use the **switch provision** command in global configuration mode on the . To delete all configuration information that is associated with the removed switch (a stack member that has left the stack), use the **no** form of this command.

**switch** *stack-member-number* **provision** *type*  
**no switch** *stack-member-number* **provision**

## Syntax Description

*stack-member-number*

*type*

Switch type of the new switch before it joins the stack.

## Command Default

The switch is not provisioned.

## Command Modes

Global configuration

## Command History

### Release

### Modification

Cisco IOS XE Everest 16.5.1a This command was introduced.

## Usage Guidelines

For *type*, enter the model number of a supported switch that is listed in the command-line help strings.

To avoid receiving an error message, you must remove the specified switch from the switch stack before using the **no** form of this command to delete a provisioned configuration.

To change the switch type, you must also remove the specified switch from the switch stack. You can change the stack member number of a provisioned switch that is physically present in the switch stack if you do not also change the switch type.

If the switch type of the provisioned switch does not match the switch type in the provisioned configuration on the stack, the switch stack applies the default configuration to the provisioned switch and adds it to the stack. The switch stack displays a message when it applies the default configuration.

Provisioned information appears in the running configuration of the switch stack. When you enter the **copy running-config startup-config** privileged EXEC command, the provisioned configuration is saved in the startup configuration file of the switch stack.

## Caution

When you use the **switch provision** command, memory is allocated for the provisioned configuration. When a new switch type is configured, the previously allocated memory is not fully released. Therefore, do not use this command more than approximately 200 times, or the switch will run out of memory and unexpected behavior will result.

## Examples

This example shows how to provision a switch with a stack member number of 2 for the switch stack. The **show running-config** command output shows the interfaces associated with the provisioned switch.

```
(config) # switch 2 provision WS-xxxx
(config) # end
```

```
# show running-config | include switch 2
!
interface GigabitEthernet2/0/1
!
interface GigabitEthernet2/0/2
!
interface GigabitEthernet2/0/3
<output truncated>
```

You also can enter the **show switch** user EXEC command to display the provisioning status of the switch stack.

This example shows how to delete all configuration information about stack member 5 when the switch is removed from the stack:

```
(config)# no switch 5 provision
```

You can verify that the provisioned switch is added to or removed from the running configuration by entering the **show running-config** privileged EXEC command.

# switch renumber

To change the stack member number, use the **switch renumber** command in mode on the .

**switch** *current-stack-member-number* **renumber** *new-stack-member-number*

## Syntax Description

*current-stack-member-number*

*new-stack-member-number*

## Command Default

The default stack member number is 1.

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

If another stack member is already using the member number that you just specified, the assigns the lowest available number when you reload the stack member.

### Note

If you change the number of a stack member, and no configuration is associated with the new stack member number, that stack member loses its current configuration and resets to its default configuration.

Do not use the **switch** *current-stack-member-number* **renumber** *new-stack-member-number* command on a provisioned switch. If you do, the command is rejected.

Use the **reload slot** *current stack member number* privileged EXEC command to reload the stack member and to apply this configuration change.

## Examples

This example shows how to change the member number of stack member 6 to 7:

# switch renumber

To change the stack member number, use the **switch renumber** command in mode on the .

**switch** *current-stack-member-number* **renumber** *new-stack-member-number*

## Syntax Description

*current-stack-member-number*

*new-stack-member-number*

## Command Default

The default stack member number is 1.

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

If another stack member is already using the member number that you just specified, the assigns the lowest available number when you reload the stack member.

### Note

If you change the number of a stack member, and no configuration is associated with the new stack member number, that stack member loses its current configuration and resets to its default configuration.

Do not use the **switch** *current-stack-member-number* **renumber** *new-stack-member-number* command on a provisioned switch. If you do, the command is rejected.

Use the **reload slot** *current stack member number* privileged EXEC command to reload the stack member and to apply this configuration change.

## Examples

This example shows how to change the member number of stack member 6 to 7:

# switch stack port

To disable or enable the specified stack port on the member, use the **switch** command in privileged EXEC mode on a stack member.

```
switch stack-member-number stack port port-number {disable | enable}
```

|                    |                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------|
| Syntax Description | <i>stack-member-number</i>                                                                        |
|                    | <b>stack port</b> <i>port-number</i> Specifies the stack port on the member. The range is 1 to 2. |
|                    | <b>disable</b> Disables the specified port.                                                       |
|                    | <b>enable</b> Enables the specified port.                                                         |

**Command Default** The stack port is enabled.

**Command Modes** Privileged EXEC

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** A stack is in the full-ring state when all members are connected through the stack ports and are in the ready state.

The stack is in the partial-ring state when the following occurs:

- All members are connected through their stack ports but some are not in the ready state.
- Some members are not connected through the stack ports.

**Note** Be careful when using the **switch stack-member-number stack port port-number disable** command. When you disable the stack port, the stack operates at half bandwidth.

If you enter the **switch stack-member-number stack port port-number disable** privileged EXEC command and the stack is in the full-ring state, you can disable only one stack port. This message appears:

```
Enabling/disabling a stack port may cause undesired stack changes. Continue?[confirm]
```

If you enter the **switch stack-member-number stack port port-number disable** privileged EXEC command and the stack is in the partial-ring state, you cannot disable the port. This message appears:

```
Disabling stack port not allowed with current stack configuration.
```

## Examples

This example shows how to disable stack port 2 on member 4:

```
# switch 4 stack port 2 disable
```

# switch stack-speed

To configure the bandwidth of the Standard Interchange Format (SIF) ports on a switch stack to 480 Gbps (legacy mode) or 1 Tbps (high speed mode) use the **switch stack-speed** [**high** | **low**] command in the Global configuration mode.

**switch stack-speed** [ **high** | **low** ]

|                           |             |                                                |
|---------------------------|-------------|------------------------------------------------|
| <b>Syntax Description</b> | <b>high</b> | Configures the SIF port bandwidth to 1 Tbps.   |
|                           | <b>low</b>  | Configures the SIF port bandwidth to 480 Gbps. |

**Command Default** The bandwidth is set to low by default.

**Command Modes** Global configuration mode.

| Release                       | Modification                |
|-------------------------------|-----------------------------|
| Cisco IOS XE Bengaluru 17.5.1 | The command was introduced. |

The following example show how to configure the stack speed to high.

```
Device(config)# switch stack-speed high
```

| <b>Related Commands</b> | Command                             | Description                                                                                |
|-------------------------|-------------------------------------|--------------------------------------------------------------------------------------------|
|                         | <b>show switch stack-ring speed</b> | Displays the current stack ring speed and the speed after the next reboot.                 |
|                         | <b>show switch stack-bandwidth</b>  | Displays the current stack bandwidth and what the bandwidth will be after the next reboot. |

# switch switch-number role

To change the role of the device in the stack to either active or standby, use the **switch switch-number role** command in privileged EXEC mode.

**switch switch-number role** {standby | active}

| Syntax Description |                      |                                                        |
|--------------------|----------------------|--------------------------------------------------------|
| Syntax Description | <i>switch-number</i> | Stack member number.                                   |
|                    | <b>standby</b>       | Designates the device as Standby Device for the stack. |
|                    | <b>active</b>        | Designates the device as Active Device for the stack.  |

|                 |      |
|-----------------|------|
| Command Default | None |
|-----------------|------|

|               |                 |
|---------------|-----------------|
| Command Modes | privileged EXEC |
|---------------|-----------------|

| Command History | Release                     | Modification                 |
|-----------------|-----------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

|                  |                                                                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | Use this command to set a device to active or standby role in the stack. The other devices in the stack remain as members of the stack. |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------|

|      |                                                                                                                                                                                                              |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Note | Changing the role of the device results in redundancy mode being configured to 1:1 mode for the stack. If the configured active or standby device does not boot up, then the stack will not be able to boot. |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The following example sets the device number 2 as active device and device number 1 as standby device for the stack.

```
Device> enable
Device# switch 2 role active
WARNING: Changing the switch role may result in redundancy mode being configured to 1+1 mode for this stack. If the configured Active or Standby switch numbers do not boot up, then the stack will not be able to boot. Do you want to continue?[y/n]? : yes

Device# switch 1 role standby
WARNING: Changing the switch role may result in redundancy mode being configured to 1+1 mode for this stack. If the configured Active or Standby switch numbers do not boot up, then the stack will not be able to boot. Do you want to continue?[y/n]? : yes
```

# system mode maintenance

To enter the system mode maintenance configuration mode, use the **system mode maintenance** command in the global configuration mode.

## system mode maintenance

|                           |                                |                                            |
|---------------------------|--------------------------------|--------------------------------------------|
| <b>Syntax Description</b> | <b>system mode maintenance</b> | Enters the maintenance configuration mode. |
| <b>Command Default</b>    | Disabled.                      |                                            |

# arp

To display the contents of the Address Resolution Protocol (ARP) table, use the **arp** command in boot loader mode.

**arp** [*ip\_address*]

|                           |                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>ip_address</i> (Optional) Shows the ARP table or the mapping for a specific IP address. |
|---------------------------|--------------------------------------------------------------------------------------------|

|                        |                                |
|------------------------|--------------------------------|
| <b>Command Default</b> | No default behavior or values. |
|------------------------|--------------------------------|

|                      |             |
|----------------------|-------------|
| <b>Command Modes</b> | Boot loader |
|----------------------|-------------|

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                |
|-------------------------|----------------------------------------------------------------|
| <b>Usage Guidelines</b> | The ARP table contains the IP-address-to-MAC-address mappings. |
|-------------------------|----------------------------------------------------------------|

|                 |                                                  |
|-----------------|--------------------------------------------------|
| <b>Examples</b> | This example shows how to display the ARP table: |
|-----------------|--------------------------------------------------|

```
Device: arp 172.20.136.8  
arp'ing 172.20.136.8...  
172.20.136.8 is at 00:1b:78:d1:25:ae, via port 0
```

# boot

To load and boot an executable image and display the command-line interface (CLI), use the **boot** command in boot loader mode.

**boot** [-post | -n | -p | flag] filesystem:/file-url...

|                    |                    |                                                                                                                                                         |
|--------------------|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>-post</b>       | (Optional) Run the loaded image with an extended or comprehensive power-on self-test (POST). Using this keyword causes POST to take longer to complete. |
|                    | <b>-n</b>          | (Optional) Pause for the Cisco IOS Debugger immediately after launching.                                                                                |
|                    | <b>-p</b>          | (Optional) Pause for the JTAG Debugger right after loading the image.                                                                                   |
|                    | <i>filesystem:</i> | Alias for a file system. Use <b>flash:</b> for the system board flash device; use <b>usbflash0:</b> for USB memory sticks.                              |
|                    | <i>/file-url</i>   | Path (directory) and name of a bootable image. Separate image names with a semicolon.                                                                   |

|                 |                                |
|-----------------|--------------------------------|
| Command Default | No default behavior or values. |
|-----------------|--------------------------------|

|               |             |
|---------------|-------------|
| Command Modes | Boot loader |
|---------------|-------------|

|                 |                              |                              |
|-----------------|------------------------------|------------------------------|
| Command History | <b>Release</b>               | <b>Modification</b>          |
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

When you enter the **boot** command without any arguments, the device attempts to automatically boot the system by using the information in the BOOT environment variable, if any.

If you supply an image name for the *file-url* variable, the **boot** command attempts to boot the specified image.

When you specify boot loader **boot** command options, they are executed immediately and apply only to the current boot loader session.

These settings are not saved for the next boot operation.

Filenames and directory names are case sensitive.

## Example

This example shows how to boot the device using the *new-image.bin* image:

```
Device: set BOOT flash:/new-images/new-image.bin
Device: boot
```

After entering this command, you are prompted to start the setup program.

# cat

To display the contents of one or more files, use the **cat** command in boot loader mode.

**cat** *filesystem:/file-url...*

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                       |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| Syntax Description | <i>filesystem:</i> Specifies a file system.                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                       |
|                    | <i>/file-url</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Specifies the path (directory) and name of the files to display. Separate each filename with a space. |
| Command Default    | No default behavior or values.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                       |

# copy

To copy a file from a source to a destination, use the **copy** command in boot loader mode.

**copy** *filesystem:/source-file-url filesystem:/destination-file-url*

## Syntax Description

|                              |                                                                       |
|------------------------------|-----------------------------------------------------------------------|
| <i>filesystem:</i>           | Alias for a file system. Use <b>usbflash0:</b> for USB memory sticks. |
| <i>/source-file-url</i>      | Path (directory) and filename (source) to be copied.                  |
| <i>/destination-file-url</i> | Path (directory) and filename of the destination.                     |

## Command Default

No default behavior or values.

## Command Modes

Boot loader

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Filenames and directory names are case sensitive.

Directory names are limited to 127 characters between the slashes (/); the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

Filenames are limited to 127 characters; the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

If you are copying a file to a new directory, the directory must already exist.

## Examples

This example shows how to copy a file at the root:

```
Device: copy usbflash0:test1.text usbflash0:test4.text
File "usbflash0:test1.text" successfully copied to "usbflash0:test4.text"
```

You can verify that the file was copied by entering the **dir filesystem:** boot loader command.

## copy startup-config tftp:

To copy the configuration settings from a switch to a TFTP server, use the **copy startup-config tftp:** command in Privileged EXEC mode.

**copy startup-config tftp:** *remote host {ip-address}/{name}*

### Syntax Description

*remote host {ip-address}/{name}* Host name or IP-address of Remote host.

### Command Default

No default behavior or values.

### Command Modes

Privileged EXEC

### Command History

| Release                   | Modification                 |
|---------------------------|------------------------------|
| Cisco IOS XE Release 16.1 | This command was introduced. |

### Usage Guidelines

To copy your current configurations from the switch, run the command **copy startup-config tftp:** and follow the instructions. The configurations are copied onto the TFTP server.

Then, login to another switch and run the command **copy tftp: startup-config** and follow the instructions. The configurations are now copied onto the other switch.

### Examples

This example shows how to copy the configuration settings onto a TFTP server:

```
Device: copy startup-config tftp:
Address or name of remote host []?
```

# copy tftp: startup-config

To copy the configuration settings from a TFTP server onto a new switch, use the **copy tftp: startup-config** command in Privileged EXEC mode on the new switch.

**copy tftp: startup-config** *remote host {ip-address}/{name}*

|                    | Cisco IOS XE Everest 16.5.1a                      | This command was introduced.                  |

The following is sample output from the **debug voice diagnostics mac-address** command and shows how to enable debugging of voice diagnostics for voice client with MAC address of 00:1f:ca:cf:b6:60:

```
Device# debug voice diagnostics mac-address 00:1f:ca:cf:b6:60
```

## debug platform condition feature multicast controlplane

To enable radioactive tracing for the Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) snooping features, use the **debug platform condition feature multicast controlplane** command in privileged EXEC mode. To disable radioactive tracing, use the **no** form of this command.

**debug platform condition feature multicast controlplane** **{igmp-debug | pim}** **group-ip** *{ipv4 address | ipv6 address}* **{mld-snooping | igmp-snooping}** **mac** *mac-address* **ip** *{ipv4 address | ipv6 address}* **vlan** *vlan-id* **level** **{debug | error | info | verbose | warning}**  
**no debug platform condition feature multicast controlplane** **{igmp-debug | pim}** **group-ip** *{ipv4 address | ipv6 address}* **{mld-snooping | igmp-snooping}** **mac** *mac-address* **ip** *{ipv4 address | ipv6 address}* **vlan** *vlan-id* **level** **{debug | error | info | verbose | warning}**

| Syntax                                               | Description                                                               |
|------------------------------------------------------|---------------------------------------------------------------------------|
| <b>igmp-debug</b>                                    | Enables IGMP control radioactive tracing.                                 |
| <b>pim</b>                                           | Enables Protocol Independent Multicast (PIM) control radioactive tracing. |
| <b>mld-snooping</b>                                  | Enables MLD snooping control radioactive tracing.                         |
| <b>igmp-snooping</b>                                 | Enables IGMP snooping control radioactive tracing.                        |
| <b>mac</b> <i>mac-address</i>                        | MAC address of the receiver.                                              |
| <b>group-ip</b> <i>{ipv4 address   ipv6 address}</i> | IPv4 or IPv6 address of the igmp-debug or pim group.                      |
| <b>ip</b> <i>{ipv4 address   ipv6 address}</i>       | IPv4 or IPv6 address of the mld-snooping or igmp-snooping group.          |
| <b>vlan</b> <i>vlan-id</i>                           | VLAN ID. The range is from 1 to 4094.                                     |
| <b>level</b>                                         | Enables debug severity levels.                                            |
| <b>debug</b>                                         | Enables debugging level.                                                  |
| <b>error</b>                                         | Enables error debugging.                                                  |
| <b>info</b>                                          | Enables information debugging.                                            |
| <b>verbose</b>                                       | Enables detailed debugging.                                               |
| <b>warning</b>                                       | Enables warning debugging.                                                |

**Command Modes** Privileged EXEC (#)

|                  | <b>show platform condition</b>            | Displays the currently active debug configuration.                                       |
|                  | <b>debug platform condition</b>           | Filters debugging output for <b>debug</b> commands on the basis of specified conditions. |
|                  | <b>debug platform condition start</b>     | Starts conditional debugging on a system.                                                |
|                  | <b>debug platform condition stop</b>      | Stops conditional debugging on a system.                                                 |
|                  | <b>clear debug platform condition all</b> | Removes the debug conditions applied to a platform.                                      |

# debug platform rep

To enable debugging of Resilient Ethernet Protocol (REP) functions, use the **debug platform rep** command in privileged EXEC mode. To remove the specified condition, use the **no** form of this command.

**debug platform rep {all | error | event | packet | verbose}**  
**no debug platform rep {all | error | event | packet | verbose}**

|                    |                |                                      |
|--------------------|----------------|--------------------------------------|
| Syntax Description | <b>all</b>     | Enables all REP debugging functions. |
|                    | <b>error</b>   | Enables REP error debugging.         |
|                    | <b>event</b>   | Enables REP event debugging.         |
|                    | <b>packet</b>  | Enables REP packet debugging.        |
|                    | <b>verbose</b> | Enables REP verbose debugging.       |

|               |                     |
|---------------|---------------------|
| Command Modes | Privileged EXEC (#) |
|---------------|---------------------|

# debug ilpower powerman

To enable debugging of the power controller and Power over Ethernet (PoE) system, use the **debug ilpower powerman** command in privileged EXEC mode. Use the no form of this command to disable debugging.

**Command Default** This command has no arguments or keywords.

**Command Modes** Privileged EXEC

| Command History | Release                        | Modification                 |
|-----------------|--------------------------------|------------------------------|
|                 | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |

This example shows the output for the **debug ilpower powerman** command for releases prior to Cisco IOS XE Gibraltar 16.10.1:

```
Device# debug ilpower powerman

| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                     |         |              |                              |                              |

|                  |                                                                                                                         |
|------------------|-------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | Filenames and directory names are case sensitive.<br>The device prompts you for confirmation before deleting each file. |
|------------------|-------------------------------------------------------------------------------------------------------------------------|

|          |                                             |
|----------|---------------------------------------------|
| Examples | This example shows how to delete two files: |
|----------|---------------------------------------------|

```
Device: delete usbflash0:test2.text usbflash0:test5.text
Are you sure you want to delete "usbflash0:test2.text" (y/n)?y
File "usbflash0:test2.text" deleted
Are you sure you want to delete "usbflash0:test5.text" (y/n)?y
File "usbflash0:test2.text" deleted
```

You can verify that the files were deleted by entering the **dir usbflash0:** boot loader command.

# dir

To display the list of files and directories on the specified file system, use the **dir** command in boot loader mode.

**dir** *filesystem:/file-url*

| <b>Syntax Description</b>    | <p><i>filesystem:</i> Alias for a file system. Use <b>flash:</b> for the system board flash device; use <b>usbflash0:</b> for USB memory sticks.</p> <p><i>/file-url</i> (Optional) Path (directory) and directory name that contain the contents you want to display. Separate each directory name with a space.</p>                                                                                                                                                                                                                                                                                                                  |         |              |                              |                              |

|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | This command was introduced. |
| <b>Usage Guidelines</b>   | The boot flash is erased during the installation operation. After you perform the emergency install operation, set the BOOT variable in the ROMMON prompt by using the <b>set BOOT flash:packages.conf</b> command, and run the <b>boot flash:packages.conf</b> command manually in boot loader mode to boot the system. If the BOOT variable is not set in the ROMMON prompt, once the system has booted, set the BOOT variable in the device prompt by using the <b>boot system flash:packages.conf</b> command in global configuration mode. |                              |

## Example

This example shows how to perform the emergency install operation using the contents of an image file:

```
Device: emergency-install tftp:<url>
The bootflash will be erased during install operation, continue (y/n)?y
Starting emergency recovery (tftp:<url> ...
Reading full image into memory.....done

|                    | Cisco IOS XE Everest 16.5.1a               | This command was introduced. |

This example shows how to exit the configuration mode:

```
Device(config)# exit
Device#
```

# factory-reset

To erase all customer-specific data and restore a device to its factory configuration, use the **factory-reset** command in privileged EXEC mode.

## Note

The erasure is consistent with the clear method, as described in NIST SP 800-88 Rev. 1.

### Standalone Device

```
factory-reset { all [secure 3-pass] | boot-vars | config }
```

### Stacked Device

```
factory-reset { all [secure 3-pass] | boot-vars | config | switch switch_number | all { all [secure 3-pass] | boot-vars | config } }
```

## Syntax Description

|                                                     |                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b>                                          | Erases all the content from the NVRAM, all Cisco IOS images, including the current boot image, boot variables, startup and running configuration data, and user data.                                                                                                                                                                           |
| <b>secure 3-pass</b>                                | Erases all the content from the device with 3-pass overwrite. <ul style="list-style-type: none"> <li>• Pass 1: Overwrites all addressable locations with binary zeroes.</li> <li>• Pass 2: Overwrites all addressable locations with binary ones.</li> <li>• Pass 3: Overwrites all addressable locations with a random bit pattern.</li> </ul> |
| <b>boot-vars</b>                                    | Erases only the user-added boot variables.                                                                                                                                                                                                                                                                                                      |
| <b>config</b>                                       | Erases only the startup configurations.                                                                                                                                                                                                                                                                                                         |
| <b>switch</b> { <i>switch_number</i>   <b>all</b> } | Erases content on the selected switch: <ul style="list-style-type: none"> <li>• <i>switch-number</i>: Specifies the switch number. The range is from 1 to 16.</li> <li>• <b>all</b>: Selects all the switches in the stack.</li> </ul>                                                                                                          |

| Cisco IOS XE Fuji 16.8.1a     | This command was introduced.                                       |
| Cisco IOS XE Amsterdam 17.2.1 | The <b>secure 3-pass</b> and <b>switch</b> keyword was introduced. |

## Usage Guidelines

The **factory-reset** command is used in the following scenarios:

- To return a device to Cisco for Return Material Authorization (RMA), use this command to remove all the customer-specific data before obtaining an RMA certificate for the device.
- If the key information or credentials that are stored on a device is compromised, use this command to reset the device to factory configuration, and then reconfigure the device.

After the factory reset process is successfully completed, the device reboots and enters ROMMON mode.

## Examples

The following example shows how to erase all the content from a device using the **factory-reset all** command:

```
Device> enable
Device# factory-reset all

The factory reset operation is irreversible for all operations. Are you sure? [confirm]
The following will be deleted as a part of factory reset:
1: Crash info and logs
2: User data, startup and running configuration
3: All IOS images, including the current boot image
4: OBFL logs
5: User added rommon variables
6: Data on Field Replaceable Units(USB/SSD/SATA)
The system will reload to perform factory reset.
It will take some time to complete and bring it to rommon.
You will need to load IOS image using USB/TFTP from rommon after
this operation is completed.
DO NOT UNPLUG THE POWER OR INTERRUPT THE OPERATION
Are you sure you want to continue? [confirm]
```

The following examples show how to perform a factory reset on stacked devices:

```
Device> enable
Device# factory-reset switch all all

The factory reset operation is irreversible for all operations. Are you sure? [confirm]
The following will be deleted as a part of factory reset:
1: Crash info and logs
2: User data, startup and running configuration
3: All IOS images, including the current boot image
4: OBFL logs
5: User added rommon variables
6: Data on Field Replaceable Units(USB/SSD/SATA)
The system will reload to perform factory reset.
It will take some time to complete and bring it to rommon.
You will need to load IOS image using USB/TFTP from rommon after
this operation is completed.
DO NOT UNPLUG THE POWER OR INTERRUPT THE OPERATION
Are you sure you want to continue? [confirm]

| Release                      | Modification                                                                                                                                          |         |              |                              |                              |
| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                          |         |              |                              |                              |

## Example

This example shows how to display a list of available boot loader commands:

```
Device:help
? -- Present list of available commands
arp -- Show arp table or arp-resolve an address
boot -- Load and boot an executable image
cat -- Concatenate (type) file(s)
copy -- Copy a file
delete -- Delete file(s)
dir -- List files in directories
emergency-install -- Initiate Disaster Recovery
...
...
...
unset -- Unset one or more environment variables
version -- Display boot loader version
```

# install

To install Software Maintenance Upgrade (SMU) packages, use the **install** command in privileged EXEC mode.

```
install {abort | activate | file {bootflash: | flash: | harddisk: | webui:} [{auto-abort-timer timer timer
prompt-level {all | none}}]} | add file {bootflash: | flash: | ftp: | harddisk: | http: | https: | rcp: | scp:
| tftp: | webui:} [{activate [{auto-abort-timer timer prompt-level {all | none}commit}]}] | commit |
auto-abort-timer stop | deactivate file {bootflash: | flash: | harddisk: | webui:} | label id {description
description | label-name name} | remove {file {bootflash: | flash: | harddisk: | webui:} | inactive } |
rollback to {base | committed | id {install-ID } | label {label-name}}}
```

## Syntax Description

|                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>abort</b>                                                                                     | Terminates the current install operation.                                                                                                                                                                                                                                                                                                                                          |
| <b>activate</b>                                                                                  | <p>Validates whether the SMU is added through the <b>install add</b> command.</p> <p>This keyword runs a compatibility check, updates package status, and if the package can be restarted, triggers post-install scripts to restart the necessary processes, or triggers a reload for nonrestartable packages.</p>                                                                 |
| <b>file</b>                                                                                      | Specifies the package to be activated.                                                                                                                                                                                                                                                                                                                                             |
| <b>{bootflash:   flash:   harddisk:   webui:}</b>                                                | Specifies the location of the installed package.                                                                                                                                                                                                                                                                                                                                   |
| <b>auto-abort-timer timer</b>                                                                    | (Optional) Installs an auto-abort timer.                                                                                                                                                                                                                                                                                                                                           |
| <b>prompt-level {all   none}</b>                                                                 | <p>(Optional) Prompts a user about installation activities.</p> <p>For example, the <b>activate</b> keyword automatically triggers a reload for packages that require a reload. Before activating the package, a message prompts users about wanting to continue or not.</p> <p>The <b>all</b> keyword allows you to enable prompts. The <b>none</b> keyword disables prompts.</p> |
| <b>add</b>                                                                                       | <p>Copies files from a remote location (through FTP or TFTP) to a device and performs SMU compatibility check for the platform and image versions.</p> <p>This keyword runs base compatibility checks to ensure that a specified package is supported on a platform.</p>                                                                                                           |
| <b>{ bootflash:   flash:   ftp:   harddisk:   http:   https:   rcp:   scp:   tftp:   webui:}</b> | Specifies the package to be added.                                                                                                                                                                                                                                                                                                                                                 |

|                               |                                                                                                                                                                                                                                                                                   |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>commit</b>                 | Makes SMU changes persistent over reloads.<br><br>You can perform a commit after activating a package while the system is up, or after the first reload. If a package is activated, but not committed, it remains active after the first reload, but not after the second reload. |
| <b>auto-abort-timer stop</b>  | Stops the auto-abort timer.                                                                                                                                                                                                                                                       |
| <b>deactivate</b>             | Deactivates an installed package.<br><br><b>Note</b> Deactivating a package also updates the package status and might trigger a process restart or reload.                                                                                                                        |
| <b>label</b> <i>id</i>        | Specifies the ID of the install point to label.                                                                                                                                                                                                                                   |
| <b>description</b>            | Adds a description to the specified install point.                                                                                                                                                                                                                                |
| <b>label-name</b> <i>name</i> | Adds a label name to the specified install point.                                                                                                                                                                                                                                 |
| <b>remove</b>                 | Removes the installed packages.<br><br>The <b>remove</b> keyword can only be used on packages that are currently inactive.                                                                                                                                                        |
| <b>inactive</b>               | Removes all the inactive packages from the device.                                                                                                                                                                                                                                |
| <b>rollback</b>               | Rolls back the data model interface (DMI) package SMU to the base version, the last committed version, or a known commit ID.                                                                                                                                                      |
| <b>to base</b>                | Returns to the base image.                                                                                                                                                                                                                                                        |
| <b>committed</b>              | Returns to the installation state when the last commit operation was performed.                                                                                                                                                                                                   |
| <b>id</b> <i>install-ID</i>   | Returns to the specific install point ID. Valid values are from 1 to 4294967295.                                                                                                                                                                                                  |

| Cisco IOS XE Everest 16.6.1 | This command was introduced.                                                    |
| Cisco IOS XE Fuji 16.9.1    | Hot-patching support is introduced. Sample output updated with hot SMU outputs. |

## Usage Guidelines

An SMU is a package that can be installed on a system to provide a patch fix or security resolution to a released image. This package contains a minimal set of files for patching the release along with metadata that describes the contents of the package.

Packages must be added before the SMU is activated.

A package must be deactivated before it is removed from Flash. A removed packaged must be added again.

The following example shows how to add an install package to a device:

```
Device# install add file
flash:cat9k_iosxe.BLD_SMU_20180302_085005_TWIG_LATEST_20180306_013805.3.SSA.smu.bin

install_add: START Mon Mar  5 21:48:51 PST 2018
install_add: Adding SMU

--- Starting initial file syncing ---
Info: Finished copying
flash:cat9k_iosxe.BLD_SMU_20180302_085005_TWIG_LATEST_20180306_013805.3.SSA.smu.bin to the
selected switch(es)
Finished initial file syncing

Executing pre scripts....

Executing pre scripts done.
--- Starting SMU Add operation ---
Performing SMU_ADD on all members
  [1] SMU_ADD package(s) on switch 1
  [1] Finished SMU_ADD on switch 1
Checking status of SMU_ADD on [1]
SMU_ADD: Passed on [1]
Finished SMU Add operation

SUCCESS: install_add
/flash/cat9k_iosxe.BLD_SMU_20180302_085005_TWIG_LATEST_20180306_013805.3.SSA.smu.bin Mon
Mar  5 21:49:00 PST 2018
```

The following example shows how to activate an install package:

```
Device# install activate file
flash:cat9k_iosxe.BLD_SMU_20180302_085005_TWIG_LATEST_20180306_013805.3.SSA.smu.bin

install_activate: START Mon Mar  5 21:49:22 PST 2018
install_activate: Activating SMU
Executing pre scripts....

Executing pre scripts done.

--- Starting SMU Activate operation ---
Performing SMU_ACTIVATE on all members
  [1] SMU_ACTIVATE package(s) on switch 1
  [1] Finished SMU_ACTIVATE on switch 1
Checking status of SMU_ACTIVATE on [1]
SMU_ACTIVATE: Passed on [1]
Finished SMU Activate operation

SUCCESS: install_activate
/flash/cat9k_iosxe.BLD_SMU_20180302_085005_TWIG_LATEST_20180306_013805.3.SSA.smu.bin Mon
Mar  5 21:49:34 PST 2018
```

The following example shows how to commit an installed package:

```
Device# install commit

install_commit: START Mon Mar  5 21:50:52 PST 2018
install_commit: Committing SMU
Executing pre scripts....

Executing pre scripts done.

|                           | Cisco IOS XE Amsterdam 17.3.2a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | This command was introduced. |
| <b>Usage Guidelines</b>   | <p>The <b>install add file activate reloadfast commit</b> command upgrades the standalone switch or stacked switch using Extended Fast Software Upgrade. The Extended Fast Software Upgrade reduces traffic downtime to less than 30 seconds depending on the switch configuration.</p> <p>For a Border Gateway Protocol-configured (BGP-configured) standalone switch, use the <b>bgp graceful-restart</b> command to enable Nonstop Forwarding (NSF) awareness before upgrading the software.</p> <p>For a Border Gateway Protocol-configured (BGP-configured) stacked switch, use the <b>bgp graceful-restart all</b> command to enable Nonstop Forwarding (NSF) awareness before upgrading the switch.</p> <p>For an Open Shortest Path First Version 3-configured (OSPFv3-configured) standalone switch, use the <b>ipv6 nd reachable-time</b> command to set the timeout limit, and the <b>snmp ifmib ifindex persist</b> command to enable Simple Network Management Protocol (SNMP) interface index (ifIndex) persistence globally, and the <b>interface-id snmp-if-index</b> command to enable SNMP ifIndex persistence on the interface, before upgrading the software.</p> <p>For an Intermediate System-to-Intermediate System-configured (IS-IS-configured) stacked switch, use either the <b>nsf cisco</b> or <b>nsf ietf</b> command before upgrading the switch.</p> |                              |

## Examples

### Standalone Switch

The following example shows how to upgrade a standalone switch for a configuration other than BGP or OSPFv3:

```
Device> enable
Device# install add file bootflash: cat9k_iosxe.17.03.02.SPA.bin activate reloadfast commit
```

The following example shows how to upgrade a standalone switch for a BGP configuration:

```
Device> enable
Device# configure terminal
Device(config)# router bgp 65000
Device(config-router)# bgp graceful-restart
Device(config-router)# end
Device# write memory
Device# install add file bootflash: cat9k_iosxe.17.03.02.SPA.bin activate reloadfast commit
```

The following example shows how to upgrade a standalone switch for an OSPFv3 configuration:

```

Device> enable
Device# configure terminal
Device(config)# ipv6 nd reachable-time 3600000
Device(config)# snmp ifmib ifindex persist
Device(config)# router OSPFv3 1
Device(config-router)# router-id 192.0.2.5
Device(config-router)# interface-id snmp-if-index
Device(config-router)# end
Device# write memory
Device# install add file bootflash: cat9k_iosxe.17.03.02.SPA.bin activate reloadfast commit

```

### Stacked Switch

The following example shows how to upgrade a stacked switch for a configuration other than BGP or OSPFv3:

```

Device> enable
Device# install add file bootflash: cat9k_iosxe.17.03.02.SPA.bin activate reloadfast commit

```

The following example shows how to upgrade a stacked switch for a BGP configuration:

```

Device> enable
Device# configure terminal
Device(config)# router bgp 65000
Device(config-router)# bgp graceful-restart all
Device(config-router)# end
Device# write memory
Device# install add file bootflash: cat9k_iosxe.17.03.02.SPA.bin activate reloadfast commit

```

The following example shows how to upgrade a stacked switch for an IS-IS configuration:

```

Device> enable
Device# configure terminal
Device(config)# router isis tag1
Device(config-router)# nsf cisco
Device(config-router)# end
Device# write memory
Device# install add file bootflash: cat9k_iosxe.17.03.02.SPA.bin activate reloadfast commit

```

# ip ssh bulk-mode

To enable the Secure Shell (SSH) bulk data transfer mode, use the **ip ssh bulk-mode** command in global configuration mode. To disable this mode, use the **no** form of this command.

**ip ssh bulk-mode**  
**no ip ssh bulk-mode**

|                        | Cisco IOS XE Amsterdam 17.2.1 | This command was introduced. |

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | SSH bulk mode enables optimizing the throughput performance of procedures that involve the transfer of large amounts of data. Secure Copy feature has been enhanced to leverage bulk mode optimizations. We recommend that you enable the <b>ip ssh bulk-mode</b> command for transferring large files only because this operation consumes more system resources such as, CPU and memory, compared to other file transfer operations. Do not use this command when the system resources are heavily loaded, and disable this command after the required file transfers are completed. |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Note**

- Bulk data transfer mode does not support the time or volume-based SSH rekey functionality.
- Bulk data transfer mode is not supported with SSH Version 1.
- Do not configure the **ip ssh window-size** command if the **ip ssh bulk-mode** command is enabled.

**Examples**

The following example shows how to enable bulk data transfer mode on an SSH server:

```
Device> enable
Device# configure terminal
Device(config)# ip ssh bulk-mode
Device(config)# exit
```

**Related Commands**

| Command                   | Description                                    |
|---------------------------|------------------------------------------------|
| <b>ip ssh window-size</b> | Modifies the Secure Copy Protocol window size. |

# l2 traceroute

To enable the Layer 2 traceroute server, use the **l2 traceroute** command in global configuration mode. Use the **no** form of this command to disable the Layer 2 traceroute server.

**l2 traceroute**  
**no l2 traceroute**

## Syntax Description

This command has no arguments or keywords.

## Command Modes

Global configuration (config#)

## Command History

| Release                      | Modification                |
|------------------------------|-----------------------------|
| Cisco IOS XE Everest 16.5.1a | The command was introduced. |

## Usage Guidelines

Layer 2 traceroute is enabled by default and opens a listening socket on User Datagram Protocol (UDP) port 2228. To close the UDP port 2228 and disable Layer 2 traceroute, use the **no l2 traceroute** command in global configuration mode.

The following example shows how to configure Layer 2 traceroute using the **l2 traceroute** command.

```
Device# configure terminal  
Device(config)# l2 traceroute
```

# license air level

To configure AIR licenses on a wireless controller that is connected to Cisco Catalyst Access, Core, and Aggregation Switches, enter the **license air level** command in global configuration mode. To revert to the default setting, use the **no** form of this command.

**license air level** { **air-network-advantage** [ **addon air-dna-advantage** ] | **air-network-essentials** [ **addon air-dna-essentials** ] }

**no license air level**

|                    |                                 |                                                                                                                                                                              |

|-----------------|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced.                                                                                                                                                            |
|                 | Cisco IOS XE Amsterdam 17.3.2a | This command continues to be available and applicable with the introduction of Smart Licensing Using Policy in this release. See the <i>Usage Guidelines</i> section below for details. |

|                  |                                                                                                                                                                                                                                                                                   |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | In the Smart Licensing Using Policy environment, you can use the <b>license air level</b> command to change the license level being used on the product instance, or to additionally configure an add-on license on the product instance. The change is effective after a reload. |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The licenses that can be configured are:

- AIR Network Essential
- AIR Network Advantage
- AIR DNA Essential
- AIR DNA Advantage

You can configure AIR DNA Essential or AIR DNA Advantage license level, and on term expiry, you can move to the Network Advantage or Network Essentials license level, if you do not want to renew the DNA license.

Every connecting Access Point requires a Cisco DNA Center License to leverage the unique value properties of the controller.

For more information, see the [Cisco Catalyst 9800 Series Wireless Controller Software Configuration Guide](#) for the required release.

### Examples

The following example shows how to configure the AIR DNA Essential license level:

```
Device# configure terminal
Device(config)# license air level network-essentials addon air-dna-essentials
```

The following example shows how to configure the AIR DNA Advantage license level:

```
Device# configure terminal
Device(config)# license air level air-network-advantage addon air-dna-advantage
```

# license boot level

To boot a new software license on the device, use the **license boot level** command in global configuration mode. Use the **no** form of this command to remove all software licenses from the device.

**license boot level** { **network-advantage** [ **addon dna-advantage** ] | **network-essentials** [ **addon dna-essentials** ] }

**no license boot level**

|                           |                                                                                                                                                                                                                              |                                                                                                                                                                                         |

See the <i>Usage Guidelines</i> section below for details. |
|                           |                                                                                                                                                                                                                              |                                                                                                                                                                                         |
| <b>Usage Guidelines</b>   | The software features available on Cisco Catalyst 9000 Series Switches fall under these base or add-on license levels:                                                                                                       |                                                                                                                                                                                         |
|                           | Base Licenses:                                                                                                                                                                                                               |                                                                                                                                                                                         |
|                           | <ul style="list-style-type: none"> <li>• Network Essentials</li> <li>• Network Advantage—Includes features available with the Network Essentials license and more.</li> </ul>                                                |                                                                                                                                                                                         |
|                           | Add-on Licenses:                                                                                                                                                                                                             |                                                                                                                                                                                         |
|                           | <ul style="list-style-type: none"> <li>• DNA Essentials</li> <li>• DNA Advantage—Includes features available with the Network Essentials license and more.</li> </ul>                                                        |                                                                                                                                                                                         |
|                           | Base licenses are permanent or perpetual licenses.                                                                                                                                                                           |                                                                                                                                                                                         |
|                           | Add-on licenses are subscription or term licenses and can be purchased for a three, five, or seven year period. Base licenses are a prerequisite for add-on licenses. See the release notes for more information about this. |                                                                                                                                                                                         |

The sections below provide information about using the **license boot level** command in the earlier Smart Licensing environment, and in the Smart Licensing Using Policy environment.

**Smart Licensing Using Policy:** If the software version on the device (also referred to as a product instance) is Cisco IOS XE Amsterdam 17.3.2a or a later release, Smart Licensing Using Policy is enabled by default and you can use the **license boot level** command for these purposes:

- To change the base or add-on license levels being used on the product instance.  
For example, if you are using Network Essentials and you want to use Network Advantage with the next reload, or if you are using DNA Advantage and you want to use DNA Essentials with the next reload.
- To add or remove add-on license levels being used on the product instance.  
For example, if you are using only Network Essentials and you want to use DNA Essentials with the next reload, or if you are using DNA Advantage and you do not want to use the add-on after the next reload.

The notion of evaluation or expired licenses does not exist in Smart Licensing Using Policy.

After the command is configured, the configured license is effective after the next reload. License usage continues to be recorded on device and this changed licensing consumption information may have to be sent via the next Resource Utilization Measurement Report (RUM report) to CSSM. The reporting requirements and frequency are determined by the policy that is applied. See the *Usage Reporting* section of the **show license status** command output. For more information about Smart Licensing Using Policy, in the software configuration guide of the required release, see *System Management > Smart Licensing Using Policy*.

**Smart Licensing:** If the software version on the device is Cisco IOS XE Amsterdam 17.3.1 or an earlier release, Smart Licensing is enabled by default you can use the **license boot level** command for these purposes:

- Downgrade or upgrade licenses
- Enable or disable an evaluation or extension license
- Clear an upgrade license

This command forces the licensing infrastructure to boot the configured license level instead of the license hierarchy maintained by the licensing infrastructure for a given module:

- When the switch reloads, the licensing infrastructure checks the configuration in the startup configuration for licenses, if any. If there is a license in the configuration, the switch boots with that license. If there is no license, the licensing infrastructure follows the image hierarchy to check for licenses.
- If the forced boot evaluation license expires, the licensing infrastructure follows the regular hierarchy to check for licenses.
- If the configured boot license has already expired, the licensing infrastructure follows the hierarchy to check for licenses.

The following example shows how to configure the Network Essentials license at the next reload:

```
Device# configure terminal
Device(config)# license boot level network-essentials
Device(config)# exit
Device# copy running-config startup-config
Device# reload
```

The following example shows how to activate the DNA Essentials license at the next reload:

```
Device# configure terminal  
Device(config)# license boot level network-essentials add-on dna-essentials  
Device(config)# exit  
Device# copy running-config startup-config  
Device# reload
```

## license smart (global config)

To configure licensing-related settings such as the mode of transport and the URL that the product instance uses to communicate with Cisco Smart Software Manager (CSSM), or Cisco Smart Licensing Utility (CSLU), or Smart Software Manager On-Prem (SSM On-Prem), to configure the usage reporting interval, to configure the information that must be excluded or included in a license usage report (RUM report), enter the **license smart** command in global configuration mode. Use the **no** form of the command to revert to default values.

```
license smart { custom_id ID | enable | privacy { all | hostname | version } | proxy { address
address_hostname | port port } | reservation | server-identity-check | transport { automatic | callhome
| cslu | off | smart } | url { url | cslu cslu_or_on-prem_url | default | smart smart_url | utility secondary_url
} | usage { customer-tags { tag1 | tag2 | tag3 | tag4 } tag_value | interval interval_in_days } | utility [
customer_info { city city | country country | postalcode postalcode | state state | street street } ] }
```

```
no license smart { custom_id | enable | privacy { all | hostname | version } | proxy { address
address_hostname | port port } | reservation | server-identity-check | transport | url { url | cslu
cslu_or_on-prem_url | default | smart smart_url | utility secondary_url } | usage { customer-tags { tag1
| tag2 | tag3 | tag4 } tag_value | interval interval_in_days } | utility [ customer_info { city city | country
country | postalcode postalcode | state state | street street } ] }
```

### Syntax Description

|                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>custom_id</b> <i>ID</i>                                       | Although available on the CLI, this option is not supported.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>enable</b>                                                    | Although visible on the CLI, configuring this keyword has no effect. Smart licensing is always enabled.                                                                                                                                                                                                                                                                                                                                          |
| <b>privacy</b> { <b>all</b>   <b>hostname</b>   <b>version</b> } | Enables you to <i>leave out</i> certain information from the usage reports that are sent to CSSM. Choose from the following options: <ul style="list-style-type: none"> <li>• <b>all</b>: Sends only the minimal licensing information in any communication.</li> <li>• <b>hostname</b>: Excludes the hostname from any communication.</li> <li>• <b>version</b>: Excludes the product instance agent version from any communication.</li> </ul> |

---

```
proxy { address address_hostname | port port
}
```

Configures a proxy for license usage synchronization with CSLU or CSSM. This means that you can use this option to configure a proxy only if the transport mode is **license smart transport smart** (CSSM), or **license smart transport cslu** (CSLU).

However, you cannot configure a proxy for license usage synchronization in an SSM On-Prem deployment, which also uses **license smart transport cslu** as the transport mode.

Configure the following options:

- **address address\_hostname**: Configures the proxy address.

For *address\_hostname*, enter the IP address or hostname of the proxy.

- **port port**: Configures the proxy port.

For *port*, enter the proxy port number.

---

#### reservation

Enables or disables a license reservation feature.

**Note** Although available on the CLI, this option is not applicable because license *reservation* is not applicable in the Smart Licensing Using Policy environment.

---

#### server-identity-check

Enables or disables the HTTP secure server identity check.

---

```
transport { automatic | callhome | cslu | off
| smart }
```

Configures the mode of transport the product instance uses to communicate with CSSM. Choose from the following options:

- **automatic**: Sets the transport mode **cslu**.
- **callhome**: Enables Call Home as the transport mode.
- **cslu**: Enables CSLU as the transport mode. This is the default transport mode.

The same keyword applies to both CSLU and SSM On-Prem, but the URLs are different. See **cslu cslu\_or\_on-prem\_url** in the following row.

- **off**: Disables all communication from the product instance.
  - **smart**: Enables Smart transport.
-

---

```
url { url | cslu clu_url | default | smart  
smart_url | utility secondary_url }
```

---

Sets a URL for the configured transport mode. Choose from the following options:

- **url**: If you have configured the transport mode as **callhome**, configure this option. Enter the CSSM URL exactly as follows:

```
https://tools.cisco.com/its/service/oddbe/services/DDCEService
```

The **no license smart url url** command reverts to the default URL.

- **cslu cslu\_or\_on-prem\_url**: If you have configured the transport mode as **cslu**, configure this option, with the URL for CSLU or SSM On-Prem, as applicable:

- If you are using CSLU, enter the URL as follows:

```
http://<cslu_ip_or_host>:8182/cslu/v1/pi
```

For <cslu\_ip\_or\_host>, enter the hostname or the IP address of the windows host where you have installed CSLU. 8182 is the port number and it is the only port number that CSLU uses.

The **no license smart url cslu cslu\_or\_on-prem\_url** command reverts to

```
http://cslu-local:8182/cslu/v1/pi
```

- If you are using SSM On-Prem, enter the URL as follows:

```
http://<ip>/cslu/v1/pi/<tenant ID>
```

For <ip>, enter the hostname or the IP address of the server where you have installed SSM On-Prem. The <tenantID> must be the default local virtual account ID.

**Tip** You can retrieve the entire URL from SSM On-Prem. In the software configuration guide of the required release (17.3.x onwards), see *System Management > Smart Licensing Using Policy > Task Library for Smart Licensing Using Policy > Retrieving the Transport URL (SSM On-Prem UI)*.

The **no license smart url cslu cslu\_or\_on-prem\_url** command reverts to

```
http://cslu-local:8182/cslu/v1/pi
```

- **default**: Depends on the configured transport mode. Only the **smart** and **cslu** transport modes are supported with this option.

If the transport mode is set to **cslu**, and you configure

**license smart url default**, the CSLU URL is configured automatically

(<https://cslu-local:8182/cslu/v1/pi>).

If the transport mode is set to **smart**, and you configure **license smart url default**, the Smart URL is configured automatically

(<https://smartreceiver.cisco.com/licservice/license>).

- **smart smart\_url**: If you have configured the transport type as **smart**, configure this option. Enter the URL exactly as follows:

<https://smartreceiver.cisco.com/licservice/license>

When you configure this option, the system automatically creates a duplicate of the URL in **license smart url url**. You can ignore the duplicate entry, no further action is required.

The **no license smart url smartsmart\_url** command reverts to the default URL.

- **utility smart\_url**: Although available on the CLI, this option is not supported.
-

**usage** { **customer-tags** { **tag1** | **tag2** | **tag3** | **tag4** } *tag\_value* | **interval** *interval\_in\_days* } Configures usage reporting settings. You can set the following options:

- **customer-tags** { **tag1** | **tag2** | **tag3** | **tag4** } *tag\_value*: Defines strings for inclusion in data models, for telemetry. Up to 4 strings (or tags) may be defined.

For *tag\_value*, enter the string value for each tag that you define.

- **interval** *interval\_in\_days*: Sets the reporting interval in days. By default the RUM report is sent every 30 days. The valid value range is 1 to 3650.

If you set the value to zero, RUM reports are not sent, regardless of what the applied policy specifies - this applies to topologies where CSLU or CSSM may be on the receiving end.

If you set a value that is greater than zero and the transport type is set to **off**, then, between the *interval\_in\_days* and the policy value for *Ongoing reporting frequency (days)* :, the lower of the two values is applied. For example, if *interval\_in\_days* is set to 100, and the value in the in the policy says *Ongoing reporting frequency (days) : 90*, RUM reports are sent every 90 days.

If you do not set an interval, and the default is effective, the reporting interval is determined entirely by the policy value. For example, if the default value is effective and only unenforced licenses are in use, if the policy states that reporting is not required, then RUM reports are not sent.

**utility** [ **customer\_info** { **city** *city* | **country** *country* | **postalcode** *postalcode* | **state** *state* | **street** *street* } ] Although visible on the CLI, this option is not supported.

#### Command Default

Cisco IOS XE Amsterdam 17.3.1 or earlier: Smart Licensing is enabled by default

Cisco IOS XE Amsterdam 17.3.2a and later: Smart Licensing Using Policy is enabled by default.

#### Command Modes

Global config (Device(config)# )

#### Command History

| Release                  | Modification                 |
|--------------------------|------------------------------|
| Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

| Release                           | Modification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cisco IOS XE<br>Amsterdam 17.3.2a | <p>The following keywords and variables were introduced with Smart Licensing Using Policy:</p> <ul style="list-style-type: none"> <li>Under the <b>url</b> keyword, these options were introduced:           <br/><br/>           { <b>cslu</b> <i>cslu_url</i>   <b>smart</b> <i>smart_url</i> }         </li> <li>Under the <b>transport</b> keyword, these options were introduced:           <br/><br/>           { <b>cslu</b>   <b>off</b> }         </li> </ul> <p>Further, the default transport type was changed from <b>callhome</b>, to <b>cslu</b>.</p> <ul style="list-style-type: none"> <li><b>usage</b> { <b>customer-tags</b> { <b>tag1</b>   <b>tag2</b>   <b>tag3</b>   <b>tag4</b> } <i>tag_value</i>   <b>interval</b> <i>interval_in_days</i> }</li> </ul> <p>The following keywords and variables under the <b>license smart</b> global command are deprecated and no longer available on the CLI: <b>enable</b> and <b>conversion automatic</b>.</p> |
| Cisco IOS XE<br>Amsterdam 17.3.3  | <p>SSM On-Prem support was introduced. For product instance-initiated communication in an SSM On-Prem deployment, the existing <b>[no ]license smart url csclu</b> <i>cslu_or_on-prem_url</i> command supports the configuration of a URL for SSM On-Prem as well. But the required URL format for SSM On-Prem is:</p> <pre>http://&lt;ip&gt;/cslu/v1/pi/&lt;tenant ID&gt;.</pre> <p>The corresponding transport mode that must be configured is also an existing command (<b>license smart transport csclu</b>).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Usage Guidelines

The reporting interval that you configure (**license smart usage interval** *interval\_in\_days* command), determines the date and time at which the product instance sends out the RUM report. If the scheduled interval coincides with a communication failure, the product instance attempts to send out the RUM report for up to four hours after the scheduled time has expired. If it is still unable to send out the report (because the communication failure persists), the system resets the interval to 15 minutes. Once the communication failure is resolved, the system reverts the reporting interval to the value that you last configured.

The system message you may see in case of a communication failure is %SMART\_LIC-3-COMM\_FAILED. For information about resolving this error and restoring the reporting interval value, in the software configuration guide of the required release (17.3.x onwards), see *System Management > Smart Licensing Using Policy > Troubleshooting Smart Licensing Using Policy*.

- [Examples for Usage Reporting Options, on page 1822](#)

## Examples for Data Privacy

The following examples show how to configure data privacy related information using **license smart privacy** command in global configuration mode. The accompanying **show license status** output displays configured information.

No private information is sent:

```
Device# configure terminal
Device(config)# license smart privacy all
Device(config)# license smart transport callhome
Device(config)# license smart url
https://tools.cisco.com/its/service/oddce/services/DDCEService
Device(config)# exit
Device# show license status
<output truncated>
Data Privacy:
  Sending Hostname: no
  Callhome hostname privacy: ENABLED
  Smart Licensing hostname privacy: ENABLED
  Version privacy: ENABLED

Transport:
  Type: Callhome
<output truncated>
```

Agent version on the product instance is not sent:

```
Device# configure terminal
Device(config)# license smart privacy version
Device(config)# license smart transport callhome
Device(config)# license smart url
https://tools.cisco.com/its/service/oddce/services/DDCEService
Device(config)# exit
Device# show license status
<output truncated>
Data Privacy:
  Sending Hostname: yes
  Callhome hostname privacy: DISABLED
  Smart Licensing hostname privacy: DISABLED
  Version privacy: ENABLED

Transport:
  Type: Callhome
<output truncated>
```

## Examples for Transport Type and URL

The following examples show how to configure some of the transport types using the **license smart transport** and the **license smart url** commands in global configuration mode. The accompanying **show license all** output displays configured information.

Transport: **cslu**:

```
Device# configure terminal
Device(config)# license smart transport cslu
Device(config)# license smart url default
Device(config)# exit
Device# show license all
<output truncated>
Transport:
  Type: cslu
  Cslu address: http://192.168.0.1:8182/cslu/v1/pi
  Proxy:
    Not Configured
<output truncated>
```

Transport: **smart**:

```

Device# configure terminal
Device(config)# license smart transport smart
Device(config)# license smart url smart https://smartreceiver.cisco.com/licservice/license
Device(config)# exit
Device# show license all
<output truncated>
Transport:
  Type: Smart
  URL: https://smartreceiver-stage.cisco.com/licservice/license
  Proxy:
    Not Configured
<output truncated>

```

### Examples for Usage Reporting Options

The following examples show how to configure some of the usage reporting settings using the **license smart usage** command in global configuration mode. The accompanying **show running-config** output displays configured information.

Configuring the **customer-tag** option:

```

Device# configure terminal
Device(config)# license smart usage customer-tags tag1 SA/VA:01
Device(config)# exit
Device# show running-config | include tag1
license smart usage customer-tags tag1 SA/VA:01

```

Configuring a narrower reporting interval than the currently applied policy:

```

Device# show license status
<output truncated>
Usage Reporting:
Last ACK received: Sep 22 13:49:38 2020 PST
Next ACK deadline: Dec 21 12:02:21 2020 PST
Reporting push interval: 30 days
Next ACK push check: Sep 22 12:20:34 2020 PST
Next report push: Oct 22 12:05:43 2020 PST
Last report push: Sep 22 12:05:43 2020 PST
Last report file write: <none>
<output truncated>

```

```

Device# configure terminal
Device(config)# license smart usage interval 20
Device(config)# exit
Device# show license status
<output truncated>

```

```

Usage Reporting:
Last ACK received: Sep 22 13:49:38 2020 PST
Next ACK deadline: Nov 22 12:02:21 2020 PST
Reporting push interval: 20 days
Next ACK push check: Sep 22 12:20:34 2020 PST
Next report push: Oct 12 12:05:43 2020 PST
Last report push: Sep 22 12:05:43 2020 PST
Last report file write: <none>
<output truncated>

```

## license smart (privileged EXEC)

To configure licensing functions such as requesting or returning authorization codes, saving Resource Utilization Measurement reports (RUM reports), importing a file on to a product instance, establishing trust with Cisco Smart Software Manager (CSSM), synchronizing the product instance with CSSM, or Cisco Smart License Utility (CSLU), or Smart Software Manager On-Prem (SSM On-Prem), and removing licensing information from the product instance, enter the **license smart** command in privileged EXEC mode with the corresponding keyword or argument.

```
license smart { authorization { request { add | replace } feature_name { all | local } | return { all | local } { offline [ path ] | online } } | clear eventlog | export return { all | local } feature_name | factory reset | import file_path | save { trust-request filepath_filename | usage { all | days days | rum-id rum-ID | unreported } { file file_path } } | sync { all | local } | trust idtoken id_token_value { local | all } { { force } }
```

| Syntax Description | smart             | Provides options for Smart Licensing.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | authorization     | Provides the option to request for, or return, authorization codes.<br><br>Authorization codes are required <i>only</i> if you use licenses with enforcement type: export-controlled or enforced.                                                                                                                                                                                                                                                                      |
|                    | request           | Requests an authorization code from CSSM, CSLU (CSLU in-turn fetches it from CSSM), or SSM On-Prem and installs it on the product instance.                                                                                                                                                                                                                                                                                                                            |
|                    | add               | Adds the requested license to the existing authorization code. The new authorization code will contain all the licenses of the existing authorization code and the requested license.                                                                                                                                                                                                                                                                                  |
|                    | replace           | Replaces the existing authorization code. The new authorization code will contain only the requested license. All licenses in the current authorization code are returned.<br><br>When you enter this option, the product instance verifies if licenses that correspond to the authorization codes that will be removed, are in-use. If licenses are being used, an error message tells you to first disable the corresponding features.                               |
|                    | feature_name      | Name of the license for which you are requesting an authorization code.                                                                                                                                                                                                                                                                                                                                                                                                |
|                    | all               | Performs the action for all product instances in a High Availability configuration.                                                                                                                                                                                                                                                                                                                                                                                    |
|                    | local             | Performs the action for the <i>active</i> product instance. This is the default option.                                                                                                                                                                                                                                                                                                                                                                                |
|                    | return            | Returns an authorization code back to the license pool in CSSM.                                                                                                                                                                                                                                                                                                                                                                                                        |
|                    | offline file_path | Means the product instance is not connected to CSSM. The authorization code is returned offline. This option requires you to print the return code to a file.<br><br>Optionally, you can also specify a path to save the file. The file format can be any readable format, such as <code>.txt</code><br><br>If you choose the offline option, you must complete the additional step of copying the return code from the CLI or the saved file and entering it in CSSM. |

|                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Cisco IOS XE Amsterdam 17.3.3  | Support for SSM On-Prem was introduced. You can perform licensing-related tasks such as saving Resource Utilization Measurement reports (RUM reports), importing a file on to a product instance, synchronizing the product instance, returning authorization codes, and removing licensing information from the product instance in an SSM On-Prem deployment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Usage Guidelines****Overwriting a Trust Code**

Use case for the **force** option when configuring the **license smart trust idtoken** command: You use same token for all the product instances that are part of one Virtual Account. If the product instance has moved from one account to another (for instance, because it was added to a High Availability set-up, which is part of another Virtual Account), then there may be an existing trust code you have to overwrite.

### Removing Licensing Information

Entering the **license smart factory reset** command removes all licensing information (except the licenses in-use) from the product instance, including any authorization codes, RUM reports etc. Therefore, we recommend the use of this command only if the product instance is being returned (Return Material Authorization, or RMA), or being decommissioned permanently. We also recommend that you send a RUM report to CSSM, before you remove licensing information from the product instance - this is to ensure that CSSM has up-to-date usage information.

### Authorization Codes and License Reservations:

Options relating to authorization codes and license reservations:

- Since there are no export-controlled or enforced licenses on any of the Cisco Catalyst Access, Core, and Aggregation Switches, the following commands are not applicable:
  - **license smart authorization request { add | replace } feature\_name { all | local }**
  - **license smart export return**
- The following option is applicable and required for any SLR authorization codes you may want to return:

**license smart authorization return { all | local } { offline [ path ] | online }**

### Examples

- [Example for Saving Licensing Usage Information, on page 1826](#)
- [Example for Installing a Trust Code, on page 1827](#)
- [Example for Returning an SLR Authorization Code, on page 1827](#)

### Example for Saving Licensing Usage Information

The following example shows how you can save license usage information on the product instance. You can use this option to fulfil reporting requirements in an air-gapped network. In the example, the file is first save to flash memory and then copied to a TFTP location:

```
Device> enable
Device# license smart save usage unreported file flash:RUM-unrep.txt
Device# copy flash:RUM-unrep.txt tftp://192.168.0.1//auto/tftp-user/user01/
Address or name of remote host [192.168.0.1]?
Destination filename [//auto/tftp-user/user01/RUM-unrep.txt]?
!!
15128 bytes copied in 0.161 secs (93963 bytes/sec)
```

After you save RUM reports to a file, you must upload it to CSSM (from a workstation that has connectivity to the internet, and Cisco).

### Example for Installing a Trust Code

The following example shows how to install a trust code even if one is already installed on the product instance. This requires connectivity to CSSM. The accompanying **show license status** output shows sample output after successful installation:

Before you can install a trust code, you must generate a token and download the corresponding file from CSSM.

Use the **show license status** command (Trust Code Installed:) to verify results.

```
Device> enable
Device# license smart trust idtoken
NGMwMjk5mYtNZaxMS00NzMZmtgWm local force
Device# show license status
<output truncated>
Trust Code Installed:
  Active: PID:C9500-24Y4C,SN:CAT2344L4GH
         INSTALLED on Sep 04 01:01:46 2020 EDT
  Standby: PID:C9500-24Y4C,SN:CAT2344L4GJ
         INSTALLED on Sep 04 01:01:46 2020 EDT
<output truncated>
```

### Example for Returning an SLR Authorization Code

The following example shows how to remove and return an SLR authorization code. Here the code is returned offline (no connectivity to CSSM). The accompanying **show license all** output shows sample output after successful return:

```
Device> enable
Device# license smart authorization return local online
Enter this return code in Cisco Smart Software Manager portal:
UDI: PID:C9500-16X,SN:FCW2233A5ZV
Return code: Cr9JHx-L1x5Rj-ftwzgL-h9QZAU-LE5DT1-babWeL-FABPt9-Wr1Dn7-Rp7
Device# configure terminal
Device(config)# no license smart reservation

Device# show license all
<output truncated>
License Authorizations
=====
Overall status:
  Active: UDI: PID:C9500-16X,SN:FCW2233A5ZV
         Status: NOT INSTALLED
         Last return code: Cr9JHx-L1x5Rj-ftwzgL-h9QZAU-LE5DT1-babWeL-FABPt9-Wr1Dn7-Rp7
<output truncated>
```

Complete the additional step of copying the return code from the CLI or the saved file and entering it in CSSM.

# line auto-consolidation

To consolidate multiple line configurations of the same submode into a single line, use the **line auto-consolidation** command in global configuration mode. Auto-consolidation of line configurations is enabled by default. Starting with the Cisco IOS XE Bengaluru 17.4.1 you can disable auto consolidation by using the **no** form of the command.

**line auto-consolidation**  
**no line auto-consolidation**

|                           |                                          |                                                                                   |
|---------------------------|------------------------------------------|-----------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>auto-consolidation</b>                | Consolidates multiple line configurations of the same submode into a single line. |
| <b>Command Default</b>    | Autoconsolidation is enabled by default. |                                                                                   |
| <b>Command Modes</b>      | Global configuration mode (config)       |                                                                                   |
| <b>Command History</b>    | <b>Release</b>                           | <b>Modification</b>                                                               |
|                           | Cisco IOS XE Bengaluru 17.4.1            | The command was introduced.                                                       |

The following example shows the nonvolatile generation (NVGEN) process output with **line auto-consolidation** configured:

```
Device# show run | sec line
line con 0
stopbits 1
line vty 0 4
transport input ssh
line vty 5 9
transport input all
Device# configure terminal
Device(config)# line vty 10 15
Device(config-line)# transport input all
Device(config-line)# end
Device# show run | sec line
line con 0
stopbits 1
line vty 0 4
transport input ssh
line vty 5 15
transport input all
```

The following example shows the nonvolatile generation (NVGEN) process output after **no line auto-consolidation** is configured:

```
Device# show run | sec line
line con 0
stopbits 1
line vty 0 4
transport input ssh
line vty 5 9
transport input all
Device# configure terminal
```

```
Device(config)#no line auto-consolidation
Device(config)# line vty 10 15
Device(config-line)# transport input all
Device(config-line)# end
Device# show run | sec line
no line auto-consolidation
line con 0
stopbits 1
line vty 0 4
transport input ssh
line vty 5 9
transport input all
line vty 10 15
transport input all
```

# location

To configure location information for an endpoint, use the **location** command in global configuration mode. To remove the location information, use the **no** form of this command.

**location** {**admin-tag** *string* | **civic-location identifier** {*hostid*} | **civic-location identifier** {*hostid*} | **elin-location** {*string* | **identifier** *id*} | **geo-location identifier** {*hostid*} | **prefer** {**cdp weight** *priority-value* | **lldp-med weight** *priority-value* | **static config weight** *priority-value*}  
**no location** {**admin-tag** *string* | **civic-location identifier** {*hostid*} | **civic-location identifier** {*hostid*} | **elin-location** {*string* | **identifier** *id*} | **geo-location identifier** {*hostid*} | **prefer** {**cdp weight** *priority-value* | **lldp-med weight** *priority-value* | **static config weight** *priority-value*}

|                    |                                |                                                                                                                                                                                                                                                                                                                             |
|--------------------|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>admin-tag</b> <i>string</i> | Configures administrative tag or site information. Site or location information in alphanumeric format.                                                                                                                                                                                                                     |
|                    | <b>civic-location</b>          | Configures civic location information.                                                                                                                                                                                                                                                                                      |
|                    | <b>identifier</b>              | Specifies the name of the civic location, emergency, or geographical location.                                                                                                                                                                                                                                              |
|                    | <b>host</b>                    | Defines the host civic or geo-spatial location.                                                                                                                                                                                                                                                                             |
|                    | <i>id</i>                      | Name of the civic, emergency, or geographical location.                                                                                                                                                                                                                                                                     |
|                    | <b>Note</b>                    | The identifier for the civic location in the LLDP-MED switch TLV is limited to 250 bytes or less. To avoid error messages about available buffer space during switch configuration, be sure that the total length of all civic-location information specified for each civic-location identifier does not exceed 250 bytes. |
|                    | <b>elin-location</b>           | Configures emergency location information (ELIN).                                                                                                                                                                                                                                                                           |
|                    | <b>geo-location</b>            | Configures geo-spatial location information.                                                                                                                                                                                                                                                                                |
| Syntax Description | <b>prefer</b>                  | Sets location information source priority.                                                                                                                                                                                                                                                                                  |

**Command Default** No default behavior or values.

**Command Modes** Global configuration

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** After entering the **location civic-location identifier** global configuration command, you enter civic location configuration mode. After entering the **location geo-location identifier** global configuration command, you enter geo location configuration mode.

The civic-location identifier must not exceed 250 bytes.

The host identifier configures the host civic or geo-spatial location. If the identifier is not a host, the identifier only defines a civic location or geo-spatial template that can be referenced on the interface.

The **host** keyword defines the device location. The civic location options available for configuration using the **identifier** and the **host** keyword are the same. You can specify the following civic location options in civic location configuration mode:

- **additional-code**—Sets an additional civic location code.
- **additional-location-information**—Sets additional civic location information.
- **branch-road-name**—Sets the branch road name.
- **building**—Sets building information.
- **city**—Sets the city name.
- **country**—Sets the two-letter ISO 3166 country code.
- **county**—Sets the county name.
- **default**—Sets a command to its defaults.
- **division**—Sets the city division name.
- **exit**—Exits from the civic location configuration mode.
- **floor**—Sets the floor number.
- **landmark**—Sets landmark information.
- **leading-street-dir**—Sets the leading street direction.
- **name**—Sets the resident name.
- **neighborhood**—Sets neighborhood information.
- **no**—Negates the specified civic location data and sets the default value.
- **number**—Sets the street number.
- **post-office-box**—Sets the post office box.
- **postal-code**—Sets the postal code.
- **postal-community-name**—Sets the postal community name.
- **primary-road-name**—Sets the primary road name.
- **road-section**—Sets the road section.
- **room**—Sets room information.
- **seat**—Sets seat information.
- **state**—Sets the state name.
- **street-group**—Sets the street group.
- **street-name-postmodifier**—Sets the street name postmodifier.
- **street-name-premodifier**—Sets the street name premodifier.
- **street-number-suffix**—Sets the street number suffix.
- **street-suffix**—Sets the street suffix.
- **sub-branch-road-name**—Sets the sub-branch road name.
- **trailing-street-suffix**—Sets the trailing street suffix.
- **type-of-place**—Sets the type of place.
- **unit**—Sets the unit.

You can specify the following geo-spatial location information in geo-location configuration mode:

- **altitude**—Sets altitude information in units of floor, meters, or feet.
- **latitude**—Sets latitude information in degrees, minutes, and seconds. The range is from -90 degrees to 90 degrees. Positive numbers indicate locations north of the equator.

- **longitude**—Sets longitude information in degrees, minutes, and seconds. The range is from -180 degrees to 180 degrees. Positive numbers indicate locations east of the prime meridian.
- **resolution**—Sets the resolution for latitude and longitude. If the resolution value is not specified, default value of 10 meters is applied to latitude and longitude resolution parameters. For latitude and longitude, the resolution unit is measured in meters. The resolution value can also be a fraction.
- **default**—Sets the geographical location to its default attribute.
- **exit**—Exits from geographical location configuration mode.
- **no**—Negates the specified geographical parameters and sets the default value.

Use the **no lldp med-tlv-select location information** interface configuration command to disable the location TLV. The location TLV is enabled by default.

This example shows how to configure civic location information on the switch:

```
Device(config)# location civic-location identifier 1
Device(config-civic)# number 3550
Device(config-civic)# primary-road-name "Cisco Way"
Device(config-civic)# city "San Jose"
Device(config-civic)# state CA
Device(config-civic)# building 19
Device(config-civic)# room C6
Device(config-civic)# county "Santa Clara"
Device(config-civic)# country US
Device(config-civic)# end
```

You can verify your settings by entering the **show location civic-location** privileged EXEC command.

This example shows how to configure the emergency location information on the switch:

```
Device(config)# location elin-location 14085553881 identifier 1
```

You can verify your settings by entering the **show location elin** privileged EXEC command.

The example shows how to configure geo-spatial location information on the switch:

```
Device(config)# location geo-location identifier host
Device(config-geo)# latitude 12.34
Device(config-geo)# longitude 37.23
Device(config-geo)# altitude 5 floor
Device(config-geo)# resolution 12.34
```

You can use the **show location geo-location identifier** command to display the configured geo-spatial location details.

# location plm calibrating

To configure path loss measurement (CCX S60) request for calibrating clients, use the **location plm calibrating** command in global configuration mode.

**location plm calibrating** {multiband | uniband}

## Syntax Description

|                  |                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>multiband</b> | Specifies the path loss measurement request for calibrating clients on the associated 802.11a or 802.11b/g radio. |
| <b>uniband</b>   | Specifies the path loss measurement request for calibrating clients on the associated 802.11a/b/g radio.          |

## Command Default

No default behavior or values.

## Command Modes

Global configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The uniband is useful for single radio clients (even if the radio is a dual band and can operate in the 2.4-GHz and the 5-GHz bands). The multiband is useful for multiple radio clients.

This example shows how to configure the path loss measurement request for calibrating clients on the associated 802.11a/b/g radio:

```
Device# configure terminal
Device(config)# location plm calibrating uniband
Device(config)# end
```

# mac address-table move update

To enable the MAC address table move update feature, use the **mac address-table move update** command in global configuration mode on the switch stack or on a standalone switch. To return to the default setting, use the **no** form of this command.

**mac address-table move update {receive | transmit}**  
**no mac address-table move update {receive | transmit}**

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                      |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>receive</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Specifies that the switch processes MAC address-table move update messages.                                                                                          |
|                           | <b>transmit</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Specifies that the switch sends MAC address-table move update messages to other switches in the network if the primary link goes down and the standby link comes up. |
| <b>Command Default</b>    | By default, the MAC address-table move update feature is disabled.                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                      |
| <b>Command Modes</b>      | Global configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                      |

|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                                               | This command was introduced.                                                                                                                                         |
| <b>Usage Guidelines</b>   | <p>The MAC address-table move update feature allows the switch to provide rapid bidirectional convergence if a primary (forwarding) link goes down and the standby link begins forwarding traffic.</p> <p>You can configure the access switch to send the MAC address-table move update messages if the primary link goes down and the standby link comes up. You can configure the uplink switches to receive and process the MAC address-table move update messages.</p> |                                                                                                                                                                      |

## Examples

This example shows how to configure an access switch to send MAC address-table move update messages:

```
Device# configure terminal
Device(config)# mac address-table move update transmit
Device(config)# end
```

This example shows how to configure an uplink switch to get and process MAC address-table move update messages:

```
Device# configure terminal
Device(config)# mac address-table move update receive
Device(config)# end
```

You can verify your setting by entering the **show mac address-table move update** privileged EXEC command.

# mgmt\_init

To initialize the Ethernet management port, use the **mgmt\_init** command in boot loader mode.

## mgmt\_init

| Syntax Description           |                                                                                                                                                                                           |         |              |                              |                              |

|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                             |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | Directory names are case sensitive.                                                                                                                                         |
|                         | Directory names are limited to 127 characters between the slashes (/); the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons. |

## Example

This example shows how to make a directory called Saved\_Configs:

```
Device: mkdir usbflash0:Saved_Configs
Directory "usbflash0:Saved_Configs" created
```

# more

To display the contents of one or more files, use the **more** command in boot loader mode.

**more** *filesystem:/file-url...*

| Syntax Description           | <p><i>filesystem:</i> Alias for a file system. Use <b>flash:</b> for the system board flash device.</p> <p><i>/file-url...</i> Path (directory) and name of the files to display. Separate each filename with a space.</p>                                                                                                                                                                                                                                                                             |         |              |                              |                              |

| <b>Examples</b> | This example shows how to disable debugging on a switch. |
|-----------------|----------------------------------------------------------|

```
Device: no debug all
All possible debugging has been turned off.
```

# reload fast

To reload a standalone switch or stacked switch with the software image using Extended Fast Software Upgrade, use the **reload fast** command in privileged EXEC mode.

## reload fast

|                      |                     |
|----------------------|---------------------|
| <b>Command Modes</b> | Privileged EXEC (#) |
|----------------------|---------------------|

|                        |                                |                              |
|------------------------|--------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>                 | <b>Modification</b>          |
|                        | Cisco IOS XE Amsterdam 17.3.2a | This command was introduced. |

**Usage Guidelines**

The **reload fast** command reloads the standalone switch or stacked switch using Extended Fast Software Upgrade, which reduces traffic downtime to less than 30 seconds depending on the switch configuration.

For a Border Gateway Protocol-configured (BGP-configured) standalone switch, use the **bgp graceful-restart** command to enable Nonstop Forwarding (NSF) awareness before reloading the switch.

For a Border Gateway Protocol-configured (BGP-configured) stacked switch, use the **bgp graceful-restart all** command to enable Nonstop Forwarding (NSF) awareness before reloading the switch.

For an Open Shortest Path First Version 3-configured (OSPFv3-configured) standalone switch, use the **ipv6 nd reachable-time** command to set the timeout limit, and the **snmp ifmib ifindex persist** command to enable Simple Network Management Protocol (SNMP) interface index (ifIndex) persistence globally, and the **interface-id snmp-if-index** command to enable SNMP ifIndex persistence on the interface before reloading the switch.

For an Intermediate System-to-Intermediate System-configured (IS-IS-configured) stacked switch, use either the **nsf cisco** or **nsf ietf** command before reloading the switch.

## Examples

### Standalone Switch

The following example shows how to reload a standalone switch for a configuration other than BGP or OSPFv3:

```
Device> enable
Device# reload fast
```

The following example shows how to reload a standalone switch for a BGP configuration:

```
Device> enable
Device# configure terminal
Device(config)# router bgp 65000
Device(config-router)# bgp graceful-restart
Device(config-router)# end
Device# write memory
Device# reload fast
```

The following example shows how to reload a standalone switch for an OSPFv3 configuration:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 nd reachable-time 3600000
Device(config)# snmp ifmib ifindex persist
Device(config)# router OSPFv3 1
```

```
Device(config-router)# router-id 192.0.2.5
Device(config-router)# interface-id snmp-if-index
Device(config-router)# end
Device# write memory
Device# reload fast
```

### Stacked Switch

The following example shows how to reload a stacked switch for a configuration other than BGP or OSPFv3:

```
Device> enable
Device# reload fast
```

The following example shows how to reload a stacked switch for a BGP configuration:

```
Device> enable
Device# configure terminal
Device(config)# router bgp 65000
Device(config-router)# bgp graceful-restart all
Device(config-router)# end
Device# write memory
Device# reload fast
```

The following example shows how to reload a stacked switch for an IS-IS configuration:

```
Device> enable
Device# configure terminal
Device(config)# router isis tag1
Device(config-router)# nsf cisco
Device(config-router)# end
Device# write memory
Device# reload fast
```

# rename

To rename a file, use the **rename** command in boot loader mode.

**rename** *filesystem:/source-file-url filesystem:/destination-file-url*

## Syntax Description

|                              |                                                                       |
|------------------------------|-----------------------------------------------------------------------|
| <i>filesystem:</i>           | Alias for a file system. Use <b>usbflash0:</b> for USB memory sticks. |
| <i>/source-file-url</i>      | Original path (directory) and filename.                               |
| <i>/destination-file-url</i> | New path (directory) and filename.                                    |

## Command Default

No default behavior or values.

## Command Modes

Boot loader

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Filenames and directory names are case sensitive.

Directory names are limited to 127 characters between the slashes (/); the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

Filenames are limited to 127 characters; the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

## Examples

This example shows a file named *config.text* being renamed to *config1.text*:

Device: **rename usbflash0:config.text usbflash0:config1.text**

You can verify that the file was renamed by entering the **dir filesystem:** boot loader command.

# request consent-token accept-response shell-access

To submit the Consent Token response to a previously generated challenge, use the **request consent-token accept-response shell-access** command.

**request consent-token accept-response shell-access** *response-string*

## Syntax Description

| Syntax                 | Description                                               |
|------------------------|-----------------------------------------------------------|
| <i>response-string</i> | Specifies the character string representing the response. |

## Command Modes

Privileged EXEC mode (#)

## Command History

| Release                        | Modification                 |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.11.1 | This command was introduced. |

## Usage Guidelines

You must enter the response string within 30 minutes of challenge generation. If it is not entered, the challenge expires and a new challenge must be requested.

## Example

The following is sample output from the **request consent-token accept-response shell-access** *response-string* command:

```
Device# request consent-token accept-response shell-access
% Consent token authorization success
*Jan 18 02:51:37.807: %CTOKEN-6-AUTH_UPDATE: Consent Token Update (authentication success:
Shell access 0).
```

# request consent-token generate-challenge shell-access

To generate a Consent Token challenge for system shell access, use the **request consent-token generate-challenge shell-access** command.

**request consent-token generate-challenge shell-access auth-timeout** *time-validity-slot*

## Syntax Description

| Syntax                                        | Description                                                             |
|-----------------------------------------------|-------------------------------------------------------------------------|
| <b>auth-timeout</b> <i>time-validity-slot</i> | Specifies the time slot in minutes for which shell-access is requested. |

**Command Modes** Privileged EXEC mode (#)

| Command History | Release                        | Modification                 |
|-----------------|--------------------------------|------------------------------|
|                 | Cisco IOS XE Gibraltar 16.11.1 | This command was introduced. |

**Usage Guidelines** When the requested time-slot for system shell expires, the session gets terminated automatically.  
The maximum authorization timeout for system shell access is seven days.

## Example

The following is sample output from the **request consent-token generate-challenge shell-access auth-timeout time-validity-slot** command:

```
Device# request consent-token generate-challenge shell-access auth-timeout 900
%CHALLENGE_TOKEN_GENERATION_SUCCESSFUL%
Device#
*Jan 18 02:47:06.733: %CTOKEN-6-AUTH_UPDATE: Consent Token Update (challenge generation attempt: Shell access 0).
```

# request consent-token terminate-auth

To terminate the Consent Token based authorization to system shell, use the **request consent-token terminate-auth** command.

## request consent-token terminate-auth

### Command Modes

Privileged EXEC mode (#)

### Command History

| Release                        | Modification                 |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.11.1 | This command was introduced. |

### Usage Guidelines

In system shell access scenario, exiting the shell does not terminate authorization until the authorization timeout occurs.

We recommend that you force terminate system shell authorization by explicitly issuing the **request consent-token terminate-auth** command once the purpose of system shell access is complete.

If the current authentication is terminated using the **request consent-token terminate-auth** command, the user will have to repeat the authentication process to gain access to system shell.

### Example

The following is sample output from the **request consent-token terminate-auth** command:

```
Device# request consent-token terminate-auth shell-access
% Consent token authorization termination success
```

```
Device#
*Mar 13 01:45:39.197: %CTOKEN-6-AUTH_UPDATE: Consent Token Update (terminate authentication:
  Shell access 0).
Device#
```

# request platform software console attach switch

To start a session on a member switch, use the **request platform software console attach switch** command in privileged EXEC mode.

**Note** On stacking switches (Catalyst 3650/3850/9200/9300 switches), this command can only be used to start a session on the standby console. On Catalyst 9500 switches, this command is supported only in a stackwise virtual setup. You cannot start a session on member switches. By default, all consoles are already active, so a request to start a session on the active console will result in an error.

**request platform software console attach switch** { *switch-number* | **active** | **standby** } { **0/0** | **R0** }

## Syntax Description

|                      |                                                                            |
|----------------------|----------------------------------------------------------------------------|
| <i>switch-number</i> | Specifies the switch number. The range is from 1 to 9.                     |
| <b>active</b>        | Specifies the active switch.                                               |
| <b>Note</b>          | This argument is not supported on Catalyst 9500 switches.                  |
| <b>standby</b>       | Specifies the standby switch.                                              |
| <b>0/0</b>           | Specifies that the SPA-Inter-Processor slot is 0, and bay is 0.            |
| <b>Note</b>          | Do not use this option with stacking switches. It will result in an error. |
| <b>R0</b>            | Specifies that the Route-Processor slot is 0.                              |

## Command Default

By default, all switches in the stack are active.

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

To start a session on the standby switch, you must first enable it in the configuration.

## Examples

This example shows how to session to the standby switch:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# redundancy
Device(config-red)# main-cpu
Device(config-r-mc)# standby console enable
Device(config-r-mc)# end
Device# request platform software console attach switch standby R0
```

```
#  
# Connecting to the IOS console on the route-processor in slot 0.  
# Enter Control-C to exit.  
#  
Device-stby> enable  
Device-stby#
```

# reset

To perform a hard reset on the system, use the **reset** command in boot loader mode. A hard reset is similar to power-cycling the device; it clears the processor, registers, and memory.

## reset

|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

This example shows how to reset the system:

```
Device: reset
Are you sure you want to reset the system (y/n)? y
System resetting...
```

# rmdir

To remove one or more empty directories from the specified file system, use the **rmdir** command in boot loader mode.

**rmdir** *filesystem:/directory-url...*

## Syntax Description

*filesystem:* Alias for a file system. Use **usbflash0:** for USB memory sticks.

*/directory-url...* Path (directory) and name of the empty directories to remove. Separate each directory name with a space.

## Command Default

No default behavior or values.

## Command Modes

Boot loader

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Directory names are case sensitive and limited to 45 characters between the slashes (/); the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

Before removing a directory, you must first delete all of the files in the directory.

The device prompts you for confirmation before deleting each directory.

## Example

This example shows how to remove a directory:

```
Device: rmdir usbflash0:Test
```

You can verify that the directory was deleted by entering the **dir filesystem:** boot loader command.

# sdm prefer

To specify the SDM template for use on the switch, use the **sdm prefer** command in global configuration mode.

**sdm prefer**  
{ **access** }

## Syntax Description

**access** Specifies the SDM access template.

## Command Default

No default behavior or values.

## Command Modes

Global configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

In a stack, all stack members must use the same SDM template that is stored on the active .

When a new is added to a stack, the SDM configuration that is stored on the active overrides the template configured on an individual .

## Example

This example shows how to configure the access template:

```
Device(config)# sdm prefer access
Device(config)# exit
Device# reload
```

# service private-config-encryption

To enable private configuration file encryption, use the **service private-config-encryption** command. To disable this feature, use the **no** form of this command.

**service private-config-encryption**  
**no service private-config-encryption**

**Syntax Description** This command has no arguments or keywords.

**Command Default** No default behavior or values.

**Command Modes** Global configuration (config)

| Command History | Release                   | Modification                 |
|-----------------|---------------------------|------------------------------|
|                 | Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

**Examples** The following example shows how to enable private configuration file encryption:

```
Device> enable
Device# configure terminal
Device(config)# service private-config-encryption
```

|                  | <b>show parser encrypt file status</b> | Displays the private configuration encryption status. |

# set

To set or display environment variables, use the **set** command in boot loader mode. Environment variables can be used to control the boot loader or any other software running on the device.

**set** *variable value*

## Syntax Description

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <i>variable</i> | Use one of the following keywords for <i>variable</i> and the appropriate value for <i>value</i> :                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <i>value</i>    | <p><b>MANUAL_BOOT</b>—Decides whether the device boots automatically or manually.</p> <p>Valid values are 1/Yes and 0/No. If it is set to 0 or No, the boot loader attempts to automatically boot the system. If it is set to anything else, you must manually boot the device from the boot loader mode.</p> <hr/> <p><b>BOOT</b> <i>filesystem:/file-url</i>—Identifies a semicolon-separated list of executable files to try to load and execute when automatically booting.</p> <p>If the BOOT environment variable is not set, the system attempts to load and execute the first executable image it can find by using a recursive, depth-first search through the flash: file system. If the BOOT variable is set but the specified images cannot be loaded, the system attempts to boot the first bootable file that it can find in the flash: file system.</p> <hr/> <p><b>ENABLE_BREAK</b>—Allows the automatic boot process to be interrupted when the user presses the <b>Break</b> key on the console.</p> <p>Valid values are 1, Yes, On, 0, No, and Off. If set to 1, Yes, or On, you can interrupt the automatic boot process by pressing the <b>Break</b> key on the console after the flash: file system has initialized.</p> <hr/> <p><b>HELPER</b> <i>filesystem:/file-url</i>—Identifies a semicolon-separated list of loadable files to dynamically load during the boot loader initialization. Helper files extend or patch the functionality of the boot loader.</p> <hr/> <p><b>PS1</b> <i>prompt</i>—Specifies a string that is used as the command-line prompt in boot loader mode.</p> <hr/> <p><b>CONFIG_FILE</b> <b>flash:</b> <i>/file-url</i>—Specifies the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration.</p> <hr/> <p><b>BAUD</b> <i>rate</i>—Specifies the number of bits per second (b/s) that is used for the baud rate for the console. The Cisco IOS software inherits the baud rate setting from the boot loader and continues to use this value unless the configuration file specifies another setting. The range is from 0 to 128000 b/s. Valid values are 50, 75, 110, 150, 300, 600, 1200, 1800, 2000, 2400, 3600, 4800, 7200, 9600, 14400, 19200, 28800, 38400, 56000, 57600, 115200, and 128000.</p> <p>The most commonly used values are 300, 1200, 2400, 9600, 19200, 57600, and 115200.</p> <hr/> <p><b>SWITCH_NUMBER</b> <i>stack-member-number</i>—Changes the member number of a stack member.</p> <hr/> <p><b>SWITCH_PRIORITY</b> <i>priority-number</i>—Changes the priority value of a stack member.</p> |

## Command Default

The environment variables have these default values:

MANUAL\_BOOT: No (0)

BOOT: Null string

ENABLE\_BREAK: No (Off or 0) (the automatic boot process cannot be interrupted by pressing the **Break** key on the console).

HELPER: No default value (helper files are not automatically loaded).

PS1 device:

CONFIG\_FILE: config.text

BAUD: 9600 b/s

SWITCH\_NUMBER: 1

SWITCH\_PRIORITY: 1

#### Note

Environment variables that have values are stored in the flash: file system in various files. Each line in the files contains an environment variable name and an equal sign followed by the value of the variable.

A variable has no value if it is not listed in these files; it has a value if it is listed even if the value is a null string. A variable that is set to a null string (for example, “”) is a variable with a value.

Many environment variables are predefined and have default values.

#### Command Modes

Boot loader

#### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

#### Usage Guidelines

Environment variables are case sensitive and must be entered as documented.

Environment variables that have values are stored in flash memory outside of the flash: file system.

Under typical circumstances, it is not necessary to alter the setting of the environment variables.

The MANUAL\_BOOT environment variable can also be set by using the **boot manual** global configuration command.

The BOOT environment variable can also be set by using the **boot system filesystem:/file-url** global configuration command.

The ENABLE\_BREAK environment variable can also be set by using the **boot enable-break** global configuration command.

The HELPER environment variable can also be set by using the **boot helper filesystem: / file-url** global configuration command.

The CONFIG\_FILE environment variable can also be set by using the **boot config-file flash: /file-url** global configuration command.

The SWITCH\_NUMBER environment variable can also be set by using the **switch current-stack-member-number renumber new-stack-member-number** global configuration command.

The SWITCH\_PRIORITY environment variable can also be set by using the device *stack-member-number priority priority-number* global configuration command.

The boot loader prompt string (PS1) can be up to 120 printable characters not including the equal sign (=).

### Example

This example shows how to set the SWITCH\_PRIORITY environment variable:

Device: **set SWITCH\_PRIORITY 2**

You can verify your setting by using the **set** boot loader command.

# show avc client

To display information about top number of applications, use the **show avc client** command in privileged EXEC mode.

**show avc client** *client-mac* **top** *n* **application** [**aggregate** | **upstream** | **downstream**]

|                           |                                                                                                                                                                                           |

# show cable-diagnostics tdr

To display the Time Domain Reflector (TDR) results, use the **show cable-diagnostics tdr** command in privileged EXEC mode.

**show cable-diagnostics tdr interface** *interface-id*

|                           |                                                                  |
|---------------------------|------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>interface-id</i> Specifies the interface on which TDR is run. |
|---------------------------|------------------------------------------------------------------|

|                        |                                |
|------------------------|--------------------------------|
| <b>Command Default</b> | No default behavior or values. |
|------------------------|--------------------------------|

|                      |                 |
|----------------------|-----------------|
| <b>Command Modes</b> | Privileged EXEC |
|----------------------|-----------------|

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                 |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | TDR is supported only on 10/100/100 copper Ethernet ports. It is not supported on 10-Gigabit Ethernet ports and small form-factor pluggable (SFP) module ports. |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

This example shows the output from the **show cable-diagnostics tdr interface** *interface-id* command on a device:

```
Device# show cable-diagnostics tdr interface gigabitethernet1/0/23
TDR test last run on: March 01 00:04:08
Interface  Speed  Local pair  Pair length      Remote pair  Pair status
-----
Gi1/0/23   1000M  Pair A      1 +/- 1 meters   Pair A      Normal
           Pair B      1 +/- 1 meters   Pair B      Normal
           Pair C      1 +/- 1 meters   Pair C      Normal
           Pair D      1 +/- 1 meters   Pair D      Normal
```

**Table 193: Field Descriptions for the show cable-diagnostics tdr Command Output**

| Field      | Description                                                               |
|------------|---------------------------------------------------------------------------|
| Interface  | The interface on which TDR is run.                                        |
| Speed      | The speed of connection.                                                  |
| Local pair | The name of the pair of wires that TDR is testing on the local interface. |

| Field       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pair length | The location of the problem on the cable, with respect to your device. TDR can only find the location in one of these cases: <ul style="list-style-type: none"> <li>• The cable is properly connected, the link is up, and the interface speed is 1000 Mb/s.</li> <li>• The cable is open.</li> <li>• The cable has a short.</li> </ul>                                                                                                                                                                                                                                                       |
| Remote pair | The name of the pair of wires to which the local pair is connected. TDR can learn about the remote pair only when the cable is properly connected and the link is up.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Pair status | The status of the pair of wires on which TDR is running: <ul style="list-style-type: none"> <li>• Normal—The pair of wires is properly connected.</li> <li>• Not completed—The test is running and is not completed.</li> <li>• Not supported—The interface does not support TDR.</li> <li>• Open—The pair of wires is open.</li> <li>• Shorted—The pair of wires is shorted.</li> <li>• ImpedanceMis—The impedance is mismatched.</li> <li>• Short/Impedance Mismatched—The impedance mismatched or the cable is short.</li> <li>• InProgress—The diagnostic test is in progress.</li> </ul> |

This example shows the output from the **show interface** *interface-id* command when TDR is running:

```
Device# show interface gigabitethernet1/0/2
gigabitethernet1/0/2 is up, line protocol is up (connected: TDR in Progress)
```

This example shows the output from the **show cable-diagnostics tdr interface** *interface-id* command when TDR is not running:

```
# show cable-diagnostics tdr interface gigabitethernet1/0/2
% TDR test was never issued on gigabitethernet1/0/2
```

If an interface does not support TDR, this message appears:

```
% TDR test is not supported on device 1
```

# show debug

To display all the debug commands available on a switch, use the **show debug** command in Privileged EXEC mode.

**show debug**

**show debug condition** *Condition identifier* | *All conditions*

## Syntax Description

*Condition identifier* Sets the value of the condition identifier to be used. Range is between 1 and 1000.

*All conditions* Shows all conditional debugging options available.

## Command Default

No default behavior or values.

## Command Modes

Privileged EXEC

## Command History

| Release                   | Modification                 |
|---------------------------|------------------------------|
| Cisco IOS XE Release 16.1 | This command was introduced. |

## Usage Guidelines

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use debug commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. Moreover, it is best to use debug commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased debug command processing overhead will affect system use.

## Examples

This example shows the output of a **show debug** command:

```
Device# show debug condition all
```

To disable debugging, use the **no debug all** command.

# show env

To display fan, temperature, and power information for the switch (standalone switch, stack's active switch, or stack member), use the **show env** command in EXEC modes.

**show env** { **all** | **fan** | **power** [**all** | **switch** [*switch-number*]] | **stack** [*stack-number*] | **temperature** [*status*] }

|                           |                                                                                                                                             |                                                                                                                                                                                |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>all</b>                                                                                                                                  | Displays fan, temperature and power environmental status.                                                                                                                      |
|                           | <b>fan</b>                                                                                                                                  | Displays the switch fan status.                                                                                                                                                |
|                           | <b>power</b>                                                                                                                                | Displays the power supply status.                                                                                                                                              |
|                           | <b>all</b>                                                                                                                                  | (Optional) Displays the status for all power supplies.                                                                                                                         |
|                           | <b>switch</b> <i>switch-number</i>                                                                                                          | (Optional) Displays the power supply status for a specific switch.                                                                                                             |
|                           | <b>stack</b> <i>switch-number</i>                                                                                                           | (Optional) Displays all environmental status for each switch in the stack or for a specified switch. The range is 1 to 9, depending on the switch member numbers in the stack. |
|                           | <b>temperature</b>                                                                                                                          | Displays the switch temperature status.                                                                                                                                        |
|                           | <b>status</b>                                                                                                                               | (Optional) Displays the temperature status and threshold values.                                                                                                               |
|                           |                                                                                                                                             |                                                                                                                                                                                |
| <b>Command Default</b>    | No default behavior or values.                                                                                                              |                                                                                                                                                                                |
| <b>Command Modes</b>      | User EXEC                                                                                                                                   |                                                                                                                                                                                |
|                           | Privileged EXEC                                                                                                                             |                                                                                                                                                                                |
| <b>Command History</b>    | <b>Release</b>                                                                                                                              | <b>Modification</b>                                                                                                                                                            |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                | This command was introduced.                                                                                                                                                   |
| <b>Usage Guidelines</b>   | Use the <b>show env stack</b> [ <i>switch-number</i> ] command to display information about any switch in the stack from any member switch. |                                                                                                                                                                                |
|                           | Use the <b>show env temperature status</b> command to display the switch temperature states and threshold levels.                           |                                                                                                                                                                                |

## Examples

This example shows how to display information about stack member 1 from the active switch:

```
Device> show env stack 1
Device 1:
Device Fan 1 is OK
Device Fan 2 is OK
Device Fan 3 is OK
FAN-PS1 is OK
```

```
FAN-PS2 is NOT PRESENT
Device 1: SYSTEM TEMPERATURE is OK
Temperature Value: 32 Degree Celsius
Temperature State: GREEN
Yellow Threshold : 41 Degree Celsius
Red Threshold : 56 Degree Celsius
```

```
Device>
```

This example shows how to display temperature value, state, and threshold values:

```
Device> show env temperature status
Temperature Value: 32 Degree Celsius
Temperature State: GREEN
Yellow Threshold : 41 Degree Celsius
Red Threshold : 56 Degree Celsius
```

```
Device>
```

**Table 194: States in the show env temperature status Command Output**

| State  | Description                                                                                                             |
|--------|-------------------------------------------------------------------------------------------------------------------------|
| Green  | The switch temperature is in the <i>normal</i> operating range.                                                         |
| Yellow | The temperature is in the <i>warning</i> range. You should check the external temperature around the switch.            |
| Red    | The temperature is in the <i>critical</i> range. The switch might not run properly if the temperature is in this range. |

# show env xps

To display budgeting, configuration, power, and system power information for the Cisco eXpandable Power System (XPS) 2200, use the **show env xps** command in privileged EXEC mode.

**show env xps** { **budgeting** | **configuration** | **port** [ **all** | *number* ] | **power** | **system** | **thermal** | **upgrade** | **version** }

| Syntax Description                         |  |                                                                                                                                                                                                                       |
|--------------------------------------------|--|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>budgeting</b>                           |  | Displays XPS power budgeting, the allocated and budgeted power of all switches in the power stack.                                                                                                                    |
| <b>configuration</b>                       |  | Displays the configuration resulting from the power xps privileged EXEC commands. The XPS configuration is stored in the XPS. Enter the show env xps configuration command to retrieve the non-default configuration. |
| <b>port</b> [ <b>all</b>   <i>number</i> ] |  | Displays the configuration and status of all ports or the specified XPS port. Port numbers are from 1 to 9.                                                                                                           |
| <b>power</b>                               |  | Displays the status of the XPS power supplies.                                                                                                                                                                        |
| <b>system</b>                              |  | Displays the XPS system status.                                                                                                                                                                                       |
| <b>thermal</b>                             |  | Displays the XPS thermal status.                                                                                                                                                                                      |
| <b>upgrade</b>                             |  | Displays the XPS upgrade status.                                                                                                                                                                                      |
| <b>version</b>                             |  | Displays the XPS version details.                                                                                                                                                                                     |

**Command Modes** Privileged EXEC

| Command History | Release     | Modification                 |
|-----------------|-------------|------------------------------|
|                 | 12.2(55)SE1 | This command was introduced. |

**Usage Guidelines** Use the **show env xps** privileged EXEC command to display the information for XPS 2200.

## Examples

This is an example of output from the show env xps budgeting command:

```
Switch#
=====

XPS 0101.0100.0000 :
=====

|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | <p>The <b>cache</b> keyword uses the record format by default.</p> <p>The uppercase field names in the display output of the <b>show flowmonitor</b> <i>monitor-name</i> <b>cache</b> command are key fields that uses to differentiate flows. The lowercase field names in the display output of the <b>show flow monitor</b> <i>monitor-name</i> <b>cache</b> command are nonkey fields from which collects values as additional data for the cache.</p> |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

The following example displays the status for a flow monitor:

```
# show flow monitor FLOW-MONITOR-1

Flow Monitor FLOW-MONITOR-1:
  Description:      Used for basic traffic analysis
  Flow Record:     flow-record-1
  Flow Exporter:   flow-exporter-1
                  flow-exporter-2
  Cache:
    Type:          normal
    Status:        allocated
    Size:          4096 entries / 311316 bytes
    Inactive Timeout: 15 secs
    Active Timeout: 1800 secs
```

This table describes the significant fields shown in the display.

**Table 196: show flow monitor monitor-name Field Descriptions**

| Field            | Description                                                                                                                                                                                                                                                              |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flow Monitor     | Name of the flow monitor that you configured.                                                                                                                                                                                                                            |
| Description      | Description that you configured or the monitor, or the default description User defined.                                                                                                                                                                                 |
| Flow Record      | Flow record assigned to the flow monitor.                                                                                                                                                                                                                                |
| Flow Exporter    | Exporters that are assigned to the flow monitor.                                                                                                                                                                                                                         |
| Cache            | Information about the cache for the flow monitor.                                                                                                                                                                                                                        |
| Type             | Flow monitor cache type. The value is always normal, as it is the only supported cache type.                                                                                                                                                                             |

| <b>Usage Guidelines</b> | Use the show commands to view the status of the install package. |
|-------------------------|------------------------------------------------------------------|

## Example

The following is sample output from the **show install package** command:

```
Device# show install package bootflash:cat3k-universalk9.2017-01-10_13.15.1.  
CSCxxx.SSA.dmp.bin  
Name: cat3k-universalk9.2017-01-10_13.15.1.CSCxxx.SS  
Version: 16.6.1.0.199.1484082952..Everest  
Platform: Catalyst3k  
Package Type: dmp  
Defect ID: CSCxxx  
Package State: Added  
Supersedes List: {}  
Smu ID: 1
```

The following is sample output from the **show install summary** command:

```
Device# show install summary

Active Packages:
  bootflash:cat3k-universalk9.2017-01-10_13.15.1.CSCxxx.SSA.dmp.bin
Inactive Packages:
  No packages
Committed Packages:
  bootflash:cat3k-universalk9.2017-01-10_13.15.1.CSCxxx.SSA.dmp.bin
Uncommitted Packages:
  No packages
Device#
```

The table below lists the significant fields shown in the display.

**Table 197: show install summary Field Descriptions**

| Field                | Description                                                                                                                  |
|----------------------|------------------------------------------------------------------------------------------------------------------------------|
| Active Packages      | Name of the active install package.                                                                                          |
| Inactive Packages    | List of inactive packages.                                                                                                   |
| Committed Packages   | Install packages that have saved or committed changes to the harddisk, so that the changes become persistent across reloads. |
| Uncommitted Packages | Intall package activations that are nonpersistent.                                                                           |

The following is sample output from the **show install log** command:

```
Device# show install log

| Cisco IOS XE Fuji 16.9.1       | This command was introduced.                                                                                                                                                        |
| Cisco IOS XE Amsterdam 17.3.2a | Command output was updated to display information relating to Smart Licensing Using Policy.<br><br>Command output no longer displays Smart Account and Virtual account information. |

## Usage Guidelines

**Smart Licensing Using Policy:** If the software version on the device (also referred to as a product instance) is Cisco IOS XE Amsterdam 17.3.2a or a later release, command output displays fields pertinent to Smart Licensing Using Policy.

**Smart Licensing:** If the software version on the device is Cisco IOS XE Amsterdam 17.3.1 or an earlier release, command output displays fields pertinent to Smart Licensing (whether smart licensing is enabled, all associated licensing certificates, compliance status, and so on).

## Examples

[show license all for Smart Licensing Using Policy, on page 1871](#)

[show license all for Smart Licensing, on page 1873](#)

### show license all for Smart Licensing Using Policy

The following is sample output from the **show license all** command on a Cisco Catalyst 9500 switch. Similar output is displayed on all supported Cisco Catalyst Access, Core, and Aggregation Switches.

```
Device# show license all

|                 | Cisco IOS XE Amsterdam 17.3.2a | This command was introduced. |

**Usage Guidelines** While there are no export-controlled or enforced licenses on Cisco Catalyst Access, Core, and Aggregation Switches, you can use this command to display migrated SLR authorization codes.

**Examples**

See [Table 198: show license authorization Field Descriptions, on page 1877](#) for information about fields shown in the display.

See [show license authorization Displaying Migrated SLR Authorization Code, on page 1879](#) for sample output.

**Table 198: show license authorization Field Descriptions**

| Field          |                     | Description                                                                                                                                                                                                                                     |
|----------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Overall Status |                     | Header for UDI information for all product instances in the set-up, the type of authorization that is installed, and configuration errors, if any.<br><br>In a High Availability set-up, all UDIs in the set-up are listed.                     |
|                | Active:<br>Status:  | The active product instance UDI, followed by the status of the authorization code installation for this UDI.<br><br>If the status indicates that the authorization code is installed and there is a confirmation code, this is also displayed.  |

# show license data conversion

To display license data conversion information, enter the **show license data** command in privileged EXEC mode.

**show license data    conversion**

## Syntax Description

This command has no keywords or arguments

## Command Modes

Privileged EXEC (Device#)

## Command History

| Release                        | Modification                                                                                                                                                                        |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cisco IOS XE Fuji 16.9.1       | This command was introduced.                                                                                                                                                        |
| Cisco IOS XE Amsterdam 17.3.2a | Command output was updated to display information relating to Smart Licensing Using Policy.<br><br>Command output no longer displays Smart Account and Virtual account information. |

## Usage Guidelines

**Smart Licensing Using Policy:** If the software version on the device (also referred to as a product instance) is Cisco IOS XE Amsterdam 17.3.2a or a later release, command output displays fields pertinent to Smart Licensing Using Policy.

Device-led conversion is not supported on Cisco Catalyst Access, Core, and Aggregation Switches.

**Smart Licensing:** If the software version on the device is Cisco IOS XE Amsterdam 17.3.1 or an earlier release, command output displays fields pertinent to Smart Licensing.

# show license eventlog

To display event logs relating to Smart Licensing Using Policy, enter the **show license eventlog** command in privileged EXEC mode.

**show license eventlog** [ *days* ]

## Syntax Description

*days* Enter the number of days for which you want to display event logs. The valid value range is from 0 to 2147483647.

## Command Modes

Privileged EXEC (Device#)

## Command History

| Release                        | Modification                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cisco IOS XE Fuji 16.9.1       | This command was introduced.                                                                                                                                                                                                                                                                                                                                                        |
| Cisco IOS XE Amsterdam 17.3.2a | Additional events were added with the introduction of Smart Licensing Using Policy: <ul style="list-style-type: none"> <li>• Installation and removal of a policy</li> <li>• Request, installation and removal of an authorization code.</li> <li>• Installation and removal of a trust code.</li> <li>• Addition of authorization source information for license usage.</li> </ul> |

## Usage Guidelines

**Smart Licensing Using Policy:** If the software version on the device (also referred to as a product instance) is Cisco IOS XE Amsterdam 17.3.2a or a later release, command output displays fields pertinent to Smart Licensing Using Policy.

**Smart Licensing:** If the software version on the device is Cisco IOS XE Amsterdam 17.3.1 or an earlier release, command output displays fields pertinent to Smart Licensing.

## Examples

|                           | Cisco IOS XE Amsterdam 17.3.2a                                                                                                                                                                                                                                                                                                                                                                           | This command was introduced. |
| <b>Usage Guidelines</b>   | When you encounter an error message that you are not able to resolve, along with a copy of the message that appears on the console or in the system log, provide your Cisco technical support representative with sample output of these commands: <b>show license tech support</b> , <b>show license history message</b> , and the <b>show platform software sl-infra all</b> privileged EXEC commands. |                              |

# show license reservation

To display license reservation information, enter the **show license reservation** command in privileged EXEC mode.

## show license reservation

This command has no arguments or keywords.

### Command Modes

Privileged EXEC (Device#)

### Command History

| Release                        | Modification                                                                                                                                                                    |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cisco IOS XE Fuji 16.9.1       | This command was introduced.                                                                                                                                                    |
| Cisco IOS XE Amsterdam 17.3.2a | The command continues to be available on the CLI, but is no longer applicable because the notion of reservation does not exist in the Smart Licensing Using Policy environment. |

### Usage Guidelines

The command continues to be available on the CLI and corresponding output is displayed, but with the introduction of Smart Licensing Using Policy, the notion of reservation is no longer applicable. Use the **show license all** command in privileged EXEC mode, to display *migrated* SLR licenses instead (the SLR authorization code is migrated to Smart Licensing Using Policy).

# show license status

To display information about licensing settings such as data privacy, policy, transport, usage reporting and trust codes, enter the **show license status** command in privileged EXEC mode.

## show license status

### Syntax Description

This command has no arguments or keywords.

### Command Default

Privileged EXEC (#)

### Command History

| Release                        | Modification                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cisco IOS XE Fuji 16.9.1       | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                        |
| Cisco IOS XE Amsterdam 17.3.2a | Command output was updated to reflect new fields that are applicable to Smart Licensing Using Policy. This includes <code>Trust code installed:</code> , <code>Policy in use</code> , <code>Policy name:</code> , <code>reporting requirements</code> as in the policy, and <code>Usage Reporting:</code> .<br><br>Command output no longer displays Smart Account and Virtual account information. |

### Usage Guidelines

**Smart Licensing Using Policy:** If the software version on the device (also referred to as a product instance) is Cisco IOS XE Amsterdam 17.3.2a or a later release, command output displays fields pertinent to Smart Licensing Using Policy.

**Smart Licensing:** If the software version on the device is Cisco IOS XE Amsterdam 17.3.1 or an earlier release, command output displays fields pertinent to Smart Licensing.

### Examples

See [Table 199: show license status Field Descriptions for Smart Licensing Using Policy, on page 1887](#) for information about fields shown in the display.

### show license status for Smart Licensing Using Policy

The following is sample output of the **show license status** command. A Cisco default policy (merged from multiple sources) is applied here, on a Cisco Catalyst 9500 switch. Similar output is displayed on all supported Cisco Catalyst Access, Core, and Aggregation Switches.

```

Device# show license status
Utility:
  Status: DISABLED
License Reservation is ENABLED
Data Privacy:
  Sending Hostname: yes
    Callhome hostname privacy: DISABLED
    Smart Licensing hostname privacy: DISABLED
    Version privacy: DISABLED
Transport:
  Type: Transport Off
Policy:
  Policy in use: Merged from multiple sources.
  Reporting ACK required: yes (CISCO default)
  Unenforced/Non-Export Perpetual Attributes:
    First report requirement (days): 365 (CISCO default)
    Reporting frequency (days): 0 (CISCO default)
    Report on change (days): 90 (CISCO default)
  Unenforced/Non-Export Subscription Attributes:
    First report requirement (days): 90 (CISCO default)
    Reporting frequency (days): 90 (CISCO default)
    Report on change (days): 90 (CISCO default)
  Enforced (Perpetual/Subscription) License Attributes:
    First report requirement (days): 0 (CISCO default)
    Reporting frequency (days): 0 (CISCO default)

# show license summary

To display a brief summary of license usage, which includes information about licenses being used, the count, and status, use the **show license summary** command in privileged EXEC mode.

## show license summary

### Syntax Description

This command has no arguments or keywords.

### Command Default

Privileged EXEC (#)

### Command History

| Release                        | Modification                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cisco IOS XE Fuji 16.9.1       | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                            |
| Cisco IOS XE Amsterdam 17.3.2a | <p>Command output was updated to reflect valid license status for Smart Licensing Using Policy. Valid license statuses are now only <code>IN USE</code>, <code>NOT IN USE</code>, <code>NOT AUTHORIZED</code>.</p> <p>Command output was also updated to remove registration and authorization information.</p> <p>Command output no longer displays Smart Account and Virtual account information.</p> |

### Usage Guidelines

**Smart Licensing Using Policy:** If the software version on the device (also referred to as a product instance) is Cisco IOS XE Amsterdam 17.3.2a or a later release, command output displays fields pertinent to Smart Licensing Using Policy.

The licenses on Cisco Catalyst Access, Core, and Aggregation Switches are never `NOT AUTHORIZED` or `NOT IN USE`, because none of the available licenses are export-controlled or enforced (Only these licenses require authorization before use).

**Smart Licensing:** If the software version on the device is Cisco IOS XE Amsterdam 17.3.1 or an earlier release, command output displays fields pertinent to Smart Licensing (summary of all active licenses).

### Examples

See [Table 200: show license summary Field Descriptions for Smart Licensing Using Policy, on page 1894](#) for information about fields shown in the display.

[show license summary for Smart Licensing Using Policy \(Cisco Catalyst 9300 Series Switches\), on page 1895](#)

[show license summary for Smart Licensing Using Policy \(Cisco Catalyst 9500 Series Switches\), on page 1895](#)

[show license summary for Smart Licensing, on page 1895](#)

**Table 200: show license summary Field Descriptions for Smart Licensing Using Policy**

| Field   | Description                 |
|---------|-----------------------------|
| License | Name of the licenses in use |

| Field           | Description                                                                                                                                                                                                                                                                                                                                                   |

|                           |                                 |                                                                                                                                                                                                                                                                                                    |

**Command Modes** Privileged EXEC (Device#)

|                        |                                |                                                                                                       |
|------------------------|--------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Command History</b> | <b>Release</b>                 | <b>Modification</b>                                                                                   |
|                        | Cisco IOS XE Fuji 16.9.1       | This command was introduced.                                                                          |
|                        | Cisco IOS XE Amsterdam 17.3.2a | Command output was updated to reflect new fields that are applicable to Smart Licensing Using Policy. |

**Usage Guidelines** **Smart Licensing Using Policy:** If the software version on the device (also referred to as a product instance) is Cisco IOS XE Amsterdam 17.3.2a or a later release, command output displays fields pertinent to Smart Licensing Using Policy.

When you encounter an error message that you are not able to resolve, along with a copy of the message that appears on the console or in the system log, provide your Cisco technical support representative with sample output of these commands: **show license tech support**, **show license history message**, and the **show platform software sl-infra all** privileged EXEC commands.

**Smart Licensing:** If the software version on the device is Cisco IOS XE Amsterdam 17.3.1 or an earlier release, command output displays fields pertinent to Smart Licensing (whether smart licensing is enabled, all associated licensing certificates, compliance status, and so on).

## show license tech support for Smart Licensing Using Policy

The following is sample output from the **show license tech support** command on a Cisco Catalyst 9500 switch. Similar output is displayed on all supported Cisco Catalyst Access, Core, and Aggregation Switches.

```
Device# show license tech support
Smart Licensing Tech Support info
```

```

# show license udi

To display Unique Device Identifier (UDI) information for a product instance, enter the **show license udi** command in Privileged EXEC mode. In a High Availability set-up, the output displays UDI information for all connected product instances.

**show license udi**

| <b>Syntax Description</b>      | This command has no arguments or keywords.                                                                                                                                                                                                                                                                                                                                                                                                           |         |              |                          |                              |                                |                                                                                                       |

## Examples

[show licensing udi for Smart Licensing Using Policy, on page 1905](#)  
[show license udi for Smart Licensing, on page 1905](#)

### show licensing udi for Smart Licensing Using Policy

The following is sample output of the **show license udi** command for a High Availability set-up on a Catalyst 9500 switch. Similar output is displayed on all supported Cisco Catalyst Access, Core, and Aggregation Switches.

```
Device# show license udi

UDI: PID:C9500-16X,SN:FCW2233A5ZV
HA UDI List:
Active:PID:C9500-16X,SN:FCW2233A5ZV
Standby:PID:C9500-16X,SN:FCW2233A5ZY
```

### show license udi for Smart Licensing

The following is sample output of the **show license udi** command:

```
Device# show license udi
UDI: PID:C9300-24U,SN:FCW2125L046

HA UDI List:
  Active:PID:C9300-24U,SN:FCW2125L046
```

Standby:PID:C9300-24U,SN:FCW2125L03U  
Member:PID:C9300-24U,SN:FCW2125G01T

# show license usage

To display license usage information such as status, a count of licenses being used, and enforcement type, enter the **show license usage** command in privileged EXEC mode.

## show license usage

This command has no arguments or keywords.

### Command Default

Privileged EXEC (#)

### Command History

|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cisco IOS XE Fuji 16.9.1       | This command was introduced.                                                                                                                                                                                                                                                                                                           |
| Cisco IOS XE Amsterdam 17.3.2a | Command output was updated to reflect new fields that are applicable to Smart Licensing Using Policy. This includes the <code>Status</code> , <code>Enforcement</code> type fields.<br><br>Command output was also updated to remove reservation related information, authorization status information, and export status information. |

### Usage Guidelines

**Smart Licensing Using Policy:** If the software version on the device (also referred to as a product instance) is Cisco IOS XE Amsterdam 17.3.2a or a later release, command output displays fields pertinent to Smart Licensing Using Policy.

**Smart Licensing:** If the software version on the device is Cisco IOS XE Amsterdam 17.3.1 or an earlier release, command output displays fields pertinent to Smart Licensing.

### Examples

See [Table 201: show license usage Field Descriptions for Smart Licensing Using Policy, on page 1907](#) for information about fields shown in the display.

[show license usage for Smart Licensing Using Policy, on page 1908](#)

[show license usage for Smart Licensing, on page 1909](#)

**Table 201: show license usage Field Descriptions for Smart Licensing Using Policy**

| Field                             | Description                                                                                                                                     |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| License Authorization:<br>Status: | Displays overall authorization status.                                                                                                          |
| ():                               | Name of the license as in CSSM.<br><br>If this license is one that requires an authorization code, the name of the license comes from the code. |
| Description                       | Description of the license as in CSSM.                                                                                                          |

| Field                    | Description                                                                                                                                                                                                                                                                                                    |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Count                    | License count. If the license is not in-use, the count is reflected as zero.                                                                                                                                                                                                                                   |
| Version                  | Version.                                                                                                                                                                                                                                                                                                       |
| Status                   | License status can be one of the following <ul style="list-style-type: none"> <li>• In-Use: Valid license, and in-use.</li> <li>• Not In-Use</li> <li>• Not Authorized: Means that the license requires installation of SLAC before use. For more information, see</li> </ul>                                  |
| Export Status:           | Indicates if this license is export-controlled or not. ### show license usage for Smart Licensing Using Policy

The following is sample output of the **show license usage** command on a Cisco Catalyst 9500 switch. Unenforced licenses are in-use here. Similar output is displayed on all supported Cisco Catalyst Access, Core, and Aggregation Switches.

```

Device# show license usage
License Authorization:
  Status: Not Applicable
network-advantage (C9500 Network Advantage):
  Description: network-advantage
  Count: 2
  Version: 1.0
  Status: IN USE
  Export status: NOT RESTRICTED
  Feature Name: network-advantage
  Feature Description: network-advantage
  Enforcement type: NOT ENFORCED
  License type: Perpetual
dna-advantage (C9500-16X DNA Advantage):
  Description: C9500-16X DNA Advantage
  Count: 2
  Version: 1.0
  Status: IN USE
  Export status: NOT RESTRICTED
  Feature Name: dna-advantage
  Feature Description: C9500-16X DNA Advantage
  Enforcement type: NOT ENFORCED
  License type: Subscription

```

### show license usage for Smart Licensing

This example shows a sample output from the **show license usage** command:

```

Device# show license usage
License Authorization:
  Status: AUTHORIZED on Jul 17 09:47:28 2018 EDT

C9300 DNA Advantage (C9300-24 DNA Advantage):
  Description: C9300-24P DNA Advantage
  Count: 3
  Version: 1.0
  Status: AUTHORIZED

C9300 Network Advantage (C9300-24 Network Advantage):
  Description: C9300-24P Network Advantage
  Count: 3
  Version: 1.0
  Status: AUTHORIZED

```

## Usage Guidelines

The following example shows how to display the logs for the IPSLA Sender module:

```
Device# show logging process ios module ipsla_s
Displaying logs from the last 0 days, 0 hours, 10 minutes, 0 seconds
executing cmd on chassis local ...
Collecting files on current[local] chassis.
# of files collected = 2

2019/10/07 09:07:47.799791 {IOSRP_R0-0}{1}: [ipsla_s] [917]: (note): [1000] Starting

## show mac address-table

To display the MAC address table, use the **show mac address-table** command in privileged EXEC mode.

```
show mac address-table [{ address mac-addr [ interface type/number | vlan vlan-id ] | aging-time
[ routed-mac | vlan vlan-id ] | control-packet-learn | count [ summary | vlan vlan-id ] | [ dynamic
| secure | static ] [ address mac-addr ] [ interface type/number | vlan vlan-id ] | interface type/number
| learning [ vlan vlan-id ] | multicast [ count ] [ igmp-snooping | mld-snooping | user ] [ vlan
vlan-id ] | notification { change [ interface [ type/number ] ] | mac-move | threshold } | vlan
vlan-id }]
```

### Syntax Description

|                                                                      |                                                                                                      |
|----------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| <b>address</b> <i>mac-addr</i>                                       | (Optional) Displays information about the MAC address table for a specific MAC address.              |
| <b>interface</b> <i>type/number</i>                                  | (Optional) Displays addresses for a specific interface.                                              |
| <b>vlan</b> <i>vlan-id</i>                                           | (Optional) Displays addresses for a specific VLAN.                                                   |
| <b>aging-time</b> [ <b>routed-mac</b>   <b>vlan</b> <i>vlan-id</i> ] | (Optional) Displays the aging time for the routed MAC or VLAN.                                       |
| <b>control-packet-learn</b>                                          | (Optional) Displays the controlled packet MAC learning parameters.                                   |
| <b>count</b>                                                         | (Optional) Displays the number of entries that are currently in the MAC address table.               |
| <b>dynamic</b>                                                       | (Optional) Displays only the dynamic addresses.                                                      |
| <b>secure</b>                                                        | (Optional) Displays only the secure addresses.                                                       |
| <b>static</b>                                                        | (Optional) Displays only the static addresses.                                                       |
| <b>learning</b>                                                      | (Optional) Displays learnings of a VLAN or interface.                                                |
| <b>multicast</b>                                                     | (Optional) Displays information about the multicast MAC address table entries only.                  |
| <b>igmp-snooping</b>                                                 | (Optional) Displays the addresses learned by Internet Group Management Protocol (IGMP) snooping.     |
| <b>mld-snooping</b>                                                  | (Optional) Displays the addresses learned by Multicast Listener Discover version 2 (MLDv2) snooping. |
| <b>user</b>                                                          | (Optional) Displays the manually entered (static) addresses.                                         |
| <b>notification change</b>                                           | Displays the MAC notification parameters and history table.                                          |
| <b>notification mac-move</b>                                         | Displays the MAC-move notification status.                                                           |
| <b>notification threshold</b>                                        | Displays the Counter-Addressable Memory (CAM) table utilization notification status.                 |

**Command Modes** Privileged EXEC (#)

| Command History | Release                        | Modification                                                                                                                                                                        |
|-----------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a   | This command was introduced.                                                                                                                                                        |
|                 | Cisco IOS XE Gibraltar 16.12.4 | The output of the <b>show mac address-table vlan <i>vlan-id</i></b> command has been updated to show the MAC addresses used for Cisco Software-Defined Access (SD-Access) solution. |

**Usage Guidelines** The *mac-addr* value is a 48-bit MAC address. The valid format is H.H.H.

The interface *number* argument designates the module and port number. Valid values depend on the specified interface type and the chassis and module that are used. For example, if you specify a Gigabit Ethernet interface and have a 48-port 10/100BASE-T Ethernet module that is installed in a 13-slot chassis, valid values for the module number are from 1 to 13 and valid values for the port number are from 1 to 48.

The following is sample output from the **show mac address-table** command:

Device# **show mac address-table**

```

```

# show parser encrypt file status

To view the private configuration encryption status, use the **show parser encrypt file status** command.

## show parser encrypt file status

**Syntax Description** This command has no arguments or keywords.

**Command Default** None

**Command Modes** User EXEC

| Command History | Release                   | Modification                 |
|-----------------|---------------------------|------------------------------|
|                 | Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

## Examples

The following command output indicates that the feature is available and the file is encrypted. The file is in 'cipher text' format.

```
Device> enable
Device# show parser encrypt file status
Feature:                Enabled
File Format:             Cipher text
Encryption Version: ver1
```

# show platform software audit

To display the SE Linux Audit logs, use the **show platform software audit** command in privileged EXEC mode.

```
show platform software audit {all | summary | [switch {switch-number | active | standby}]  
{0 | F0 | R0 | {FP | RP} {active}}}
```

| Syntax Description   |  |                                                                     |
|----------------------|--|---------------------------------------------------------------------|
| <b>all</b>           |  | Shows the audit log from all the slots.                             |
| <b>summary</b>       |  | Shows the audit log summary count from all the slots.               |
| <b>switch</b>        |  | Shows the audit logs for a slot on a specific switch.               |
| <i>switch-number</i> |  | Selects the switch with the specified switch number.                |
| <b>switch active</b> |  | Selects the active instance of the switch.                          |
| <b>standby</b>       |  | Selects the standby instance of the switch.                         |
| <b>0</b>             |  | Shows the audit log for the SPA-Inter-Processor slot 0.             |
| <b>F0</b>            |  | Shows the audit log for the Embedded-Service-Processor slot 0.      |
| <b>R0</b>            |  | Shows the audit log for the Route-Processor slot 0.                 |
| <b>FP active</b>     |  | Shows the audit log for the active Embedded-Service-Processor slot. |
| <b>RP active</b>     |  | Shows the audit log for the active Route-Processor slot.            |

|                      |                     |
|----------------------|---------------------|
| <b>Command Modes</b> | Privileged EXEC (#) |
|----------------------|---------------------|

| Command History | Release                        | Modification                 |
|-----------------|--------------------------------|------------------------------|
|                 | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |

**Usage Guidelines** This command was introduced in the Cisco IOS XE Gibraltar 16.10.1 as a part of the SELinux Permissive Mode feature. The **show platform software audit** command displays the system logs containing the access violation events.

In Cisco IOS XE Gibraltar 16.10.1, operation in a permissive mode is available - with the intent of confining specific components (process or application) of the IOS-XE platform. In the permissive mode, access violation events are detected and system logs are generated, but the event or operation itself is not blocked. The solution operates mainly in an access violation detection mode.

The following is a sample output of the **show software platform software audit summary** command:

## show platform software audit

```
Device# show platform software audit summary
```

```
=====
AUDIT LOG ON switch 1
-----

# show platform software fed switch punt cause

To display information about why the packets received on an interface are punted to the Router Processor (RP), use the **show platform software fed switch punt cpuq cause** command in privileged EXEC mode.

**show platform software fed switch** {*switch-number* | **active** | **standby**} **punt**{*cause\_id* | **clear** | **summary**}

## Syntax Description

**switch** {*switch-number* | **active** | **standby**}

Displays information about the switch. You have the following options:

- *switch-number*.
- **active** —Displays information relating to the active switch.
- **standby**—Displays information relating to the standby switch, if available.

**Note** This keyword is not supported.

*cause\_id*

Specifies the ID of the cause for which the details have to be displayed.

**clear**

Clears the statistics for all the causes. Clearing the causes might result in inconsistent statistics.

**summary**

Displays a high-level overview of the punt reason.

## Command Default

None

## Command Modes

Privileged EXEC (#)

## Command History

| Release                        | Modification                 |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |

## Usage Guidelines

None

## Example

The following is sample output from the **show platform software fed switch active punt cause summary** command.

```
Device# show platform software fed switch active punt cause summary
Statistics for all causes
```

| Cause | Cause Info                    | Rcvd   | Dropped |
|-------|-------------------------------|--------|---------|
| 7     | ARP request or response       | 1      | 0       |
| 21    | RP<->QFP keepalive            | 22314  | 0       |
| 55    | For-us control                | 12     | 0       |
| 60    | IP subnet or broadcast packet | 21     | 0       |
| 96    | Layer2 control protocols      | 133808 | 0       |

-----

The following is sample output from the **show platform software fed switch active punt cause** *cause-id* command.

Device# **show platform software fed switch active punt cause 21**  
Detailed Statistics

| Sub Cause | Rcvd  | Dropped |
|-----------|-------|---------|
| 0         | 22363 | 0       |

# show platform software fed switch punt cpuq

To display information about the punt traffic on CPU queues, use the **show platform software fed switch punt cpuq** command in privileged EXEC mode.

**show platform software fed switch** {*switch-number* | **active** | **standby**} **punt cpuq** {*cpuq\_id* | **all** | **brief** | **clear** | **rates**}

|                    |                                                                     |                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>switch</b> { <i>switch-number</i> <b>active</b> <b>standby</b> } | Displays information about the switch. You have the following options: <ul style="list-style-type: none"><li>• <i>switch-number</i>.</li><li>• <b>active</b>—Displays information relating to the active switch.</li><li>• <b>standby</b>—Displays information relating to the standby switch, if available.</li></ul> <b>Note</b> This keyword is not supported. |
|                    | <b>punt</b>                                                         | Displays the punt informtion.                                                                                                                                                                                                                                                                                                                                     |
|                    | <b>cpuq</b>                                                         | Displays information about the CPU receive queue.                                                                                                                                                                                                                                                                                                                 |
|                    | <i>cpuq_id</i>                                                      | Specifies details specific to a particular CPU queue.                                                                                                                                                                                                                                                                                                             |
|                    | <b>all</b>                                                          | Displays the statistics for all the CPU queues.                                                                                                                                                                                                                                                                                                                   |
|                    | <b>brief</b>                                                        | Displays summarized statistics for all the queues like details about punt packets received and dropped.                                                                                                                                                                                                                                                           |
|                    | <b>clear</b>                                                        | Clears the statistics for all the CPU queues. Clearing the CPU queue might result in inconsistent statistics.                                                                                                                                                                                                                                                     |
|                    | <b>rates</b>                                                        | Displays the rate at which the packets are punted.                                                                                                                                                                                                                                                                                                                |

The table below describes the significant fields shown in the display.

**Table 203: show platform software fed switch active punt cpuq brief Field Descriptions**

| Field      | Description                 |
|------------|-----------------------------|
| Q no       | ID of the queue.            |
| Queue Name | Name of the queue.          |
| Rx         | Number of packets received. |

| Field | Description                |
|-------|----------------------------|
| Drop  | Number of packets dropped. |

The following is sample output from the **show platform software fed switch active punt cpuq cpuq\_id** command.

```
Device#show platform software fed switch active punt cpuq 1
```

```
Punt CPU Q Statistics

```

# show platform software sl-infra

To display troubleshooting information and for debugging, enter the **show platform software sl-infra** command in privileged EXEC mode. The output of this command is used by the technical support team, for troubleshooting and debugging.

**show platform software sl-infra** { **all** | **current** | **debug** | **stored** }

## Syntax Description

|                |                                                              |
|----------------|--------------------------------------------------------------|
| <b>all</b>     | Displays current, debugging, and stored information.         |
| <b>current</b> | Displays current license-related information.                |
| <b>debug</b>   | Enables debugging                                            |
| <b>stored</b>  | Displays information that is stored on the product instance. |

## Command Modes

Privileged EXEC (Device#)

## Command History

| Release                        | Modification                 |
|--------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.3.2a | This command was introduced. |

## Usage Guidelines

When you encounter an error message that you are not able to resolve, along with a copy of the message that appears on the console or in the system log, provide your Cisco technical support representative with sample output of these commands: **show license tech support**, **show license history message**, and the **show platform software sl-infra all** privileged EXEC commands.

# show platform sudi certificate

To display checksum record for the specific SUDI, use the **show platform sudi certificate** command in privileged EXEC mode.

**show platform sudi certificate** [**sign** [**nonce** <nonce>]]

|                    |                              |                                |
|--------------------|------------------------------|--------------------------------|
| Syntax Description | <b>sign</b>                  | (Optional) Show signature      |
|                    | <b>nonce</b>                 | (Optional) Enter a nonce value |
| Command Modes      | Privileged EXEC (#)          |                                |
| Command History    | <b>Release</b>               | <b>Modification</b>            |
|                    | This command was introduced. |                                |

## Examples

This example shows how to view the checksum record for a specific SUDI :

```
# show platform sudi certificate

# show running-config

To display the contents of the current running configuration file or the configuration for a specific module, Layer 2 VLAN, class map, interface, map class, policy map, or virtual circuit (VC) class, use the **show running-config** command in privileged EXEC mode.

**show running-config** [*options*]

## Syntax Description

*options* (Optional) Keywords used to customize output. You can enter more than one keyword.

- **aaa** [**accounting** | **attribute** | **authentication** | **authorization** | **diameter** | **group** | **ldap** | **miscellaneous** | **radius-server** | **server** | **tacacs-server** | **user-name** | **username**]: Displays AAA configurations.
- **all**: Expands the output to include the commands that are configured with default parameters. If the **all** keyword is not used, the output does not display commands configured with default parameters.
- **bridge-domain** {**id** | **parameterized vlan**}: Displays the running configuration for bridge domains.
- **brief**: Displays the configuration without certification data and encrypted filter details.
- **class-map** [*name*] [**linenum**]: Displays class map information.
- **cts** [**interface** | **policy-server** | **rbm-rbac** | **server** | **sxp**]: Displays Cisco TrustSec configurations.
- **deprecated**: Displays deprecated configuration along with the running configuration.
- **eap** {**method** | **profiles**}: Displays EAP method configurations and profiles.
- **flow** {**exporter** | **monitor** | **record**}: Displays global flow configuration commands.
- **full**: Displays the full configuration.
- **identity** {**policy** | **profile**}: Displays identity profile or policy information.

- **interface** *type number*: Displays interface-specific configuration information. If you use the **interface** keyword, you must specify the interface type and the interface number (for example, **interface GigabitEthernet 1/0/1**). Use the **show run interface ?** command to determine the interfaces available on your system.
- **ip dhcp pool** [*name*]: Displays IPv4 DHCP pool configuration.
- **ipv6 dhcp pool** [*name*]: Displays IPv6 DHCP pool configuration.
- **linenum** [**brief** | **full** | **partition**]: Displays line numbers in the output.
- **map-class** [**atm** | **dialer** | **frame-relay**] [*name*]: Displays map class information.
- **mdns-sd** [**gateway** | **location-group** | **service-definition** | **service-list** | **service-peer** | **service-policy**]: Displays Multicast DNS Service Discovery (mDNS-SD) configurations.
- **partition** {**access-list** | **class-map** | **common** | **global-cdp** | **interface** | **ip-as-path** | **ip-community** | **ip-prefix-list** | **ip-static-routes** | **line** | **policy-map** | **route-map** | **router** | **snmp** | **tacacs**}: Displays the configuration corresponding to a partition.
- **policy-map** [*name*] [*linenum*]: Displays policy map information.
- **switch** *number*: Displays configuration for the specified switch.
- **view** [**full**]: Enables the display of a full running configuration. This is for view-based users who typically can only view the configuration commands that they are entitled to access for that particular view.
- **vlan** [*vlan-id*]: Displays the specific VLAN information; valid values are from 1 to 4094.
- **vrf** [*vrf-name*]: Displays the Virtual routing and forwarding (VRF)-aware configuration module number .

**Command Default**

The default syntax, **show running-config**, displays the contents of the running configuration file, except commands configured using the default parameters.

**Command Modes**

Privileged EXEC (#)

**Command History**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

The **show running-config** command is technically a command alias (substitute or replacement syntax) of the **more system:running-config** command. Although the use of more commands is recommended (because of their uniform structure across platforms and their expandable syntax), the **show running-config** command remains enabled to accommodate its widespread use, and to allow typing shortcuts such as **show run**.

The **show running-config interface** command is useful when there are multiple interfaces and you want to look at the configuration of a specific interface.

The **linenum** keyword causes line numbers to be displayed in the output. This option is useful for identifying a particular portion of a very large configuration.

You can enter additional output modifiers in the command syntax by including a pipe character (|) after the optional keyword. For example, **show running-config interface GigabitEthernet 1/0/1 linenum | begin 3**.

To display the output modifiers that are available for a keyword, enter `| ?` after the keyword. Depending on the platform you are using, the keywords and the arguments for the *options* argument may vary.

The **show running-config all** command displays complete configuration information, including the default settings and values. For example, if the Cisco Discovery Protocol (abbreviated as CDP in the output) hold-time value is set to its default of 180:

- The **show running-config** command does not display this value.
- The **show running-config all** displays the following output: `cdp holdtime 180`.

If the Cisco Discovery Protocol holdtime is changed to a nondefault value (for example, 100), the output of the **show running-config** and **show running-config all** commands is the same; that is, the configured parameter is displayed.

The **show running-config** command displays ACL information. To exclude ACL information from the output, use the **show running | section exclude ip access | access list** command.

## Examples

The following example shows the configuration for GigabitEthernet0/0 interface. The fields are self-explanatory.

```
Device# show running-config interface gigabitEthernet0/0
```

```
Building configuration...
```

```
Current configuration : 130 bytes
!
interface GigabitEthernet0/0
 vrf forwarding Mgmt-vrf
 ip address 10.5.20.10 255.255.0.0
 negotiation auto
 ntp broadcast
end
```

The following example shows how to set line numbers in the command output and then use the output modifier to start the display at line 10. The fields are self-explanatory.

```
Device# show running-config linenum | begin 10
```

```
10 : boot-start-marker
11 : boot-end-marker
12 : !
13 : no logging buffered
14 : enable password #####
15 : !
16 : spe 1/0 1/7
17 :  firmware location bootflash:mica-modem-pw.10.16.0.0.bin
18 : !
19 : !
20 : resource-pool disable
21 : !
22 : no aaa new-model
23 : ip subnet-zero
24 : ip domain name cisco.com
25 : ip name-server 172.16.11.48
26 : ip name-server 172.16.2.133
27 : !
28 : !
29 : isdn switch-type primary-5ess
30 : !
.
```

```
.
.
126 : end
```

In the following sample output from the **show running-config** command, the **shape average** command indicates that the traffic shaping overhead accounting for ATM is enabled. The BRAS-DSLAM encapsulation type is qinq and the subscriber line encapsulation type is snap-rbe based on the ATM adaptation layer 5 (AAL5) service. The fields are self-explanatory.

```
Device# show running-config
.
.
.
subscriber policy recording rules limit 64
no mpls traffic-eng auto-bw timers frequency 0
call rsvp-sync
!

| <b>show startup-config</b>                | Displays the contents of NVRAM (if present and valid) or displays the configuration file pointed to by the CONFIG_FILE environment variable. (Command alias for the <b>more:nvram startup-config</b> command.) |

# show sdm prefer

To display information about the templates that can be used to maximize system resources for a particular feature, use the **show sdm prefer** command in privileged EXEC mode. To display the current template, use the command without a keyword.

**show sdm prefer** [**access**]

|                           |                                                                       |
|---------------------------|-----------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>access</b> (Optional) Displays information on the access template. |
|---------------------------|-----------------------------------------------------------------------|

|                        |                                |
|------------------------|--------------------------------|
| <b>Command Default</b> | No default behavior or values. |
|------------------------|--------------------------------|

|                      |                 |
|----------------------|-----------------|
| <b>Command Modes</b> | Privileged EXEC |
|----------------------|-----------------|

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                                                                                      |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | If you did not reload the switch after entering the <b>sdm prefer</b> global configuration command, the <b>show sdm prefer</b> privileged EXEC command displays the template currently in use and not the newly configured template. |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The numbers displayed for each template represent an approximate maximum number for each feature resource. The actual number might vary, depending on the actual number of other features configured. For example, in the default template if your had more than 16 routed interfaces (subnet VLANs), the number of possible unicast MAC addresses might be less than 6000.

## Example

The following is sample output from the **show sdm prefer** command:

```
# show sdm prefer

Showing SDM Template Info

This is the Access template.
  Number of VLANs:                        4094

| Control Plane Entries:                  | 512   |
| Input Netflow flows:                    | 32768 |
| Output Netflow flows:                   | 32768 |
| SGT/DGT (or) MPLS VPN entries:          | 8192  |
| SGT/DGT (or) MPLS VPN Overflow entries: | 512   |
| Wired clients:                          | 2048  |
| MACSec SPD Entries:                     | 256   |
| MPLS L3 VPN VRF:                        | 255   |
| MPLS Labels:                            | 2048  |
| MPLS L3 VPN Routes VRF Mode:            | 7168  |
| MPLS L3 VPN Routes Prefix Mode:         | 3072  |
| MVPN MDT Tunnels:                       | 256   |
| L2 VPN EOMPLS Attachment Circuit:       | 256   |
| MAX VPLS Bridge Domains :               | 128   |
| MAX VPLS Peers Per Bridge Domain:       | 32    |
| MAX VPLS/VPWS Pseudowires :             | 1024  |

These numbers are typical for L2 and IPv4 features.

Some features such as IPv6, use up double the entry size;  
so only half as many entries can be created.

\* values can be modified by sdm cli.

#

# show tech-support confidential

To hide confidential information from the **show tech-support** output, use the **show tech-support confidential** command in privileged EXEC mode.

**show tech-support confidential output** *file-name*

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                       |

|                           | Cisco IOS XE Amsterdam 17.3.1                                                                                                                                                                                                                                                                                                                                                                                                                | This command was introduced.                                          |
| <b>Usage Guidelines</b>   | The <b>show tech-support confidential</b> command will hide sensitive data like MAC addresses, IP addresses, and passwords. The output will be the same as that of the <b>show tech-support</b> command with all the customer-specific data masked.                                                                                                                                                                                          |                                                                       |
|                           | The output from the <b>show tech-support confidential</b> command is very long. To better manage this output, you can redirect the output to a file in the local writable storage file system or the remote file system by using the <b>show tech-support confidential output location:filename</b> ). Redirecting the output to a file also makes sending the output to your Cisco Technical Assistance Center (TAC) representative easier. |                                                                       |
|                           | Device# <b>show tech-support confidential output flash:tech_confidential</b><br>Collecting tech-support without confidential info, it will take few min..                                                                                                                                                                                                                                                                                    |                                                                       |
|                           | To view the output of the redirected file, use the command <b>more location:filename</b> .                                                                                                                                                                                                                                                                                                                                                   |                                                                       |

# show tech-support monitor

To display the SPAN monitor information, use the **show tech-support monitor** command in privileged EXEC mode.

**show tech-support monitor** [{**switch** *switch-number* | **active** | **standby**}]

|                    | Cisco IOS XE Amsterdam 17.3.1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | This command was introduced.                  |
| Usage Guidelines   | <p>The output from the <b>show tech-support monitor</b> command is very long. To better manage this output, you can redirect the output to a file (for example, <b>show tech-support monitor</b> [<b>switch</b> <i>switch-number</i>   <b>active</b>   <b>standby</b>]   <b>redirect location:filename</b>) in the local writable storage file system or the remote file system. Redirecting the output to a file also makes sending the output to your Cisco Technical Assistance Center (TAC) representative easier.</p> <p>To view the output of the redirected file, use the command <b>more location:filename</b>.</p> |                                               |

# show tech-support platform

To display detailed information about a platform for use by technical support, use the **show tech-support platform** command in privileged EXEC mode.

## show tech-support platform

### Syntax Description

This command has no arguments or keywords.

### Command Modes

Privileged EXEC (#)

### Command History

| Release                        | Modification                 |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |

### Usage Guidelines

This command is used for platform-specific debugging. The output provides detailed information about a platform, such as CPU usage, Ternary Content Addressable Memory (TCAM) usage, capacity, and memory usage.

The output of the **show tech-support platform** command is very long. To better manage this output, you can redirect the output to an external file (for example, **show tech-support platform | redirect flash:filename**) in the local writable storage file system or remote file system.

The output of the **show tech-support platform** command displays a list commands and their output. These commands may differ based on the platform.

### Examples

The following is sample output from the **show tech-support platform** command:

```
Device# show tech-support platform

.
.
.
----- show platform hardware capacity -----

```

**show tech-support platform evpn\_vxlan**

```

Input Netflow flows:                        8192
Output Netflow flows:                      16384
SGT/DGT (or) MPLS VPN entries:             4096
SGT/DGT (or) MPLS VPN Overflow entries:     512
Wired clients:                             2048
MACSec SPD Entries:                        256
MPLS L3 VPN VRF:                           127
MPLS Labels:                               2048
MPLS L3 VPN Routes VRF Mode:               7168
MPLS L3 VPN Routes Prefix Mode:            3072
MVPN MDT Tunnels:                          256
L2 VPN EOMPLS Attachment Circuit:          256
MAX VPLS Bridge Domains :                   64
MAX VPLS Peers Per Bridge Domain:           8
MAX VPLS/VPWS Pseudowires :                256
These numbers are typical for L2 and IPv4 features.
Some features such as IPv6, use up double the entry size;
so only half as many entries can be created.
* values can be modified by sdm cli.

| <b>show tech-support platform</b> | Displays detailed information about a platform for use by technical support. |

# show tech-support platform igmp\_snooping

To display Internet Group Management Protocol (IGMP) snooping information about a group, use the **show tech-support platform igmp\_snooping** command in privileged EXEC mode.

**show tech-support platform igmp\_snooping** [{Group\_ipAddr ipv4-address | [{vlan vlan-ID}]]

|                    |                                |                                                                                      |
|--------------------|--------------------------------|--------------------------------------------------------------------------------------|
| Syntax Description | Group_ipAddr                   | (Optional) Displays snooping information about the specified group address.          |
|                    | ipv4-address                   | (Optional) IPv4 address of the group.                                                |
|                    | vlan vlan-ID                   | (Optional) Displays IGMP snooping VLAN information. Valid values are from 1 to 4094. |
| Command Modes      | Privileged EXEC (#)            |                                                                                      |
| Command History    | Release                        | Modification                                                                         |
|                    | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced.                                                         |

The output of this command is very long. To better manage this output, you can redirect the output to a file (for example, **show tech-support platform igmp\_snooping | redirect flash:filename**) in the local writable storage file system or remote file system.

|-----------------------------------|------------------------------------------------------------------------------|
| <b>ip igmp snooping</b>           | Enables IGMP snooping globally or on an interface.                           |
| <b>show ip igmp snooping</b>      | Displays the IGMP snooping configuration of a device.                        |
| <b>show tech-support platform</b> | Displays detailed information about a platform for use by technical support. |

# show tech-support platform layer3

To display Layer 3 platform forwarding information, use the **show tech-support platform layer3** command in privileged EXEC mode.

**show tech-support platform layer3** {**multicast** **Group\_ipAddr** *ipv4-address* **switch** *switch-number* **srcIP** *ipv4-address* | **unicast** {**dstIP** *ipv4-address* **srcIP** *ipv4-address* | **vrf** *vrf-name* **destIP** *ipv4-address* **srcIP** *ipv4-address*}}

|                    |                                           |                                                                                |
|--------------------|-------------------------------------------|--------------------------------------------------------------------------------|
| Syntax Description | <b>multicast</b>                          | Displays multicast information.                                                |
|                    | <b>Group_ipv6Addr</b> <i>ipv4-address</i> | Displays information about the specified multicast group address.              |
|                    | <b>switch</b> <i>switch-number</i>        | Displays information about the specified switch. Valid values are from 1 to 9. |
|                    | <b>srcIP</b> <i>ipv4-address</i>          | Displays information about the specified source address.                       |
|                    | <b>unicast</b>                            | Displays unicast-related information.                                          |
|                    | <b>dstIP</b> <i>ipv4-address</i>          | Displays information about the specified destination address.                  |
|                    | <b>vrf</b> <i>vrf-name</i>                | Displays unicast-related virtual routing and forwarding (VRF) information.     |

# show tech-support platform mld\_snooping

To display Multicast Listener Discovery (MLD) snooping information about a group, use the **show tech-support platform mld\_snooping** command in privileged EXEC mode.

**show tech-support platform mld\_snooping** [{**Group\_ipv6Addr** *ipv6-address* }][{**vlan** *vlan-ID*}]

|                    |                            |                                                                                     |
|--------------------|----------------------------|-------------------------------------------------------------------------------------|
| Syntax Description | <b>Group_ipv6Addr</b>      | (Optional) Displays snooping information about the specified group address.         |
|                    | <i>ipv6-address</i>        | (Optional) IPv6 address of the group.                                               |
|                    | <b>vlan</b> <i>vlan-ID</i> | (Optional) Displays MLD snooping VLAN information. Valid values are from 1 to 4094. |

|                        | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |

|                         |                                                                                                                                                                                                                                                                                              |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The output of the <b>show tech-support port</b> command is very long. To better manage this output, you can redirect the output to an external file (for example, <b>show tech-support port   redirect flash:filename</b> ) in the local writable storage file system or remote file system. |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The output of this command displays the following commands:

- **show clock**
- **show version**
- **show module**
- **show inventory**
- **show interface status**
- **show interface counters**
- **show interface counters errors**
- **show interfaces**
- **show interfaces capabilities**
- **show controllers**
- **show controllers utilization**
- **show idprom interface**
- **show controller ethernet-controller phy detail**
- **show switch**
- **show platform software fed switch active port summary**
- **show platform software fed switch ifm interfaces ethernet**
- **show platform software fed switch ifm mappings**
- **show platform software fed switch ifm mappings lpn**

- show platform software fed switch ifm mappings gpn
- show platform software fed switch ifm mappings port-le
- show platform software fed switch ifm if-id
- show platform software fed switch active port if\_id

## Examples

The following is sample output from the **show tech-support port** command:

```
Device# show tech-support port
.
.
.
----- show controllers utilization -----

# show version

To display information about the currently loaded software along with hardware and device information, use the **show version** command in user EXEC or privileged EXEC mode.

**show version** [{*switch node*}][{**installed** | **provisioned** | **running**}]

## Syntax Description

|                       |                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------|
| <b>switch node</b>    | (optional) Only a single switch may be specified. Default is all switches in a stacked system. |
| <b>running</b>        | (optional) Specifies information on the files currently running.                               |
| <b>provisioned</b>    | (optional) Specifies information on the software files that are provisioned.                   |
| <b>installed</b>      | Specifies information on the software installed on the RP                                      |
| <b>user-interface</b> | Specifies information on the files related to the user-interface.                              |

## Command Default

No default behavior or values.

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

This command displays information about the Cisco IOS software version currently running on a device, the ROM Monitor and Bootflash software versions, and information about the hardware configuration, including the amount of system memory. Because this command displays both software and hardware information, the output of this command is the same as the output of the **show hardware** command. (The **show hardware** command is a command alias for the **show version** command.)

Specifically, the **show version** command provides the following information:

- Software information
  - Main Cisco IOS image version
  - Main Cisco IOS image capabilities (feature set)
  - Location and name of bootfile in ROM
  - Bootflash image version (depending on platform)
- Device-specific information
  - Device name
  - System uptime
  - System reload reason
  - Config-register setting
  - Config-register settings for after the next reload (depending on platform)

- Hardware information
  - Platform type
  - Processor type
  - Processor hardware revision
  - Amount of main (processor) memory installed
  - Amount I/O memory installed
  - Amount of Flash memory installed on different types (depending on platform)
  - Processor board ID

The output of this command uses the following format:

```
Cisco IOS Software, <platform> Software (<image-id>), Version <software-version>,
<software-type>

Technical Support: http://www.cisco.com/techsupport
Copyright (c) <date-range> by Cisco Systems, Inc.
Compiled <day> <date> <time> by <compiler-id>

ROM: System Bootstrap, Version <software-version>, <software-type>
BOOTLDR: <platform> Software (image-id), Version <software-version>, <software-type>

<router-name> uptime is <w> weeks, <d> days, <h> hours,
<m> minutes
System returned to ROM by reload at <time> <day> <date>
System image file is "<filesystem-location>/<software-image-name>"
Last reload reason: <reload-reason>Cisco <platform-processor-type>
processor (revision <processor-revision-id>) with <free-DRAM-memory>
K/<packet-memory>K bytes of memory.
Processor board ID <ID-number>

<CPU-type> CPU at <clock-speed>Mhz, Implementation <number>, Rev <
Revision-number>, <kilobytes-Processor-Cache-Memory>KB <cache-Level> Cache
```

See the Examples section for descriptions of the fields in this output.

Entering **show version** displays the IOS XE software version and the IOS XE software bundle which includes a set of individual packages that comprise the complete set of software that runs on the switch.

The **show version running** command displays the list of individual packages that are currently running on the switch. When booted in installed mode, this is typically the set of packages listed in the booted provisioning file. When booted in bundle mode, this is typically the set of packages contained in the bundle.

The **show version provisioned** command displays information about the provisioned package set.

The following is sample output from the **show version** command on a Cisco Catalyst 9300 Series Switch:

```
Device# show version
Cisco IOS XE Software, Version BLD_V1610_THROTTLE_LATEST_20180903_070602 V16_10_0_101_2
Cisco IOS Software [Fujii], Catalyst L3 Switch Software (CAT9K_IOSXE), Experimental Version
 16.10.20180903:072347
[v1610_throttle-/nobackup/mcpre/BLD-BLD_V1610_THROTTLE_LATEST_20180903_070602 183]

**Table 204: Table 5, show version running Field Descriptions**

| Field    | Description                                                                          |
|----------|--------------------------------------------------------------------------------------|
| Package: | The individual sub-package name.                                                     |
| version: | The individual sub-package version.                                                  |
| status:  | Reveals if the package is active or inactive for the specific Supervisor module.     |
| File:    | The filename of the individual package file.                                         |
| on:      | The slot number of the Active or Standby Supervisor that this package is running on. |
| Built:   | The date the individual package was built.                                           |

# system env temperature threshold yellow

To configure the difference between the yellow and red temperature thresholds that determines the value of yellow threshold, use the **system env temperature threshold yellow** command in global configuration mode. To return to the default value, use the **no** form of this command.

**system env temperature threshold yellow** *value*  
**no system env temperature threshold yellow** *value*

## Syntax Description

*value* Specifies the difference between the yellow and red threshold values (in Celsius). The range is 10 to 25.

## Command Default

These are the default values

*Table 205: Default Values for the Temperature Thresholds*

| Device        | Difference between Yellow and Red | Red <sup>11</sup> |
|---------------|-----------------------------------|-------------------|
| Catalyst 9300 | 14°C                              | 60°C              |

<sup>11</sup> You cannot configure the red temperature threshold.

## Command Modes

Global configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

You cannot configure the green and red thresholds but can configure the yellow threshold. Use the **system env temperature threshold yellow** *value* global configuration command to specify the difference between the yellow and red thresholds and to configure the yellow threshold. For example, if the red threshold is 66 degrees C and you want to configure the yellow threshold as 51 degrees C, set the difference between the thresholds as 15 by using the **system env temperature threshold yellow 15** command. For example, if the red threshold is 60 degrees C and you want to configure the yellow threshold as 51 degrees C, set the difference between the thresholds as 15 by using the **system env temperature threshold yellow 9** command.

### Note

The internal temperature sensor in the device measures the internal system temperature and might vary  $\pm 5$  degrees C.

## Examples

This example sets 15 as the difference between the yellow and red thresholds:

```
Device(config)# system env temperature threshold yellow 15
Device(config)#
```

■ system env temperature threshold yellow

# test cable-diagnostics tdr

To run the Time Domain Reflector (TDR) feature on an interface, use the **test cable-diagnostics tdr** command in privileged EXEC mode.

**test cable-diagnostics tdr interface** *interface-id*

|                           |                                                        |
|---------------------------|--------------------------------------------------------|
| <b>Syntax Description</b> | <i>interface-id</i> The interface on which to run TDR. |
|---------------------------|--------------------------------------------------------|

|                        |                                |
|------------------------|--------------------------------|
| <b>Command Default</b> | No default behavior or values. |
|------------------------|--------------------------------|

|                      |                 |
|----------------------|-----------------|
| <b>Command Modes</b> | Privileged EXEC |
|----------------------|-----------------|

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | TDR is supported only on 10/100/100 copper Ethernet ports. It is not supported on 10-Gigabit Ethernet ports or small form-factor pluggable (SFP) module ports. |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|

After you run TDR by using the **test cable-diagnostics tdr interface** *interface-id* command, use the **show cable-diagnostics tdr interface** *interface-id* privileged EXEC command to display the results.

This example shows how to run TDR on an interface:

```
Device# test cable-diagnostics tdr interface gigabitethernet1/0/2
TDR test started on interface Gi1/0/2
A TDR test can take a few seconds to run on an interface
Use 'show cable-diagnostics tdr' to read the TDR results
```

If you enter the **test cable-diagnostics tdr interface** *interface-id* command on an interface that has an link up status and a speed of 10 or 100 Mb/s, these messages appear:

```
Device# test cable-diagnostics tdr interface gigabitethernet1/0/3
TDR test on Gi1/0/9 will affect link state and traffic
TDR test started on interface Gi1/0/3
A TDR test can take a few seconds to run on an interface
Use 'show cable-diagnostics tdr' to read the TDR results.
```

# tracert mac

To display the Layer 2 path taken by the packets from the specified source MAC address to the specified destination MAC address, use the **tracert mac** command in privileged EXEC mode.

```
tracert mac [ interface interface-id ] source-mac-address [ interface interface-id ]  
destination-mac-address [ vlan vlan-id ] [detail]
```

## Syntax Description

|                                |                                                                                                                                                                        |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interface interface-id</b>  | (Optional) Specifies an interface on the source or destination device.                                                                                                 |
| <b>source-mac-address</b>      | The MAC address of the source device in hexadecimal format.                                                                                                            |
| <b>destination-mac-address</b> | The MAC address of the destination device in hexadecimal format.                                                                                                       |
| <b>vlan vlan-id</b>            | (Optional) Specifies the VLAN on which to trace the Layer 2 path that the packets take from the source device to the destination device. Valid VLAN IDs are 1 to 4094. |
| <b>detail</b>                  | (Optional) Specifies that detailed information appears.                                                                                                                |

## Command Default

No default behavior or values.

|-------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Cisco IOS XE Everest 16.5.1a  | This command was introduced.                                                                                       |
| Cisco IOS XE Bengaluru 17.5.1 | <b>aborted</b> was replaced with <b>terminated</b> in the output error message for the <b>tracert mac</b> command. |

## Usage Guidelines

For Layer 2 tracert to function properly, Cisco Discovery Protocol (CDP) must be enabled on all of the devices in the network. Do not disable CDP.

When the device detects a device in the Layer 2 path that does not support Layer 2 tracert, the device continues to send Layer 2 trace queries and lets them time out.

The maximum number of hops identified in the path is ten.

Layer 2 tracert supports only unicast traffic. If you specify a multicast source or destination MAC address, the physical path is not identified, and an error message appears.

The **tracert mac** command output shows the Layer 2 path when the specified source and destination addresses belong to the same VLAN.

If you specify source and destination addresses that belong to different VLANs, the Layer 2 path is not identified, and an error message appears.

If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong.

If the VLAN is not specified, the path is not identified, and an error message appears.

The Layer 2 traceroute feature is not supported when multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port).

When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

This feature is not supported in Token Ring VLANs.

## Examples

This example shows how to display the Layer 2 path by specifying the source and destination MAC addresses:

```
Device# traceroute mac 0000.0201.0601 0000.0201.0201
Source 0000.0201.0601 found on con6[WS-C3750E-24PD] (2.2.6.6)
con6 (2.2.6.6) :Gi0/0/1 => Gi0/0/3
con5          (2.2.5.5)   ) :   Gi0/0/3 => Gi0/0/1
con1          (2.2.1.1)   ) :   Gi0/0/1 => Gi0/0/2
con2          (2.2.2.2)   ) :   Gi0/0/2 => Gi0/0/1
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed
```

This example shows how to display the Layer 2 path by using the **detail** keyword:

```
Device# traceroute mac 0000.0201.0601 0000.0201.0201 detail
Source 0000.0201.0601 found on con6[WS-C3750E-24PD] (2.2.6.6)
con6 / WS-C3750E-24PD / 2.2.6.6 :
      Gi0/0/2 [auto, auto] => Gi0/0/3 [auto, auto]
con5 / WS-C2950G-24-EI / 2.2.5.5 :
      Fa0/3 [auto, auto] => Gi0/1 [auto, auto]
con1 / WS-C3550-12G / 2.2.1.1 :
      Gi0/1 [auto, auto] => Gi0/2 [auto, auto]
con2 / WS-C3550-24 / 2.2.2.2 :
      Gi0/2 [auto, auto] => Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
```

This example shows how to display the Layer 2 path by specifying the interfaces on the source and destination devices:

```
Device# traceroute mac interface fastethernet0/1 0000.0201.0601 interface fastethernet0/3
0000.0201.0201
Source 0000.0201.0601 found on con6[WS-C3750E-24PD] (2.2.6.6)
con6 (2.2.6.6) :Gi0/0/1 => Gi0/0/3
con5          (2.2.5.5)   ) :   Gi0/0/3 => Gi0/0/1
con1          (2.2.1.1)   ) :   Gi0/0/1 => Gi0/0/2
con2          (2.2.2.2)   ) :   Gi0/0/2 => Gi0/0/1
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed
```

This example shows the Layer 2 path when the device is not connected to the source device:

```
Device# traceroute mac 0000.0201.0501 0000.0201.0201 detail
Source not directly connected, tracing source .....
```

```

Source 0000.0201.0501 found on con5[WS-C3750E-24TD] (2.2.5.5)
con5 / WS-C3750E-24TD / 2.2.5.5 :
    Gi0/0/1 [auto, auto] => Gi0/0/3 [auto, auto]
con1 / WS-C3550-12G / 2.2.1.1 :
    Gi0/1 [auto, auto] => Gi0/2 [auto, auto]
con2 / WS-C3550-24 / 2.2.2.2 :
    Gi0/2 [auto, auto] => Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.

```

This example shows the Layer 2 path when the device cannot find the destination port for the source MAC address:

```

Device# tracert mac 0000.0011.1111 0000.0201.0201
Error:Source Mac address not found.
Layer2 trace terminated.

```

This example shows the Layer 2 path when the source and destination devices are in different VLANs:

```

Device# tracert mac 0000.0201.0601 0000.0301.0201
Error:Source and destination macs are on different vlans.
Layer2 trace terminated.

```

This example shows the Layer 2 path when the destination MAC address is a multicast address:

```

Device# tracert mac 0000.0201.0601 0100.0201.0201
Invalid destination mac address

```

This example shows the Layer 2 path when source and destination devices belong to multiple VLANs:

```

Device# tracert mac 0000.0201.0601 0000.0201.0201
Error:Mac found on multiple vlans.
Layer2 trace terminated.

```

# traceroute mac ip

To display the Layer 2 path taken by the packets from the specified source IP address or hostname to the specified destination IP address or hostname, use the **traceroute mac ip** command in privileged EXEC mode.

```
traceroute mac ip { source-ip-address source-hostname } { destination-ip-address destination-hostname } [detail]
```

## Syntax Description

|                               |                                                                                         |
|-------------------------------|-----------------------------------------------------------------------------------------|
| <i>source-ip-address</i>      | The IP address of the source device as a 32-bit quantity in dotted-decimal format.      |
| <i>source-hostname</i>        | The IP hostname of the source device.                                                   |
| <i>destination-ip-address</i> | The IP address of the destination device as a 32-bit quantity in dotted-decimal format. |
| <i>destination-hostname</i>   | The IP hostname of the destination device.                                              |
| <b>detail</b>                 | (Optional) Specifies that detailed information appears.                                 |

## Command Default

No default behavior or values.

## Command Modes

Privileged EXEC

## Command History

| Release                       | Modification                                                                                                             |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| Cisco IOS XE Everest 16.5.1a  | This command was introduced.                                                                                             |
| Cisco IOS XE Bengaluru 17.5.1 | <b>aborted</b> was replaced with <b>terminated</b> in the output error message for the <b>traceroute mac ip</b> command. |

## Usage Guidelines

For Layer 2 traceroute to function properly, Cisco Discovery Protocol (CDP) must be enabled on each device in the network. Do not disable CDP.

When the device detects a device in the Layer 2 path that does not support Layer 2 traceroute, the device continues to send Layer 2 trace queries and lets them time out.

The maximum number of hops identified in the path is ten.

The **traceroute mac ip** command output shows the Layer 2 path when the specified source and destination IP addresses are in the same subnet.

When you specify the IP addresses, the device uses Address Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.

- If an ARP entry exists for the specified IP address, the device uses the associated MAC address and identifies the physical path.
- If an ARP entry does not exist, the device sends an ARP query and tries to resolve the IP address. The IP addresses must be in the same subnet. If the IP address is not resolved, the path is not identified, and an error message appears.

The Layer 2 traceroute feature is not supported when multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port).

When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

This feature is not supported in Token Ring VLANs.

### Examples

This example shows how to display the Layer 2 path by specifying the source and destination IP addresses and by using the **detail** keyword:

```
Device# traceroute mac ip 2.2.66.66 2.2.22.22 detail
Translating IP to mac .....
2.2.66.66 => 0000.0201.0601
2.2.22.22 => 0000.0201.0201

Source 0000.0201.0601 found on con6[WS-C2950G-24-EI] (2.2.6.6)
con6 / WS-C3750E-24TD / 2.2.6.6 :
    Gi0/0/1 [auto, auto] => Gi0/0/3 [auto, auto]
con5 / WS-C2950G-24-EI / 2.2.5.5 :
    Fa0/3 [auto, auto] => Gi0/1 [auto, auto]
con1 / WS-C3550-12G / 2.2.1.1 :
    Gi0/1 [auto, auto] => Gi0/2 [auto, auto]
con2 / WS-C3550-24 / 2.2.2.2 :
    Gi0/2 [auto, auto] => Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
```

This example shows how to display the Layer 2 path by specifying the source and destination hostnames:

```
Device# traceroute mac ip con6 con2
Translating IP to mac .....
2.2.66.66 => 0000.0201.0601
2.2.22.22 => 0000.0201.0201

Source 0000.0201.0601 found on con6
con6 (2.2.6.6) :Gi0/0/1 => Gi0/0/3
con5           (2.2.5.5)      ) :   Gi0/0/3 => Gi0/1
con1           (2.2.1.1)      ) :   Gi0/0/1 => Gi0/2
con2           (2.2.2.2)      ) :   Gi0/0/2 => Fa0/1
Destination 0000.0201.0201 found on con2
Layer 2 trace completed
```

This example shows the Layer 2 path when ARP cannot associate the source IP address with the corresponding MAC address:

```
Device# traceroute mac ip 2.2.66.66 2.2.77.77
Arp failed for destination 2.2.77.77.
Layer2 trace terminated.
```

# type

To display the contents of one or more files, use the **type** command in boot loader mode.

**type** *filesystem:/file-url...*

|                    |                                                                                                                                                                                                                                                              |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <i>filesystem:</i> Alias for a file system. Use <b>flash:</b> for the system board flash device; use <b>usbflash0:</b> for USB memory sticks.<br><i>/file-url...</i> Path (directory) and name of the files to display. Separate each filename with a space. |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                 |                                |

info_end:
```

# unset

To reset one or more environment variables, use the **unset** command in boot loader mode.

**unset** *variable...*

## Syntax Description

*variable*

Use one of these keywords for *variable*:

**MANUAL\_BOOT**—Specifies whether the device automatically or manually boots.

**BOOT**—Resets the list of executable files to try to load and execute when automatically booting. If the BOOT environment variable is not set, the system attempts to load and execute the first executable image it can find by using a recursive, depth-first search through the flash: file system. If the BOOT variable is set but the specified images cannot be loaded, the system attempts to boot the first bootable file that it can find in the flash: file system.

**ENABLE\_BREAK**—Specifies whether the automatic boot process can be interrupted by using the **Break** key on the console after the flash: file system has been initialized.

**HELPER**—Identifies the semicolon-separated list of loadable files to dynamically load during the boot loader initialization. Helper files extend or patch the functionality of the boot loader.

**PS1**—Specifies the string that is used as the command-line prompt in boot loader mode.

**CONFIG\_FILE**—Resets the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration.

**BAUD**—Resets the rate in bits per second (b/s) used for the console. The Cisco IOS software inherits the baud rate setting from the boot loader and continues to use this value unless the configuration file specifies another setting.

## Command Default

No default behavior or values.

## Command Modes

Boot loader

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Under typical circumstances, it is not necessary to alter the setting of the environment variables.

The **MANUAL\_BOOT** environment variable can also be reset by using the **no boot manual** global configuration command.

The **BOOT** environment variable can also be reset by using the **no boot system** global configuration command.

The **ENABLE\_BREAK** environment variable can also be reset by using the **no boot enable-break** global configuration command.

The HELPER environment variable can also be reset by using the **no boot helper** global configuration command.

The CONFIG\_FILE environment variable can also be reset by using the **no boot config-file** global configuration command.

### Example

This example shows how to unset the SWITCH\_PRIORITY environment variable:

Device: **unset SWITCH\_PRIORITY**

# upgrade rom-monitor capsule

To upgrade the read-only memory monitor (ROMMON) by using the capsule method, use the **upgrade rom-monitor capsule** command in privileged EXEC mode.

## Standalone Devices

**upgrade rom-monitor capsule** {golden | primary} [{R0 | RP active}]

## Device with High Availability

**upgrade rom-monitor capsule** {golden | primary} [{R0 | R1 | RP {active | standby}}]

## Device with StackWise Virtual

**upgrade rom-monitor capsule** {golden | primary} [{R0 | R1 | RP {active | standby} | switch {switch\_number | active | standby}} {R0 | R1 | RP {active | standby}}]

### Syntax Description

|                                                  |                                                                                                                                                                                                                                                             |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>golden</b>                                    | Specifies the golden ROMMON to be upgraded.                                                                                                                                                                                                                 |
| <b>primary</b>                                   | Specifies the primary ROMMON to be upgraded.                                                                                                                                                                                                                |
| <b>R0</b>                                        | Upgrades the ROMMON of the Route Processor (RP) slot 3.                                                                                                                                                                                                     |
| <b>R1</b>                                        | Upgrades the ROMMON of the RP slot 4.                                                                                                                                                                                                                       |
| <b>RP {active   standby}</b>                     | Upgrades the ROMMON of the RP slot 1 and slot 2. <ul style="list-style-type: none"> <li>• <b>active</b>: Specifies the active instance.</li> <li>• <b>standby</b>: Specifies the standby instance.</li> </ul>                                               |
| <b>switch {switch_number   active   standby}</b> | Specifies the switch. <ul style="list-style-type: none"> <li>• <b>switch_number</b>: ID of the switch. The range is from 1 to 2.</li> <li>• <b>active</b>: Specifies the active switch.</li> <li>• <b>standby</b>: Specifies the standby switch.</li> </ul> |

### Command Default

This command has no default settings.

### Command Modes

Privileged EXEC (#)

### Command History

| Release                       | Modification                 |
|-------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

### Usage Guidelines

To know if a ROMMON version upgrade is applicable to a software version, see the release notes of the corresponding software release:

<https://www.cisco.com/c/en/us/support/switches/catalyst-9300-series-switches/products-release-notes-list.html>

## Examples

This example shows how to upgrade the golden ROMMON on a device with StackWise Virtual:

```
Device# upgrade rom-monitor capsule golden switch active R0
```

```
This operation will reload the switch and take a few minutes to complete.  
Do you want to proceed (y/n)? [confirm]y
```

```
Device#
```

```
Initializing Hardware .....
```

```
!  
!  
!
```

```
Warning : New region (type 2) access rights will be modified
```

```
Updating Block at FFFFF000h 100%
```

```
Restarting switch to complete capsule upgrade
```

```
<output truncated>
```

# version

To display the boot loader version, use the **version** command in boot loader mode.

## version

# Information About Tracing

## Tracing Overview

The tracing functionality logs internal events. Trace files are automatically created and saved to the `tracelogs` subdirectory under `crashinfo`.

The contents of trace files are useful for the following purposes:

- **Troubleshooting**—If a switch has an issue, the trace file output may provide information that can be used for locating and solving the issue.
- **Debugging**—The trace file outputs helps users get a more detailed view of system actions and operations.

To view the most recent trace information for a specific module, use the **show platform software trace message** command.

To modify the trace level to increase or decrease the amount of trace message output, you can set a new trace level using the **set platform software trace** command. Trace levels can be set for each process using the **all-modules** keyword in the **set platform software trace** command, or per module within a process.

## Location of Tracelogs

Each process uses `btrace` infrastructure to log its trace messages. When a process is active, the corresponding in-memory tracelog is found in the directory `/tmp/<FRU>/trace/`, where `<FRU>` refers to the location where the process is running (`rp`, `fp`, or `cc`).

When a tracelog file has reached the maximum file size limit allowed for the process, or if the process ends, it gets rotated into the following directory:

- `/crashinfo/tracelogs`, if the `crashinfo`: partition is available on the switch
- `/harddisk/tracelogs`, if the `crashinfo`: partition is not available on the switch

The tracelog files are compressed before being stored in the directory.

## Tracelog Naming Convention

All the tracelogs that are created using `btrace` have the following naming convention:

`<process_name>_<FRU><SLOT>-<BAY>.<pid>_<counter>.<creation_timestamp>.bin`

Here, `counter` is a free-running 64-bit counter that gets incremented for each new file created for the process. For example, `wcm_R0-0.1362_0.20151006171744.bin`. When compressed, the files will have the `gz` extension appended to their names

### Tracelog size limits and rotation policy

The maximum size limit for a tracelog file is 1MB for each process, and the maximum number of tracelog files that are maintained for a process is 25.

## Rotation and Throttling Policy

Initially, all the tracelog files are moved from the initial `/tmp/<FRU>/trace` directory to the `/tmp/<FRU>/trace/stage` staging directory. The `btrace_rotate` script then moves these tracelogs from the staging directory to the `/crashinfo/tracelogs` directory. When the number of files stored in the `/crashinfo/tracelogs` directory per process reaches the maximum limit, the oldest files for the process are deleted, while the newer files are maintained. This is repeated at every 60 minutes under worst-case situations.

There are two other sets of files that are purged from the `/crashinfo/tracelogs` directory:

- Files that do not have the standard naming convention (other than a few exceptions such as `fed_python.log`)
- Files older than two weeks

The throttling policy has been introduced so that a process with errors does not affect the functioning of the switch. Whenever a process starts logging at a very high rate, for example, if there are more than 16 files in a 4-second interval for the process in the staging directory, the process is throttled. The files do not rotate for the process from `/tmp/<FRU>/trace` into `/tmp/<FRU>/trace/stage`, however the files are deleted when they reach the maximum size. Throttling is re-enabled, when the count goes below 8.

## Tracing Levels

Tracing levels determine how much information should be stored about a module in the trace buffer or file.

The following table shows all of the tracing levels that are available, and provides descriptions of the message that are displayed with each tracing level.

**Table 206: Tracing Levels and Descriptions**

| Tracing Level | Description                                                                                                                                                                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Emergency     | The message is regarding an issue that makes the system unusable.                                                                                                                                                                                                                       |
| Error         | The message is regarding a system error.                                                                                                                                                                                                                                                |
| Warning       | The message is regarding a system warning.                                                                                                                                                                                                                                              |
| Notice        | The message is regarding a significant issue, but the switch is still working normally.                                                                                                                                                                                                 |
| Informational | The message is useful for informational purposes only.                                                                                                                                                                                                                                  |
| Debug         | The message provides debug-level output.                                                                                                                                                                                                                                                |
| Verbose       | All possible trace messages are sent.                                                                                                                                                                                                                                                   |
| Noise         | All possible trace messages for the module are logged.<br><br>The noise level is always equal to the highest possible tracing level. Even if a future enhancement to tracing introduces a higher tracing level, the noise level will become equal to the level of that new enhancement. |

# set platform software trace

To set the trace level for a specific module within a process, use the **set platform software trace** command in privileged EXEC or user EXEC mode.

**set platform software trace** *process slot module trace-level*

## Syntax Description

*process*

Process whose tracing level is being set. Options include:

- **chassis-manager**—The Chassis Manager process.
- **cli-agent**—The CLI Agent process.
- **dbm**—The Database Manager process.
- **emd**—The Environmental Monitoring process.
- **fed**—The Forwarding Engine Driver process.
- **forwarding-manager**—The Forwarding Manager process.
- **host-manager**—The Host Manager process.
- **iomd**—The Input/Output Module daemon (IOMd) process.
- **ios**—The IOS process.
- **license-manager**—The License Manager process.
- **logger**—The Logging Manager process.
- **platform-mgr**—The Platform Manager process.
- **pluggable-services**—The Pluggable Services process.
- **replication-mgr**—The Replication Manager process.
- **shell-manager**—The Shell Manager process.
- **smd**—The Session Manager process.
- **table-manager**—The Table Manager Server.
- **wireless**—The wireless controller module process.
- **wireshark**—The Embedded Packet Capture (EPC) Wireshark process.

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>slot</i>   | <p>Hardware slot where the process for which the trace level is set, is running. Options include:</p> <ul style="list-style-type: none"><li>• <i>number</i>—Number of the SIP slot of the hardware module where the trace level is set. For instance, if you want to specify the SIP in SIP slot 2 of the switch, enter 2.</li><li>• <i>SIP-slot / SPA-bay</i>—Number of the SIP switch slot and the number of the shared port adapter (SPA) bay of that SIP. For instance, if you want to specify the SPA in bay 2 of the SIP in switch slot 3, enter 3/2.</li><li>• <b>F0</b>—The Embedded-Service-Processor in slot 0.</li><li>• <b>FP active</b>—The active Embedded-Service-Processor.</li><li>• <b>R0</b>—The route processor in slot 0.</li><li>• <b>RP active</b>—The active route processor.</li><li>• <b>switch</b> <i>&lt;number&gt;</i> —The switch with its number specified.</li><li>• <b>switch active</b>—The active switch.</li><li>• <b>switch standby</b>—The standby switch.</li></ul> |
| <i>module</i> | <p>Module within the process for which the tracing level is set.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

*trace-level*

Trace level. Options include:

- **debug**—Debug level tracing. A debug-level trace message is a non-urgent message providing a large amount of detail about the module.
- **emergency**—Emergency level tracing. An emergency-level trace message is a message indicating that the system is unusable.
- **error**—Error level tracing. An error-level tracing message is a message indicating a system error.
- **info**—Information level tracing. An information-level tracing message is a non-urgent message providing information about the system.
- **noise**—Noise level tracing. The noise level is always equal to the highest tracing level possible and always generates every possible tracing message.  
  
The noise level is always equal to the highest-level tracing message possible for a module, even if future enhancements to this command introduce options that allow users to set higher tracing levels.
- **notice**—The message is regarding a significant issue, but the switch is still working normally.
- **verbose**—Verbose level tracing. All possible tracing messages are sent when the trace level is set to verbose.
- **warning**—Warning messages.

**Command Default**

The default tracing level for all modules is **notice**.

**Command Modes**

User EXEC (>)

Privileged EXEC (#)

**Command History**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

The *module* options vary by process and by *hardware-module*. Use the ? option when entering this command to see which *module* options are available with each keyword sequence.

Use the **show platform software trace message** command to view trace messages.

Trace files are stored in the tracelogs directory in the harddisk: file system. These files can be deleted without doing any harm to your switch operation.

Trace file output is used for debugging. The trace level is a setting that determines how much information should be stored in trace files about a module.

---

## Examples

This example shows how to set the trace level for all the modules in dbm process:

```
# set platform software trace dbm R0 all-modules debug
```

# show platform software trace filter-binary

To display the most recent trace information for a specific module, use the **show platform software trace filter-binary** command in privileged EXEC or user EXEC mode.

**show platform software trace filter-binary***modules* [**context** *mac-address*]

| <b>Syntax Description</b>    | <b>context</b> <i>mac-address</i>                                                                                                                                                                                                                                                                                                                                         | Represents the context used to filter. Additionally, you can filter based on module names and trace levels. The context keyword accepts either a MAC address or any other argument based on which a trace is tagged. |              |                              |                              |  |

| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                      |              |                              |                              |  |
| <b>Usage Guidelines</b>      | This command collates and sorts all the logs present in the /tmp/. . . / across all the processes relevant to the module. The trace logs of all the processes relevant to the specified module are printed to the console. This command also generates a file named <code>collated_log_{system time}</code> with the same content, in the /crashinfo/tracelogs directory. |                                                                                                                                                                                                                      |              |                              |                              |  |
| <b>Examples</b>              | This example shows how to display the trace information for a wireless module:<br><br><pre># show platform software trace filter-binary wireless</pre>                                                                                                                                                                                                                    |                                                                                                                                                                                                                      |              |                              |                              |  |

# show platform software trace message

To display the trace messages for a process, use the **set platform software trace** command in privileged EXEC or user EXEC mode.

**show platform software trace message** *process slot*

**Syntax Description***process*

Tracing level that is being set. Options include:

- **chassis-manager**—The Chassis Manager process.
- **cli-agent**—The CLI Agent process.
- **cmm**—The CMM process.
- **dbm**—The Database Manager process.
- **emd**—The Environmental Monitoring process.
- **fed**—The Forwarding Engine Driver process.
- **forwarding-manager**—The Forwarding Manager process.
- **geo**—The Geo Manager process.
- **host-manager**—The Host Manager process.
- **interface-manager**—The Interface Manager process.
- **iomd**—The Input/Output Module daemon (IOMd) process.
- **ios**—The IOS process.
- **license-manager**—The License Manager process.
- **logger**—The Logging Manager process.
- **platform-mgr**—The Platform Manager process.
- **pluggable-services**—The Pluggable Services process.
- **replication-mgr**—The Replication Manager process.
- **shell-manager**—The Shell Manager process.
- **sif**—The Stack Interface (SIF) Manager process.
- **smd**—The Session Manager process.
- **stack-mgr**—The Stack Manager process.
- **table-manager**—The Table Manager Server.
- **thread-test**—The Multithread Manager process.
- **virt-manager**—The Virtualization Manager process.
- **wireless**—The wireless controller module process.

*slot*

Hardware slot where the process for which the trace level is set, is running. Options include:

- **number**—Number of the SIP slot of the hardware module where the trace level is set. For instance, if you want to specify the SIP in SIP slot 2 of the switch, enter 2.
- **SIP-slot / SPA-bay**—Number of the SIP switch slot and the number of the shared port adapter (SPA) bay of that SIP. For instance, if you want to specify the SPA in bay 2 of the SIP in switch slot 3, enter 3/2.
- **F0**—The Embedded Service Processor slot 0.
- **FP active**—The active Embedded Service Processor.
- **R0**—The route processor in slot 0.
- **RP active**—The active route processor.
- **switch <number>** —The switch, with its number specified.
- **switch active**—The active switch.
- **switch standby**—The standby switch.
  - **number**—Number of the SIP slot of the hardware module where the trace level is set. For instance, if you want to specify the SIP in SIP slot 2 of the switch, enter 2.
  - **SIP-slot / SPA-bay**—Number of the SIP switch slot and the number of the shared port adapter (SPA) bay of that SIP. For instance, if you want to specify the SPA in bay 2 of the SIP in switch slot 3, enter 3/2.
  - **F0**—The Embedded Service Processor in slot 0.
  - **FP active**—The active Embedded Service Processor.
  - **R0**—The route processor in slot 0.
  - **RP active**—The active route processor.

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

This example shows how to display the trace messages for the Stack Manager and the Forwarding Engine Driver processes:

```
# show platform software trace message stack-mgr switch active R0

# request platform software trace archive

To archive all the trace logs relevant to all the processes running on a system since the last reload on the switch and to save this in the specified location, use the **request platform software trace archive** command in privileged EXEC or user EXEC mode.

**request platform software trace archive** [**last** *number-of-days* [**days** [**target** *location*]] | **target** *location*]

|                    |                                   |                                                                             |
|--------------------|-----------------------------------|-----------------------------------------------------------------------------|
| Syntax Description | <b>last</b> <i>number-of-days</i> | Specifies the number of days for which the trace files have to be archived. |
|                    | <b>target</b> <i>location</i>     | Specifies the location and name of the archive file.                        |

**Command Modes**

User EXEC (>)

Privileged EXEC (#)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

This archive file can be copied from the system, using the tftp or scp commands.

**Examples**

This example shows how to archive all the trace logs of the processes running on the switch since the last 5 days:

```
# request platform software trace archive last 5 days target flash:test_archive
```

# request platform software trace rotate all

To rotate all the current in-memory trace logs into the crashinfo partition and start a new in-memory trace log for each process, use the **request platform software trace rotate all** command in privileged EXEC or user EXEC mode.

**request platform software trace rotate all**

**Command Modes**

User EXEC (>)

Privileged EXEC (#)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

The trace log files are for read-only purpose. Do not edit the contents of the file. If there is a requirement to delete the contents of the file to view certain set of logs, use this command to start a new trace log file.

**Examples**

This example shows how to rotate all the in-memory trace logs of the processes running on the switch since the last one day:

```
# request platform software trace slot switch active R0 archive last 1 days target flash:test
```

# request platform software trace filter-binary

To collate and sort all the archived logs present in the tracelogs subdirectory, use the **request platform software trace filter-binary** command in privileged EXEC or user EXEC mode.

**request platform software trace filter-binary** *modules* [**context** *mac-address*]

## Syntax Description

**context** *mac-address*

Represents the context used to filter. Additionally, you can filter based on module names and trace levels. The context keyword accepts either a MAC address or any other argument based on which a trace is tagged.

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release | Modification |
|---------|--------------|
|---------|--------------|

|                              |                              |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |
|------------------------------|------------------------------|

## Usage Guidelines

This command collates and sorts all the archived logs present in the tracelogs subdirectory, across all the processes relevant to the module. This command also generates a file named `collated_log_{system time}` with the same content, in the `/crashinfo/tracelogs` directory.

## Examples

This example shows how to display the trace information for a wireless module:

```
# request platform software trace filter-binary wireless
```

# PART **XIV**

# clear vtp counters

To clear the VLAN Trunking Protocol (VTP) and pruning counters, use the **clear vtp counters** command in privileged EXEC mode.

**clear vtp counters**

## Syntax Description

This command has no arguments or keywords.

## Command Modes

Privileged EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

This example shows how to clear the VTP counters:

```
Device> enable
Device# clear vtp counters
```

You can verify that information was deleted by entering the **show vtp counters** privileged EXEC command.

# debug sw-vlan

To enable debugging of VLAN manager activities, use the **debug sw-vlan** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

**debug sw-vlan** {badpmcookies | cfg-vlan {bootup | cli} | events | ifs | mapping | notification | packets | redundancy | registries | vtp}  
**no debug sw-vlan** {badpmcookies | cfg-vlan {bootup | cli} | events | ifs | mapping | notification | packets | redundancy | registries | vtp}

| Syntax Description  |                                                                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>badpmcookies</b> | Displays debug messages for VLAN manager incidents of bad port manager cookies.                                                               |
| <b>cfg-vlan</b>     | Displays VLAN configuration debug messages.                                                                                                   |
| <b>bootup</b>       | Displays messages when the switch is booting up.                                                                                              |
| <b>cli</b>          | Displays messages when the command-line interface (CLI) is in VLAN configuration mode.                                                        |
| <b>events</b>       | Displays debug messages for VLAN manager events.                                                                                              |
| <b>ifs</b>          | Displays debug messages for the VLAN manager IOS file system (IFS). See <a href="#">debug sw-vlan ifs, on page 2033</a> for more information. |
| <b>mapping</b>      | Displays debug messages for VLAN mapping.                                                                                                     |
| <b>notification</b> | Displays debug messages for VLAN manager notifications. See <a href="#">debug sw-vlan notification, on page 2034</a> for more information.    |
| <b>packets</b>      | Displays debug messages for packet handling and encapsulation processes.                                                                      |
| <b>redundancy</b>   | Displays debug messages for VTP VLAN redundancy.                                                                                              |
| <b>registries</b>   | Displays debug messages for VLAN manager registries.                                                                                          |
| <b>vtp</b>          | Displays debug messages for the VLAN Trunking Protocol (VTP) code. See <a href="#">debug sw-vlan vtp, on page 2035</a> for more information.  |

**Command Default** Debugging is disabled.

**Command Modes** Privileged EXEC

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **undebg sw-vlan** command is the same as the **no debug sw-vlan** command.

**Examples** This example shows how to display debug messages for VLAN manager events:

```
Device> enable
Device# debug sw-vlan events
```

# debug sw-vlan ifs

To enable debugging of the VLAN manager IOS file system (IFS) error tests, use the **debug sw-vlan ifs** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

```
debug sw-vlan ifs {open {read | write} | read {1 | 2 | 3 | 4} | write}
no debug sw-vlan ifs {open {read | write} | read {1 | 2 | 3 | 4} | write}
```

|                    |                   |                                                                                                                            |
|--------------------|-------------------|----------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>open read</b>  | Displays VLAN manager IFS file-read operation debug messages.                                                              |
|                    | <b>open write</b> | Displays VLAN manager IFS file-write operation debug messages.                                                             |
|                    | <b>read</b>       | Displays file-read operation debug messages for the specified error test ( <b>1</b> , <b>2</b> , <b>3</b> , or <b>4</b> ). |
|                    | <b>write</b>      | Displays file-write operation debug messages.                                                                              |

**Command Default** Debugging is disabled.

**Command Modes** Privileged EXEC

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **undebug sw-vlan ifs** command is the same as the **no debug sw-vlan ifs** command.

When selecting the file read operation, Operation **1** reads the file header, which contains the header verification word and the file version number. Operation **2** reads the main body of the file, which contains most of the domain and VLAN information. Operation **3** reads type length version (TLV) descriptor structures. Operation **4** reads TLV data.

**Examples** This example shows how to display file-write operation debug messages:

```
Device> enable
Device# debug sw-vlan ifs write
```

# debug sw-vlan notification

To enable debugging of VLAN manager notifications, use the **debug sw-vlan notification** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

**debug sw-vlan notification** {accfwdchange | allowedvlanfgchange | fwdchange | linkchange | modechange | pruningcfgchange | statechange}  
**no debug sw-vlan notification** {accfwdchange | allowedvlanfgchange | fwdchange | linkchange | modechange | pruningcfgchange | statechange}

## Syntax Description

|                            |                                                                                                                     |
|----------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>accfwdchange</b>        | Displays debug messages for VLAN manager notification of aggregated access interface spanning-tree forward changes. |
| <b>allowedvlanfgchange</b> | Displays debug messages for VLAN manager notification of changes to the allowed VLAN configuration.                 |
| <b>fwdchange</b>           | Displays debug messages for VLAN manager notification of spanning-tree forwarding changes.                          |
| <b>linkchange</b>          | Displays debug messages for VLAN manager notification of interface link-state changes.                              |
| <b>modechange</b>          | Displays debug messages for VLAN manager notification of interface mode changes.                                    |
| <b>pruningcfgchange</b>    | Displays debug messages for VLAN manager notification of changes to the pruning configuration.                      |
| <b>statechange</b>         | Displays debug messages for VLAN manager notification of interface state changes.                                   |

## Command Default

Debugging is disabled.

## Command Modes

Privileged EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **undebug sw-vlan notification** command is the same as the **no debug sw-vlan notification** command.

When you enable debugging on a switch stack, it is enabled only on the active switch. To debug a specific stack member, you can start a CLI session from the active switch by using the **session switch stack-member-number** privileged EXEC command.

## Examples

This example shows how to display debug messages for VLAN manager notification of interface mode changes:

```
Device> enable
Device# debug sw-vlan notification
```

# debug sw-vlan vtp

To enable debugging of the VLAN Trunking Protocol (VTP) code, use the **debug sw-vlan vtp** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

**debug sw-vlan vtp** {events | packets | pruning [{packets | xmit}] | redundancy | xmit}  
**no debug sw-vlan vtp** {events | packets | pruning | redundancy | xmit}

|                    |                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                           |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | events                                                                                                                                                                                                                                                                                             | Displays debug messages for general-purpose logic flow and detailed VTP messages generated by the VTP_LOG_RUNTIME macro in the VTP code.                                                  |
|                    | packets                                                                                                                                                                                                                                                                                            | Displays debug messages for the contents of all incoming VTP packets that have been passed into the VTP code from the Cisco IOS VTP platform-dependent layer, except for pruning packets. |
|                    | pruning                                                                                                                                                                                                                                                                                            | Displays debug messages generated by the pruning segment of the VTP code.                                                                                                                 |
|                    | packets                                                                                                                                                                                                                                                                                            | (Optional) Displays debug messages for the contents of all incoming VTP pruning packets that have been passed into the VTP code from the Cisco IOS VTP platform-dependent layer.          |
|                    | xmit                                                                                                                                                                                                                                                                                               | (Optional) Displays debug messages for the contents of all outgoing VTP packets that the VTP code requests the Cisco IOS VTP platform-dependent layer to send.                            |
|                    | redundancy                                                                                                                                                                                                                                                                                         | Displays debug messages for VTP redundancy.                                                                                                                                               |
|                    | xmit                                                                                                                                                                                                                                                                                               | Displays debug messages for the contents of all outgoing VTP packets that the VTP code requests the Cisco IOS VTP platform-dependent layer to send, except for pruning packets.           |
| Command Default    | Debugging is disabled.                                                                                                                                                                                                                                                                             |                                                                                                                                                                                           |
| Command Modes      | Privileged EXEC                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                           |
| Command History    | Release                                                                                                                                                                                                                                                                                            | Modification                                                                                                                                                                              |
|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                       | This command was introduced.                                                                                                                                                              |
| Usage Guidelines   | The <b>undebg sw-vlan vtp</b> command is the same as the <b>no debug sw-vlan vtp</b> command.                                                                                                                                                                                                      |                                                                                                                                                                                           |
|                    | If no additional parameters are entered after the <b>pruning</b> keyword, VTP pruning debugging messages appear. They are generated by the VTP_PRUNING_LOG_NOTICE, VTP_PRUNING_LOG_INFO, VTP_PRUNING_LOG_DEBUG, VTP_PRUNING_LOG_ALERT, and VTP_PRUNING_LOG_WARNING macros in the VTP pruning code. |                                                                                                                                                                                           |
|                    | When you enable debugging on a switch stack, it is enabled only on the active switch. To debug a specific stack member, you can start a CLI session from the active switch by using the <b>session switch stack-member-number</b> privileged EXEC command.                                         |                                                                                                                                                                                           |

---

## Examples

This example shows how to display debug messages for VTP redundancy:

```
Device> enable
Device# debug sw-vlan vtp redundancy
```

# dot1q vlan native

To assign the native VLAN ID of a physical interface trunking 802.1Q VLAN traffic, use the **dot1q vlan native** command in interface configuration mode. To remove the VLAN ID assignment, use the **no** form of this command.

**dot1q vlan *vlan-id* [native]**  
**no dot1q vlan *vlan-id* [native]**

| <b>Syntax Description</b>      | <div> <i>vlan-id</i> Trunk interface ID. The range is from 1 to 4000. </div> <div> <b>native</b> Specifies the native VLAN associated with the 802.1Q trunk interface. </div>                                                                                                                                                                                                                                                                                                     |         |              |                                |                              |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|--------------------------------|------------------------------|
| <b>Command Default</b>         | No default behavior or values                                                                                                                                                                                                                                                                                                                                                                                                                                                     |         |              |                                |                              |

| <b>Usage Guidelines</b>        | <p>To use this command, you must be in a user group associated with a task group that includes proper task IDs. If you suspect that user group assignment is preventing you from using a command, contact your AAA administrator.</p> <p>The <b>dot1q vlan native</b> command defines the default, or native VLAN, associated with an 802.1Q trunk interface. The native VLAN of a trunk interface is the VLAN to which all the untagged VLAN packets are logically assigned.</p> |         |              |                                |                              |
| <b>Note</b>                    | <p>The native VLAN cannot be configured on a subinterface of the trunk interface. The native VLAN must be configured with the same value at both ends of the link, or traffic can be lost or sent to the wrong VLAN.</p>                                                                                                                                                                                                                                                          |         |              |                                |                              |

## Examples

The following example shows how to configure the native VLAN of a 1/0/33 trunk interface as 1. Packets received on this interface that are untagged, or that have an 802.1Q tag with VLAN ID 1, are received on the main interface. Packets sent from the main interface are transmitted without an 802.1Q tag.

```
Device> enable
Device(config)# interface 1/0/33.201
Device(config-subif)# dot1q vlan 1 native
```

# interface (VLAN)

To create a VLAN subinterface, use the **interface** command in global configuration mode. To delete a subinterface, use the **no** form of this command.

**interface** {*type switch |slot |port.subinterface* }  
**no interface** {*type switch |slot |port.subinterface* }

|                           |                                                                                                                                                                                                                               |                                                                                 |

|                           | Cisco IOS XE Gibraltar 16.12.1                                                                                                                                                                                                | This command was introduced.                                                    |
| <b>Usage Guidelines</b>   | To use this command, you must be in a user group associated with a task group that includes the proper task IDs. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator. |                                                                                 |
|                           | To configure a large number of subinterfaces, we recommend entering all configuration data before you commit the interface command.                                                                                           |                                                                                 |
|                           | To change an interface from Layer 2 to Layer 3 mode and back, you must delete the interface first and then re-configure it in the appropriate mode.                                                                           |                                                                                 |

## Examples

This example shows how to configure subinterfaces on layer 3 interfaces:

```
Device> enable
Device(config)# interface HundredGigabitEthernet 1/0/33.201
Device(config-subif)# encapsulation dot1q 33 native
```

|                         |                          |                                                            |

## private-vlan

To configure private VLANs and to configure the association between private VLAN primary and secondary VLANs, use the **private-vlan** VLAN configuration command on the switch stack or on a standalone switch. Use the **no** form of this command to return the VLAN to normal VLAN configuration.

```
private-vlan {association [{add | remove}] secondary-vlan-list | community | isolated | primary}  
no private-vlan {association | community | isolated | primary}
```

| Syntax Description         |  |                                                                                     |
|----------------------------|--|-------------------------------------------------------------------------------------|
| <b>association</b>         |  | Creates an association between the primary VLAN and a secondary VLAN.               |
| <b>add</b>                 |  | Associates a secondary VLAN to a primary VLAN.                                      |
| <b>remove</b>              |  | Clears the association between a secondary VLAN and a primary VLAN.                 |
| <i>secondary-vlan-list</i> |  | One or more secondary VLANs to be associated with a primary VLAN in a private VLAN. |
| <b>community</b>           |  | Designates the VLAN as a community VLAN.                                            |
| <b>isolated</b>            |  | Designates the VLAN as an isolated VLAN.                                            |
| <b>primary</b>             |  | Designates the VLAN as a primary VLAN.                                              |

|                        |                                                     |
|------------------------|-----------------------------------------------------|
| <b>Command Default</b> | The default is to have no private VLANs configured. |
|------------------------|-----------------------------------------------------|

|                      |                    |

|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

Before configuring private VLANs, you must disable VTP (VTP mode transparent). After you configure a private VLAN, you should not change the VTP mode to client or server.

VTP does not propagate private VLAN configurations. You must manually configure private VLANs on all switches in the Layer 2 network to merge their Layer 2 databases and to prevent flooding of private VLAN traffic.

You cannot include VLAN 1 or VLANs 1002 to 1005 in the private VLAN configuration. Extended VLANs (VLAN IDs 1006 to 4094) can be configured in private VLANs.

You can associate a secondary (isolated or community) VLAN with only one primary VLAN. A primary VLAN can have one isolated VLAN and multiple community VLANs associated with it.

- A secondary VLAN cannot be configured as a primary VLAN.
- The *secondary-vlan-list* cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private VLAN ID or a hyphenated range of private VLAN IDs. The list can contain one isolated VLAN and multiple community VLANs.

- If you delete either the primary or secondary VLANs, the ports associated with the VLAN become inactive.

A community VLAN carries traffic among community ports and from community ports to the promiscuous ports on the corresponding primary VLAN.

An isolated VLAN is used by isolated ports to communicate with promiscuous ports. It does not carry traffic to other community ports or isolated ports with the same primary VLAN domain.

A primary VLAN is the VLAN that carries traffic from a gateway to customer end stations on private ports.

Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.

The **private-vlan** commands do not take effect until you exit from VLAN configuration mode.

Do not configure private VLAN ports as EtherChannels. While a port is part of the private VLAN configuration, any EtherChannel configuration for it is inactive.

Do not configure a private VLAN as a Remote Switched Port Analyzer (RSPAN) VLAN.

Do not configure a private VLAN as a voice VLAN.

Do not configure fallback bridging on switches with private VLANs.

Although a private VLAN contains more than one VLAN, only one STP instance runs for the entire private VLAN. When a secondary VLAN is associated with the primary VLAN, the STP parameters of the primary VLAN are propagated to the secondary VLAN.

For more information about private VLAN interaction with other features, see the software configuration guide for this release.

This example shows how to configure VLAN 20 as a primary VLAN, VLAN 501 as an isolated VLAN, and VLANs 502 and 503 as community VLANs, and to associate them in a private VLAN:

```
# configure terminal
(config)# vlan 20
(config-vlan)# private-vlan primary
(config-vlan)# exit
(config)# vlan 501
(config-vlan)# private-vlan isolated
(config-vlan)# exit
(config)# vlan 502
(config-vlan)# private-vlan community
(config-vlan)# exit
(config)# vlan 503
(config-vlan)# private-vlan community
(config-vlan)# exit
(config)# vlan 20
(config-vlan)# private-vlan association 501-503
(config-vlan)# end
```

You can verify your setting by entering the **show vlan private-vlan** or **show interfaces status privileged EXEC** command.

# private-vlan mapping

To create a mapping between the primary and the secondary VLANs so that both VLANs share the same primary VLAN switched virtual interface (SVI), use the **private-vlan mapping** interface configuration command on a switch virtual interface (SVI). Use the **no** form of this command to remove private VLAN mappings from the SVI.

**private-vlan mapping** [{**add** | **remove**}] *secondary-vlan-list*  
**no private-vlan mapping**

|                           |                                                                                                                                                                                                                                                                         |                                                                                     |

| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                                                                          | <b>Modification</b>                                                                 |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                            | This command was introduced.                                                        |
| <b>Usage Guidelines</b>   | The device must be in VTP transparent mode when you configure private VLANs.                                                                                                                                                                                            |                                                                                     |
|                           | The SVI of the primary VLAN is created at Layer 3.                                                                                                                                                                                                                      |                                                                                     |
|                           | Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.                                              |                                                                                     |
|                           | The <i>secondary-vlan-list</i> argument cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private VLAN ID or a hyphenated range of private VLAN IDs. The list can contain one isolated VLAN and multiple community VLANs. |                                                                                     |
|                           | Traffic that is received on the secondary VLAN is routed by the SVI of the primary VLAN.                                                                                                                                                                                |                                                                                     |
|                           | A secondary VLAN can be mapped to only one primary SVI. If you configure the primary VLAN as a secondary VLAN, all SVIs specified in this command are brought down.                                                                                                     |                                                                                     |
| <b>Examples</b>           | If you configure a mapping between two VLANs that do not have a valid Layer 2 private VLAN association, the mapping configuration does not take effect.                                                                                                                 |                                                                                     |
|                           | This example shows how to map the interface of VLAN 20 to the SVI of VLAN 18:                                                                                                                                                                                           |                                                                                     |

```
Device# configure terminal
Device# interface vlan 18
Device(config-if)# private-vlan mapping 20
Device(config-vlan)# end
```

This example shows how to permit routing of secondary VLAN traffic from secondary VLANs 303 to 305 and 307 through VLAN 20 SVI:

```
Device# configure terminal
Device# interface vlan 20
Device(config-if)# private-vlan mapping 303-305, 307
Device(config-vlan)# end
```

You can verify your settings by entering the **show interfaces private-vlan mapping** privileged EXEC command.

# show interfaces private-vlan mapping

To display private VLAN mapping information for the VLAN switch virtual interfaces (SVIs), use the **show interfaces private-vlan mapping** command in user EXEC or privileged EXEC mode.

**show interfaces** [*interface-id*] **private-vlan mapping**

|                           |                                                                                                           |                              |

|                           | Cisco IOS XE Everest 16.5.1a                                                                              | This command was introduced. |

## Examples

This example shows how to display the information about the private VLAN mapping:

```
Device#show interfaces private-vlan mapping
Interface Secondary VLAN Type
-----
vlan2      301      community
vlan3      302      community
```

# show vlan

To display the parameters for all configured VLANs or one VLAN (if the VLAN ID or name is specified) on the switch, use the **show vlan** command in user EXEC mode.

**show vlan** [{**brief** | **group** | **id** *vlan-id* | **mtu** | **name** *vlan-name* | **private-vlan** [{**type**}] | **remote-span** | **summary**}]

## Syntax Description

|                              |                                                                                                                                                                                                                                                                                 |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>brief</b>                 | (Optional) Displays one line for each VLAN with the VLAN name, status, and its ports.                                                                                                                                                                                           |
| <b>group</b>                 | (Optional) Displays information about VLAN groups.                                                                                                                                                                                                                              |
| <b>id</b> <i>vlan-id</i>     | (Optional) Displays information about a single VLAN identified by the VLAN ID number. For <i>vlan-id</i> , the range is 1 to 4094.                                                                                                                                              |
| <b>mtu</b>                   | (Optional) Displays a list of VLANs and the minimum and maximum transmission unit (MTU) sizes configured on ports in the VLAN.                                                                                                                                                  |
| <b>name</b> <i>vlan-name</i> | (Optional) Displays information about a single VLAN identified by the VLAN name. The VLAN name is an ASCII string from 1 to 32 characters.                                                                                                                                      |
| <b>private-vlan</b>          | (Optional) Displays information about configured private VLANs, including primary and secondary VLAN IDs, type (community, isolated, or primary) and ports belonging to the private VLAN. This keyword is only supported if your switch is running the IP services feature set. |
| <b>type</b>                  | (Optional) Displays only private VLAN ID and type.                                                                                                                                                                                                                              |
| <b>remote-span</b>           | (Optional) Displays information about Remote SPAN (RSPAN) VLANs.                                                                                                                                                                                                                |
| <b>summary</b>               | (Optional) Displays VLAN summary information.                                                                                                                                                                                                                                   |

### Note

The **ifindex** keyword is not supported, even though it is visible in the command-line help string.

## Command Modes

User EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

In the **show vlan mtu** command output, the MTU\_Mismatch column shows whether all the ports in the VLAN have the same MTU. When yes appears in the column, it means that the VLAN has ports with different MTUs, and packets that are switched from a port with a larger MTU to a port with a smaller MTU might be dropped.

If the VLAN does not have an SVI, the hyphen (-) symbol appears in the SVI\_MTU column. If the MTU-Mismatch column displays yes, the names of the ports with the MinMTU and the MaxMTU appear.

If you try to associate a private VLAN secondary VLAN with a primary VLAN before you define the secondary VLAN, the secondary VLAN is not included in the **show vlan private-vlan** command output.

In the **show vlan private-vlan type** command output, a type displayed as normal means a VLAN that has a private VLAN association but is not part of the private VLAN. For example, if you define and associate two VLANs as primary and secondary VLANs and then delete the secondary VLAN configuration without removing the association from the primary VLAN, the VLAN that was the secondary VLAN is shown as normal in the display. In the **show vlan private-vlan** output, the primary and secondary VLAN pair is shown as nonoperational.

## Examples

This is an example of output from the **show vlan** command. See the table that follows for descriptions of the fields in the display.

Device> **show vlan**

| VLAN | Name               | Status    | Ports                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 207: show vlan Command Output Fields

| Field             | Description                                                                                                                         |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| VLAN              | VLAN number.                                                                                                                        |
| Name              | Name, if configured, of the VLAN.                                                                                                   |
| Status            | Status of the VLAN (active or suspend).                                                                                             |
| Ports             | Ports that belong to the VLAN.                                                                                                      |
| Type              | Media type of the VLAN.                                                                                                             |
| SAID              | Security association ID value for the VLAN.                                                                                         |
| MTU               | Maximum transmission unit size for the VLAN.                                                                                        |
| Parent            | Parent VLAN, if one exists.                                                                                                         |
| RingNo            | Ring number for the VLAN, if applicable.                                                                                            |
| BrdgNo            | Bridge number for the VLAN, if applicable.                                                                                          |
| Stp               | Spanning Tree Protocol type used on the VLAN.                                                                                       |
| BrdgMode          | Bridging mode for this VLAN—possible values are source-route bridging (SRB) and source-route transparent (SRT); the default is SRB. |
| Trans1            | Translation bridge 1.                                                                                                               |
| Trans2            | Translation bridge 2.                                                                                                               |
| Remote SPAN VLANs | Identifies any RSPAN VLANs that have been configured.                                                                               |

This is an example of output from the **show vlan summary** command:

```
Device> show vlan summary
Number of existing VLANs           : 45
Number of existing VTP VLANs      : 45
Number of existing extended VLANs : 0
```

This is an example of output from the **show vlan id 2** command:

```
Device# show vlan id 2
VLAN Name                Status    Ports
-----
2    VLAN0200              active    Gi1/0/7, Gi1/0/8
2    VLAN0200              active    Gi2/0/1, Gi2/0/2

# show vtp

To display general information about the VLAN Trunking Protocol (VTP) management domain, status, and counters, use the **show vtp** command in EXEC mode.

**show vtp** {**counters** | **devices** [**conflicts**] | **interface** [*interface-id*] | **password** | **status**}

## Syntax Description

|                     |                                                                                                                                                                                   |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>counters</b>     | Displays the VTP statistics for the device.                                                                                                                                       |
| <b>devices</b>      | Displays information about all VTP version 3 devices in the domain. This keyword applies only if the device is not running VTP version 3.                                         |
| <b>conflicts</b>    | (Optional) Displays information about VTP version 3 devices that have conflicting primary servers. This command is ignored when the device is in VTP transparent or VTP off mode. |
| <b>interface</b>    | Displays VTP status and configuration for all interfaces or the specified interface.                                                                                              |
| <i>interface-id</i> | (Optional) Interface for which to display VTP status and configuration. This can be a physical interface or a port channel.                                                       |
| <b>password</b>     | Displays whether the VTP password is configured or not (available in privileged EXEC mode only).                                                                                  |
| <b>status</b>       | Displays general information about the VTP management domain status.                                                                                                              |

## Command Modes

User EXEC  
Privileged EXEC

## Command History

| Release                        | Modification                                                                                           |
|--------------------------------|--------------------------------------------------------------------------------------------------------|
| Cisco IOS XE Everest 16.5.1a   | This command was introduced.                                                                           |
| Cisco IOS XE Gibraltar 16.12.4 | The <b>show vtp password</b> command output now displays whether the password is or is not configured. |

## Examples

This is an example of output from the **show vtp devices** command. A **Yes** in the **Conflict** column indicates that the responding server is in conflict with the local server for the feature; that is, when two devices in the same domain do not have the same primary server for a database.

```
Device> enable
Device# show vtp devices
Retrieving information from the VTP domain. Waiting for 5 seconds.
VTP Database Conf Device ID      Primary Server Revision  System Name
-----
VLAN          Yes  00b0.8e50.d000 000c.0412.6300 12354    main.cisco.com
MST            No   00b0.8e50.d000 0004.AB45.6000 24       main.cisco.com
VLAN          Yes  000c.0412.6300=000c.0412.6300 67       qwerty.cisco.com
```

This is an example of output from the **show vtp counters** command. The table that follows describes each field in the display.

```
Device> show vtp counters
VTP statistics:
Summary advertisements received      : 0
Subset advertisements received      : 0
Request advertisements received     : 0
Summary advertisements transmitted : 0
Subset advertisements transmitted   : 0
Request advertisements transmitted  : 0
Number of config revision errors    : 0
Number of config digest errors      : 0
Number of V1 summary errors         : 0

VTP pruning statistics:

```

**Table 208: show vtp counters Field Descriptions**

| Field                              | Description                                                                                                                                                                                                                                                                                   |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Summary advertisements received    | Number of summary advertisements received by this device on its trunk ports. Summary advertisements contain the management domain name, the configuration revision number, the update timestamp and identity, the authentication checksum, and the number of subset advertisements to follow. |
| Subset advertisements received     | Number of subset advertisements received by this device on its trunk ports. Subset advertisements contain all the information for one or more VLANs.                                                                                                                                          |
| Request advertisements received    | Number of advertisement requests received by this device on its trunk ports. Advertisement requests normally request information on all VLANs. They can also request information on a subset of VLANs.                                                                                        |
| Summary advertisements transmitted | Number of summary advertisements sent by this device on its trunk ports. Summary advertisements contain the management domain name, the configuration revision number, the update timestamp and identity, the authentication checksum, and the number of subset advertisements to follow.     |
| Subset advertisements transmitted  | Number of subset advertisements sent by this device on its trunk ports. Subset advertisements contain all the information for one or more VLANs.                                                                                                                                              |

| Field                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Request advertisements transmitted      | Number of advertisement requests sent by this device on its trunk ports. Advertisement requests normally request information on all VLANs. They can also request information on a subset of VLANs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Number of configuration revision errors | <p>Number of revision errors.</p> <p>Whenever you define a new VLAN, delete an existing one, suspend or resume an existing VLAN, or modify the parameters on an existing VLAN, the configuration revision number of the device increments.</p> <p>Revision errors increment whenever the device receives an advertisement whose revision number matches the revision number of the device, but the MD5 digest values do not match. This error means that the VTP password in the two devices is different or that the devices have different configurations.</p> <p>These errors indicate that the device is filtering incoming advertisements, which causes the VTP database to become unsynchronized across the network.</p> |
| Number of configuration digest errors   | <p>Number of MD5 digest errors.</p> <p>Digest errors increment whenever the MD5 digest in the summary packet and the MD5 digest of the received advertisement calculated by the device do not match. This error usually means that the VTP password in the two devices is different. To solve this problem, make sure the VTP password on all devices is the same.</p> <p>These errors indicate that the device is filtering incoming advertisements, which causes the VTP database to become unsynchronized across the network.</p>                                                                                                                                                                                           |
| Number of V1 summary errors             | <p>Number of Version 1 errors.</p> <p>Version 1 summary errors increment whenever a device in VTP V2 mode receives a VTP Version 1 frame. These errors indicate that at least one neighboring device is either running VTP Version 1 or VTP Version 2 with V2-mode disabled. To solve this problem, change the configuration of the devices in VTP V2-mode to disabled.</p>                                                                                                                                                                                                                                                                                                                                                    |
| Join Transmitted                        | Number of VTP pruning messages sent on the trunk.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 209: show vtp status Field Descriptions**

| Field                | Description                                                                                                                                                                                                                                                     |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VTP Version capable  | Displays the VTP versions that are capable of operating on the device.                                                                                                                                                                                          |
| VTP Version running  | Displays the VTP version operating on the device. By default, the device implements Version 1 but can be set to Version 2.                                                                                                                                      |
| VTP Domain Name      | Name that identifies the administrative domain for the device.                                                                                                                                                                                                  |
| VTP Pruning Mode     | Displays whether pruning is enabled or disabled. Enabling pruning on a VTP server enables pruning for the entire management domain. Pruning restricts flooded traffic to those trunk links that the traffic must use to access the appropriate network devices. |
| VTP Traps Generation | Displays whether VTP traps are sent to a network management station.                                                                                                                                                                                            |
| Device ID            | Displays the MAC address of the local device.                                                                                                                                                                                                                   |

| Field                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Configuration last modified     | Displays the date and time of the last configuration modification. Displays the IP address of the device that caused the configuration change to the database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| VTP Operating Mode              | <p>Displays the VTP operating mode, which can be server, client, or transparent.</p> <p><b>Server</b>—A device in VTP server mode is enabled for VTP and sends advertisements. You can configure VLANs on it. The device guarantees that it can recover all the VLAN information in the current VTP database from NVRAM after reboot. By default, every device is a VTP server.</p> <p><b>Note</b> The device automatically changes from VTP server mode to VTP client mode if it detects a failure while writing the configuration to NVRAM and cannot return to server mode until the NVRAM is functioning.</p> <p><b>Client</b>—A device in VTP client mode is enabled for VTP, can send advertisements, but does not have enough nonvolatile storage to store VLAN configurations. You cannot configure VLANs on it. When a VTP client starts up, it does not send VTP advertisements until it receives advertisements to initialize its VLAN database.</p> <p><b>Transparent</b>—A device in VTP transparent mode is disabled for VTP, does not send or learn from advertisements sent by other devices, and cannot affect VLAN configurations on other devices in the network. The device receives VTP advertisements and forwards them on all trunk ports except the one on which the advertisement was received.</p> |
| Maximum VLANs Supported Locally | Maximum number of VLANs supported locally.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Number of Existing VLANs        | Number of existing VLANs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## switchport mode private-vlan

To configure an interface as either a host private-VLAN port or a promiscuous private-VLAN port, use the **switchport mode private-vlan** command in interface configuration mode. To reset the mode to the appropriate default for the device, use the **no** form of this command.

```
switchport mode private-vlan {host | promiscuous}
no switchport mode private-vlan
```

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                |

| <b>Syntax Description</b> | <p><b>host</b> Configures the interface as a private-VLAN host port. Host ports belong to private-VLAN secondary VLANs and are either community ports or isolated ports, depending on the VLAN to which they belong.</p> <p><b>promiscuous</b> Configures the interface as a private-VLAN promiscuous port. Promiscuous ports are members of private-VLAN primary VLANs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                |

| <b>Usage Guidelines</b>   | <p>A private-VLAN host or promiscuous port cannot be a Switched Port Analyzer (SPAN) destination port. If you configure a SPAN destination port as a private-VLAN host or promiscuous port, the port becomes inactive.</p> <p>Do not configure private VLAN on ports with these other features:</p> <ul style="list-style-type: none"> <li>• Dynamic-access port VLAN membership</li> <li>• Dynamic Trunking Protocol (DTP)</li> <li>• Port Aggregation Protocol (PAgP)</li> <li>• Link Aggregation Control Protocol (LACP)</li> <li>• Multicast VLAN Registration (MVR)</li> <li>• Voice VLAN</li> </ul> <p>While a port is part of the private-VLAN configuration, any EtherChannel configuration for it is inactive.</p> <p>A private-VLAN port cannot be a secure port and should not be configured as a protected port.</p> <p>For more information about private-VLAN interaction with other features, see the software configuration guide for this release.</p> <p>We strongly recommend that you enable spanning tree Port Fast and bridge-protocol-data-unit (BPDU) guard on isolated and community host ports to prevent STP loops due to misconfigurations and to speed up STP convergence.</p> <p>If you configure a port as a private-VLAN host port and you do not configure a valid private-VLAN association by using the <b>switchport private-vlan host-association</b> command, the interface becomes inactive.</p> |                                                                |

If you configure a port as a private-VLAN promiscuous port and you do not configure a valid private VLAN mapping by using the **switchport private-vlan mapping** command, the interface becomes inactive.

## Examples

This example shows how to configure an interface as a private-VLAN host port and associate it to primary VLAN 20. The interface is a member of secondary isolated VLAN 501 and primary VLAN 20.

```
(config)# interface gigabitethernet2/0/1
(config-if)# switchport mode private-vlan host
(config-if)# switchport private-vlan host-association 20 501
(config-if)# end
```

This example shows how to configure an interface as a private-VLAN promiscuous port and map it to a private VLAN. The interface is a member of primary VLAN 20 and secondary VLANs 501 to 503 are mapped to it.

```
(config)# interface gigabitethernet2/0/1
(config-if)# switchport mode private-vlan promiscuous
(config-if)# switchport private-vlan mapping 20 501-503
(config-if)# end
```

# switchport priority extend

To set a port priority for the incoming untagged frames or the priority of frames received by the IP phone connected to the specified port, use the **switchport priority extend** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

**switchport priority extend** {cos value | trust}  
**no switchport priority extend**

|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                | This command was introduced.                                                                                                                                                                                                   |
| Usage Guidelines   | When voice VLAN is enabled, you can configure the device to send the Cisco Discovery Protocol (CDP) packets to instruct the IP phone how to send data packets from the device attached to the access port on the Cisco IP Phone. You must enable CDP on the device port connected to the Cisco IP Phone to send the configuration to the Cisco IP Phone. (CDP is enabled by default globally and on all device interfaces.) |                                                                                                                                                                                                                                |
|                    | You should configure voice VLAN on the device access ports.                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                |
|                    | This example shows how to configure the IP phone connected to the specified port to trust the received IEEE 802.1p priority:                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                |
|                    | <pre>Device&gt; enable Device# configure terminal Device(config)# interface gigabitethernet1/0/2 Device(config-if)# switchport priority extend trust</pre>                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                |
|                    | You can verify your settings by entering the <b>show interfaces interface-id switchport</b> privileged EXEC command.                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                |

# switchport trunk

To set the trunk characteristics when the interface is in trunking mode, use the **switchport trunk** command in interface configuration mode. To reset a trunking characteristic to the default, use the **no** form of this command.

**switchport trunk** {**allowed vlan** *vlan-list* | **native vlan** *vlan-id* | **pruning vlan** *vlan-list*}  
**no switchport trunk** {**allowed vlan** | **native vlan** | **pruning vlan**}

## Syntax Description

|                                      |                                                                                                                                                                                       |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>allowed vlan</b> <i>vlan-list</i> | Sets the list of allowed VLANs that can receive and send traffic on this interface in tagged format when in trunking mode. See the Usage Guidelines for the <i>vlan-list</i> choices. |
| <b>native vlan</b> <i>vlan-id</i>    | Sets the native VLAN for sending and receiving untagged traffic when the interface is in IEEE 802.1Q trunking mode. The range is 1 to 4094.                                           |
| <b>pruning vlan</b> <i>vlan-list</i> | Sets the list of VLANs that are eligible for VTP pruning when in trunking mode. See the Usage Guidelines for the <i>vlan-list</i> choices.                                            |

## Command Default

VLAN 1 is the default native VLAN ID on the port.  
 The default for all VLAN lists is to include all VLANs.

## Command Modes

Interface configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The *vlan-list* format is **all** | **none** | [**add** | **remove** | **except**] *vlan-atom* [,*vlan-atom*...]:

- **all** specifies all VLANs from 1 to 4094. This is the default. This keyword is not allowed on commands that do not permit all VLANs in the list to be set at the same time.
- **none** specifies an empty list. This keyword is not allowed on commands that require certain VLANs to be set or at least one VLAN to be set.
- **add** adds the defined list of VLANs to those currently set instead of replacing the list. Valid IDs are from 1 to 1005; extended-range VLANs (VLAN IDs greater than 1005) are valid in some cases.

### Note

You can add extended-range VLANs to the allowed VLAN list, but not to the pruning-eligible VLAN list.

Separate nonconsecutive VLAN IDs with a comma; use a hyphen to designate a range of IDs.

- **remove** removes the defined list of VLANs from those currently set instead of replacing the list. Valid IDs are from 1 to 1005; extended-range VLAN IDs are valid in some cases.

**Note** You can remove extended-range VLANs from the allowed VLAN list, but you cannot remove them from the pruning-eligible list.

- **except** lists the VLANs that should be calculated by inverting the defined list of VLANs. (VLANs are added except the ones specified.) Valid IDs are from 1 to 1005. Separate nonconsecutive VLAN IDs with a comma; use a hyphen to designate a range of IDs.
- *vlan-atom* is either a single VLAN number from 1 to 4094 or a continuous range of VLANs described by two VLAN numbers, the lesser one first, separated by a hyphen.

#### Native VLANs:

- All untagged traffic received on an IEEE 802.1Q trunk port is forwarded with the native VLAN configured for the port.
- If a packet has a VLAN ID that is the same as the sending-port native VLAN ID, the packet is sent without a tag; otherwise, the switch sends the packet with a tag.
- The **no** form of the **native vlan** command resets the native mode VLAN to the appropriate default VLAN for the device.

#### Allowed VLAN:

- To reduce the risk of spanning-tree loops or storms, you can disable VLAN 1 on any individual VLAN trunk port by removing VLAN 1 from the allowed list. When you remove VLAN 1 from a trunk port, the interface continues to send and receive management traffic, for example, Cisco Discovery Protocol (CDP), Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), Dynamic Trunking Protocol (DTP), and VLAN Trunking Protocol (VTP) in VLAN 1.
- The **no** form of the **allowed vlan** command resets the list to the default list, which allows all VLANs.

#### Trunk pruning:

- The pruning-eligible list applies only to trunk ports.
- Each trunk port has its own eligibility list.
- If you do not want a VLAN to be pruned, remove it from the pruning-eligible list. VLANs that are pruning-ineligible receive flooded traffic.
- VLAN 1, VLANs 1002 to 1005, and extended-range VLANs (VLANs 1006 to 4094) cannot be pruned.

## Examples

This example shows how to configure VLAN 3 as the default for the port to send all untagged traffic:

```
Device> enable
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport trunk native vlan 3
```

This example shows how to add VLANs 1, 2, 5, and 6 to the allowed list:

```
Device> enable
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport trunk allowed vlan add 1,2,5,6
```

This example shows how to remove VLANs 3 and 10 to 15 from the pruning-eligible list:

```
Device> enable
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport trunk pruning vlan remove 3,10-15
```

You can verify your settings by entering the **show interfaces *interface-id* switchport** privileged EXEC command.

# vlan

To add a VLAN and to enter the VLAN configuration mode, use the **vlan** command in global configuration mode. To delete the VLAN, use the **no** form of this command.

```
vlan vlan-id
no vlan vlan-id
```

| Syntax Description | <i>vlan-id</i> ID of the VLAN to be added and configured. The range is 1 to 4094. You can enter a single VLAN ID, a series of VLAN IDs separated by commas, or a range of VLAN IDs separated by hyphens. |                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| Command Default    | None                                                                                                                                                                                                     |                              |

|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                             | This command was introduced. |

**Usage Guidelines**

You can use the **vlan *vlan-id*** global configuration command to add normal-range VLANs (VLAN IDs 1 to 1005) or extended-range VLANs (VLAN IDs 1006 to 4094). Configuration information for normal-range VLANs is always saved in the VLAN database, and you can display this information by entering the **show vlan** privileged EXEC command. If the VTP mode is transparent, VLAN configuration information for normal-range VLANs is also saved in the running configuration file. VLAN IDs in the extended range are not saved in the VLAN database, but they are stored in the switch running configuration file, and you can save the configuration in the startup configuration file.

VTP version 3 supports propagation of extended-range VLANs. VTP versions 1 and 2 propagate only VLANs 1 to 1005.

When you save the VLAN and VTP configurations in the startup configuration file and reboot the , the configuration is selected as follows:

- If the VTP mode is transparent in the startup configuration and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.
- If the VTP mode or domain name in the startup configuration do not match the VLAN database, the domain name and VTP mode and configuration for VLAN IDs 1 to 1005 use the VLAN database information.

If you enter an invalid VLAN ID, you receive an error message and do not enter VLAN configuration mode.

Entering the **vlan** command with a VLAN ID enables VLAN configuration mode. When you enter the VLAN ID of an existing VLAN, you do not create a new VLAN, but you can modify VLAN parameters for that VLAN. The specified VLANs are added or modified when you exit the VLAN configuration mode. Only the **shutdown** command (for VLANs 1 to 1005) takes effect immediately.

**Note**

Although all commands are visible, the only VLAN configuration command that is supported on extended-range VLANs is **remote-span**. For extended-range VLANs, all other characteristics must remain at the default state.

These configuration commands are available in VLAN configuration mode. The **no** form of each command returns the characteristic to its default state:

- **are** *are-number*—Defines the maximum number of all-routes explorer (ARE) hops for this VLAN. This keyword applies only to TrCRF VLANs. The range is 0 to 13. The default is 7. If no value is entered, 0 is assumed to be the maximum.
- **backupcrf**—Specifies the backup CRF mode. This keyword applies only to TrCRF VLANs.
  - **enable**—Backup CRF mode for this VLAN.
  - **disable**—Backup CRF mode for this VLAN (the default).
- **bridge** {*bridge-number* | **type**}—Specifies the logical distributed source-routing bridge, the bridge that interconnects all logical rings that have this VLAN as a parent VLAN in FDDI-NET, Token Ring-NET, and TrBRF VLANs. The range is 0 to 15. The default bridge number is 0 (no source-routing bridge) for FDDI-NET, TrBRF, and Token Ring-NET VLANs. The **type** keyword applies only to TrCRF VLANs and is one of these:
  - **srb**—Source-route bridging
  - **srt**—Source-route transparent) bridging VLAN
- **exit**—Applies changes, increments the VLAN database revision number (VLANs 1 to 1005 only), and exits VLAN configuration mode.
- **media**—Defines the VLAN media type and is one of these:

**Note**

The supports only Ethernet ports. You configure only FDDI and Token Ring media-specific characteristics for VLAN Trunking Protocol (VTP) global advertisements to other . These VLANs are locally suspended.

- **ethernet**—Ethernet media type (the default).
- **fd-net**—FDDI network entity title (NET) media type.
- **fddi**—FDDI media type.
- **tokenring**—Token Ring media type if the VTP v2 mode is disabled, or TrCRF if the VTP Version 2 (v) mode is enabled.
- **tr-net**—Token Ring network entity title (NET) media type if the VTP v2 mode is disabled or TrBRF media type if the VTP v2 mode is enabled.

See the table that follows for valid commands and syntax for different media types.

- **name** *vlan-name*—Names the VLAN with an ASCII string from 1 to 32 characters that must be unique within the administrative domain. The default is VLANxxxx where xxxx represents four numeric digits (including leading zeros) equal to the VLAN ID number.

- **no**—Negates a command or returns it to the default setting.
- **parent** *parent-vlan-id*—Specifies the parent VLAN of an existing FDDI, Token Ring, or TrCRF VLAN. This parameter identifies the TrBRF to which a TrCRF belongs and is required when defining a TrCRF. The range is 0 to 1005. The default parent VLAN ID is 0 (no parent VLAN) for FDDI and Token Ring VLANs. For both Token Ring and TrCRF VLANs, the parent VLAN ID must already exist in the database and be associated with a Token Ring-NET or TrBRF VLAN.
- **remote-span**—Configures the VLAN as a Remote SPAN (RSPAN) VLAN. When the RSPAN feature is added to an existing VLAN, the VLAN is first deleted and is then recreated with the RSPAN feature. Any access ports are deactivated until the RSPAN feature is removed. If VTP is enabled, the new RSPAN VLAN is propagated by VTP for VLAN IDs that are lower than 1024. Learning is disabled on the VLAN.
- **ring** *ring-number*—Defines the logical ring for an FDDI, Token Ring, or TrCRF VLAN. The range is 1 to 4095. The default for Token Ring VLANs is 0. For FDDI VLANs, there is no default.
- **said** *said-value*—Specifies the security association identifier (SAID) as documented in IEEE 802.10. The range is 1 to 4294967294, and the number must be unique within the administrative domain. The default value is 100000 plus the VLAN ID number.
- **shutdown**—Shuts down VLAN switching on the VLAN. This command takes effect immediately. Other commands take effect when you exit VLAN configuration mode.
- **state**—Specifies the VLAN state:
  - **active** means the VLAN is operational (the default).
  - **suspend** means the VLAN is suspended. Suspended VLANs do not pass packets.
- **ste** *ste-number*—Defines the maximum number of spanning-tree explorer (STE) hops. This keyword applies only to TrCRF VLANs. The range is 0 to 13. The default is 7.
- **stp type**—Defines the spanning-tree type for FDDI-NET, Token Ring-NET, or TrBRF VLANs. For FDDI-NET VLANs, the default STP type is *ieee*. For Token Ring-NET VLANs, the default STP type is *ibm*. For FDDI and Token Ring VLANs, the default is no type specified.
  - **ieee**—IEEE Ethernet STP running source-route transparent (SRT) bridging.
  - **ibm**—IBM STP running source-route bridging (SRB).
  - **auto**—STP running a combination of source-route transparent bridging (IEEE) and source-route bridging (IBM).
- **tb-vlan1** *tb-vlan1-id* and **tb-vlan2** *tb-vlan2-id*—Specifies the first and second VLAN to which this VLAN is translationally bridged. Translational VLANs translate FDDI or Token Ring to Ethernet, for example. The range is 0 to 1005. If no value is specified, 0 (no transitional bridging) is assumed.

**Table 210: Valid Commands and Syntax for Different Media Types**

| Media Type | Valid Syntax                                                                                                                                                                                                                                |

| VTP v2 mode is enabled, and you are configuring VLANs other than TrCRF media type. | Do not specify a backup CRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| VTP v2 mode is enabled, and you are configuring a TrBRF VLAN media type.           | Specify a bridge number. Do not leave this field blank.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| VTP v1 mode is enabled.                                                            | No VLAN can have an STP type set to auto.<br><br>This rule applies to Ethernet, FDDI, FDDI-NET, Token Ring, and Token Ring-NET VLANs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Add a VLAN that requires translational bridging (values are not set to zero).      | The translational bridging VLAN IDs that are used must already exist in the database.<br><br>The translational bridging VLAN IDs that a configuration points to must also contain a pointer to the original VLAN in one of the translational bridging parameters (for example, Ethernet points to FDDI, and FDDI points to Ethernet).<br><br>The translational bridging VLAN IDs that a configuration points to must be different media types than the original VLAN (for example, Ethernet can point to Token Ring).<br><br>If both translational bridging VLAN IDs are configured, these VLANs must be different media types (for example, Ethernet can point to FDDI and Token Ring). |

## Examples

This example shows how to add an Ethernet VLAN with default media characteristics. The default includes a *vlan-name* of VLAN xxxx, where xxxx represents four numeric digits (including leading zeros) equal to the VLAN ID number. The default media is ethernet; the state is active. The default said-value is 100000 plus the VLAN ID; the mtu-size variable is 1500; the stp-type is ieee. When you enter the **exit** VLAN configuration command, the VLAN is added if it did not already exist; otherwise, this command does nothing.

This example shows how to create a new VLAN with all default characteristics and enter VLAN configuration mode:

```
(config)# vlan 200
(config-vlan)# exit
```

```
(config) #
```

This example shows how to create a new extended-range VLAN with all the default characteristics, to enter VLAN configuration mode, and to save the new VLAN in the startup configuration file:

```
(config) # vlan 2000  
(config-vlan) # end  
# copy running-config startup config
```

You can verify your setting by entering the **show vlan** privileged EXEC command.

# vlan dot1q tag native

To enable tagging of native VLAN frames on all IEEE 802.1Q trunk ports, use the **vlan dot1q tag native** command in global configuration mode. To return to the default setting, use the **no** form of this command.

**vlan dot1q tag native**  
**no vlan dot1q tag native**

|                           |                                                                                                          |                              |
|---------------------------|----------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | This command has no arguments or keywords.                                                               |                              |
| <b>Command Default</b>    | The IEEE 802.1Q native VLAN tagging is disabled.                                                         |                              |
| <b>Command Modes</b>      | Global configuration                                                                                     |                              |
| <b>Command History</b>    | <b>Release</b>                                                                                           | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.5.1a                                                                             | This command was introduced. |
| <b>Usage Guidelines</b>   | When enabled, native VLAN packets going out of all IEEE 802.1Q trunk ports are tagged.                   |                              |
|                           | When disabled, native VLAN packets going out of all IEEE 802.1Q trunk ports are not tagged.              |                              |
|                           | For more information about IEEE 802.1Q tunneling, see the software configuration guide for this release. |                              |
| <b>Examples</b>           | This example shows how to enable IEEE 802.1Q tagging on native VLAN frames:                              |                              |
|                           | <pre> Device# configure terminal Device (config)# vlan dot1q tag native Device (config)# end </pre>      |                              |
|                           | You can verify your settings by entering the <b>show vlan dot1q tag native</b> privileged EXEC command.  |                              |

## vtp (global configuration)

To set or modify the VLAN Trunking Protocol (VTP) configuration characteristics, use the **vtp** command in global configuration mode. To remove the settings or to return to the default settings, use the **no** form of this command.

**vtp** {**domain** *domain-name* | **file** *filename* | **interface** *interface-name* [**only**] | **mode** {**client** | **off** | **server** | **transparent**} [{**mst** | **unknown** | **vlan**}] | **password** *password* [{**hidden** | **secret**}] | **pruning** | **version** *number*}

**no vtp** {**file** | **interface** | **mode** [{**client** | **off** | **server** | **transparent**}] [{**mst** | **unknown** | **vlan**}] | **password** | **pruning** | **version**}

### Syntax Description

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>domain</b> <i>domain-name</i>       | Specifies the VTP domain name, an ASCII string from 1 to 32 characters that identifies the VTP administrative domain for the device. The domain name is case sensitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>file</b> <i>filename</i>            | Specifies the Cisco IOS file system file where the VTP VLAN configuration is stored.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>interface</b> <i>interface-name</i> | Specifies the name of the interface providing the VTP ID updated for this device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>only</b>                            | (Optional) Uses only the IP address of this interface as the VTP IP updater.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>mode</b>                            | Specifies the VTP device mode as client, server, or transparent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>client</b>                          | Places the device in VTP client mode. A device in VTP client mode is enabled for VTP, and can send advertisements, but does not have enough nonvolatile storage to store VLAN configurations. You cannot configure VLANs on a VTP client. VLANs are configured on another device in the domain that is in server mode. When a VTP client starts up, it does not send VTP advertisements until it receives advertisements to initialize its VLAN database.                                                                                                                                                                                                        |
| <b>off</b>                             | Places the device in VTP off mode. A device in VTP off mode functions the same as a VTP transparent device except that it does not forward VTP advertisements on trunk ports.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>server</b>                          | Places the device in VTP server mode. A device in VTP server mode is enabled for VTP and sends advertisements. You can configure VLANs on the device. The device can recover all the VLAN information in the current VTP database from nonvolatile storage after reboot.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>transparent</b>                     | Places the device in VTP transparent mode. A device in VTP transparent mode is disabled for VTP, does not send advertisements or learn from advertisements sent by other devices, and cannot affect VLAN configurations on other devices in the network. The device receives VTP advertisements and forwards them on all trunk ports except the one on which the advertisement was received.<br><br>When VTP mode is transparent, the mode and domain name are saved in the device running configuration file, and you can save them in the device startup configuration file by entering the <b>copy running-config startup config</b> privileged EXEC command. |
| <b>mst</b>                             | (Optional) Sets the mode for the multiple spanning tree (MST) VTP database (only VTP Version 3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                          |                                                                                                                                                                                                                                                                                                  |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>unknown</b>           | (Optional) Sets the mode for unknown VTP databases (only VTP Version 3).                                                                                                                                                                                                                         |
| <b>vlan</b>              | (Optional) Sets the mode for VLAN VTP databases. This is the default (only VTP Version 3).                                                                                                                                                                                                       |
| <b>password password</b> | Sets the administrative domain password for the generation of the 16-byte secret value used in MD5 digest calculation to be sent in VTP advertisements and to validate received VTP advertisements. The password can be an ASCII string from 1 to 32 characters. The password is case sensitive. |
| <b>hidden</b>            | (Optional) Specifies that the key generated from the password string is saved in the VLAN database file. When the hidden password is entered, you need to reenter the password to issue a command in the domain. This keyword is supported only in VTP Version 3.                                |
| <b>secret</b>            | (Optional) Allows the user to directly configure the password secret key (only VTP Version 3).                                                                                                                                                                                                   |
| <b>pruning</b>           | Enables VTP pruning on the device.                                                                                                                                                                                                                                                               |
| <b>version number</b>    | Sets the VTP Version to Version 1, Version 2, or Version 3.                                                                                                                                                                                                                                      |

**Command Default**

The default filename is *flash:vlan.dat*.

The default mode is server mode and the default database is VLAN.

In VTP Version 3, for the MST database, the default mode is transparent.

No domain name or password is defined.

No password is configured.

Pruning is disabled.

The default version is Version 1.

Global configuration

**Command History**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

When you save VTP mode, domain name, and VLAN configurations in the device startup configuration file and reboot the device, the VTP and VLAN configurations are selected by these conditions:

- If the VTP mode is transparent in the startup configuration and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.
- If the VTP mode or domain name in the startup configuration do not match the VLAN database, the domain name and VTP mode and configuration for VLAN IDs 1 to 1005 use the VLAN database information.

The **vtp file** *filename* cannot be used to load a new database; it renames only the file in which the existing database is stored.

Follow these guidelines when configuring a VTP domain name:

- The device is in the no-management-domain state until you configure a domain name. While in the no-management-domain state, the device does not send any VTP advertisements even if changes occur to the local VLAN configuration. The device leaves the no-management-domain state after it receives the first VTP summary packet on any port that is trunking or after you configure a domain name by using the **vtp domain** command. If the device receives its domain from a summary packet, it resets its configuration revision number to 0. After the device leaves the no-management-domain state, it cannot be configured to reenter it until you clear the NVRAM and reload the software.
- Domain names are case-sensitive.
- After you configure a domain name, it cannot be removed. You can only reassign it to a different domain.

Follow these guidelines when setting VTP mode:

- The **no vtp mode** command returns the device to VTP server mode.
- The **vtp mode server** command is the same as **no vtp mode** except that it does not return an error if the device is not in client or transparent mode.
- If the receiving device is in client mode, the client device changes its configuration to duplicate the configuration of the server. If you have devices in client mode, be sure to make all VTP or VLAN configuration changes on a device in server mode, as it has a higher VTP configuration revision number. If the receiving device is in transparent mode, the device configuration is not changed.
- A device in transparent mode does not participate in VTP. If you make VTP or VLAN configuration changes on a device in transparent mode, the changes are not propagated to other devices in the network.
- If you change the VTP or VLAN configuration on a device that is in server mode, that change is propagated to all the devices in the same VTP domain.
- The **vtp mode transparent** command disables VTP from the domain but does not remove the domain from the device.
- In VTP Versions 1 and 2, the VTP mode must be transparent for VTP and VLAN information to be saved in the running configuration file.
- With VTP Versions 1 and 2, you cannot change the VTP mode to client or server if extended-range VLANs are configured on the switch. Changing the VTP mode is allowed with extended VLANs in VTP Version 3.
- The VTP mode must be transparent for you to add extended-range VLANs or for VTP and VLAN information to be saved in the running configuration file.
- VTP can be set to either server or client mode only when dynamic VLAN creation is disabled.
- The **vtp mode off** command sets the device to off. The **no vtp mode off** command resets the device to the VTP server mode.

Follow these guidelines when setting a VTP password:

- Passwords are case sensitive. Passwords should match on all devices in the same domain.
- When you use the **no vtp password** form of the command, the device returns to the no-password state.

- The **hidden** and **secret** keywords are supported only in VTP Version 3. If you convert from VTP Version 2 to VTP Version 3, you must remove the hidden or secret keyword before the conversion.

Follow these guidelines when setting VTP pruning:

- VTP pruning removes information about each pruning-eligible VLAN from VTP updates if there are no stations belonging to that VLAN.
- If you enable pruning on the VTP server, it is enabled for the entire management domain for VLAN IDs 1 to 1005.
- Only VLANs in the pruning-eligible list can be pruned.
- Pruning is supported with VTP Version 1 and Version 2.

Follow these guidelines when setting the VTP version:

- Toggling the Version 2 (v2) mode state modifies parameters of certain default VLANs.
- Each VTP device automatically detects the capabilities of all the other VTP devices. To use Version 2, all VTP devices in the network must support Version 2; otherwise, you must configure them to operate in VTP Version 1 mode.
- If all devices in a domain are VTP Version 2-capable, you only need to configure Version 2 on one device; the version number is then propagated to the other Version-2 capable devices in the VTP domain.
- If you are using VTP in a Token Ring environment, VTP Version 2 must be enabled.
- If you are configuring a Token Ring bridge relay function (TrBRF) or Token Ring concentrator relay function (TrCRF) VLAN media type, you must use Version 2.
- If you are configuring a Token Ring or Token Ring-NET VLAN media type, you must use Version 1.
- In VTP Version 3, all database VTP information is propagated across the VTP domain, not only VLAN database information.
- Two VTP Version 3 regions can only communicate over a VTP Version 1 or VTP Version 2 region in transparent mode.

You cannot save password, pruning, and version configurations in the device configuration file.

## Examples

This example shows how to rename the filename for VTP configuration storage to vtpfilename:

```
Device(config)# vtp file vtpfilename
```

This example shows how to clear the device storage filename:

```
Device(config)# no vtp file vtpconfig  
Clearing device storage filename.
```

This example shows how to specify the name of the interface providing the VTP updater ID for this device:

```
Device(config)# vtp interface gigabitethernet
```

This example shows how to set the administrative domain for the device:

```
Device(config)# vtp domain OurDomainName
```

This example shows how to place the device in VTP transparent mode:

```
Device(config)# vtp mode transparent
```

This example shows how to configure the VTP domain password:

```
Device(config)# vtp password ThisIsOurDomainsPassword
```

This example shows how to enable pruning in the VLAN database:

```
Device(config)# vtp pruning  
Pruning switched ON
```

This example shows how to enable Version 2 mode in the VLAN database:

```
Device(config)# vtp version 2
```

You can verify your settings by entering the **show vtp status** privileged EXEC command.

## vtp (interface configuration)

To enable the VLAN Trunking Protocol (VTP) on a per-port basis, use the **vtp** command in interface configuration mode. To disable VTP on the interface, use the **no** form of this command.

**vtp**  
**no vtp**

---

**Syntax Description**

This command has no arguments or keywords.

---

**Command Modes**

Interface configuration

---

**Command History**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

---

**Usage Guidelines**

Enter this command only on interfaces that are in trunking mode.

---

**Examples**

This example shows how to enable VTP on an interface:

```
Device> enable
Device(config-if)# vtp
```

This example shows how to disable VTP on an interface:

```
Device(config-if)# no vtp
```

# vtp primary

To configure a device as the VLAN Trunking Protocol (VTP) primary server, use the **vtp primary** command in privileged EXEC mode.

**vtp primary** [{**mst** | **vlan**}] [**force**]

|                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                              |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b>                                                           | <div> <div><b>mst</b></div> <div>(Optional) Configures the device as the primary VTP server for the multiple spanning tree (MST) feature.</div> </div> <div> <div><b>vlan</b></div> <div>(Optional) Configures the device as the primary VTP server for VLANs.</div> </div> <div> <div><b>force</b></div> <div>(Optional) Configures the device to not check for conflicting devices when configuring the primary server.</div> </div>                                                                                                                                                        |                              |
| <b>Command Default</b>                                                              | The device is a VTP secondary server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                              |

| <b>Usage Guidelines</b>                                                             | <p>A VTP primary server updates the database information and sends updates that are honored by all devices in the system. A VTP secondary server can only back up the updated VTP configurations received from the primary server to NVRAM.</p> <p>By default, all devices come up as secondary servers. Primary server status is needed only for database updates when the administrator issues a takeover message in the domain. You can have a working VTP domain without any primary servers.</p> <p>Primary server status is lost if the device reloads or domain parameters change.</p> |                              |
|  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                              |
| <b>Note</b>                                                                         | This command is supported only when the device is running VTP Version 3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                              |

## Examples

This example shows how to configure the device as the primary VTP server for VLANs:

```
Device> enable
Device# vtp primary vlan
Setting device to VTP TRANSPARENT mode.
```

You can verify your settings by entering the **show vtp status** privileged EXEC command.
