### Example

The following example shows how to permit register packets for a source address sending to any group range, with the exception of source address 172.16.10.1 sending to the SSM group range (232.0.0.0/8). These are denied. These statements should be configured on all candidate RPs because candidate RPs will receive PIM registers from first-hop routers or switches.

```
(config)# ip pim accept-register list ssm-range
(config)# ip access-list extended ssm-range
(config-ext-nacl)# deny ip any 232.0.0.0 0.255.255.255
(config-ext-nacl)# permit ip any any
```

# ip pim bidir-enable

To enable bidirectional Protocol Independent Multicast (bidirectional PIM), use the **ip pim bidir-enable** command in global configuration mode. To disable bidirectional PIM, use the **no** form of this command.

**ip pim bidir-enable**

**no ip pim bidir-enable**

|                  | Cisco IOS XE Gibraltar 16.12.1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | This command was introduced. |
| Command Default  | The command is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                              |
| Command Modes    | Global configuration (config)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                              |
| Usage Guidelines | <p>When bidirectional PIM is disabled, the router will behave similarly to a router without bidirectional PIM support. The following conditions will apply:</p> <ul style="list-style-type: none"><li>• PIM hello messages sent by the router will not contain the bidirectional mode option.</li><li>• The router will not send designated forwarder (DF) election messages and will ignore DF election messages it receives.</li><li>• The <b>ip pim rp-address</b>, <b>ip pim send-rp-announce</b>, and <b>ip pim rp-candidate</b> global configuration commands will be treated as follows:<ul style="list-style-type: none"><li>• If these commands are configured when bidirectional PIM is disabled, bidirectional mode will not be a configuration option.</li><li>• If these commands are configured with the bidirectional mode option when bidirectional PIM is enabled and then bidirectional PIM is disabled, these commands will be removed from the command-line interface (CLI). In this situation, these commands must be configured again with the bidirectional mode option when bidirectional PIM is reenabled.</li></ul></li><li>• The <b>df</b> keyword for the <b>show ip pim interface</b> user EXEC or privileged EXEC command and <b>debug ip pim</b> privileged EXEC command is not supported.</li></ul> |                              |

The following example shows how to enable bidirectional PIM:

```
Device# enable
Device# configure terminal
Device(config)# ip pim bidir-enable
```

## ip pim bsr-candidate

To configure the switch to be a candidate BSR, use the **ip pim bsr-candidate** command in global configuration mode. To remove the switch as a candidate BSR, use the **no** form of this command.

**ip pim** [*vrf vrf-name*] **bsr-candidate** *interface-id* [*hash-mask-length*] [*priority*]  
**no ip pim** [*vrf vrf-name*] **bsr-candidate**

| Syntax Description      |                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vrf vrf-name</i>     | (Optional) Configures the switch to be a candidate BSR for the Multicast Virtual Private Network (MVPN) routing and forwarding (MVRP) instance specified for the <i>vrf-name</i> argument.                                                                                                                                                                                                                        |
| <i>interface-id</i>     | ID of the interface on the switch from which the BSR address is derived to make it a candidate. This interface must be enabled for Protocol Independent Multicast (PIM) using the <b>ip pim</b> command. Valid interfaces include physical ports, port channels, and VLANs.                                                                                                                                       |
| <i>hash-mask-length</i> | (Optional) Length of a mask (32 bits maximum) that is to be ANDed with the group address before the PIMv2 hash function is called. All groups with the same seed hash correspond to the same rendezvous point (RP). For example, if this value is 24, only the first 24 bits of the group addresses matter. The hash mask length allows one RP to be used for multiple groups. The default hash mask length is 0. |
| <i>priority</i>         | (Optional) Priority of the candidate BSR (C-BSR). The range is from 0 to 255. The default priority is 0. The C-BSR with the highest priority value is preferred.                                                                                                                                                                                                                                                  |

**Command Default** The switch is not configured to announce itself as a candidate BSR.

**Command Modes** Global configuration

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The interface specified for this command must be enabled for Protocol Independent Multicast (PIM) using the **ip pim** command.

This command configures the switch to send BSR messages to all of its PIM neighbors, with the address of the designated interface as the BSR address.

This command should be configured on backbone switches that have good connectivity to all parts of the PIM domain.

The BSR mechanism is specified in RFC 2362. Candidate RP (C-RP) switches unicast C-RP advertisement packets to the BSR. The BSR then aggregates these advertisements in BSR messages, which it regularly multicasts with a TTL of 1 to the ALL-PIM-ROUTERS group address, 224.0.0.13. The multicasting of these messages is handled by hop-by-hop RPF flooding; so, no pre-existing IP multicast routing setup is required (unlike with AutoRP). In addition, the BSR does not preselect the designated RP for a particular group range (unlike AutoRP); instead, each switch that receives BSR messages will elect RPs for group ranges based on the information in the BSR messages.

Cisco switches always accept and process BSR messages. There is no command to disable this function.

Cisco perform the following steps to determine which C-RP is used for a group:

- A long match lookup is performed on the group prefix that is announced by the BSR C-RPs.
- If more than one BSR-learned C-RP is found by the longest match lookup, the C-RP with the lowest priority (configured with the **ip pim rp-candidate** command) is preferred.
- If more than one BSR-learned C-RP has the same priority, the BSR hash function is used to select the RP for a group.
- If more than one BSR-learned C-RP returns the same hash value derived from the BSR hash function, the BSR C-RP with the highest IP address is preferred.

### Example

The following example shows how to configure the IP address of the on Gigabit Ethernet interface 1/0/0 to be a BSR C-RP with a hash mask length of 0 and a priority of 192:

```
(config)# ip pim bsr-candidate GigabitEthernet1/0/1 0 192
```

## ip pim rp-address

To statically configure the address of a Protocol Independent Multicast (PIM) rendezvous point (RP) for multicast groups, use the **ip pim rp-address** command in global configuration mode. To remove an RP address, use the **no** form of this command.

**ip pim** [*vrf vrf-name*] **rp-address** *rp-address* [*access-list*] [**override**] [**bidir**]

**no ip pim** [*vrf vrf-name*] **rp-address** *rp-address* [*access-list*] [**override**] [**bidir**]

### Syntax Description

|                                     |                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i>          | (Optional) Specifies that the static group-to-RP mapping be associated with the Multicast Virtual Private Network (MVPN) routing and forwarding (MVRP) instance specified for the <i>vrf-name</i> argument.                                                                                                                                                                                           |
| <b>rp-address</b> <i>rp-address</i> | IP address of the RP to be used for the static group-to-RP mapping. This is a unicast IP address in four-part dotted-decimal notation.                                                                                                                                                                                                                                                                |
| <i>access-list</i>                  | (Optional) Number or name of a standard access list that defines the multicast groups to be statically mapped to the RP.<br><br><b>Note</b> If no access list is defined, the RP will map to all multicast groups                                                                                                                                                                                     |
| <b>override</b>                     | (Optional) Specifies that if dynamic and static group-to-RP mappings are used together and there is an RP address conflict, the RP address configured for a static group-to-RP mapping will take precedence.<br><br><b>Note</b> If the <b>override</b> keyword is not specified and there is RP address conflict, dynamic group-to-RP mappings will take precedence over static group-to-RP mappings. |
| <b>bidir</b>                        | (Optional) Specifies that the static group-to-RP mapping be applied to a bidirectional PIM RP.<br><br>If the command is configured without the <b>bidir</b> keyword, the groups will operate in sparse mode.<br><br><b>Note</b> The <b>bidir</b> keyword is available as an optional keyword only if bidirectional PIM has been enabled using the <b>ip pim bidir-enable</b> command.                 |

| Command History  | Release                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Modification                 |

| Usage Guidelines | <p>Under PIM, multicast groups in sparse mode (PIM-SM) or bidirectional mode (bidirectional PIM) use RPs to connect sources and receivers. All routers in a PIM domain need to have a consistent configuration for the mode and RP addresses of the multicast groups.</p> <p>The Cisco IOS software learns the mode and RP addresses of multicast groups through the following three mechanisms: static group-to-RP mapping configurations, Auto-RP, and bootstrap router (BSR).</p> <p>Use the <b>ip pim rp-address</b> command to statically define the RP address for PIM-SM or bidirectional PIM groups (an <b>ip pim rp-address</b> command configuration is referred to as a static group-to-RP mapping).</p> <p>You can configure a single RP for more than one group using an access list. If no access list is specified, the static RP will map to all multicast groups.</p> <p>You can configure multiple RPs, but only one RP per group range.</p> <p>If multiple <b>ip pim rp-address</b> commands are configured, the following rules apply:</p> <ul style="list-style-type: none"> <li>• Highest RP IP address selected regardless of reachability: If a multicast group is matched by the access list of more than one configured <b>ip pim rp-address</b> command, then the RP for the group is determined by the RP with the highest RP address configured.</li> <li>• One RP address per command: If multiple <b>ip pim rp-address</b> commands are configured, each static group-to-RP mapping must be configured with a unique RP address (if not, it will be overwritten). This restriction also means that only one RP address can be used to provide RP functions for either sparse mode or bidirectional mode groups. If you want to configure static group-to-RP mappings for both bidirectional and sparse mode, the RP addresses must be unique for each mode.</li> <li>• One access list per command: If multiple <b>ip pim rp-address</b> commands are configured, only one access list can be configured per static group-to-RP mapping. An access list cannot be reused with other static group-to-RP mappings configured on a router.</li> </ul> <p>If dynamic and static group-to-RP mappings are used together, the following rule applies to a multicast group: Dynamic group-to-RP mappings take precedence over static group-to-RP mappings--unless the <b>override</b> keyword is used.</p> <p>The following example shows how to set the bidirectional PIM RP address to 172.16.0.2 for the multicast range 239/8:</p> <pre>Device(config)# access list 10 239.0.0.0 0.255.255.255 Device(config)# ip pim rp-address 172.16.0.2 10 bidir</pre> |                              |

# ip pim rp-candidate

To configure the switch to advertise itself to the BSR as a Protocol Independent Multicast (PIM) Version 2 (PIMv2) candidate rendezvous point (C-RP), use the **ip pim rp-candidate** command in global configuration mode. To remove the switch as a C-RP, use the **no** form of this command.

**ip pim** [**vrf** *vrf-name*] **rp-candidate** *interface-id* [**group-list** *access-list-number*]  
**no ip pim** [**vrf** *vrf-name*] **rp-candidate** *interface-id* [**group-list** *access-list-number*]

|                           |                                                                                                                                                                                                                        |                                                                                                                                                                                                                   |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>vrf</b> <i>vrf-name</i>                                                                                                                                                                                             | (Optional) Configures the switch to advertise itself to the BSR as PIMv2 C-RP for the Multicast Virtual Private Network (MVPN) routing and forwarding (MVRP) instance specified for the <i>vrf-name</i> argument. |
|                           | <i>interface-id</i>                                                                                                                                                                                                    | ID of the interface whose associated IP address is advertised as a candidate RP address. Valid interfaces include physical ports, port channels, and VLANs.                                                       |
|                           | <b>group-list</b> <i>access-list-number</i>                                                                                                                                                                            | (Optional) Specifies the standard IP access list number that defines the group prefixes that are advertised in association with the RP address.                                                                   |
| <b>Command Default</b>    | The switch is not configured to announce itself to the BSR as a PIMv2 C-RP.                                                                                                                                            |                                                                                                                                                                                                                   |
| <b>Command Modes</b>      | Global configuration                                                                                                                                                                                                   |                                                                                                                                                                                                                   |

|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                           | This command was introduced.                                                                                                                                                                                      |
| <b>Usage Guidelines</b>   | Use this command to configure the switch to send PIMv2 messages so that it advertises itself as a candidate RP to the BSR.                                                                                             |                                                                                                                                                                                                                   |
|                           | This command should be configured on backbone switches that have good connectivity to all parts of the PIM domain.                                                                                                     |                                                                                                                                                                                                                   |
|                           | The IP address associated with the interface specified by <i>interface-id</i> will be advertised as the C-RP address.                                                                                                  |                                                                                                                                                                                                                   |
|                           | The interface specified for this command must be enabled for Protocol Independent Multicast (PIM) using the <b>ip pim</b> command.                                                                                     |                                                                                                                                                                                                                   |
|                           | If the optional <b>group-list</b> keyword and <i>access-list-number</i> argument are configured, the group prefixes defined by the standard IP access list will also be advertised in association with the RP address. |                                                                                                                                                                                                                   |

## Example

The following example shows how to configure the switch to advertise itself as a C-RP to the BSR in its PIM domain. The standard access list number 4 specifies the group prefix associated with the RP that has the address identified by Gigabit Ethernet interface 1/0/1.

```
(config)# ip pim rp-candidate GigabitEthernet1/0/1 group-list 4
```

## ip pim send-rp-announce

To use Auto-RP to configure groups for which the device will act as a rendezvous point (RP), use the **ip pim send-rp-announce** command in global configuration mode. To unconfigure the device as an RP, use the **no** form of this command.

**ip pim** [**vrf** *vrf-name*] **send-rp-announce** *interface-id* **scope** *ttl-value* [**group-list** *access-list-number*] [**interval** *seconds*] [**bidir**]  
**no ip pim** [**vrf** *vrf-name*] **send-rp-announce** *interface-id*

### Syntax Description

|                                             |                                                                                                                                                                                                                                                                                |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i>                  | (Optional) Uses Auto-RP to configure groups for which the device will act as a rendezvous point (RP) for the <i>vrf-name</i> argument.                                                                                                                                         |
| <i>interface-id</i>                         | Enter the interface ID of the interface that identifies the RP address. Valid interfaces include physical ports, port channels, and VLANs.                                                                                                                                     |
| <b>scope</b> <i>ttl-value</i>               | Specifies the time-to-live (TTL) value in hops that limits the number of Auto-RP announcements. Enter a hop count that is high enough to ensure that the RP-announce messages reach all the mapping agents in the network. There is no default setting. The range is 1—255.    |
| <b>group-list</b> <i>access-list-number</i> | (Optional) Specifies the standard IP access list number that defines the group prefixes that are advertised in association with the RP address. Enter an IP standard access list number from 1—99. If no access list is configured, the RP is used for all groups.             |
| <b>interval</b> <i>seconds</i>              | (Optional) Specifies the interval between RP announcements, in seconds. The total hold time of the RP announcements is automatically set to three times the value of the interval. The default interval is 60 seconds. The range is 1—16383.                                   |
| <b>bidir</b>                                | (Optional) Indicates that the multicast groups specified by the <i>access-list</i> argument are to operate in bidirectional mode. If the command is configured without this keyword, the groups specified will operate in Protocol Independent Multicast sparse mode (PIM-SM). |

### Command Default

Auto-RP is disabled.

### Command Modes

Global configuration

### Command History

| Release                        | Modification                                                   |
|--------------------------------|----------------------------------------------------------------|
| Cisco IOS XE Everest 16.5.1a   | This command was introduced.                                   |
| Cisco IOS XE Gibraltar 16.12.1 | This command was modified. The <b>bidir</b> keyword was added. |

### Usage Guidelines

Enter this command on the device that you want to be an RP. When you are using Auto-RP to distribute group-to-RP mappings, this command causes the router to send an Auto-RP announcement message to the well-known group CISCO-RP-ANNOUNCE (224.0.1.39). This message announces the router as a candidate RP for the groups in the range described by the access list.

Use this command with the **bidir** keyword when you want bidirectional forwarding and you are using Auto-RP to distribute group-to-RP mappings. Other options are as follows:

- If you are using the PIM Version 2 bootstrap router (PIMv2 BSR) mechanism to distribute group-to-RP mappings, use the **bidir** keyword with the **ip pim rp-candidate** command.
- If you are not distributing group-to-RP mappings using either Auto-RP or the PIMv2 BSR mechanism, use the **bidir** keyword with the **ip pim rp-address** command.

### Example

The following example shows how to configure the device to send RP announcements out all Protocol Independent Multicast (PIM)-enabled interfaces for a maximum of 31 hops. The IP address by which the switch wants to be identified as RP is the IP address associated with Gigabit Ethernet interface 1/0/1 at an interval of 120 seconds:

```
Device(config)# ip pim send-rp-announce GigabitEthernet1/0/1 scope 31 group-list 5 interval 120
```

# ip pim spt-threshold

To specify the threshold that must be reached before moving to shortest-path tree (spt), use the **ip pim spt-threshold** command in global configuration mode. To remove the threshold, use the **no** form of this command.

```
ip pim {kpbs | infinity} [group-list access-list]
no ip pim {kpbs | infinity} [group-list access-list]
```

|                    |                                               |                                                                                                                                                                                                                                   |
|--------------------|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <i>kpbs</i>                                   | Threshold that must be reached before moving to shortest-path tree (spt). 0 is the only valid entry even though the range is 0 to 4294967. A 0 entry always switches to the source-tree.                                          |
|                    | <b>infinity</b>                               | Specifies that all the sources for the specified group use the shared tree, never switching to the source tree.                                                                                                                   |
|                    | <b>group-list</b> <i>access-list</i>          | (Optional) Specifies an access list number or a specific access list that you have created by name. If the value is 0 or if the <b>group-list</b> <i>access-list</i> option is not used, the threshold applies to all the groups. |
| Command Default    | Switches to the PIM shortest-path tree (spt). |                                                                                                                                                                                                                                   |
| Command Modes      | Global configuration                          |                                                                                                                                                                                                                                   |
| Command History    | <b>Release</b>                                | <b>Modification</b>                                                                                                                                                                                                               |
|                    | Cisco IOS XE Everest 16.5.1a                  | This command was introduced.                                                                                                                                                                                                      |

## Example

The following example shows how to make all the sources for access list 16 use the shared tree:

```
(config)# ip pim spt-threshold infinity group-list 16
```

# match message-type

To set a message type to match a service list, use the **match message-type** command.

**match message-type** {announcement | any | query}

|                    |                     |                                                                   |
|--------------------|---------------------|-------------------------------------------------------------------|
| Syntax Description | <b>announcement</b> | Allows only service advertisements or announcements for the .     |
|                    | <b>any</b>          | Allows any match type.                                            |
|                    | <b>query</b>        | Allows only a query from the client for a certain in the network. |

Command Default      None

Command Modes      Service list configuration.

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**      Multiple service maps of the same name with different sequence numbers can be created, and the evaluation of the filters will be ordered on the sequence number. Service lists are an ordered sequence of individual statements, with each one having a permit or deny result. The evaluation of a service list consists of a list scan in a predetermined order, and an evaluation of the criteria of each statement that matches. A list scan is stopped once the first statement match is found and a permit/deny action associated with the statement match is performed. The default action after scanning through the entire list is to deny.

**Note**      It is not possible to use the **match** command if you have used the **service-list mdns-sd service-list-name query** command. The **match** command can be used only for the **permit** or **deny** option.

## Example

The following example shows how to set the announcement message type to be matched:

```
(config-mdns-sd-sl)# match message-type announcement
```

# match service-type

To set the value of the mDNS service type string to match, use the **match service-type** command.

**match service-type** *line*

| <b>Syntax Description</b>    | <i>line</i> Regular expression to match the service type in packets.                                                                                                                                                        |         |              |                              |                              |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|------------------------------|
| <b>Command Default</b>       | None                                                                                                                                                                                                                        |         |              |                              |                              |
| <b>Command Modes</b>         | Service list configuration                                                                                                                                                                                                  |         |              |                              |                              |
| <b>Command History</b>       | <table><tr><th>Release</th><th>Modification</th></tr><tr><td>Cisco IOS XE Everest 16.5.1a</td><td>This command was introduced.</td></tr></table>                                                                            | Release | Modification | Cisco IOS XE Everest 16.5.1a | This command was introduced. |
| Release                      | Modification                                                                                                                                                                                                                |         |              |                              |                              |
| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                                                                |         |              |                              |                              |
| <b>Usage Guidelines</b>      | It is not possible to use the <b>match</b> command if you have used the <b>service-list mdns-sd service-list-name query</b> command. The <b>match</b> command can be used only for the <b>permit</b> or <b>deny</b> option. |         |              |                              |                              |

## Example

The following example shows how to set the value of the mDNS service type string to match:

```
(config-mdns-sd-sl)# match service-type _ipp._tcp
```

# match service-instance

To set a service instance to match a service list, use the **match service-instance** command.

**match service-instance** *line*

|                    |                                                                                                                                                                                                                             |                              |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| Syntax Description | <i>line</i> Regular expression to match the service instance in packets.                                                                                                                                                    |                              |
| Command Default    | None                                                                                                                                                                                                                        |                              |
| Command Modes      | Service list configuration                                                                                                                                                                                                  |                              |
| Command History    | Release                                                                                                                                                                                                                     | Modification                 |
|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                | This command was introduced. |
| Usage Guidelines   | It is not possible to use the <b>match</b> command if you have used the <b>service-list mdns-sd service-list-name query</b> command. The <b>match</b> command can be used only for the <b>permit</b> or <b>deny</b> option. |                              |

## Example

The following example shows how to set the service instance to match:

```
(config-mdns-sd-sl)# match service-instance servInst 1
```

# mrinfo

To query which neighboring multicast routers or multilayer switches are acting as peers, use the **mrinfo** command in user EXEC or privileged EXEC mode.

**mrinfo** [**vrf** *route-name*] [*hostname* | *address*] [*interface-id*]

|                    |                                  |                                                                                                                                                      |
|--------------------|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>vrf</b> <i>route-name</i>     | (Optional) Specifies the VPN routing or forwarding instance.                                                                                         |
|                    | <i>hostname</i>   <i>address</i> | (Optional) Domain Name System (DNS) name or IP address of the multicast router or multilayer switch to query. If omitted, the switch queries itself. |
|                    | <i>interface-id</i>              | (Optional) Interface ID.                                                                                                                             |

|                 |                          |
|-----------------|--------------------------|
| Command Default | The command is disabled. |
|-----------------|--------------------------|

|               |                 |
|---------------|-----------------|
| Command Modes | User EXEC       |
|               | Privileged EXEC |

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                  |                                                                                                                                                                                                                                                                          |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | The <b>mrinfo</b> command is the original tool of the multicast backbone (MBONE) to determine which neighboring multicast routers or switches are peering with multicast routers or switches. Cisco routers supports <b>mrinfo</b> requests from Cisco IOS Release 10.2. |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

You can query a multicast router or multilayer switch using the **mrinfo** command. The output format is identical to the multicast routed version of the Distance Vector Multicast Routing Protocol (DVMRP). (The mrouted software is the UNIX software that implements DVMRP.)

## Example

The following is the sample output from the **mrinfo** command:

```
# mrinfo
vrf 192.0.1.0
192.31.7.37 (barrnet-gw.cisco.com) [version cisco 11.1] [flags: PMSA]:
  192.31.7.37 -> 192.31.7.34 (sj-wall-2.cisco.com) [1/0/pim]
  192.31.7.37 -> 192.31.7.47 (dirtylab-gw-2.cisco.com) [1/0/pim]
  192.31.7.37 -> 192.31.7.44 (dirtylab-gw-1.cisco.com) [1/0/pim]
```

---

**Note** The flags indicate the following:

- P: prune-capable
  - M: mtrace-capable
  - S: Simple Network Management Protocol-capable
  - A: Auto RP capable
-

# service-policy-query

To configure the service-list query periodicity, use the **service-policy-query** command. To delete the configuration, use the **no** form of this command.

**service-policy-query** [*service-list-query-name service-list-query-periodicity*]  
**no service-policy-query**

## Syntax Description

*service-list-query-name service-list-query-periodicity* (Optional) Service-list query periodicity.

## Command Default

Disabled.

## Command Modes

mDNS configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Since there are devices that do not send unsolicited announcements and to force such devices the learning of services and to keep them refreshed in the cache, this command contains an active query feature that ensures that the services listed in the active query list are queried.

## Example

This example shows how to configure service list query periodicity:

```
(config-mdns) # service-policy-query sl-query1 100
```

# service-policy

To apply a filter on incoming or outgoing service-discovery information on a service list, use the **service-policy** command. To remove the filter, use the **no** form of this command.

```
service-policy service-policy-name {IN | OUT}
no service-policy service-policy-name {IN | OUT}
```

|                    |     |                                                             |
|--------------------|-----|-------------------------------------------------------------|
| Syntax Description | IN  | Applies a filter on incoming service-discovery information. |
|                    | OUT | Applies a filter on outgoing service-discovery information. |

|                 |           |

|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Example

The following example shows how to apply a filter on incoming service-discovery information on a service list:

```
(config-mdns) # service-policy serv-poll IN
```

# show ip igmp filter

To display Internet Group Management Protocol (IGMP) filter information, use the **show ip igmp filter** command in privileged EXEC mode.

**show ip igmp** [**vrf** *vrf-name*] **filter**

|                           |                                                                                                         |                              |
|---------------------------|---------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <b>vrf</b> <i>vrf-name</i> (Optional) Supports the multicast VPN routing and forwarding (VRF) instance. |                              |
| <b>Command Default</b>    | IGMP filters are enabled by default.                                                                    |                              |
| <b>Command Modes</b>      | Privileged EXEC                                                                                         |                              |
| <b>Command History</b>    | <b>Release</b>                                                                                          | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.5.1a                                                                            | This command was introduced. |
| <b>Usage Guidelines</b>   | The <b>show ip igmp filter</b> command displays information about all filters defined on the .          |                              |

## Example

The following example shows the sample output from the **show ip igmp filter** command:

```
# show ip igmp filter

IGMP filter enabled
```

# show ip igmp profile

To display all the configured Internet Group Management Protocol (IGMP) profiles or a specified IGMP profile, use the **show ip igmp profile** command in privileged EXEC mode.

**show ip igmp** [**vrf** *vrf-name*] **profile** [*profile number*]

|                           |                                         |                                                                                                                                                     |

| <b>Command History</b>    | <b>Release</b>                          | <b>Modification</b>                                                                                                                                 |
|                           | Cisco IOS XE Everest 16.5.1a            | This command was introduced.                                                                                                                        |
| <b>Usage Guidelines</b>   | None                                    |                                                                                                                                                     |

## Examples

The following example shows the output of the **show ip igmp profile** command for profile number 40 on the :

```
# show ip igmp profile 40
IGMP Profile 40
  permit
  range 233.1.1.1 233.255.255.255
```

The following example shows the output of the **show ip igmp profile** command for all the profiles configured on the :

```
# show ip igmp profile

IGMP Profile 3
  range 230.9.9.0 230.9.9.0
IGMP Profile 4
  permit
  range 229.9.9.0 229.255.255.255
```

# show ip igmp snooping

To display the Internet Group Management Protocol (IGMP) snooping configuration of the or the VLAN, use the **show ip igmp snooping** command in user EXEC or privileged EXEC mode.

**show ip igmp snooping** [**groups** | **mrrouter** | **querier**] [**vlan** *vlan-id*] [**detail**]

|                           |                                                                                                                                                                                                                                                                                                 |                                                                                       |

|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                    | This command was introduced.                                                          |
| <b>Usage Guidelines</b>   | <p>VLAN IDs 1002—1005 are reserved for Token Ring and FDDI VLANs, and cannot be used in IGMP snooping.</p> <p>Expressions are case sensitive. For example, if you enter   <b>exclude output</b>, the lines that contain "output" do not appear, but the lines that contain "Output" appear.</p> |                                                                                       |

## Examples

The following is a sample output from the **show ip igmp snooping vlan 1** command. It shows snooping characteristics for a specific VLAN:

```
# show ip igmp snooping vlan 1

Global IGMP Snooping configuration:
-----
IGMP snooping                : Enabled
IGMPv3 snooping (minimal)    : Enabled
Report suppression           : Enabled
TCN solicit query            : Disabled
TCN flood query count        : 2
Robustness variable          : 2
Last member query count      : 2
Last member query interval   : 1000

Vlan 1:
-----
IGMP snooping                : Enabled
```

**show ip igmp snooping**

```

IGMPv2 immediate leave      : Disabled
Multicast router learning mode : pim-dvmrp
CGMP interoperability mode   : IGMP_ONLY
Robustness variable         : 2
Last member query count      : 2
Last member query interval   : 1000

```

The following is a sample output from the **show ip igmp snooping** command. It displays snooping characteristics for all the VLANs on the :

**# show ip igmp snooping**

Global IGMP Snooping configuration:

```

-----
IGMP snooping                : Enabled
IGMPv3 snooping (minimal)    : Enabled
Report suppression           : Enabled
TCN solicit query            : Disabled
TCN flood query count        : 2
Robustness variable          : 2
Last member query count      : 2
Last member query interval    : 1000

```

Vlan 1:

```

-----
IGMP snooping                : Enabled
IGMPv2 immediate leave       : Disabled
Multicast router learning mode : pim-dvmrp
CGMP interoperability mode    : IGMP_ONLY
Robustness variable          : 2
Last member query count      : 2
Last member query interval    : 1000

```

Vlan 2:

```

-----
IGMP snooping                : Enabled
IGMPv2 immediate leave       : Disabled
Multicast router learning mode : pim-dvmrp
CGMP interoperability mode    : IGMP_ONLY
Robustness variable          : 2
Last member query count      : 2
Last member query interval    : 1000

```

```

-
.
.
.

```

# show ip igmp snooping groups

To display the Internet Group Management Protocol (IGMP) snooping multicast table for the or the multicast information, use the **show ip igmp snooping groups** command in privileged EXEC mode.

**show ip igmp snooping groups** [**vlan** *vlan-id* ] [ **count** ] | *ip\_address*]

|                           |                                                                                                                                                                                |                                                                                                                                                                                        |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>vlan</b> <i>vlan-id</i>                                                                                                                                                     | (Optional) Specifies a VLAN; the range is 1 to 1001 and 1006 to 4094. Use this option to display the multicast table for a specified multicast VLAN or specific multicast information. |
|                           | <b>count</b>                                                                                                                                                                   | (Optional) Displays the total number of entries for the specified command options instead of the actual entries.                                                                       |
|                           | <i>ip_address</i>                                                                                                                                                              | (Optional) Characteristics of the multicast group with the specified group IP address.                                                                                                 |

|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                   | This command was introduced.                                                                                                                                                           |
| <b>Usage Guidelines</b>   | Expressions are case sensitive. For example, if you enter   <b>exclude output</b> , the lines that contain "output" do not appear, but the lines that contain "Output" appear. |                                                                                                                                                                                        |

## Examples

The following is a sample output from the **show ip igmp snooping groups** command without any keywords. It displays the multicast table for the .

```
# show ip igmp snooping groups
```

| Vlan | Group      | Type | Version | Port List        |
|------|------------|------|---------|------------------|
| 1    | 224.1.4.4  | igmp |         | Gi1/0/11         |
| 1    | 224.1.4.5  | igmp |         | Gi1/0/11         |
| 2    | 224.0.1.40 | igmp | v2      | Gi1/0/15         |
| 104  | 224.1.4.2  | igmp | v2      | Gi2/0/1, Gi2/0/2 |
| 104  | 224.1.4.3  | igmp | v2      | Gi2/0/1, Gi2/0/2 |

The following is a sample output from the **show ip igmp snooping groups count** command. It displays the total number of multicast groups on the .

```
# show ip igmp snooping groups count
```

```
Total number of multicast groups: 2
```

The following is a sample output from the **show ip igmp snooping groups vlan vlan-id ip-address** command. It shows the entries for the group with the specified IP address:

```
# show ip igmp snooping groups vlan 104 224.1.4.2
```

| Vlan | Group | Type | Version | Port List |
|------|-------|------|---------|-----------|
|------|-------|------|---------|-----------|

show ip igmp snooping groups

-----  
104            224.1.4.2            igmp            v2            Gi2/0/1, Gi1/0/15

# show ip igmp snooping mrouter

To display the Internet Group Management Protocol (IGMP) snooping dynamically learned and manually configured multicast router ports for the or for the specified multicast VLAN, use the **show ip igmp snooping mrouter** command in privileged EXEC mode.

**show ip igmp snooping mrouter** [**vlan** *vlan-id*]

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                              |

|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                                                 | This command was introduced. |
| <b>Usage Guidelines</b>   | <p>VLAN IDs 1002—1005 are reserved for Token Ring and FDDI VLANs, and cannot be used in IGMP snooping.</p> <p>When multicast VLAN registration (MVR) is enabled, the <b>show ip igmp snooping mrouter</b> command displays MVR multicast router information and IGMP snooping information.</p> <p>Expressions are case sensitive, for example, if you enter   exclude output, the lines that contain "output" do not appear, but the lines that contain "Output" appear.</p> |                              |

## Example

The following is a sample output from the **show ip igmp snooping mrouter** command. It shows how to display multicast router ports on the :

```
# show ip igmp snooping mrouter

Vlan      ports
----      -
1         Gi2/0/1 (dynamic)
```

# show ip igmp snooping querier

To display the configuration and operation information for the IGMP querier that is configured on a , use the **show ip igmp snooping querier** command in user EXEC mode.

**show ip igmp snooping querier** [**vlan** *vlan-id*] [**detail** ]

## Syntax Description

**vlan** *vlan-id* (Optional) Specifies a VLAN; Ranges are from 1—1001 and 1006—4094.

**detail** (Optional) Displays detailed IGMP querier information.

## Command Modes

User EXEC

Privileged EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **show ip igmp snooping querier** command to display the IGMP version and the IP address of a detected device, also called a querier, that sends IGMP query messages. A subnet can have multiple multicast routers but only one IGMP querier. In a subnet running IGMPv2, one of the multicast routers is elected as the querier. The querier can be a Layer 3 .

The **show ip igmp snooping querier** command output also shows the VLAN and the interface on which the querier was detected. If the querier is the , the output shows the Port field as Router. If the querier is a router, the output shows the port number on which the querier was detected in the Port field.

The **show ip igmp snooping querier detail** user EXEC command is similar to the **show ip igmp snooping querier** command. However, the **show ip igmp snooping querier** command displays only the device IP address most recently detected by the querier.

The **show ip igmp snooping querier detail** command displays the device IP address most recently detected by the querier and this additional information:

- The elected IGMP querier in the VLAN
- The configuration and operational information pertaining to the querier (if any) that is configured in the VLAN

Expressions are case sensitive, for example, if you enter | **exclude output**, the lines that contain "output" do not appear, but the lines that contain "Output" appear.

## Examples

The following is a sample output from the **show ip igmp snooping querier** command:

```
> show ip igmp snooping querier
Vlan      IP Address      IGMP Version      Port
-----
1         172.20.50.11    v3                 Gi1/0/1
2         172.20.40.20    v2                 Router
```

The following is a sample output from the **show ip igmp snooping querier detail** command:

```
> show ip igmp snooping querier detail
```

```
Vlan      IP Address      IGMP Version  Port
-----
1         1.1.1.1         v2           Fa8/0/1
Global IGMP querier status
```

```
-----
admin state           : Enabled
admin version         : 2
source IP address     : 0.0.0.0

# show ip pim bsr-router

To display information related to Protocol Independent Multicast (PIM) bootstrap router (BSR) protocol processing, use the **show ip pim bsr-router** command in user EXEC or privileged EXEC mode.

**show ip pim bsr-router**

|                           |                                            |
|---------------------------|--------------------------------------------|

# show ip pim interface df

To display information about the elected designated forwarder (DF) for each rendezvous point (RP) on an interface configured for Bidirectional Protocol Independent Multicast (PIM), use the **show ip pim interface df** command in user EXEC or privileged EXEC mode.

**show ip pim** [**vrf** *vrf-name*] **interface** [*interface-type* | *interface-name*] **df** [*rp-address*]

|                                                                    |                                                                               |
|--------------------------------------------------------------------|-------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i>                                         | (Optional) Specifies the multicast VPN routing and forwarding (VRF) instance. |
| <b>interface</b> [ <i>interface-type</i>   <i>interface-name</i> ] | Specifies the interface type or the interface number.                         |
| <i>rp-address</i>                                                  | (Optional) Specifies the RP IP address.                                       |

## Command History

| Release                        | Modification                 |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.12.1 | This command was introduced. |

## Command Default

If no interface is specified, all interfaces are displayed.

## Command Modes

User EXEC (>)

Privileged EXEC (#)

The following is sample output from the **show ip pim interface df** command:

```
Device# show ip pim interface df
Interface      RP           DF Winner    Metric      Uptime
Ethernet3/3    10.10.0.2    10.4.0.2     0            00:03:49
                10.10.0.3    10.4.0.3     0            00:01:49
                10.10.0.5    10.4.0.4     409600       00:01:49
Ethernet3/4    10.10.0.2    10.5.0.2     0            00:03:49
                10.10.0.3    10.5.0.2     409600       00:02:32
                10.10.0.5    10.5.0.2     435200       00:02:16
Loopback0     10.10.0.2    10.10.0.2     0            00:03:49
                10.10.0.3    10.10.0.2     409600       00:02:32
                10.10.0.5    10.10.0.2     435200       00:02:16
```

The following is sample output from the **show ip pim interface df** command when an interface is specified:

```
Device# show ip pim interface Ethernet3/3 df 10.10.0.3
Designated Forwarder election for Ethernet3/3, 10.4.0.2, RP 10.10.0.3
State                               Non-DF
Offer count is                      0
Current DF ip address               10.4.0.3
DF winner up time                   00:02:33
Last winner metric preference       0
Last winner metric                  0
```

The following table gives the output field descriptions for the **show ip pim interface df** command:

| Field                         | Description                                                                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| RP                            | IP address of the RP.                                                                                                     |
| DF Winner                     | IP address of the elected DF.                                                                                             |
| Metric                        | Unicast routing metric to the RP announced by the DF.                                                                     |
| Uptime                        | Length of time the RP has been up, in days and hours. If less than 1 day, time is shown in hours:minutes:seconds.         |
| State                         | Indicates whether the specified interface is an elected DF.                                                               |
| Offer count is                | Number of PIM DF election offer messages that the router has sent out the interface during the current election interval. |
| Current DF IP address         | IP address of the current DF.                                                                                             |
| DF winner uptime              | Length of time the current DF has been up, in days and hours. If less than 1 day, time is shown in hours:minutes:seconds. |
| Last winner metric preference | The preference value used for selecting the unicast routing metric to the RP announced by the DF.                         |
| Last winner metric            | Unicast routing metric to the RP announced by the DF.                                                                     |

# show ip pim rp

To display active rendezvous points ( RPs) that are cached with associated multicast routing entries, use the **show ip pim rp** command in user EXEC or privileged EXEC mode.

**show ip pim** [*vrf vrf-name*] **rp** [**mapping** [ **elected** | **in-use** ] ] [**metric**] [*rp-address*]

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                           |

| Usage Guidelines   | The Protocol Independent Multicast (PIM) version known for an RP influences the type of PIM register messages (Version 1 or Version 2) that the router sends when acting as the designated router (DR) for an active source. If an RP is statically configured, the PIM version of the RP is not set and the router, if required to send register packets, tries to send PIM Version 2 register packets. If sending PIM Version 2 packets fails, the router sends PIM Version 1 register packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                           |
|                    | The version of the RP displayed in the <b>show ip pim rp</b> command output can change according to the operations of the router. When the group is created, the version shown is for the RP in the RP mapping cache. Later, the version displayed by this command may change. If this router is acting as a DR for an active source, the router sends PIM register messages. The PIM register messages are answered by the RP with PIM register stop messages. The router learns from these PIM register stop messages the actual PIM version of the RP. Once the actual PIM version of the RP is learned, this command displays only this version. If the router is not acting as a DR for active sources on this group, then the version shown for the RP of the group does not change. In this case, the PIM version of the RP is irrelevant to the router because the version of the RP influences only the PIM register messages that this router must send. |                                                                                                                                                                                                                                                                           |

When you enter the **show ip pim rp mapping** command, the version of the RP displayed in the output is determined only by the method through which an RP is learned. If the RP is learned from Auto-RP then the RP displayed is either “v1” or “v2, v1.” If the RP is learned from a static RP definition, the RP version is undetermined and no RP version is displayed in the output. If the RP is learned from the BSR, the RP version displayed is “v2.”

The following is sample output from the **show ip pim rp** command:

```
Device# show ip pim rp
Group:227.7.7.7, RP:10.10.0.2, v2, v1, next RP-reachable in 00:00:48
```

The following is sample output from the **show ip pim rp** command when the **mapping** keyword is specified:

```
Device# show ip pim rp mapping
PIM Group-to-RP Mappings
This system is an RP (Auto-RP)
This system is an RP-mapping agent
Group(s) 227.0.0.0/8

|                    | Cisco IOS XE Everest 16.5.1a          | This command was introduced.                                                                                        |

**Usage Guidelines** Use the **show ip pim tunnel** to display information about PIM tunnel interfaces.

PIM tunnel interfaces are used by the IPv4 Multicast Forwarding Information Base (MFIB) for the PIM sparse mode (PIM-SM) registration process. Two types of PIM tunnel interfaces are used by the the IPv4 MFIB:

- A PIM encapsulation tunnel (PIM Encap Tunnel)
- A PIM decapsulation tunnel (PIM Decap Tunnel)

The PIM Encap Tunnel is dynamically created whenever a group-to-rendezvous point (RP) mapping is learned (through auto-RP, bootstrap router (BSR), or static RP configuration). The PIM Encap Tunnel is used to encapsulate multicast packets sent by first-hop designated routers (DRs) that have directly connected sources.

Similar to the PIM Encap Tunnel, the PIM Decap Tunnel interface is dynamically created—but it is created only on the RP whenever a group-to-RP mapping is learned. The PIM Decap Tunnel interface is used by the RP to decapsulate PIM register messages.

**Note** PIM tunnels will not appear in the running configuration.

The following syslog message appears when a PIM tunnel interface is created:

```
* %LINEPROTO-5-UPDOWN: Line protocol on Interface Tunnel<interface_number>,
changed state to up
```

The following is sample output from the **show ip pim tunnel** taken from an RP. The output is used to verify the PIM Encap and Decap Tunnel on the RP:

```
# show ip pim tunnel

Tunnel0
  Type   : PIM Encap
  RP     : 70.70.70.1*
  Source : 70.70.70.1
Tunnel1*
  Type   : PIM Decap
  RP     : 70.70.70.1*
  Source : -R2#
```

---

**Note** The asterisk (\*) indicates that the router is the RP. The RP will always have a PIM Encap and Decap Tunnel interface.

---

# show platform software fed switch ip multicast groups

To display platform-dependent IP multicast groups information, use the **show platform software fed switch ip multicast groups** command in privileged EXEC mode.

**show platform software fed switch** { *switch-number* | **active** | **standby** } **ip multicast groups** [**vrf-id** *vrf-id* | **vrf-name** *vrf-name* ] [*group-address* [**source** *source-address*] [**detail**] | **count** | **summary** ]

| Syntax Description                                                   |                                                                               |                                                                                                                                                                                                                                                                                                     |

## Example

The following example shows how to display platform IP multicast routes per group:

```
# show platform software fed active ip multicast groups
```

```
Total Number of entries:3
MROUTE ENTRY vrf 0 (*, 224.0.0.0)
Token: 0x0000001f6 flags: C
No RPF interface.
Number of OIF: 0
Flags: 0x10 Pkts : 0
OIF Details:No OIF interface.
```

```

 show platform software fed switch ip multicast

<output truncated>

# show platform software fed switch ip multicast df

To display information about platform-dependent IP multicast designated forwarders (DF), use the **show platform software fed switch ip multicast df** command in privileged EXEC mode.

**show platform software fed switch** {*switch-number* | **active** | **standby**} **ip multicast df** [{*vrf-id vrf-id* | *vrf-name vrf-name*}][*{df-index}*]

# avb

To enable AVB, use **avb** command in global configuration or interface configuration mode. To disable AVB on the switch, use the **no** form of the command.

**avb**  
**no avb**

|               |                                     |
|---------------|-------------------------------------|
| Command Modes | Global configuration (config)       |
|               | Interface configuration (config-if) |

| Command History | Release                   | Modification                 |
|-----------------|---------------------------|------------------------------|
|                 | Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

|                  |                                                                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | Use the <b>avb</b> command in global configuration mode to enable AVB on the device.                                                                       |
|                  | Use the <b>avb</b> command in interface configuration mode to configure the interfaces, along the connectivity path, for AVB devices as dot1q trunk ports. |

## Example

This example shows how to enable AVB in global configuration mode:

```
Device> enable
Device# configure terminal
Device(config)# avb
```

This example shows how to enable AVB in interfaceconfiguration mode:

```
Device> enable
Device# configure terminal
Device(config)# interface tel1/1/1
Device(config-if)# switchport mode trunk
Device(config-if)# exit
Device(config)# vlan 2
Device(config)# avb vlan 10
Device(config-vlan)# avb
```

# avb vlan

To set a specified VLAN as the default AVB VLAN, use the **avb vlan** command in global configuration mode.

**avb vlan** *vlan-id*

|                           |                                                             |                              |
|---------------------------|-------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <i>vlan-id</i> The range for vlan-id varies from 2 to 4094. |                              |
| <b>Command Default</b>    | VLAN 2 is the default AVB VLAN.                             |                              |
| <b>Command Modes</b>      | Global configuration (config)                               |                              |
| <b>Command History</b>    | <b>Release</b>                                              | <b>Modification</b>          |
|                           | Cisco IOS XE Fuji 16.8.1a                                   | This command was introduced. |
| <b>Usage Guidelines</b>   | Use this command when you need to set the default AVB V     |                              |

## Example

This example shows how set a specified VLAN as the default AVB VLAN:

```
Device> enable
Device# configure terminal
Device(config)# interface tel1/1/1
Device(config-if)# switchport mode trunk
Device(config-if)# exit
Device(config)# vlan 2
Device(config)# avb vlan 10
```

# channel-group

To assign an Ethernet port to an EtherChannel group, or to enable an EtherChannel mode, or both, use the **channel-group** command in interface configuration mode. To remove an Ethernet port from an EtherChannel group, use the **no** form of this command.

**channel-group** *channel-group-number* **mode** {**active** | **auto** [**non-silent**] | **desirable** [**non-silent**] | **on** | **passive**}  
**no channel-group**

## Syntax Description

|                             |                                                                                                                                                                                                                                 |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>channel-group-number</i> | Channel group number.<br>The range is 1 to 128.                                                                                                                                                                                 |
| <b>mode</b>                 | Specifies the EtherChannel mode.                                                                                                                                                                                                |
| <b>active</b>               | Unconditionally enables Link Aggregation Control Protocol (LACP).                                                                                                                                                               |
| <b>auto</b>                 | Enables the Port Aggregation Protocol (PAgP) only if a PAgP device is detected.                                                                                                                                                 |
| <b>non-silent</b>           | (Optional) Configures the interface for nonsilent operation when connected to a partner that is PAgP-capable. Use in PAgP mode with the <b>auto</b> or <b>desirable</b> keyword when traffic is expected from the other device. |
| <b>desirable</b>            | Unconditionally enables PAgP.                                                                                                                                                                                                   |
| <b>on</b>                   | Enables the on mode.                                                                                                                                                                                                            |
| <b>passive</b>              | Enables LACP only if a LACP device is detected.                                                                                                                                                                                 |

## Command Default

No channel groups are assigned.  
 No mode is configured.

## Command Modes

Interface configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

For Layer 2 EtherChannels, the **channel-group** command automatically creates the port-channel interface when the channel group gets its first physical port. You do not have to use the **interface port-channel** command

in global configuration mode to manually create a port-channel interface. If you create the port-channel interface first, the *channel-group-number* can be the same as the *port-channel-number*, or you can use a new number. If you use a new number, the **channel-group** command dynamically creates a new port channel.

Although it is not necessary to disable the IP address that is assigned to a physical port that is part of a channel group, we strongly recommend that you do so.

You create Layer 3 port channels by using the **interface port-channel** command followed by the **no switchport** interface configuration command. Manually configure the port-channel logical interface before putting the interface into the channel group.

After you configure an EtherChannel, configuration changes that you make on the port-channel interface apply to all the physical ports assigned to the port-channel interface. Configuration changes applied to the physical port affect only the port where you apply the configuration. To change the parameters of all ports in an EtherChannel, apply configuration commands to the port-channel interface, for example, spanning-tree commands or commands to configure a Layer 2 EtherChannel as a trunk.

Active mode places a port into a negotiating state in which the port initiates negotiations with other ports by sending LACP packets. A channel is formed with another port group in either the active or passive mode.

Auto mode places a port into a passive negotiating state in which the port responds to PAgP packets it receives but does not start PAgP packet negotiation. A channel is formed only with another port group in desirable mode. When auto is enabled, silent operation is the default.

Desirable mode places a port into an active negotiating state in which the port starts negotiations with other ports by sending PAgP packets. An EtherChannel is formed with another port group that is in the desirable or auto mode. When desirable is enabled, silent operation is the default.

If you do not specify non-silent with the auto or desirable mode, silent is assumed. The silent mode is used when the switch is connected to a device that is not PAgP-capable and rarely, if ever, sends packets. An example of a silent partner is a file server or a packet analyzer that is not generating traffic. In this case, running PAgP on a physical port prevents that port from ever becoming operational. However, it allows PAgP to operate, to attach the port to a channel group, and to use the port for transmission. Both ends of the link cannot be set to silent.

In on mode, a usable EtherChannel exists only when both connected port groups are in the on mode.

**Caution**

Use care when using the on mode. This is a manual configuration, and ports on both ends of the EtherChannel must have the same configuration. If the group is misconfigured, packet loss or spanning-tree loops can occur.

Passive mode places a port into a negotiating state in which the port responds to received LACP packets but does not initiate LACP packet negotiation. A channel is formed only with another port group in active mode.

Do not configure an EtherChannel in both the PAgP and LACP modes. EtherChannel groups running PAgP and LACP can coexist on the same switch or on different switches in the stack (but not in a cross-stack configuration). Individual EtherChannel groups can run either PAgP or LACP, but they cannot interoperate.

If you set the protocol by using the **channel-protocol** interface configuration command, the setting is not overridden by the **channel-group** interface configuration command.

Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an IEEE 802.1x port. If you try to enable IEEE 802.1x authentication on an EtherChannel port, an error message appears, and IEEE 802.1x authentication is not enabled.

Do not configure a secure port as part of an EtherChannel or configure an EtherChannel port as a secure port.

For a complete list of configuration guidelines, see the “Configuring EtherChannels” chapter in the software configuration guide for this release.

**Caution**

Do not enable Layer 3 addresses on the physical EtherChannel ports. Do not assign bridge groups on the physical EtherChannel ports because it creates loops.

This example shows how to configure an EtherChannel on a single switch in the stack. It assigns two static-access ports in VLAN 10 to channel 5 with the PAGP mode desirable:

```
Device# configure terminal
Device(config)# interface range GigabitEthernet 2/0/1 - 2
Device(config-if-range)# switchport mode access
Device(config-if-range)# switchport access vlan 10
Device(config-if-range)# channel-group 5 mode desirable
Device(config-if-range)# end
```

This example shows how to configure an EtherChannel on a single switch in the stack. It assigns two static-access ports in VLAN 10 to channel 5 with the LACP mode active:

```
Device# configure terminal
Device(config)# interface range GigabitEthernet 2/0/1 - 2
Device(config-if-range)# switchport mode access
Device(config-if-range)# switchport access vlan 10
Device(config-if-range)# channel-group 5 mode active
Device(config-if-range)# end
```

This example shows how to configure a cross-stack EtherChannel in a switch stack. It uses LACP passive mode and assigns two ports on stack member 2 and one port on stack member 3 as static-access ports in VLAN 10 to channel 5:

```
Device# configure terminal
Device(config)# interface range GigabitEthernet 2/0/4 - 5
Device(config-if-range)# switchport mode access
Device(config-if-range)# switchport access vlan 10
Device(config-if-range)# channel-group 5 mode passive
Device(config-if-range)# exit
Device(config)# interface GigabitEthernet 3/0/3
Device(config-if)# switchport mode access
Device(config-if)# switchport access vlan 10
Device(config-if)# channel-group 5 mode passive
Device(config-if)# exit
```

You can verify your settings by entering the **show running-config** privileged EXEC command.

# channel-protocol

To restrict the protocol used on a port to manage channeling, use the **channel-protocol** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

**channel-protocol** {lacp | pagp}  
**no channel-protocol**

## Syntax Description

**lacp** Configures an EtherChannel with the Link Aggregation Control Protocol (LACP).

**pagp** Configures an EtherChannel with the Port Aggregation Protocol (PAgP).

## Command Default

No protocol is assigned to the EtherChannel.

## Command Modes

Interface configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **channel-protocol** command only to restrict a channel to LACP or PAgP. If you set the protocol by using the **channel-protocol** command, the setting is not overridden by the **channel-group** command in interface configuration mode.

You must use the **channel-group** command in interface configuration mode to configure the EtherChannel parameters. The **channel-group** command also can set the mode for the EtherChannel.

You cannot enable both the PAgP and LACP modes on an EtherChannel group.

PAgP and LACP are not compatible; both ends of a channel must use the same protocol.

You cannot configure PAgP on cross-stack configurations.

This example shows how to specify LACP as the protocol that manages the EtherChannel:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# channel-protocol lacp
```

You can verify your settings by entering the **show etherchannel** [channel-group-number] **protocol** command in privileged EXEC mode.

# clear l2protocol-tunnel counters

To clear the protocol counters in protocol tunnel ports, use the **clear l2protocol-tunnel counters** command in privileged EXEC mode.

**clear l2protocol-tunnel counters** [*interface-id*]

|                           |                                                                                                 |                                                                                                              |

| <b>Syntax Description</b> | <i>interface-id</i>                                                                             | (Optional) The interface (physical interface or port channel) for which protocol counters are to be cleared. |
| <b>Command Default</b>    | None                                                                                            |                                                                                                              |
| <b>Command Modes</b>      | Privileged EXEC                                                                                 |                                                                                                              |
| <b>Command History</b>    | <b>Release</b>                                                                                  | <b>Modification</b>                                                                                          |
|                           | Cisco IOS XE Gibraltar 16.12.1                                                                  | This command was introduced.                                                                                 |
| <b>Usage Guidelines</b>   | Use this command to clear protocol tunnel counters on the switch or on the specified interface. |                                                                                                              |

This example shows how to clear Layer 2 protocol tunnel counters on an interface:

```
Device# clear l2protocol-tunnel counters gigabitethernet1/0/3
```

# clear lacp

To clear Link Aggregation Control Protocol (LACP) channel-group counters, use the **clear lacp** command in privileged EXEC mode.

**clear lacp** [*channel-group-number*] **counters**

|                           |                             |                                                            |

| <b>Syntax Description</b> | <i>channel-group-number</i> | (Optional) Channel group number.<br>The range is 1 to 128. |
|                           | <b>counters</b>             | Clears traffic counters.                                   |

**Command Modes** Privileged EXEC

| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|------------------------|------------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** You can clear all counters by using the **clear lacp counters** command, or you can clear only the counters for the specified channel group by using the **clear lacp channel-group-number counters** command.

This example shows how to clear all channel-group information:

```
Device> enable
Device# clear lacp counters
```

This example shows how to clear LACP traffic counters for group 4:

```
Device> enable
Device# clear lacp 4 counters
```

You can verify that the information was deleted by entering the **show lacp counters** or the **show lacp channel-group-number counters** command in privileged EXEC mode.

# clear pagp

To clear the Port Aggregation Protocol (PAgP) channel-group information, use the **clear pagp** command in privileged EXEC mode.

**clear pagp** [*channel-group-number*] **counters**

## Syntax Description

*channel-group-number* (Optional) Channel group number.  
The range is 1 to 128.

**counters** Clears traffic counters.

## Command Modes

Privileged EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

You can clear all counters by using the **clear pagp counters** command, or you can clear only the counters for the specified channel group by using the **clear pagp channel-group-number counters** command.

This example shows how to clear all channel-group information:

```
Device> enable
Device# clear pagp counters
```

This example shows how to clear PAgP traffic counters for group 10:

```
Device> enable
Device# clear pagp 10 counters
```

You can verify that the information was deleted by entering the **show pagp** command in privileged EXEC mode.

# clear spanning-tree counters

To clear the spanning-tree counters, use the **clear spanning-tree counters** command in privileged EXEC mode.

**clear spanning-tree counters** [**interface** *interface-id*]

|                           |                                                                                                                                                                                                                                                                      |                              |

| <b>Command Modes</b>      | Privileged EXEC                                                                                                                                                                                                                                                      |                              |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                                                                       | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                         | This command was introduced. |
| <b>Usage Guidelines</b>   | <p>If the <i>interface-id</i> value is not specified, spanning-tree counters are cleared for all interfaces.</p> <p>This example shows how to clear spanning-tree counters for all interfaces:</p> <pre>Device&gt; enable Device# clear spanning-tree counters</pre> |                              |

# clear spanning-tree detected-protocols

To restart the protocol migration process and force renegotiation with neighboring devices on the interface, use the **clear spanning-tree detected-protocols** command in privileged EXEC mode.

**clear spanning-tree detected-protocols** [**interface** *interface-id*]

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                              |

| <b>Command Modes</b>      | Privileged EXEC                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                              |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | This command was introduced. |
| <b>Usage Guidelines</b>   | <p>A device running the rapid per-VLAN spanning-tree plus (rapid-PVST+) protocol or the Multiple Spanning Tree Protocol (MSTP) supports a built-in protocol migration method that enables it to interoperate with legacy IEEE 802.1D devices. If a rapid-PVST+ or an MSTP device receives a legacy IEEE 802.1D configuration bridge protocol data unit (BPDU) with the protocol version set to 0, the device sends only IEEE 802.1D BPDUs on that port. A multiple spanning-tree (MST) device can also detect that a port is at the boundary of a region when it receives a legacy BPDU, an MST BPDU (Version 3) associated with a different region, or a rapid spanning-tree (RST) BPDU (Version 2).</p> <p>The device does not automatically revert to the rapid-PVST+ or the MSTP mode if it no longer receives IEEE 802.1D BPDUs because it cannot learn whether the legacy switch has been removed from the link unless the legacy switch is the designated switch. Use the <b>clear spanning-tree detected-protocols</b> command in this situation.</p> <p>This example shows how to restart the protocol migration process on a port:</p> <pre>Device&gt; enable Device# clear spanning-tree detected-protocols interface gigabitethernet2/0/1</pre> |                              |

# debug etherchannel

To enable debugging of EtherChannels, use the **debug etherchannel** command in privileged EXEC mode. To disable debugging, use the **no** form of the command.

```
debug etherchannel [{all | detail | error | event | idb}]
no debug etherchannel [{all | detail | error | event | idb}]
```

|                    |               |                                                                     |
|--------------------|---------------|---------------------------------------------------------------------|
| Syntax Description | <b>all</b>    | (Optional) Displays all EtherChannel debug messages.                |
|                    | <b>detail</b> | (Optional) Displays detailed EtherChannel debug messages.           |
|                    | <b>error</b>  | (Optional) Displays EtherChannel error debug messages.              |
|                    | <b>event</b>  | (Optional) Displays EtherChannel event messages.                    |
|                    | <b>idb</b>    | (Optional) Displays PAgP interface descriptor block debug messages. |

**Command Default** Debugging is disabled.

**Command Modes** Privileged EXEC

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **undebug etherchannel** command is the same as the **no debug etherchannel** command.

**Note** Although the **linecard** keyword is displayed in the command-line help, it is not supported.

This example shows how to display all EtherChannel debug messages:

```
Device> enable
Device# debug etherchannel all
```

This example shows how to display debug messages related to EtherChannel events:

```
Device> enable
Device# debug etherchannel event
```

# debug lacp

To enable debugging of Link Aggregation Control Protocol (LACP) activity, use the **debug lacp** command in privileged EXEC mode. To disable LACP debugging, use the **no** form of this command.

```
debug lacp [{all | event | fsm | misc | packet}]
no debug lacp [{all | event | fsm | misc | packet}]
```

## Syntax Description

|               |                                                                                  |
|---------------|----------------------------------------------------------------------------------|
| <b>all</b>    | (Optional) Displays all LACP debug messages.                                     |
| <b>event</b>  | (Optional) Displays LACP event debug messages.                                   |
| <b>fsm</b>    | (Optional) Displays messages about changes within the LACP finite state machine. |
| <b>misc</b>   | (Optional) Displays miscellaneous LACP debug messages.                           |
| <b>packet</b> | (Optional) Displays the receiving and transmitting LACP control packets.         |

## Command Default

Debugging is disabled.

## Command Modes

Privileged EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **undebg etherchannel** command is the same as the **no debug etherchannel** command.

This example shows how to display all LACP debug messages:

```
Device> enable
Device# debug LACP all
```

This example shows how to display debug messages related to LACP events:

```
Device> enable
Device# debug LACP event
```

# debug pagp

To enable debugging of Port Aggregation Protocol (PAgP) activity, use the **debug pagp** command in privileged EXEC mode. To disable PAgP debugging, use the **no** form of this command.

**debug pagp** [{all | dual-active | event | fsm | misc | packet}]  
**no debug pagp** [{all | dual-active | event | fsm | misc | packet}]

|                    |                    |                                                                                  |
|--------------------|--------------------|----------------------------------------------------------------------------------|
| Syntax Description | <b>all</b>         | (Optional) Displays all PAgP debug messages.                                     |
|                    | <b>dual-active</b> | (Optional) Displays dual-active detection messages.                              |
|                    | <b>event</b>       | (Optional) Displays PAgP event debug messages.                                   |
|                    | <b>fsm</b>         | (Optional) Displays messages about changes within the PAgP finite state machine. |
|                    | <b>misc</b>        | (Optional) Displays miscellaneous PAgP debug messages.                           |
|                    | <b>packet</b>      | (Optional) Displays the receiving and transmitting PAgP control packets.         |

|                 |                        |
|-----------------|------------------------|
| Command Default | Debugging is disabled. |
|-----------------|------------------------|

|               |                 |
|---------------|-----------------|
| Command Modes | Privileged EXEC |
|---------------|-----------------|

|                 |                              |                              |
|-----------------|------------------------------|------------------------------|
| Command History | <b>Release</b>               | <b>Modification</b>          |
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                  |                                                                                  |
|------------------|----------------------------------------------------------------------------------|
| Usage Guidelines | The <b>undebug pagp</b> command is the same as the <b>no debug pagp</b> command. |
|------------------|----------------------------------------------------------------------------------|

This example shows how to display all PAgP debug messages:

```
Device> enable
Device# debug pagp all
```

This example shows how to display debug messages related to PAgP events:

```
Device> enable
Device# debug pagp event
```

# debug platform pm

To enable debugging of the platform-dependent port manager software module, use the **debug platform pm** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

```
debug platform pm {all | counters | errdisable | fec | if-numbers | l2-control | link-status |
platform | pm-vectors [detail] | ses | vlans}
no debug platform pm {all | counters | errdisable | fec | if-numbers | l2-control | link-status |
platform | pm-vectors [detail] | ses | vlans}
```

| Syntax Description |                    |                                                                                     |
|--------------------|--------------------|-------------------------------------------------------------------------------------|
|                    | <b>all</b>         | Displays all port manager debug messages.                                           |
|                    | <b>counters</b>    | Displays counters for remote procedure call (RPC) debug messages.                   |
|                    | <b>errdisable</b>  | Displays error-disabled-related events debug messages.                              |
|                    | <b>fec</b>         | Displays forwarding equivalence class (FEC) platform-related events debug messages. |
|                    | <b>if-numbers</b>  | Displays interface-number translation event debug messages.                         |
|                    | <b>l2-control</b>  | Displays Layer 2 control infra debug messages.                                      |
|                    | <b>link-status</b> | Displays interface link-detection event debug messages.                             |
|                    | <b>platform</b>    | Displays port manager function event debug messages.                                |
|                    | <b>pm-vectors</b>  | Displays port manager vector-related event debug messages.                          |
|                    | <b>detail</b>      | (Optional) Displays vector-function details.                                        |
|                    | <b>ses</b>         | Displays service expansion shelf (SES) related event debug messages.                |
|                    | <b>vlans</b>       | Displays VLAN creation and deletion event debug messages.                           |

**Command Default** Debugging is disabled.

**Command Modes** Privileged EXEC

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **undebug platform pm** command is the same as the **no debug platform pm** command.

This example shows how to display debug messages related to the creation and deletion of VLANs:

```
Device> enable
Device# debug platform pm vlans
```

# debug platform udd

To enable debugging of the platform-dependent UniDirectional Link Detection (UDLD) software, use the **debug platform udd** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

```
debug platform udd [{error | event}] [switch switch-number]
no debug platform udd [{error | event}] [switch switch-number]
```

| Usage Guidelines   | The <b>undebg platform udd</b> command is the same as the <b>no debug platform udd</b> command.                                                                                                                                                                                                                                            |                                                                         |
|                    | When you enable debugging on a switch stack, it is enabled only on the active switch. To enable debugging on a stack member, you can start a session from the active switch by using the <b>session switch-number</b> command in privileged EXEC mode. Then enter the <b>debug</b> command at the command-line prompt of the stack member. |                                                                         |

# debug spanning-tree

To enable debugging of spanning-tree activities, use the **debug spanning-tree** command in EXEC mode. To disable debugging, use the **no** form of this command.

**debug spanning-tree** {all | backbonefast | bpdu | bpdu-opt | config | etherchannel | events | exceptions | general | ha | mstp | pvst+ | root | snmp | synchronization | switch | uplinkfast}  
**no debug spanning-tree** {all | backbonefast | bpdu | bpdu-opt | config | etherchannel | events | exceptions | general | mstp | pvst+ | root | snmp | synchronization | switch | uplinkfast}

## Syntax Description

|                        |                                                                                                                                                                                                                       |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b>             | Displays all spanning-tree debug messages.                                                                                                                                                                            |
| <b>backbonefast</b>    | Displays BackboneFast-event debug messages.                                                                                                                                                                           |
| <b>bpdu</b>            | Displays spanning-tree bridge protocol data unit (BPDU) debug messages.                                                                                                                                               |
| <b>bpdu-opt</b>        | Displays optimized BPDU handling debug messages.                                                                                                                                                                      |
| <b>config</b>          | Displays spanning-tree configuration change debug messages.                                                                                                                                                           |
| <b>etherchannel</b>    | Displays EtherChannel-support debug messages.                                                                                                                                                                         |
| <b>events</b>          | Displays spanning-tree topology event debug messages.                                                                                                                                                                 |
| <b>exceptions</b>      | Displays spanning-tree exception debug messages.                                                                                                                                                                      |
| <b>general</b>         | Displays general spanning-tree activity debug messages.                                                                                                                                                               |
| <b>ha</b>              | Displays high-availability spanning-tree debug messages.                                                                                                                                                              |
| <b>mstp</b>            | Debugs Multiple Spanning Tree Protocol (MSTP) events.                                                                                                                                                                 |
| <b>pvst+</b>           | Displays per-VLAN spanning-tree plus (PVST+) event debug messages.                                                                                                                                                    |
| <b>root</b>            | Displays spanning-tree root-event debug messages.                                                                                                                                                                     |
| <b>snmp</b>            | Displays spanning-tree Simple Network Management Protocol (SNMP) handling debug messages.                                                                                                                             |
| <b>switch</b>          | Displays switch shim command debug messages. This shim is the software module that is the interface between the generic Spanning Tree Protocol (STP) code and the platform-specific code of various device platforms. |
| <b>synchronization</b> | Displays the spanning-tree synchronization event debug messages.                                                                                                                                                      |
| <b>uplinkfast</b>      | Displays UplinkFast-event debug messages.                                                                                                                                                                             |

---

**Usage Guidelines**

The **undebbug spanning-tree** command is the same as the **no debug spanning-tree** command.

When you enable debugging on a stack, it is enabled only on the active switch. To enable debugging on the standby switch, start a session from the active switch by using the **session switch-number** command in privileged EXEC mode. Enter the **debug** command at the command-line prompt of the standby switch.

To enable debugging on the standby switch without first starting a session on the active switch, use the **remote command switch-number LINE** command in privileged EXEC mode.

This example shows how to display all spanning-tree debug messages:

```
Device> enable
Device# debug spanning-tree all
```

# interface port-channel

To access or create a port channel, use the **interface port-channel** command in global configuration mode. Use the **no** form of this command to remove the port channel.

**interface port-channel** *port-channel-number*  
**no interface port-channel**

## Syntax Description

*port-channel-number* Channel group number.  
 The range is 1 to 128.

## Command Default

No port channel logical interfaces are defined.

## Command Modes

Global configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

For Layer 2 EtherChannels, you do not have to create a port-channel interface before assigning physical ports to a channel group. Instead, you can use the **channel-group** command in interface configuration mode, which automatically creates the port-channel interface when the channel group obtains its first physical port. If you create the port-channel interface first, the *channel-group-number* can be the same as the *port-channel-number*, or you can use a new number. If you use a new number, the **channel-group** command dynamically creates a new port channel.

You create Layer 3 port channels by using the **interface port-channel** command followed by the **no switchport** command in interface configuration mode. You should manually configure the port-channel logical interface before putting the interface into the channel group.

Only one port channel in a channel group is allowed.

### Caution

When using a port-channel interface as a routed port, do not assign Layer 3 addresses on the physical ports that are assigned to the channel group.

### Caution

Do not assign bridge groups on the physical ports in a channel group used as a Layer 3 port channel interface because it creates loops. You must also disable spanning tree.

Follow these guidelines when you use the **interface port-channel** command:

- If you want to use the Cisco Discovery Protocol (CDP), you must configure it on the physical port and not on the port channel interface.
- Do not configure a port that is an active member of an EtherChannel as an IEEE 802.1x port. If IEEE 802.1x is enabled on a not-yet active port of an EtherChannel, the port does not join the EtherChannel.

For a complete list of configuration guidelines, see the “Configuring EtherChannels” chapter in the software configuration guide for this release.

This example shows how to create a port channel interface with a port channel number of 5:

```
Device> enable
Device# configure terminal
Device(config)# interface port-channel 5
```

You can verify your setting by entering either the **show running-config** in privileged EXEC mode or the **show etherchannel** *channel-group-number* **detail** command in privileged EXEC mode.

# l2protocol-tunnel

To enable tunneling of Layer 2 protocols on an access port, IEEE 802.1Q tunnel port, or a port channel, use the **l2protocol-tunnel** command in interface configuration mode on the switch stack or on a standalone switch. Use the **no** form of this command to disable tunneling on the interface.

```
l2protocol-tunnel [{drop-threshold | shutdown-threshold}] [value] [{cdp | stp | vtp}] [lldp]
[{point-to-point} [{pagp | lacp | udld}]]]
no l2protocol-tunnel [{drop-threshold | shutdown-threshold}] [value] [{cdp | stp | vtp}] [lldp]
[{point-to-point} [{pagp | lacp | udld}]]]
```

## Syntax Description

|                           |                                                                                                                                                                                                               |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>drop-threshold</b>     | (Optional) Sets a drop threshold for the maximum rate of Layer 2 protocol packets per second to be received before an interface drops packets.                                                                |
| <b>shutdown-threshold</b> | (Optional) Sets a shutdown threshold for the maximum rate of Layer 2 protocol packets per second to be received before an interface is shut down.                                                             |
| <i>value</i>              | A threshold in packets per second to be received for encapsulation before the interface shuts down, or the threshold before the interface drops packets. The range is 1 to 4096. The default is no threshold. |
| <b>cdp</b>                | (Optional) Enables tunneling of CDP, specifies a shutdown threshold for CDP, or specifies a drop threshold for CDP.                                                                                           |
| <b>stp</b>                | (Optional) Enables tunneling of STP, specifies a shutdown threshold for STP, or specifies a drop threshold for STP.                                                                                           |
| <b>vtp</b>                | (Optional) Enables tunneling or VTP, specifies a shutdown threshold for VTP, or specifies a drop threshold for VTP.                                                                                           |
| <b>lldp</b>               | (Optional) Enables tunneling of LLDP packets.                                                                                                                                                                 |
| <b>point-to-point</b>     | (Optional) Enables point-to-point tunneling of PAgP, LACP, and UDLD packets.                                                                                                                                  |
| <b>pagp</b>               | (Optional) Enables point-to-point tunneling of PAgP, specifies a shutdown threshold for PAgP, or specifies a drop threshold for PAgP.                                                                         |
| <b>lacp</b>               | (Optional) Enables point-to-point tunneling of LACP, specifies a shutdown threshold for LACP, or specifies a drop threshold for LACP.                                                                         |
| <b>udld</b>               | (Optional) Enables point-to-point tunneling of UDLD, specifies a shutdown threshold for UDLD, or specifies a drop threshold for UDLD.                                                                         |

## Command Default

The default is that no Layer 2 protocol packets are tunneled.

The default is no shutdown threshold for the number of Layer 2 protocol packets.

The default is no drop threshold for the number of Layer 2 protocol packets.

## Command Modes

Interface configuration

**Command History****Release****Modification**

Cisco IOS XE Gibraltar 16.12.1 This command was introduced.

**Usage Guidelines**

You can enable tunneling for Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunking Protocol (VTP) packets. You can also enable point-to-point tunneling for Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), or UniDirectional Link Detection (UDLD) packets.

You must enter this command, with or without protocol types, to tunnel Layer 2 packets.

If you enter this command for a port channel, all ports in the channel must have the same configuration.

Layer 2 protocol tunneling across a service-provider network ensures that Layer 2 information is propagated across the network to all customer locations. When protocol tunneling is enabled, protocol packets are encapsulated with a well-known Cisco multicast address for transmission across the network. When the packets reach their destination, the well-known MAC address is replaced by the Layer 2 protocol MAC address.

You can enable Layer 2 protocol tunneling for CDP, STP, and VTP individually or for all three protocols.

In a service-provider network, you can use Layer 2 protocol tunneling to enhance the creation of EtherChannels by emulating a point-to-point network topology. When protocol tunneling is enabled on the service-provider switch for PAgP or LACP, remote customer switches receive the protocol data units (PDUs) and can negotiate automatic creation of EtherChannels.

To enable tunneling of PAgP, LACP, and UDLD packets, you must have a point-to-point network topology. To decrease the link-down detection time, you should also enable UDLD on the interface when you enable tunneling of PAgP or LACP packets.

You can enable point-to-point protocol tunneling for PAgP, LACP, and UDLD individually or for all three protocols.

**Caution**

PAgP, LACP, and UDLD tunneling is only intended to emulate a point-to-point topology. An erroneous configuration that sends tunneled packets to many ports could lead to a network failure.

Enter the **shutdown-threshold** keyword to control the number of protocol packets per second that are received on an interface before it shuts down. When no protocol option is specified with the keyword, the threshold is applied to each of the tunneled Layer 2 protocol types. If you also set a drop threshold on the interface, the shutdown-threshold value must be greater than or equal to the drop-threshold value.

When the shutdown threshold is reached, the interface is error-disabled. If you enable error recovery by entering the **errdisable recovery cause l2ptguard** global configuration command, the interface is brought out of the error-disabled state and allowed to retry the operation again when all the causes have timed out. If the error recovery function is not enabled for **l2ptguard**, the interface stays in the error-disabled state until you enter the **shutdown** and **no shutdown** interface configuration commands.

Enter the **drop-threshold** keyword to control the number of protocol packets per second that are received on an interface before it drops packets. When no protocol option is specified with a keyword, the threshold is applied to each of the tunneled Layer 2 protocol types. If you also set a shutdown threshold on the interface, the drop-threshold value must be less than or equal to the shutdown-threshold value.

When the drop threshold is reached, the interface drops Layer 2 protocol packets until the rate at which they are received is below the drop threshold.

The configuration is saved in NVRAM.

For more information about Layer 2 protocol tunneling, see the software configuration guide for this release.

## Examples

This example shows how to enable protocol tunneling for CDP packets and to configure the shutdown threshold as 50 packets per second:

```
Device(config-if)# l2protocol-tunnel cdp
Device(config-if)# l2protocol-tunnel shutdown-threshold cdp 50
```

This example shows how to enable protocol tunneling for STP packets and to configure the drop threshold as 400 packets per second:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet1/0/11
Device(config-if)# l2protocol-tunnel stp
Device(config-if)# l2protocol-tunnel drop-threshold stp 400
```

This example shows how to enable point-to-point protocol tunneling for PAgP and UDLD packets and to configure the PAgP drop threshold as 1000 packets per second:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# switchport access vlan 19
Device(config-if)# switchport mode dot1q-tunnel
Device(config-if)# l2protocol-tunnel point-to-point pagp
Device(config-if)# l2protocol-tunnel point-to-point udld
Device(config-if)# l2protocol-tunnel drop-threshold point-to-point pagp 1000
```

# l2protocol-tunnel cos

To configure class of service (CoS) value for all tunneled Layer 2 protocol packets, use the **l2protocol-tunnel cos** global configuration command. To return to the default setting, use the **no** form of this command.

**l2protocol-tunnel cos** *value*  
**no l2protocol-tunnel cos**

## Syntax Description

*value* CoS priority value for tunneled Layer 2 protocol packets. If a CoS value is configured for data packets for the interface, the default is to use this CoS value. If no CoS value is configured for the interface, the default is 5. The range is 0 to 7, with 7 being the highest priority.

## Command Default

The default is to use the CoS value configured for data on the interface. If no CoS value is configured, the default is 5 for all tunneled Layer 2 protocol packets.

## Command Modes

Global configuration

## Command History

| Release                        | Modification                 |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.12.1 | This command was introduced. |

## Usage Guidelines

When enabled, the tunneled Layer 2 protocol packets use this CoS value.  
The value is saved in NVRAM.

## Examples

This example shows how to configure a Layer-2 protocol-tunnel CoS value of 7:

```
Device> enable
Device# configure terminal
Device(config)# l2protocol-tunnel cos 7
```

# lACP fast-switchover

To enable Link Aggregation Control Protocol (LACP) 1:1 link redundancy, use the **lACP fast-switchover** command in interface configuration mode. To disable LACP 1:1 link redundancy, use the **no** form of this command.

**lACP fast-switchover** [**dampening** *time*]

**no lACP fast-switchover** [**dampening** *time*]

|                           |                                                                                                      |                              |
|---------------------------|------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <b>dampening</b> <i>time</i> Enables LACP 1:1 hot-standby dampening. The range is 30 to 180 seconds. |                              |
| <b>Command Default</b>    | LACP 1:1 link redundancy is disabled by default.                                                     |                              |
| <b>Command Modes</b>      | Interface configuration (config-if)                                                                  |                              |
| <b>Command History</b>    | <b>Release</b>                                                                                       | <b>Modification</b>          |
|                           | Cisco IOS XE Amsterdam 17.3.1                                                                        | This command was introduced. |

|                         |                                                                                                                                                                                                                                                                                         |  |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Usage Guidelines</b> | Prior to entering the <b>lACP fast-switchover</b> command, you must ensure the following:                                                                                                                                                                                               |  |
|                         | <ul style="list-style-type: none"> <li>• The port channel protocol type is LACP.</li> <li>• The <b>lACP max-bundle 1</b> command has been entered on the port channel. Note that the <b>lACP fast-switchover</b> command will not affect the <b>lACP max-bundle</b> command.</li> </ul> |  |

Prior to entering the **lACP fast-switchover dampening** command, you must ensure the following:

- The port channel protocol type is LACP.
- The **lACP max-bundle 1** and **lACP fast-switchover** commands have been entered on the port channel.

When you enable LACP 1:1 link redundancy, based on the system priority and port priority, the port with the higher system priority chooses one link as the active link and the other link as the standby link (lower the LACP port priority, higher the preference, and lower the LACP system priority, higher the preference). In the case of the LACP 1:1 Redundancy feature, when the active link fails, the standby link is selected as the new active link without taking down the port channel. When the original active link recovers, it reverts to its active link status. During this changeover, the port channel is also up.

In the case of LACP 1:1 Hot Standby Dampening feature, a timer is configured that delays the switchover back to the higher priority port after it becomes active.

## Note

- We recommend that you configure only two ports (one active and one hot standby) in the bundle, for optimum performance.
- LACP 1:1 redundancy must be enabled at both ends of the LACP EtherChannel.
- LACP 1:1 redundancy and dampening work only on LACP port channels.

## Examples

The following example shows how to enable LACP 1:1 link redundancy:

```
Device> enable
Device# configure terminal
Device(config)# interface port-channel 40
Device(config-if)# lacp fast-switchover
Device(config-if)# lacp max-bundle 1
```

The following example shows how to enable LACP 1:1 hot standby dampening:

```
Device> enable
Device# configure terminal
Device(config)# interface port-channel 40
Device(config-if)# lacp fast-switchover
Device(config-if)# lacp max-bundle 1
Device(config-if)# lacp fast-switchover dampening 70
```

## Related Commands

| Command                  | Description                                                                |
|--------------------------|----------------------------------------------------------------------------|
| <b>lacp max-bundle</b>   | Assigns and configures an EtherChannel interface to an EtherChannel group. |
| <b>show etherchannel</b> | Displays the EtherChannel information for a channel.                       |
| <b>show lacp</b>         | Displays the LACP channel group information.                               |

# lacp max-bundle

To define the maximum number of active LACP ports allowed in a port channel, use the **lacp max-bundle** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

**lacp max-bundle** *max\_bundle\_number*  
**no lacp max-bundle**

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                              |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <i>max_bundle_number</i> The maximum number of active LACP ports in the port channel. The range is 1 to 8. The default is 8.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                              |
| <b>Command Modes</b>      | Interface configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                              |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>Modification</b>          |

# lacp port-priority

To configure the port priority for the Link Aggregation Control Protocol (LACP), use the **lacp port-priority** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

**lacp port-priority** *priority*  
**no lacp port-priority**

|                           |                                                                  |                              |
|---------------------------|------------------------------------------------------------------|------------------------------|

| <b>Command History</b>    | <b>Release</b>                                                   | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.5.1a                                     | This command was introduced. |

**Usage Guidelines**

The **lacp port-priority** command in interface configuration mode determines which ports are bundled and which ports are put in hot-standby mode when there are more than eight ports in an LACP channel group.

An LACP channel group can have up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in standby mode.

In port-priority comparisons, a numerically lower value has a higher priority: When there are more than eight ports in an LACP channel group, the eight ports with the numerically lowest values (highest priority values) for LACP port priority are bundled into the channel group, and the lower-priority ports are put in hot-standby mode. If two or more ports have the same LACP port priority (for example, they are configured with the default setting of 65535), then an internal value for the port number determines the priority.

**Note** The LACP port priorities are only effective if the ports are on the device that controls the LACP link. See the **lacp system-priority** command in global configuration mode for determining which device controls the link.

Use the **show lacp internal** command in privileged EXEC mode to display LACP port priorities and internal port number values.

For information about configuring LACP on physical ports, see the configuration guide for this release.

This example shows how to configure the LACP port priority on a port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# lacp port-priority 1000
```

You can verify your settings by entering the **show lacp [channel-group-number] internal** command in privileged EXEC mode.

# lacp rate

To set the rate at which Link Aggregation Control Protocol (LACP) control packets are ingressed to an LACP-supported interface, use the **lacp rate** command in interface configuration mode. To return to the default settings, use the **no** form of this command

**lacp rate** {**normal** | **fast**}  
**no lacp rate**

|                           |                                                                                                                                                                                                                                                                                                |                              |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <b>normal</b> Specifies that LACP control packets are ingressed at the normal rate, every 30 seconds after the link is bundled.                                                                                                                                                                |                              |
|                           | <b>fast</b> Specifies that LACP control packets are ingressed at the fast rate, once every 1 second.                                                                                                                                                                                           |                              |
| <b>Command Default</b>    | The default ingress rate for control packets is 30 seconds after the link is bundled.                                                                                                                                                                                                          |                              |
| <b>Command Modes</b>      | Interface configuration                                                                                                                                                                                                                                                                        |                              |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                                                                                                 | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                   | This command was introduced. |
| <b>Usage Guidelines</b>   | Use this command to modify the duration of LACP timeout. The LACP timeout value on Cisco switch is three times the LACP rate that is configured on the interface. Using the <b>lacp rate</b> command, you can select the LACP timeout value for a switch to be either 90 seconds or 3 seconds. |                              |
|                           | This command is supported only on LACP-enabled interfaces.                                                                                                                                                                                                                                     |                              |
|                           | This example shows how to specify the fast (1 second) ingress rate on interface GigabitEthernet 0/0:                                                                                                                                                                                           |                              |
|                           | <pre>Device&gt; enable Device# configure terminal Device(config)# interface gigabitEthernet 0/0 Device(config-if)# lacp rate fast</pre>                                                                                                                                                        |                              |

# lacp system-priority

To configure the system priority for the Link Aggregation Control Protocol (LACP), use the **lacp system-priority** command in global configuration mode on the device. To return to the default setting, use the **no** form of this command.

**lacp system-priority** *priority*  
**no lacp system-priority**

| <b>Syntax Description</b>    | <i>priority</i> System priority for LACP. The range is 1 to 65535.                                                                                    |         |              |                              |                              |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|------------------------------|
| <b>Command Default</b>       | The default is 32768.                                                                                                                                 |         |              |                              |                              |
| <b>Command Modes</b>         | Global configuration                                                                                                                                  |         |              |                              |                              |

| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                          |         |              |                              |                              |

**Usage Guidelines**

The **lacp system-priority** command determines which device in an LACP link controls port priorities.

An LACP channel group can have up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in standby mode. When there are more than eight ports in an LACP channel group, the device on the controlling end of the link uses port priorities to determine which ports are bundled into the channel and which ports are put in hot-standby mode. Port priorities on the other device (the noncontrolling end of the link) are ignored.

In priority comparisons, numerically lower values have a higher priority. Therefore, the system with the numerically lower value (higher priority value) for LACP system priority becomes the controlling system. If both devices have the same LACP system priority (for example, they are both configured with the default setting of 32768), the LACP system ID (the device MAC address) determines which device is in control.

The **lacp system-priority** command applies to all LACP EtherChannels on the device.

Use the **show etherchannel summary** command in privileged EXEC mode to see which ports are in the hot-standby mode (denoted with an H port-state flag in the output display).

This example shows how to set the LACP system priority:

```
Device> enable
Device# configure terminal
Device(config)# lacp system-priority 20000
```

You can verify your settings by entering the **show lacp sys-id** command in privileged EXEC mode.

# loopdetect

To detect network loops, use the **loopdetect** command in interface configuration mode. To disable loop-detection guard use the **no** form of this command.

**loopdetect** [ *time* | **action syslog** | **source-port** ]  
**no loopdetect** [ *time* | **action syslog** | **source-port** ]

|                           |                      |                                                                                                        |
|---------------------------|----------------------|--------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>time</i>          | (Optional) Time interval at which loop-detect frames are sent, in seconds. Range: 0 to 10. Default: 5. |
|                           | <b>action syslog</b> | (Optional) Displays a system message when a loop is detected.                                          |
|                           | <b>source-port</b>   | (Optional) Error-disables the source port.                                                             |

**Command Default** Loop-detection guard is not enabled.

**Command Modes** Interface configuration (config-if)

| <b>Command History</b> | <b>Release</b>                | <b>Modification</b>          |
|------------------------|-------------------------------|------------------------------|
|                        | Cisco IOS XE Amsterdam 17.2.1 | This command was introduced. |

**Usage Guidelines** You can error-disable either the source port or the destination port depending on your requirement. When the **loopdetect** command is configured without any of the keywords or variables, the feature is enabled and the destination port is error-disabled when a loop is detected. We recommend that you error-disable the source port to better control traffic flow to and from your network.

The **loopdetect action syslog** command displays only a system message and does not error-disable the configured port. The **no loopdetect action syslog** command reverts the system to the last configured option.

## Examples

The following example shows how to enable loop-detection guard. In this example, the destination port is error-disabled by default and loop-detect frames are sent at the default time interval of five seconds:

```
Device# enable
Device# configure terminal
Device(config)# interface tengigabitethernet 1/0/18
Device(config-if)# loopdetect
```

The following example shows how to configure the time interval to send loop-detect frames. In this example, loop-detect frames are sent every 7 seconds and destination port is error-disabled when a loop is detected:

```
Device# enable
Device# configure terminal
Device(config)# interface tengigabitethernet 1/0/18
Device(config-if)# loopdetect 7
```

The following example shows how to enable the feature and only display a system message. There is no action taken on either the destination port or the source port:

```
Device# enable
Device# configure terminal
Device(config)# interface tengigabitethernet 1/0/18
Device(config-if)# loopdetect action syslog
```

The following example shows how to enable the feature and error-disable the source port:

```
Device# enable
Device# configure terminal
Device(config)# interface tengigabitethernet 1/0/18
Device(config-if)# loopdetect source-port
```

The following example shows how the **no loopdetect action syslog** command works. In the first part of the example, the feature has been configured to error disable the source port (**loopdetect source-port**). The feature is then reconfigured to display a system message and not error-disable a port (**loopdetect action syslog**). In the last part of the example, the **no** form of the **loopdetect action syslog** command is configured, which causes the system to revert to the last configured option, that is, to error disable the source port.

Part 1: Error-disabling the source port:

```
Device# enable
Device# configure terminal
Device(config)# interface twentyfivegigabitethernet 1/0/20
Device(config-if)# loopdetect source-port
```

Part 2: Reconfiguring to display a system message and not error-disable a port:

```
Device(config-if)# loopdetect action syslog
```

Part 3: Using the **no** form of **loopdetect action syslog** (see Twa1/0/20 ):

```
Device(config-if)# no loopdetect action syslog
Device(config-if)# end
```

```
Device# show loopdetect
Interface Interval Elapsed-Time Port-to-Errdisbale ACTION
-----
Twe1/0/1      5          3      errdisable Source Port  SYSLOG
Twe1/0/20     5          0      errdisable Source Port  ERRDISABLE
Twe2/0/3      5          2      errdisable Dest Port    ERRDISABLE
Loopdetect is ENABLED
```

# pagp learn-method

To learn the source address of incoming packets received from an EtherChannel port, use the **pagp learn-method** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

**pagp learn-method** {aggregation-port | physical-port}  
**no pagp learn-method**

|                    |                                                         |                                                                                                                                                                                                                                                                                                                  |
|--------------------|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | aggregation-port                                        | Specifies address learning on the logical port channel. The device sends packets to the source using any port in the EtherChannel. This setting is the default. With aggregation-port learning, it is not important on which physical port the packet arrives                                                    |
|                    | physical-port                                           | Specifies address learning on the physical port within the EtherChannel. The device sends packets to the source using the same port in the EtherChannel from which it learned the source address. The other end of the channel uses the same port in the channel for a particular destination MAC or IP address. |
|                    |                                                         |                                                                                                                                                                                                                                                                                                                  |
| Command Default    | The default is aggregation-port (logical port channel). |                                                                                                                                                                                                                                                                                                                  |

|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

This example shows how to set the learning method to learn the address on the physical port within the EtherChannel:

```
Device> enable
Device# configure terminal
Device(config)# interface port-channel 2
Device(config-if)# pagp learn-method physical-port
```

This example shows how to set the learning method to learn the address on the port channel within the EtherChannel:

```
Device> enable
Device# configure terminal
```

```
Device(config)# interface port-channel 2  
Device(config-if)# pagp learn-method aggregation-port
```

You can verify your settings by entering either the **show running-config** command in privileged EXEC mode or the **show pagp channel-group-number internal** command in privileged EXEC mode.

# pagp port-priority

To select a port over which all Port Aggregation Protocol (PAgP) traffic through the EtherChannel is sent, use the **pagp port-priority** command in interface configuration mode. If all unused ports in the EtherChannel are in hot-standby mode, they can be placed into operation if the currently selected port and link fails. To return to the default setting, use the **no** form of this command.

**pagp port-priority** *priority*  
**no pagp port-priority**

|                           |                                                              |                              |
|---------------------------|--------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <i>priority</i> Priority number. The range is from 0 to 255. |                              |
| <b>Command Default</b>    | The default is 128.                                          |                              |
| <b>Command Modes</b>      | Interface configuration                                      |                              |
| <b>Command History</b>    | <b>Release</b>                                               | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.5.1a                                 | This command was introduced. |

**Usage Guidelines** The physical port with the highest priority that is operational and has membership in the same EtherChannel is the one selected for PAgP transmission.

The device supports address learning only on aggregate ports even though the **physical-port** keyword is provided in the command-line interface (CLI). The **pagp learn-method** and the **pagp port-priority** commands in interface configuration mode have no effect on the device hardware, but they are required for PAgP interoperability with devices that only support address learning by physical ports, such as the Catalyst 1900 switch.

When the link partner to the device is a physical learner, we recommend that you configure the device as a physical-port learner by using the **pagp learn-method physical-port** command in interface configuration mode. We also recommend that you set the load-distribution method based on the source MAC address by using the **port-channel load-balance src-mac** command in global configuration mode. Use the **pagp learn-method** command in interface configuration mode only in this situation.

This example shows how to set the port priority to 200:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# pagp port-priority 200
```

You can verify your setting by entering the **show running-config** command in privileged EXEC mode or the **show pagp channel-group-number internal** command in privileged EXEC mode.

## peer (PTP)

To connect to a peer Precision Time Protocol-aware (PTP-aware) device, use the **peer** command in property transport sub-configuration mode.

```
peer { ip ip_address | vrf word ip ip_address }
```

|                    |                             |                                                                   |
|--------------------|-----------------------------|-------------------------------------------------------------------|
| Syntax Description | <b>ip</b> <i>ip_address</i> | IP address of a peer PTP device.                                  |
|                    | <b>vrf</b> <i>word</i>      | Default virtual routing and forwarding (VRF) or user-defined VRF. |

|                 |      |
|-----------------|------|
| Command Default | None |
|-----------------|------|

|               |                                                              |
|---------------|--------------------------------------------------------------|
| Command Modes | Property transport configuration (config-property-transport) |
|---------------|--------------------------------------------------------------|

| Command History | Release                       | Modification                 |
|-----------------|-------------------------------|------------------------------|
|                 | Cisco IOS XE Bengaluru 17.5.1 | This command was introduced. |

|                  |                                                                                                                                                                                                                                                               |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | You must configure the PTP-property name using the <b>ptp property</b> command and configure a unicast IPv4 connection from a loopback interface using the <b>transport unicast ipv4 local loopback</b> command before connecting to a peer PTP-aware device. |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Examples

The following example shows how to connect to a peer PTP-aware device:

```
Device> enable
Device# configure terminal
Device(config)# ptp property cisco1
Device(config-property)# transport unicast ipv4 local loopback 0
Device(config-property-transport)# peer ip 192.0.2.1
Device(config-property-transport)# end
```

| Related Commands | Command                                      | Description                                                     |
|------------------|----------------------------------------------|-----------------------------------------------------------------|
|                  | <b>ptp dot1as extend property</b>            | Extends IEEE 802.1AS profile to a PTP property name.            |
|                  | <b>ptp property</b>                          | Sets the PTP property name.                                     |
|                  | <b>transport unicast ipv4 local loopback</b> | Configures a unicast IPv4 connection from a loopback interface. |

# policy-map

To enter policy-map configuration mode and create or modify a policy map that can be attached to one or more interfaces to specify a service policy, use the **policy-map** command in global configuration mode. To delete a policy map, use the **no** form of this command.

**policy-map** [ **type** { **access-control** | **control subscriber** | **packet-service** | **performance-monitor** } ] *policy-map name*

## Syntax Description

|                            |                                                                       |
|----------------------------|-----------------------------------------------------------------------|
| <b>type</b>                | (Optional) Specifies the policy-map type.                             |
| <b>access-control</b>      | (Optional) Enables the access-control specific policy map.            |
| <b>control subscriber</b>  | (Optional) Enables subscriber control policy domain.                  |
| <b>packet-service</b>      | (Optional) Enables packet service policy map.                         |
| <b>performance-monitor</b> | (Optional) Enables policy map for the performance monitoring feature. |
| <i>policy-map name</i>     | Specifies the policy map.                                             |

## Command Default

The policy map is not configured.

## Command History

| Release                   | Modification                 |
|---------------------------|------------------------------|
| Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

## Command Modes

Global configuration (config)

## Usage Guidelines

Use the **policy-map** command to specify the name of the policy map to create (add or modify) before you configure policies for classes whose match criteria are defined in a class map with the **class-map** and **match** commands.

### Note

You can configure class policies in a policy map only if the classes have match criteria defined for them.

### Note

Because you can configure a maximum of 64 class maps, a policy map cannot contain more than 64 class policies.

A single policy map can be attached concurrently to more than one interface. Except as noted, when you attempt to attach a policy map to an interface, the attempt is denied if the available bandwidth on the interface cannot accommodate the total bandwidth requested by the multiple policies. In such cases, if the policy map is already attached to other interfaces, the map is removed.

### Example:

The following is sample output from the **policy-map** command:

```
Device# policy-map AVB-Output-Child-Policy

policy-map AVB-Output-Child-Policy
  class VOIP-PRIORITY-QUEUE
    bandwidth remaining percent 30
    queue-buffers ratio 10
  class MULTIMEDIA-CONFERENCING-STREAMING-QUEUE
    bandwidth remaining percent 15
    queue-limit dscp AF41 percent 80
    queue-limit dscp AF31 percent 80
    queue-limit dscp AF42 percent 90
    queue-limit dscp AF32 percent 90
    queue-buffers ratio 10
  class TRANSACTIONAL-DATA-QUEUE
    bandwidth remaining percent 15
    queue-limit dscp AF21 percent 80
    queue-limit dscp AF22 percent 90
    queue-buffers ratio 10
  class BULK-SCAVENGER-DATA-QUEUE
    bandwidth remaining percent 15
    queue-limit dscp AF11 percent 80
    queue-limit dscp AF12 percent 90
    queue-limit dscp CS1 percent 80
    queue-buffers ratio 15
  class class-default
    bandwidth remaining percent 25
    queue-buffers ratio 25
```

# port-channel

To convert the auto created EtherChannel into a manual channel and adding configuration on the EtherChannel, use the **port-channel** command in privileged EXEC mode.

**port-channel** { *channel-group-number* **persistent** | **persistent** }

|                           |                             |                                                                                                                       |
|---------------------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>channel-group-number</i> | Channel group number.<br>The range is 1 to 128.                                                                       |
|                           | <b>persistent</b>           | Converts the auto created EtherChannel into a manual channel and allows you to add configuration on the EtherChannel. |

**Command Modes** Privileged EXEC

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** You can use the **show etherchannel summary** command in privileged EXEC mode to display the EtherChannel information.

## Examples

This example shows how to convert the auto created EtherChannel into a manual channel:

```
Device> enable
Device# port-channel 1 persistent
```

# port-channel auto

To enable the auto-LAG feature on a switch globally, use the **port-channel auto** command in global configuration mode. To disable the auto-LAG feature on the switch globally, use **no** form of this command.

**port-channel auto**  
**no port-channel auto**

## Command Default

By default, the auto-LAG feature is disabled globally and is enabled on all port interfaces.

## Command Modes

Global configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

You can use the **show etherchannel auto** command in privileged EXEC mode to verify if the EtherChannel was created automatically.

## Examples

This example shows how to enable the auto-LAG feature on the switch:

```
Device> enable
Device# configure terminal
Device(config)# port-channel auto
```

## port-channel load-balance

To set the load-distribution method among the ports in the EtherChannel, use the **port-channel load-balance** command in global configuration mode. To reset the load-balancing mechanism to the default setting, use the **no** form of this command.

**port-channel load-balance** {**dst-ip** | **dst-mac** | **dst-mixed-ip-port** | **dst-port** | **extended** | **src-dst-ip** | **src-dst-mac** | **src-dst-mixed-ip-port** | **src-dst-port** | **src-ip** | **src-mac** | **src-mixed-ip-port** | **src-port**}

**no port-channel load-balance**

| Syntax Description           |                                       |                                                                                                                                                                                                                     |
|------------------------------|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dst-ip</b>                |                                       | Specifies load distribution based on the destination host IP address.                                                                                                                                               |
| <b>dst-mac</b>               |                                       | Specifies load distribution based on the destination host MAC address. Packets to the same destination are sent on the same port, but packets to different destinations are sent on different ports in the channel. |
| <b>dst-mixed-ip-port</b>     |                                       | Specifies load distribution based on the destination IPv4 or IPv6 address and the TCP/UDP (Layer 4) port number.                                                                                                    |
| <b>dst-port</b>              |                                       | Specifies load distribution based on the destination TCP/UDP (Layer 4) port number for both IPv4 and IPv6.                                                                                                          |
| <b>extended</b>              |                                       | Sets extended load balance methods among the ports in the EtherChannel.                                                                                                                                             |
| <b>src-dst-ip</b>            |                                       | Specifies load distribution based on the source and destination host IP address.                                                                                                                                    |
| <b>src-dst-mac</b>           |                                       | Specifies load distribution based on the source and destination host MAC address.                                                                                                                                   |
| <b>src-dst-mixed-ip-port</b> |                                       | Specifies load distribution based on the source and destination host IP address and TCP/UDP (layer 4) port number.                                                                                                  |
| <b>src-dst-port</b>          |                                       | Specifies load distribution based on the source and destination TCP/UDP (Layer 4) port number.                                                                                                                      |
| <b>src-ip</b>                |                                       | Specifies load distribution based on the source host IP address.                                                                                                                                                    |
| <b>src-mac</b>               |                                       | Specifies load distribution based on the source MAC address. Packets from different hosts use different ports in the channel, but packets from the same host use the same port.                                     |
| <b>src-mixed-ip-port</b>     |                                       | Specifies load distribution based on the source host IP address and TCP/UDP (Layer 4) port number.                                                                                                                  |
| <b>src-port</b>              |                                       | Specifies load distribution based on the TCP/UDP (Layer 4) port number.                                                                                                                                             |
| <b>Command Default</b>       | The default value is <b>src-mac</b> . |                                                                                                                                                                                                                     |
| <b>Command Modes</b>         | Global configuration (config)         |                                                                                                                                                                                                                     |

**Command History**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

You can verify your setting by entering either the **show running-config** command in privileged EXEC mode or the **show etherchannel load-balance** command in privileged EXEC mode.

**Examples**

The following example shows how to set the load-distribution method to dst-mac:

```
Device> enable
Device# configure terminal
Device(config)# port-channel load-balance dst-mac
```

**Related Commands**

|---------------------------------------|---------------------------------------------------------|
| <b>show etherchannel load-balance</b> | Displays information about EtherChannel load balancing. |
| <b>show running-config</b>            | Displays the running configuration.                     |

# port-channel load-balance extended

To set combinations of load-distribution methods among the ports in the EtherChannel, use the **port-channel load-balance extended** command in global configuration mode. To reset the extended load-balancing mechanism to the default setting, use the **no** form of this command.

**port-channel load-balance extended**{**dst-ip** | **dst-mac** | **dst-port** | **ipv6-label** | **l3-proto** | **src-ip** | **src-mac** | **src-port**}  
**no port-channel load-balance extended**

## Syntax Description

|                   |                                                                                                                                                                                                                     |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dst-ip</b>     | Specifies load distribution based on the destination host IP address.                                                                                                                                               |
| <b>dst-mac</b>    | Specifies load distribution based on the destination host MAC address. Packets to the same destination are sent on the same port, but packets to different destinations are sent on different ports in the channel. |
| <b>dst-port</b>   | Specifies load distribution based on the destination TCP/UDP (Layer 4) port number for both IPv4 and IPv6.                                                                                                          |
| <b>ipv6-label</b> | Specifies load distribution based on the source MAC address and IPv6 flow label.                                                                                                                                    |
| <b>l3-proto</b>   | Specifies load distribution based on the source MAC address and Layer 3 protocols.                                                                                                                                  |
| <b>src-ip</b>     | Specifies load distribution based on the source host IP address.                                                                                                                                                    |
| <b>src-mac</b>    | Specifies load distribution based on the source MAC address. Packets from different hosts use different ports in the channel, but packets from the same host use the same port.                                     |
| <b>src-port</b>   | Specifies load distribution based on the TCP/UDP (Layer 4) port number.                                                                                                                                             |

## Command Default

The default is **src-mac**.

## Command History

| Release                       | Modification                                                                                                                                       |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Cisco IOS XE Everest 16.5.1a  | This command was introduced.                                                                                                                       |
| Cisco IOS XE Amsterdam 17.3.x | The command was modified. You have to mandatorily configure atleast one of the keywords for the <b>port-channel load-balance extended</b> command. |

## Usage Guidelines

You can verify your setting by entering either the **show running-config** command in privileged EXEC mode or the **show etherchannel load-balance** command in privileged EXEC mode.

## Examples

This example shows how to set the extended load-distribution method:

```
Device> enable
Device# configure terminal
Device(config)# port-channel load-balance extended dst-ip dst-mac src-ip
```

# port-channel min-links

To define the minimum number of LACP ports that must be bundled in the link-up state and bundled in the EtherChannel in order that a port channel becomes active, use the **port-channel min-links** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

**port-channel min-links** *min\_links\_number*  
**no port-channel min-links**

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                              |

|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | This command was introduced. |
| <b>Usage Guidelines</b>   | <p>An LACP channel group can have up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in hot-standby mode. When there are more than eight ports in an LACP channel group, the device on the controlling end of the link uses port priorities to determine which ports are bundled into the channel and which ports are put in hot-standby mode. Port priorities on the other device (the noncontrolling end of the link) are ignored.</p> <p>The <b>port-channel min-links</b> command must specify a number a less than the number specified by the <b>lACP max-bundle</b> command.</p> <p>Use the <b>show etherchannel summary</b> command in privileged EXEC mode to see which ports are in the hot-standby mode (denoted with an H port-state flag in the output display).</p> <p>This example shows how to specify a minimum of three active LACP ports before port channel 2 becomes active:</p> <pre>Device&gt; enable Device# configure terminal Device(config)# interface port-channel 2 Device(config-if)# port-channel min-links 3</pre> |                              |

## ptp dot1as extend property

To extend IEEE 802.1AS profile to a Precision Time Protocol-property (PTP-property) name, use the **ptp dot1as extend property** command in global configuration mode.

**ptp dot1as extend property** *word*

|                           |                               |                              |
|---------------------------|-------------------------------|------------------------------|
| <b>Syntax Description</b> | <i>word</i>                   | PTP property name            |
| <b>Command Default</b>    | None                          |                              |

|                           | Cisco IOS XE Bengaluru 17.5.1 | This command was introduced. |

### Examples

The following example shows how to extend IEEE 802.1AS profile to a PTP-property name:

```
Device> enable
Device# configure terminal
Device(config)# ptp property cisco1
Device(config-property)# transport unicast ipv4 local loopback 0
Device(config-property-transport)# peer ip 192.0.2.1
Device(config-property-transport)# end
Device# configure terminal
Device(config)# ptp dot1as extend property cisco1
Device(config)# end
```

### Related Commands

| Command                                      | Description                                                     |
|----------------------------------------------|-----------------------------------------------------------------|
| <b>peer</b>                                  | Connects to a peer PTP-aware device.                            |
| <b>ptp property</b>                          | Sets the PTP property name.                                     |
| <b>source ip interface</b>                   | (Optional) Configures the source IP interface.                  |
| <b>transport unicast ipv4 local loopback</b> | Configures a unicast IPv4 connection from a loopback interface. |

## ptp priority1 value

To specify the priority 1 value to use when advertising a PTP clock, use the **ptp priority1 value** command in global configuration mode.

**ptp priority1** *value*

|                           |                               |                                                                                                                |
|---------------------------|-------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>value</b>                  | Specifies the priority 1 number to use for this clock.<br><br>The range is 0 to 255. The default value is 128. |
|                           | <b>Note</b>                   | If the value of priority1 is configured to 255, the clock cannot become as Grandmaster.                        |
| <b>Command Default</b>    | Default is 128.               |                                                                                                                |
| <b>Command Modes</b>      | Global configuration (config) |                                                                                                                |
| <b>Command History</b>    | <b>Release</b>                | <b>Modification</b>                                                                                            |
|                           | Cisco IOS XE Fuji 16.8.1a     | This command was introduced.                                                                                   |

### Example

This example shows how to specify the priority1 value:

```
Device> enable
Device# configure terminal
Device(config)# ptp priority1 120
```

| <b>Related Commands</b> | Command                    | Description                                                  |
|-------------------------|----------------------------|--------------------------------------------------------------|
|                         | <b>ptp priority2 value</b> | Specifies the priority 2 number to use for this clock.       |
|                         | <b>no ptp enable</b>       | Disables PTP on an interface.                                |
|                         | <b>ptp profile dot1as</b>  | Enables Generalized Precision Time Protocol (gPTP) globally. |

## ptp priority2 value

To specify the priority 2 number to use when advertising a PTP clock, use the **ptp priority2 value** command in global configuration mode.

**ptp priority2** *value*

| <b>Syntax Description</b> | <p><b>value</b> Specifies the priority 2 number to use for this clock.</p> <p>The range is 0 to 255. The default value is 128.</p>                 |         |              |                           |                              |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|---------------------------|------------------------------|
| <b>Command Default</b>    | Default is 128.                                                                                                                                    |         |              |                           |                              |
| <b>Command Modes</b>      | Global configuration (config)                                                                                                                      |         |              |                           |                              |
| <b>Command History</b>    | <table> <tr> <th>Release</th><th>Modification</th></tr> <tr> <td>Cisco IOS XE Fuji 16.8.1a</td><td>This command was introduced.</td></tr> </table> | Release | Modification | Cisco IOS XE Fuji 16.8.1a | This command was introduced. |
| Release                   | Modification                                                                                                                                       |         |              |                           |                              |
| Cisco IOS XE Fuji 16.8.1a | This command was introduced.                                                                                                                       |         |              |                           |                              |

### Example

This example shows how to specify the priority2 value:

```
Device> enable
Device# configure terminal
Device(config)# ptp priority 2 120
```

|-------------------------|----------------------------|--------------------------------------------------------------|
|                         | <b>ptp priority1 value</b> | Specifies the priority 1 number to use for this clock.       |
|                         | <b>no ptp enable</b>       | Disables PTP on an interface.                                |
|                         | <b>ptp profile dot1as</b>  | Enables Generalized Precision Time Protocol (gPTP) globally. |

## ptp profile dot1as

To enable Generalized Precision Time Protocol (gPTP) globally, use the **ptp profile dot1as** command in global configuration mode. To disable gPTP, use the **no** form of the command.

**ptp profile dot1as**  
**no ptp profile dot1as**

|                        |                                |
|------------------------|--------------------------------|
| <b>Command Default</b> | PTP is disabled on interfaces. |
|------------------------|--------------------------------|

|                      |                               |
|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

|                        |                           |                              |
|------------------------|---------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>            | <b>Modification</b>          |
|                        | Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

### Examples

This example shows how to enable gPTP:

```
Device> enable
Device# configure terminal
Device(config)# ptp profile dot1as
```

| Related Commands | Command                | Description                   |
|------------------|------------------------|-------------------------------|
|                  | <b>ptp (interface)</b> | Configures PTP on interfaces. |
|                  | <b>no ptp enable</b>   | Disables PTP on an interface. |

## ptp property

To set the Precision Time Protocol-property (PTP-property) name, use the **ptp property** command in global configuration mode. To remove the PTP property name, use the **no** form of this command.

**ptp property** *word*  
**no ptp property** *word*

|                           |                                                                                                                                   |                              |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <i>word</i>                                                                                                                       | PTP-property name.           |
| <b>Command Default</b>    | None                                                                                                                              |                              |
| <b>Command Modes</b>      | Global configuration (config)                                                                                                     |                              |
| <b>Command History</b>    | <b>Release</b>                                                                                                                    | <b>Modification</b>          |
|                           | Cisco IOS XE Bengaluru 17.5.1                                                                                                     | This command was introduced. |
| <b>Usage Guidelines</b>   | You can configure more than one IPv4 unicast connection that connects to a different boundary clock under the same property name. |                              |

### Examples

The following example shows how to set the PTP-property name:

```
Device> enable
Device# configure terminal
Device(config)# ptp property cisco1
Device(config-property)#
```

| <b>Related Commands</b> | Command                                      | Description                                                     |
|-------------------------|----------------------------------------------|-----------------------------------------------------------------|
|                         | <b>peer</b>                                  | Connects to a peer PTP-aware device.                            |
|                         | <b>ptp dot1as extend property</b>            | Extends IEEE 802.1AS profile to a PTP property name.            |
|                         | <b>source ip interface</b>                   | (Optional) Configures the source IP interface.                  |
|                         | <b>transport unicast ipv4 local loopback</b> | Configures a unicast IPv4 connection from a loopback interface. |

# ptp role primary

To set an interface permanently as primary (master), use the **ptp role primary** command in interface configuration mode. To remove an interface as primary (master), use the **no ptp role primary** command.

**ptp role primary**  
**no ptp role primary**

|                        |                                                                                                              |
|------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>Command Default</b> | Interface is set as either primary (master) or secondary (slave) based on Best Master Clock Algorithm (BMCA) |
|------------------------|--------------------------------------------------------------------------------------------------------------|

|                      |                                     |
|----------------------|-------------------------------------|
| <b>Command Modes</b> | Interface configuration (config-if) |
|----------------------|-------------------------------------|

|                        |                               |                              |
|------------------------|-------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>                | <b>Modification</b>          |
|                        | Cisco IOS XE Bengaluru 17.5.1 | This command was introduced. |

|                         |                                                                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | Setting a port permanently ensures that the port remain as a primary (master) even if a clock connected to the port can be elected as grandmaster clock. |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|

|             |                                                                                                                                                                 |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Note</b> | The command <b>ptp role primary</b> must be used only on ports that are used as end nodes on a network that are connected to devices requiring synchronization. |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|

Use the **show ptp port interface\_id** command to verify if the port is set as primary (master).

## Examples

The following example shows how to set an interface permanently as primary (master):

```
Device> enable
Device# configure terminal
Device(config)# interface TenGigabitEthernet1/0/1
Device(config-if)# ptp role primary
```

| Related Commands | Command                    | Description                       |
|------------------|----------------------------|-----------------------------------|
|                  | show ptp port interface_id | Displays the details of the port. |

## mvrp vlan creation

To enable dynamic VLAN creation on a device using Multiple VLAN Registration Protocol (MVRP), use the **mvrpvlancreation** command in global configuration mode. To disable dynamic VLAN creation for MVRP, use the **no** form of this command.

**mvrp vlan creation**

**no mvrp vlan creation**

**Syntax Description** This command has no arguments or keywords.

**Command Default** MVRP is disabled.

**Command Modes** Global configuration (config)

**Command History**

| Release                   | Modification                 |
|---------------------------|------------------------------|
| Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

**Usage Guidelines** MVRP dynamic VLAN creation can be used only if Virtual Trunking Protocol (VTP) is in transparent mode.

**Examples**

The following example shows a command sequence enabling MVRP dynamic VLAN creation. Notice that the device recognizes that the VTP mode is incorrect and rejects the request for dynamic VLAN creation. Once the VTP mode is changed, MVRP dynamic VLAN creation is allowed.

```
Device(config)# mvrp vlan creation
%Command Rejected: VTP is in non-transparent (server) mode.
Device(config)# vtp mode transparent
Setting device to VTP TRANSPARENT mode.
Device(config)# mvrp vlan creation
%VLAN now may be dynamically created via MVRP/
```

**Related Commands**

| Command            | Description                               |
|--------------------|-------------------------------------------|
| <b>mvrp global</b> | Enables MVRP globally on a device.        |
| <b>vtp mode</b>    | Sets the mode for VTP mode on the device. |

## mvrp registration

To set the registrars in a Multiple Registration Protocol (MRP) Attribute Declaration (MAD) instance associated with an interface, use the **mvrpregistration** command in global configuration mode. To disable the registrars, use the **no** form of this command.

**mvrp registration {normal | fixed | forbidden}**  
**no mvrp registration**

|                           |                  |                                                                                                                           |
|---------------------------|------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>normal</b>    | Registrar responds normally to incoming Multiple VLAN Registration Protocol (MVRP) messages. Normal is the default state. |
|                           | <b>fixed</b>     | Registrar ignores all incoming MVRP messages and remains in the IN state.                                                 |
|                           | <b>forbidden</b> | Registrar ignores all incoming MVRP messages and remains in the EMPTY (MT) state.                                         |

**Command Default** Registrars are set to the normal state.

**Command Modes** Global configuration (config)

|                        |                           |                              |
|------------------------|---------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>            | <b>Modification</b>          |
|                        | Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

**Usage Guidelines** The **mvrpregistration** command is operational only if MVRP is configured on an interface.

The **nomvrpregistration** command sets the registrar state to the default (normal).

This command can be used to set the registrar in a MAD instance associated with an interface to one of the three states. This command is effective only if MVRP is operational on the interface.

Given that up to 4094 VLANs can be configured on a trunk port, there may be up to 4094 Advanced Services Module (ASM) and Route Switch Module (RSM) pairs in a MAD instance associated with that interface.

### Examples

The following example sets a fixed, forbidden, and normal registrar on a MAD instance:

```
Device(config)# mvrp global
%MVRP is now globally enabled. MVRP is operational on IEEE 802.1q trunk ports only.
Device(config)# interface fastethernet2/1
Device(config-if)# mvrp registration fixed
Device(config-if)# interface fastethernet2/2
Device(config-if)# mvrp registration forbidden
Device(config-if)# interface fastethernet2/3
Device(config-if)# no mvrp registration
```

|                         |                              |                                                                           |

| <b>Related Commands</b> | <b>Command</b>               | <b>Description</b>                                                        |
|                         | <b>clear mvrp statistics</b> | Clears MVRP-related statistics recorded on one or all MVRP-enabled ports. |

| Command                       | Description                                                                                                                       |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>debug mvrp</b>             | Displays MVRP debugging information.                                                                                              |
| <b>mvrp global</b>            | Enables MVRP globally on a device and on a particular interface.                                                                  |
| <b>mvrp mac-learning auto</b> | Enables automatic learning of MAC table entries by MVRP.                                                                          |
| <b>mvrp timer</b>             | Sets period timers that are used in MRP on a given interface.                                                                     |
| <b>mvrp vlan create</b>       | Enables an MVRP dynamic VLAN.                                                                                                     |
| <b>show mvrp interface</b>    | Displays details of the administrative and operational MVRP states of all or one particular IEEE 802.1Q trunk port in the device. |
| <b>show mvrp summary</b>      | Displays the MVRP configuration at the device level.                                                                              |

## mvrp timer

To set period timers that are used in Multiple VLAN Registration Protocol (MVRP) on a given interface, use the **mvrp timer** command in interface configuration mode. To remove the timer value, use the **no** form of this command.

**mvrp timer** {join | leave | leave-all | periodic} [centiseconds]  
**no mvrp timer**

### Syntax Description

|                     |                                                                                                                                                                                                                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>join</b>         | Specifies the time interval between two transmit opportunities that are applied to the Applicant State Machine (ASMs).                                                                                                                                                                                               |
| <b>leave</b>        | Specifies the duration time before a registrar is moved to EMPTY (MT) state from leave-all (LV) state.                                                                                                                                                                                                               |
| <b>leave-all</b>    | Specifies the time it takes for a LeaveAll timer to expire.                                                                                                                                                                                                                                                          |
| <b>periodic</b>     | Sets the timer value to periodic, a fixed value of 100 centiseconds.                                                                                                                                                                                                                                                 |
| <i>centiseconds</i> | Timer value measured in centiseconds. <ul style="list-style-type: none"> <li>• Join timer value range is 20 to 10000000.</li> <li>• Leave timer value range is 60 to 10000000.</li> <li>• LeaveAll timer value range is 10000 and 10000000.</li> <li>• Periodic timer value is fixed at 100 centiseconds.</li> </ul> |

### Command Default

Join timer value: 20 centiseconds  
 Leave timer value: 60 centiseconds  
 LeaveAll timer value: 10000 centiseconds

### Command Modes

Interface configuration (config-if)

### Command History

| Release                   | Modification                 |
|---------------------------|------------------------------|
| Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

### Usage Guidelines

The **nomvrptimer** command resets the timer value to the default value.

### Examples

The following example sets the timer levels on an interface:

```
Device(config)# mvrp global
%MVRP is now globally enabled. MVRP is operational on IEE 802.1q trunk ports.
Device(config)# interface GigabitEthernet 6/1
Device(config-if)# mvrp timer join 30
Device(config-if)# mvrp timer leave 70
Device(config-if)# mvrp timer leaveAll 15000
```

| Command                       | Description                                                                                                                       |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>clear mvrp statistics</b>  | Clears MVRP-related statistics recorded on one or all MVRP enabled ports.                                                         |
| <b>debug mvrp</b>             | Displays MVRP debugging information.                                                                                              |
| <b>mvrp global</b>            | Enables MVRP globally on a device and on a particular interface.                                                                  |
| <b>mvrp mac-learning auto</b> | Enables automatic learning of MAC table entries by MVRP.                                                                          |
| <b>mvrp registration</b>      | Sets the registrars in a MAD instance associated with an interface.                                                               |
| <b>mvrp vlan create</b>       | Enables an MVRP dynamic VLAN.                                                                                                     |
| <b>show mvrp interface</b>    | Displays details of the administrative and operational MVRP states of all or one particular IEEE 802.1q trunk port in the device. |
| <b>show mvrp summary</b>      | Displays the MVRP configuration at the device level.                                                                              |

# rep admin vlan

To configure a Resilient Ethernet Protocol (REP) administrative VLAN for the REP to transmit hardware flood layer (HFL) messages, use the **rep admin vlan** command in global configuration mode. To return to the default configuration with VLAN 1 as the administrative VLAN, use the **no** form of this command.

```
rep admin vlan vlan-id segment segment-id
no rep admin vlan vlan-id segment segment-id
```

|                    |                               |                                                                                                        |
|--------------------|-------------------------------|--------------------------------------------------------------------------------------------------------|
| Syntax Description | <i>vlan-id</i>                | 48-bit static MAC address.                                                                             |
|                    | <b>segment</b>                | configures administrative VLAN for an REP segment.                                                     |
|                    | <i>segment-id</i>             | specifies the segment for which the admin VLAN has been assigned. Segment id number ranges from 1-1024 |
| Command Default    |                               |                                                                                                        |
| Command Modes      | Global configuration          |                                                                                                        |

|                    | Cisco IOS XE Everest 16.5.1a  | This command was introduced.                                                                           |
|                    | Cisco IOS XE Amsterdam 17.2.1 | The <b>segment</b> keyword was introduced.                                                             |

## rep block port

To configure Resilient Ethernet Protocol (REP) VLAN load balancing on a REP primary edge port, use the **rep block port** command in interface configuration mode. To return to the default configuration with VLAN 1 as the administrative VLAN, use the **no** form of this command.

**rep block port** {*id port-id* | *neighbor-offset* | **preferred**} **vlan** {*vlan-list* | **all**}  
**no rep block port** {*id port-id* | *neighbor-offset* | **preferred**}

| Syntax Description       |  |                                                                                                                                                                                       |
|--------------------------|--|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>id</b> <i>port-id</i> |  | Specifies the VLAN blocking alternate port by entering the unique port ID, which is automatically generated when REP is enabled. The REP port ID is a 16-character hexadecimal value. |
| <i>neighbor-offset</i>   |  | VLAN blocking alternate port by entering the offset number of a neighbor. The range is from -256 to +256. A value of 0 is invalid.                                                    |
| <b>preferred</b>         |  | Selects the regular segment port previously identified as the preferred alternate port for VLAN load balancing.                                                                       |
| <b>vlan</b>              |  | Identifies the VLANs to be blocked.                                                                                                                                                   |
| <i>vlan-list</i>         |  | VLAN ID or range of VLAN IDs to be displayed. Enter a VLAN ID from 1 to 4094, or a range or sequence of VLANs (such as 1-3, 22, and 41-44) to be blocked.                             |
| <b>all</b>               |  | Blocks all the VLANs.                                                                                                                                                                 |

**Command Default** The default behavior after you enter the **rep preempt segment** command in privileged EXEC (for manual preemption) is to block all the VLANs at the primary edge port. This behavior remains until you configure the **rep block port** command.

If the primary edge port cannot determine which port is to be the alternate port, the default action is no preemption and no VLAN load balancing.

**Command Modes** Interface configuration

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** When you select an alternate port by entering an offset number, this number identifies the downstream neighbor port of an edge port. The primary edge port has an offset number of 1; positive numbers above 1 identify downstream neighbors of the primary edge port. Negative numbers identify the secondary edge port (offset number -1) and its downstream neighbors.

**Note** Do not enter an offset value of 1 because that is the offset number of the primary edge port itself.

If you have configured a preempt delay time by entering the **rep preempt delay seconds** command in interface configuration mode and a link failure and recovery occurs, VLAN load balancing begins after the configured

preemption time period elapses without another link failure. The alternate port specified in the load-balancing configuration blocks the configured VLANs and unblocks all the other segment ports. If the primary edge port cannot determine the alternate port for VLAN balancing, the default action is no preemption.

Each port in a segment has a unique port ID. To determine the port ID of a port, enter the **show interfaces interface-id rep detail** command in privileged EXEC mode.

### Examples

The following example shows how to configure REP VLAN load balancing:

```
Device> enable
Device# configure terminal
Device(config)# interface TenGigabitEthernet 4/1
Device(config-if)# rep block port id 0009001818D68700 vlan 1-100
```

|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>show interfaces rep detail</b> | Displays detailed REP configuration and status for all the interfaces or the specified interface, including the administrative VLAN. |

## rep lsl-age-timer

To configure the Resilient Ethernet Protocol (REP) link status layer (LSL) age-out timer value, use the **rep lsl-age-timer** command in interface configuration mode. To restore the default age-out timer value, use the **no** form of this command.

**rep lsl-age-timer** *milliseconds*  
**no rep lsl-age-timer** *milliseconds*

|                           |                                                                                                                                                                    |                              |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <i>milliseconds</i> REP LSL age-out timer value, in milliseconds (ms). The range is from 120 to 10000 in multiples of 40.                                          |                              |
| <b>Command Default</b>    | The default LSL age-out timer value is 5 ms.                                                                                                                       |                              |
| <b>Command Modes</b>      | Interface configuration                                                                                                                                            |                              |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                     | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                       | This command was introduced. |
| <b>Usage Guidelines</b>   | While configuring REP configurable timers, we recommend that you configure the REP LSL number of retries first and then configure the REP LSL age-out timer value. |                              |

### Examples

The following example shows how to configure a REP LSL age-out timer value:

```
Device> enable
Device# configure terminal
Device(config)# interface TenGigabitEthernet 4/1
Device(config-if)# rep segment 1 edge primary
Device(config-if)# rep lsl-age-timer 2000
```

|                         |                                                |                                                                  |
|-------------------------|------------------------------------------------|------------------------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>                                 | <b>Description</b>                                               |
|                         | <b>interface interface-type interface-name</b> | Specifies a physical interface or port channel to receive STCNs. |
|                         | <b>rep segment</b>                             | Enables REP on an interface and assigns a segment ID.            |

# rep lsl-retries

To configure the REP link status layer (LSL) number of retries, use the **rep lsl-retries** command in interface configuration mode. To restore the default number of retries, use the **no** form of this command.

```
rep lsl-retries number-of-retries
no rep lsl-retries number-of-retries
```

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                             |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|
| Syntax Description | number-of-retries Number of LSL retries. The range of retries is from 3 to 10.                                                                                                                                                                                                                                                                                                                                                                                                                                       |                             |
| Command Default    | The default number of LSL retries is 5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                             |
| Command Modes      | Interface configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                             |

|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | This command was introduced |
| Usage Guidelines   | <p>The <b>rep lsl-retries</b> command is used to configure the number of retries before the REP link is disabled. While configuring REP configurable timers, we recommend that you configure the REP LSL number of retries first and then configure the REP LSL age-out timer value.</p> <p>The following example shows how to configure REP LSL retries.</p> <pre>Device&gt; enable Device# configure terminal Device(config)# interface TenGigabitEthernet 4/1 Device(config-if)# rep segment 2 edge primary</pre> |                             |

## rep preempt delay

To configure a waiting period after a segment port failure and recovery before Resilient Ethernet Protocol (REP) VLAN load balancing is triggered, use the **rep preempt delay** command in interface configuration mode. To remove the configured delay, use the **no** form of this command.

**rep preempt delay** *seconds*

**no rep preempt delay**

|                           |                                                                                                                                                |                              |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <i>seconds</i> Number of seconds to delay REP preemption. The range is from 15 to 300 seconds. The default is manual preemption without delay. |                              |
| <b>Command Default</b>    | REP preemption delay is not set. The default is manual preemption without delay.                                                               |                              |

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | Enter this command on the REP primary edge port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                         | Enter this command and configure a preempt time delay for VLAN load balancing to be automatically triggered after a link failure and recovery.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                         | If VLAN load balancing is configured after a segment port failure and recovery, the REP primary edge port starts a delay timer before VLAN load balancing occurs. Note that the timer restarts after each link failure. When the timer expires, the REP primary edge port alerts the alternate port to perform VLAN load balancing (configured by using the <b>rep block port</b> command in interface configuration mode) and prepares the segment for the new topology. The configured VLAN list is blocked at the alternate port, and all other VLANs are blocked at the primary edge port. |
|                         | You can verify your settings by entering the <b>show interfaces rep</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### Examples

The following example shows how to configure a REP preemption time delay of 100 seconds on the primary edge port:

```
Device> enable
Device# configure terminal
Device(config)# interface TenGigabitEthernet 4/1
Device(config-if)# rep preempt delay 100
```

|                         |                                   |                                                                                                                                      |

|                         | <b>rep block port</b>             | Configures VLAN load balancing.                                                                                                      |
|                         | <b>show interfaces rep detail</b> | Displays detailed REP configuration and status for all the interfaces or the specified interface, including the administrative VLAN. |

## rep preempt segment

To manually start Resilient Ethernet Protocol (REP) VLAN load balancing on a segment, use the **rep preempt segment** command in privileged EXEC mode.

**rep preempt segment** *segment-id*

### Syntax Description

*segment-id* ID of the REP segment. The range is from 1 to 1024.

### Command Default

Manual preemption is the default behavior.

### Command Modes

Privileged EXEC

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Enter this command on the segment, which has the primary edge port on the device.

Ensure that all the other segment configurations are completed before setting preemption for VLAN load balancing. When you enter the **rep preempt segment** *segment-id* command, a confirmation message appears before the command is executed because preemption for VLAN load balancing can disrupt the network.

If you do not enter the **rep preempt delay** *seconds* command in interface configuration mode on the primary edge port to configure a preemption time delay, the default configuration is to manually trigger VLAN load balancing on the segment.

Enter the **show rep topology** command in privileged EXEC mode to see which port in the segment is the primary edge port.

If you do not configure VLAN load balancing, entering the **rep preempt segment** *segment-id* command results in the default behavior, that is, the primary edge port blocks all the VLANs.

You can configure VLAN load balancing by entering the **rep block port** command in interface configuration mode on the REP primary edge port before you manually start preemption.

### Examples

The following example shows how to manually trigger REP preemption on segment 100:

```
Device> enable
Device# rep preempt segment 100
```

### Related Commands

| Command                  | Description                                                                                                        |
|--------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>rep block port</b>    | Configures VLAN load balancing.                                                                                    |
| <b>rep preempt delay</b> | Configures a waiting period after a segment port failure and recovery before REP VLAN load balancing is triggered. |
| <b>show rep topology</b> | Displays REP topology information for a segment or for all the segments.                                           |

# rep segment

To enable Resilient Ethernet Protocol (REP) on an interface and to assign a segment ID to the interface, use the **rep segment** command in interface configuration mode. To disable REP on the interface, use the **no** form of this command.

**rep segment** *segment-id* [**edge** [**no-neighbor**] [**primary**] ] [**preferred**]  
**no rep segment**

## Syntax Description

|                    |                                                                                                                                                                                                                |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>segment-id</i>  | Segment for which REP is enabled. Assign a segment ID to the interface. The range is from 1 to 1024.                                                                                                           |
| <b>edge</b>        | (Optional) Configures the port as an edge port. Each segment has only two edge ports.                                                                                                                          |
| <b>no-neighbor</b> | (Optional) Specifies the segment edge as one with no external REP neighbor.                                                                                                                                    |
| <b>primary</b>     | (Optional) Specifies that the port is the primary edge port where you can configure VLAN load balancing. A segment has only one primary edge port.                                                             |
| <b>preferred</b>   | (Optional) Specifies that the port is the preferred alternate port or the preferred port for VLAN load balancing.                                                                                              |
| <b>Note</b>        | Configuring a port as a preferred port does not guarantee that it becomes the alternate port; it merely gives it a slight edge among equal contenders. The alternate port is usually a previously failed port. |

## Command Default

REP is disabled on the interface.

## Command Modes

Interface configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

REP ports must be a Layer 2 IEEE 802.1Q port or a 802.1AD port. You must configure two edge ports on each REP segment, a primary edge port and a secondary edge port.

If REP is enabled on two ports on a device, both the ports must be either regular segment ports or edge ports. REP ports follow these rules:

- If only one port on a device is configured in a segment, that port should be an edge port.
- If two ports on a device belong to the same segment, both the ports must be regular segment ports.
- If two ports on a device belong to the same segment, and one is configured as an edge port and one as a regular segment port (a misconfiguration), the edge port is treated as a regular segment port.

### Caution

REP interfaces come up in a blocked state and remain in a blocked state until notified that it is safe to unblock. Be aware of this to avoid sudden connection losses.

When REP is enabled on an interface, the default is for that port to be a regular segment port.

## Examples

The following example shows how to enable REP on a regular (nonedge) segment port:

```
Device> enable
Device# configure terminal
Device(config)# interface TenGigabitEthernet 4/1
Device(config-if)# rep segment 100
```

The following example shows how to enable REP on a port and identify the port as the REP primary edge port:

```
Device> enable
Device# configure terminal
Device(config)# interface TenGigabitEthernet 4/1
Device(config-if)# rep segment 100 edge primary
```

The following example shows how to enable REP on a port and identify the port as the REP secondary edge port:

```
Device> enable
Device# configure terminal
Device(config)# interface TenGigabitEthernet 4/1
Device(config-if)# rep segment 100 edge
```

The following example shows how to enable REP as an edge no-neighbor port:

```
Device> enable
Device# configure terminal
Device(config)# interface TenGigabitEthernet 4/1
Device(config-if)# rep segment 1 edge no-neighbor primary
```

## rep stcn

To configure a Resilient Ethernet Protocol (REP) edge port to send segment topology change notifications (STCNs) to another interface or to other segments, use the **rep stcn** command in interface configuration mode. To disable the task of sending STCNs to the interface or to the segment, use the **no** form of this command.

```
rep stcn {interface interface-id | segment segment-id-list}
no rep stcn {interface | segment}
```

|                    |                                                                                                                                                                                                                                                            |                                                                                                                                                                                         |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>interface</b> <i>interface-id</i>                                                                                                                                                                                                                       | Specifies a physical interface or port channel to receive STCNs.                                                                                                                        |
|                    | <b>segment</b> <i>segment-id-list</i>                                                                                                                                                                                                                      | Specifies one REP segment or a list of REP segments to receive STCNs. The segment range is from 1 to 1024. You can also configure a sequence of segments, for example, 3 to 5, 77, 100. |
| Command Default    | Transmission of STCNs to other interfaces or segments is disabled.                                                                                                                                                                                         |                                                                                                                                                                                         |
| Command Modes      | Interface configuration                                                                                                                                                                                                                                    |                                                                                                                                                                                         |
| Command History    | <b>Release</b>                                                                                                                                                                                                                                             | <b>Modification</b>                                                                                                                                                                     |
|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                               | This command was introduced.                                                                                                                                                            |
| Usage Guidelines   | You can verify your settings by entering the <b>show interfaces rep detail</b> command in privileged EXEC mode.                                                                                                                                            |                                                                                                                                                                                         |
| Examples           | <p>The following example shows how to configure a REP edge port to send STCNs to segments 25 to 50:</p> <pre>Device&gt; enable Device# configure terminal Device(config)# interface TenGigabitEthernet 4/1 Device(config-if)# rep stcn segment 25-50</pre> |                                                                                                                                                                                         |

# show avb domain

To display the AVB domain information, use the **show avb domain** command.

## show avb domain

| Command History | Release                   | Modification                 |
|-----------------|---------------------------|------------------------------|
|                 | Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

**Command Modes** Global configuration mode (#)

### Example:

The following is sample output from the **show avb domain** command:

Device# **show avb domain**

```

AVB Class-A
  Priority Code Point      : 3
  VLAN                    : 2
  Core ports              : 1
  Boundary ports          : 67

```

```

AVB Class-B
  Priority Code Point      : 2
  VLAN                    : 2
  Core ports              : 1
  Boundary ports          : 67

```

```

# show dot1q-tunnel

To display information about IEEE 802.1Q tunnel ports, use the **show dot1q-tunnel** in EXEC mode.

**show dot1q-tunnel** [**interface** *interface-id*]

## Syntax Description

**interface** *interface-id* (Optional) Specifies the interface for which to display IEEE 802.1Q tunneling information. Valid interfaces include physical ports and port channels.

## Command Default

None

## Command Modes

User EXEC

Privileged EXEC

## Command History

| Release                        | Modification                 |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.12.1 | This command was introduced. |

## Examples

The following are examples of output from the **show dot1q-tunnel** command:

```
Device# show dot1q-tunnel
```

```
dot1q-tunnel mode LAN Port(s)
```

```
-----
```

```
Gi1/0/1
```

```
Gi1/0/2
```

```
Gi1/0/3
```

```
Gi1/0/6
```

```
Po2
```

```
Device# show dot1q-tunnel interface gigabitethernet1/0/1
```

```
dot1q-tunnel mode LAN Port(s)
```

```
-----
```

```
Gi1/0/1
```

# show etherchannel

To display EtherChannel information for a channel, use the **show etherchannel** command in user EXEC mode.

**show etherchannel** [{ *channel-group-number* | { **detail** | **port** | **port-channel** | **protocol** | **summary** } } ] | [{ **detail** | **load-balance** | **port** | **port-channel** | **protocol** | **summary** | **platform** } ]

| Syntax Description          |                                                                                                    |
|-----------------------------|----------------------------------------------------------------------------------------------------|
| <i>channel-group-number</i> | (Optional)<br>Channel group number.<br>The range is 1 to 128.                                      |
| <b>detail</b>               | (Optional) Displays detailed EtherChannel information.                                             |
| <b>load-balance</b>         | (Optional) Displays the load-balance or frame-distribution scheme among ports in the port channel. |
| <b>port</b>                 | (Optional) Displays EtherChannel port information.                                                 |
| <b>port-channel</b>         | (Optional) Displays port-channel information.                                                      |
| <b>protocol</b>             | (Optional) Displays the protocol that is being used in the channel.                                |
| <b>summary</b>              | (Optional) Displays a one-line summary per channel group.                                          |
| <b>platform</b>             | (Optional) Displays channel-group platform specific fields.                                        |

|                      |           |
|----------------------|-----------|
| <b>Command Modes</b> | User EXEC |
|----------------------|-----------|

|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

If you do not specify a channel group number, all channel groups are displayed.

In the output, the passive port list field is displayed only for Layer 3 port channels. This field means that the physical port, which is still not up, is configured to be in the channel group (and indirectly is in the only port channel in the channel group).

This is an example of output from the **show etherchannel channel-group-number detail** command:

```
Device> show etherchannel 1 detail
Group state = L2
Ports: 2    Maxports = 16
Port-channels: 1 Max Port-channels = 16
Protocol:    LACP
              Ports in the group:
              -----
Port: Gi1/0/1
-----
Port state    = Up Mstr In-Bndl
```

```

Channel group = 1          Mode = Active          Gcchange = -
Port-channel =            PolGC = -              Pseudo port-channel = Po1
Port index   =            0Load = 0x00          Protocol = LACP

Flags: S - Device is sending Slow LACPDU      F - Device is sending fast LACPDU
      A - Device is in active mode.            P - Device is in passive mode.

Local information:

Port      Flags   State   LACP port  Admin  Oper  Port  Port
          State   Priority Key      Key   Number State
Gi1/0/1   SA      bndl    32768     0x1    0x1   0x101 0x3D
Gi1/0/2   A       bndl    32768     0x0    0x1   0x0    0x3D

Age of the port in the current state: 01d:20h:06m:04s

Port-channels in the group:
-----

Port-channel: Po1 (Primary Aggregator)

Age of the Port-channel = 01d:20h:20m:26s
Logical slot/port = 10/1          Number of ports = 2
HotStandBy port    = null
Port state         = Port-channel Ag-Inuse
Protocol           = LACP

Ports in the Port-channel:

Index  Load  Port      EC state      No of bits
-----+-----+-----+-----+-----
0      00     Gi1/0/1    Active         0
0      00     Gi1/0/2    Active         0

Time since last port bundled: 01d:20h:24m:44s Gi1/0/2

```

This is an example of output from the **show etherchannel channel-group-number summary** command:

```

Device> show etherchannel 1 summary
Flags: D - down P - in port-channel
      I - stand-alone s - suspended
      H - Hot-standby (LACP only)
      R - Layer3 S - Layer2
      u - unsuitable for bundling
      U - in use f - failed to allocate aggregator
      d - default port

Number of channel-groups in use: 1
Number of aggregators: 1

Group  Port-channel  Protocol  Ports

|------------------------|--------------------------------|------------------------------|
|                        | Cisco IOS XE Gibraltar 16.12.1 | This command was introduced. |

**Usage Guidelines** After enabling Layer 2 protocol tunneling on an access or IEEE 802.1Q tunnel port by using the **l2protocol-tunnel** interface configuration command, you can configure some or all of these parameters:

- Protocol type to be tunneled
- Shutdown threshold
- Drop threshold

If you enter the **show l2protocol-tunnel interface** command, only information about the active ports on which all the parameters are configured appears.

If you enter the **show l2protocol-tunnel summary** command, only information about the active ports on which some or all of the parameters are configured appears.

## Examples

This is an example of output from the **show l2protocol-tunnel** command:

```
Device> show l2protocol-tunnel
```

```
COS for Encapsulated Packets: 5
Drop Threshold for Encapsulated Packets: 0
```

| Port    | Protocol | Shutdown<br>Threshold | Drop<br>Threshold | Encapsulation<br>Counter | Decapsulation<br>Counter | Drop<br>Counter |

# show lacp

To display Link Aggregation Control Protocol (LACP) channel-group information, use the **show lacp** command in user EXEC mode.

**show lacp** [*channel-group-number*] {**counters** | **internal** | **neighbor** | **sys-id**}

|                           |                             |                                                                                                                                                   |
|---------------------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>channel-group-number</i> | (Optional) Channel group number.<br>The range is 1 to 128.                                                                                        |
|                           | <b>counters</b>             | Displays traffic information.                                                                                                                     |
|                           | <b>internal</b>             | Displays internal information.                                                                                                                    |
|                           | <b>neighbor</b>             | Displays neighbor information.                                                                                                                    |
|                           | <b>sys-id</b>               | Displays the system identifier that is being used by LACP. The system identifier consists of the LACP system priority and the device MAC address. |

|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

You can enter any **show lacp** command to display the active channel-group information. To display specific channel information, enter the **show lacp** command with a channel-group number.

If you do not specify a channel group, information for all channel groups appears.

You can enter the *channel-group-number* to specify a channel group for all keywords except **sys-id**.

This is an example of output from the **show lacp counters** user EXEC command. The table that follows describes the fields in the display.

```
Device> show lacp counters
          LACPDUs      Marker      Marker Response      LACPDUs
Port      Sent  Recv      Sent  Recv      Sent  Recv      Pkts  Err
-----
Channel group:1
Gi2/0/1      19    10         0    0         0    0         0
Gi2/0/2      14     6         0    0         0    0         0
```

**Table 102: show lacp counters Field Descriptions**

| Field                 | Description                                                    |
|-----------------------|----------------------------------------------------------------|
| LACPDUs Sent and Recv | The number of LACP packets sent and received by a port.        |
| Marker Sent and Recv  | The number of LACP marker packets sent and received by a port. |

| Field                         | Description                                                             |
|-------------------------------|-------------------------------------------------------------------------|
| Marker Response Sent and Recv | The number of LACP marker response packets sent and received by a port. |
| LACPDU Pkts and Err           | The number of unknown and illegal packets received by LACP for a port.  |

This is an example of output from the **show lacp internal** command:

```
Device> show lacp 1 internal
Flags:  S - Device is requesting Slow LACPDU
        F - Device is requesting Fast LACPDU
        A - Device is in Active mode      P - Device is in Passive mode
```

Channel group 1

| Port    | Flags | State | LACP port<br>Priority | Admin<br>Key | Oper<br>Key | Port<br>Number | Port<br>State |
|---------|-------|-------|-----------------------|--------------|-------------|----------------|---------------|
| Gi2/0/1 | SA    | bndl  | 32768                 | 0x3          | 0x3         | 0x4            | 0x3D          |
| Gi2/0/2 | SA    | bndl  | 32768                 | 0x3          | 0x3         | 0x5            | 0x3D          |

The following table describes the fields in the display:

**Table 103: show lacp internal Field Descriptions**

| Field              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| State              | <p>State of the specific port. These are the allowed values:</p> <ul style="list-style-type: none"> <li>• <b>—</b>—Port is in an unknown state.</li> <li>• <b>bndl</b>—Port is attached to an aggregator and bundled with other ports.</li> <li>• <b>susp</b>—Port is in a suspended state; it is not attached to any aggregator.</li> <li>• <b>hot-sby</b>—Port is in a hot-standby state.</li> <li>• <b>indiv</b>—Port is incapable of bundling with any other port.</li> <li>• <b>indep</b>—Port is in an independent state (not bundled but able to handle data traffic. In this case, LACP is not running on the partner port).</li> <li>• <b>down</b>—Port is down.</li> </ul> |
| LACP Port Priority | Port priority setting. LACP uses the port priority to put ports in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Field       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Admin Key   | Administrative key assigned to this port. LACP automatically generates an administrative key value as a hexadecimal number. The administrative key defines the ability of a port to aggregate with other ports. A port's ability to aggregate with other ports is determined by the port physical characteristics (for example, data rate and duplex capability) and configuration restrictions that you establish.                                                     |
| Oper Key    | Runtime operational key that is being used by this port. LACP automatically generates this value as a hexadecimal number.                                                                                                                                                                                                                                                                                                                                               |
| Port Number | Port number.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Port State  | <p>State variables for the port, encoded as individual bits within a single octet with these meanings:</p> <ul style="list-style-type: none"> <li>• bit0: LACP_Activity</li> <li>• bit1: LACP_Timeout</li> <li>• bit2: Aggregation</li> <li>• bit3: Synchronization</li> <li>• bit4: Collecting</li> <li>• bit5: Distributing</li> <li>• bit6: Defaulted</li> <li>• bit7: Expired</li> </ul> <p><b>Note</b> In the list above, bit7 is the MSB and bit0 is the LSB.</p> |

This is an example of output from the **show lacp neighbor** command:

```
Device> show lacp neighbor
```

```
Flags: S - Device is sending Slow LACPDUs   F - Device is sending Fast LACPDUs
       A - Device is in Active mode          P - Device is in Passive mode
```

```
Channel group 3 neighbors
```

```
Partner's information:

This is an example of output from the **show lacp sys-id** command:

```
Device> show lacp sys-id
32765,0002.4b29.3a00
```

The system identification is made up of the system priority and the system MAC address. The first two bytes are the system priority, and the last six bytes are the globally administered individual MAC address associated to the system.

# show loopdetect

To display the details of all the interfaces where loop-detection guard is enabled, use the **show loopdetect** command in user EXEC or privileged EXEC mode.

**Syntax Description** This command has no arguments or keywords.

**Command Default** None

**Command Modes** User EXEC (>)  
Privileged EXEC(#)

| Command History | Release                       | Modification                 |
|-----------------|-------------------------------|------------------------------|
|                 | Cisco IOS XE Amsterdam 17.2.1 | This command was introduced. |

## Examples

The following is a sample output of the **show loopdetect** command:

```
Device# show loopdetect
Interface Interval Elapsed-Time Port-to-Errdisbale ACTION
-----
Twe1/0/1      5          3      errdisable Source Port  SYSLOG
Twe1/0/20     5          0      errdisable Source Port  ERRDISABLE
Twe2/0/3      5          2      errdisable Dest Port    ERRDISABLE
Loopdetect is ENABLED
```

The table below describes the significant fields shown in the display.

**Table 104: show loopdetect Field Descriptions**

| Field              | Description                                                                        |
|--------------------|------------------------------------------------------------------------------------|
| Interface          | Displays the interfaces that have loop-detection guard enabled.                    |
| Interval           | Displays the time interval set to send the loop-detect frames in seconds.          |
| Elapsed-Time       | Displays the time elapsed within the set time interval to send loop-detect frames. |
| Port-to-Errdisbale | Displays the port that is configured to be error-disabled.                         |
| Action             | Displays the action the system will take when it detects a network loop.           |

# show msrp port bandwidth

To display Multiple Stream Reservation Protocol (MSRP) port bandwidth information, use the **show msrp port bandwidth** command.

**show msrp port bandwidth**

| Command History | Release                   | Modification                 |
|-----------------|---------------------------|------------------------------|
|                 | Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

**Command Modes** Global configuration mode (#)

## Example:

The following is sample output from the **show msrp port bandwidth** command:

Device# **show msrp port bandwidth**

| Ethernet Interface | Capacity (Kbit/s) | Assigned A   B | Available A   B | Reserved A   B |
|--------------------|-------------------|----------------|-----------------|----------------|
| Te1/0/1            | 10000000          | 75   0         | 75   75         | 0   0          |
| Te1/0/2            | 10000000          | 75   0         | 75   75         | 0   0          |
| Te1/0/3            | 1000000           | 75   0         | 75   75         | 0   0          |
| Te1/0/4            | 10000000          | 75   0         | 75   75         | 0   0          |
| Te1/0/5            | 10000000          | 75   0         | 75   75         | 0   0          |

# show msrp streams

To display information about the Multiple Stream Reservation Protocol (MSRP) streams, use the **show msrp streams** command.

**show msrp streams** [ **detailed** | **brief** ]

|                    |                               |                                            |
|--------------------|-------------------------------|--------------------------------------------|
| Syntax Description | <b>detailed</b>               | Displays detailed MSRP stream information. |
|                    | <b>brief</b>                  | Displays MSRP stream information in brief. |
| Command History    | <b>Release</b>                | <b>Modification</b>                        |
|                    | Cisco IOS XE Fuji 16.8.1a     | This command was introduced.               |
| Command Modes      | Global configuration mode (#) |                                            |

## Example:

The following is sample output from the **show msrp streams** command:

```
Device# show msrp streams

-----
Stream ID Talker Listener
Advertise Fail Ready ReadyFail AskFail
R | D R | D R | D R | D R | D
-----
yy:yy:yy:yy:yy:yy:0001 1 | 2 0 | 0 1 | 0 0 | 1 1 | 0
zz:zz:zz:zz:zz:zz:0002 1 | 0 0 | 1 1 | 0 0 | 0 0 | 1
```

The following is sample output from the **show msrp streams detailed** command:

```
Device# show msrp streams detailed

# show pagp

To display Port Aggregation Protocol (PAgP) channel-group information, use the **show pagp** command in EXEC mode.

**show pagp** [*channel-group-number*] {**counters** | **dual-active** | **internal** | **neighbor**}

## Syntax Description

*channel-group-number* (Optional) Channel group number.  
The range is 1 to 128.

**counters** Displays traffic information.

**dual-active** Displays the dual-active status.

**internal** Displays internal information.

**neighbor** Displays neighbor information.

## Command Modes

User EXEC

Privileged EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

You can enter any **show pagp** command to display the active channel-group information. To display the nonactive information, enter the **show pagp** command with a channel-group number.

## Examples

This is an example of output from the **show pagp 1 counters** command:

```
Device> show pagp 1 counters
          Information      Flush
Port      Sent   Recv      Sent   Recv
-----
Channel group: 1
Gi1/0/1   45     42         0       0
Gi1/0/2   45     41         0       0
```

This is an example of output from the **show pagp dual-active** command:

```
Device> show pagp dual-active
PAgP dual-active detection enabled: Yes
PAgP dual-active version: 1.1

Channel group 1
          Dual-Active      Partner          Partner  Partner
Port      Detect Capable  Name            Port      Version
Gi1/0/1   No              -p2             Gi3/0/3   N/A
Gi1/0/2   No              -p2             Gi3/0/4   N/A

<output truncated>
```

This is an example of output from the **show pagp 1 internal** command:

```
Device> show pagp 1 internal
Flags: S - Device is sending Slow hello. C - Device is in Consistent state.
       A - Device is in Auto mode.
Timers: H - Hello timer is running. Q - Quit timer is running.
        S - Switching timer is running. I - Interface timer is running.
```

Channel group 1

| Port    | Flags | State | Timers | Hello Interval | Partner Count | PAGP Priority | Learning Method | Group Ifindex |
|---------|-------|-------|--------|----------------|---------------|---------------|-----------------|---------------|
| Gil/0/1 | SC    | U6/S7 | H      | 30s            | 1             | 128           | Any             | 16            |
| Gil/0/2 | SC    | U6/S7 | H      | 30s            | 1             | 128           | Any             | 16            |

This is an example of output from the **show pagp 1 neighbor** command:

```
Device> show pagp 1 neighbor
```

```
Flags: S - Device is sending Slow hello. C - Device is in Consistent state.
       A - Device is in Auto mode. P - Device learns on physical port.
```

Channel group 1 neighbors

| Port    | Partner Name | Partner Device ID | Partner Port | Age    | Partner Flags | Group Cap. |
|---------|--------------|-------------------|--------------|--------|---------------|------------|
| Gil/0/1 | -p2          | 0002.4b29.4600    | Gi01//1      | 9s SC  | 10001         |            |
| Gil/0/2 | -p2          | 0002.4b29.4600    | Gil/0/2      | 24s SC | 10001         |            |

# show platform etherchannel

To display platform-dependent EtherChannel information, use the **show platform etherchannel** command in privileged EXEC mode.

**show platform etherchannel** *channel-group-number* {**group-mask** | **load-balance** **mac** *src-mac* *dst-mac* [**ip** *src-ip* *dst-ip* [**port** *src-port* *dst-port*]]} [**switch** *switch-number*]

## Syntax Description

|                                             |                                                                     |
|---------------------------------------------|---------------------------------------------------------------------|
| <i>channel-group-number</i>                 | Channel group number.<br>The range is 1 to 128.                     |
| <b>group-mask</b>                           | Displays EtherChannel group mask.                                   |
| <b>load-balance</b>                         | Tests EtherChannel load-balance hash algorithm.                     |
| <b>mac</b> <i>src-mac</i> <i>dst-mac</i>    | Specifies the source and destination MAC addresses.                 |
| <b>ip</b> <i>src-ip</i> <i>dst-ip</i>       | (Optional) Specifies the source and destination IP addresses.       |
| <b>port</b> <i>src-port</i> <i>dst-port</i> | (Optional) Specifies the source and destination layer port numbers. |
| <b>switch</b> <i>switch-number</i>          | (Optional) Specifies the stack member.                              |

| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use this command only when you are working directly with a technical support representative while troubleshooting a problem.

Do not use this command unless a technical support representative asks you to do so.

# show platform hardware fed active vlan ingress

To display if native vlan tagging is enabled or disabled for a particular vlan, use the **show platform hardware fed active vlan ingress**

**show platform hardware fed active vlan** *vlan ID* **ingress**

## Syntax Description

| Syntax                     | Description                                                                    |
|----------------------------|--------------------------------------------------------------------------------|
| <b>vlan</b> <i>vlan ID</i> | Specifies the VLAN ID.                                                         |
| <b>ingress</b>             | Specifies Spanning Tree Protocol (STP) state information in ingress direction. |

## Command Modes

Privileged EXEC mode (#)

## Command History

| Release                        | Modification                 |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.11.1 | This command was introduced. |

## Example

The following is sample output from the **show platform hardware fed active vlan ingress** command:

```
Device# show platform hardware fed active vlan 1 ingress
VLAN STP State in hardware
```

```
vlan id is:: 1
```

```
Interfaces in forwarding state: : Hu1/0/45(Tagged)
```

```
flood list: : Hu1/0/45
```

# show platform pm

To display platform-dependent port manager information, use the **show platform pm** command in privileged EXEC mode.

**show platform pm** {**etherchannel** *channel-group-number* **group-mask** | **interface-numbers** | **port-data** *interface-id* | **port-state**}

## Syntax Description

|                                                                   |                                                                                                           |
|-------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>etherchannel</b> <i>channel-group-number</i> <b>group-mask</b> | Displays the EtherChannel group-mask table for the specified channel group.<br><br>The range is 1 to 128. |
| <b>interface-numbers</b>                                          | Displays interface numbers information.                                                                   |
| <b>port-data</b> <i>interface-id</i>                              | Displays port data information for the specified interface.                                               |
| <b>port-state</b>                                                 | Displays port state information.                                                                          |

## Command Modes

Privileged EXEC

## Command History

## Usage Guidelines

Use this command only when you are working directly with your technical support representative while troubleshooting a problem.

Do not use this command unless your technical support representative asks you to do so.

# show platform software fed active ptp interface loopback

To display the Precision Time Protocol (PTP) connection details and events of the specified loopback interface, use the **show platform software fed active ptp interface loopback** command in privileged EXEC mode.

**show platform software fed active ptp interface** *value*

|                           |                               |                                                                             |
|---------------------------|-------------------------------|-----------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>value</i>                  | Loopback interface number. The maximum number of sessions supported is 127. |
| <b>Command Default</b>    | None                          |                                                                             |
| <b>Command Modes</b>      | Privileged EXEC (#)           |                                                                             |
| <b>Command History</b>    | <b>Release</b>                | <b>Modification</b>                                                         |
|                           | Cisco IOS XE Bengaluru 17.5.1 | This command was introduced.                                                |

## Examples

The following is a sample output of the **show platform software fed active ptp interface loopback** command:

```
Device> enable
Device# show platform software fed active ptp interface loopback 0
```

## show platform software fed switch ptp

To display information about ptp status on the port, use the **show platform software fed switch ptp** command.

**show platform software fed switch** { *switch-number* | **active** | **standby** } **ptp** { **domain** *domain-value* | **if-id** *value* | **test** }

|                           |                                    |                                                                                                        |
|---------------------------|------------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>switch</b> <i>switch-number</i> | Displays information about the switch. Valid values for <i>switch-number</i> argument are from 0 to 9. |
|                           | <b>active</b>                      | Displays information about the active instance of the switch.                                          |
|                           | <b>standby</b>                     | Displays information about the standby instance of the switch.                                         |
|                           | <b>domain</b> <i>domain-value</i>  | Displays information about the specified domain.                                                       |
|                           | <b>if-id</b> <i>value</i>          | Displays information about the specified interface.                                                    |
|                           | <b>test</b>                        | Executes ptp test                                                                                      |

|                        |                           |                              |
|------------------------|---------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>            | <b>Modification</b>          |
|                        | Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

```

# show rep topology

To display Resilient Ethernet Protocol (REP) topology information for a segment or for all the segments, including the primary and secondary edge ports in the segment, use the **show rep topology** command in privileged EXEC mode.

**show rep topology** [**segment** *segment-id*] [**archive**] [**detail**]

|                           |                                  |                                                                                                                                    |
|---------------------------|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>segment</b> <i>segment-id</i> | (Optional) Specifies the segment for which to display the REP topology information. The <i>segment-id</i> range is from 1 to 1024. |
|                           | <b>archive</b>                   | (Optional) Displays the previous topology of the segment. This keyword is useful for troubleshooting a link failure.               |
|                           | <b>detail</b>                    | (Optional) Displays detailed REP topology information.                                                                             |
| <b>Command Modes</b>      | Privileged EXEC                  |                                                                                                                                    |
| <b>Command History</b>    | <b>Release</b>                   | <b>Modification</b>                                                                                                                |
|                           | Cisco IOS XE Everest 16.5.1a     | This command was introduced.                                                                                                       |

## Examples

The following is a sample output from the **show rep topology** command:

```
Device# show rep topology

REP Segment 1
BridgeName      PortName      Edge Role
-----
10.64.106.63    Te5/4         Pri  Open
10.64.106.228   Te3/4         Open
10.64.106.228   Te3/3         Open
10.64.106.67    Te4/3         Open
10.64.106.67    Te4/4         Alt
10.64.106.63    Te4/4         Sec  Open

REP Segment 3
BridgeName      PortName      Edge Role
-----
10.64.106.63    Gi50/1        Pri  Open
SVT_3400_2      Gi0/3         Open
SVT_3400_2      Gi0/4         Open
10.64.106.68    Gi40/2        Open
10.64.106.68    Gi40/1        Open
10.64.106.63    Gi50/2        Sec  Alt
```

The following is a sample output from the **show rep topology detail** command:

```
Device# show rep topology detail

REP Segment 1
10.64.106.63, Te5/4 (Primary Edge)
  Open Port, all vlans forwarding
  Bridge MAC: 0005.9b2e.1700
  Port Number: 010
```

```
Port Priority: 000
Neighbor Number: 1 / [-6]
10.64.106.228, Te3/4 (Intermediate)
Open Port, all vlans forwarding
Bridge MAC: 0005.9b1b.1f20
Port Number: 010
Port Priority: 000
Neighbor Number: 2 / [-5]
10.64.106.228, Te3/3 (Intermediate)
Open Port, all vlans forwarding
Bridge MAC: 0005.9b1b.1f20
Port Number: 00E
Port Priority: 000
Neighbor Number: 3 / [-4]
10.64.106.67, Te4/3 (Intermediate)
Open Port, all vlans forwarding
Bridge MAC: 0005.9b2e.1800
Port Number: 008
Port Priority: 000
Neighbor Number: 4 / [-3]
10.64.106.67, Te4/4 (Intermediate)
Alternate Port, some vlans blocked
Bridge MAC: 0005.9b2e.1800
Port Number: 00A
Port Priority: 000
Neighbor Number: 5 / [-2]
10.64.106.63, Te4/4 (Secondary Edge)
Open Port, all vlans forwarding
Bridge MAC: 0005.9b2e.1700
Port Number: 00A
Port Priority: 000
Neighbor Number: 6 / [-1]
```

# show udld

To display UniDirectional Link Detection (UDLD) administrative and operational status for all ports or the specified port, use the **show udld** command in user EXEC mode.

**show udld** [**Auto-Template** | **Capwap** | **GigabitEthernet** | **GroupVI** | **InternalInterface** | **Loopback** | **Null** | **Port-channel** | **TenGigabitEthernet** | **Tunnel** | **Vlan**] *interface\_number*  
**show udld neighbors**

| Syntax Description        |  |                                                                                                                    |
|---------------------------|--|--------------------------------------------------------------------------------------------------------------------|
| <b>Auto-Template</b>      |  | (Optional) Displays UDLD operational status of the auto-template interface. The range is from 1 to 999.            |
| <b>Capwap</b>             |  | (Optional) Displays UDLD operational status of the CAPWAP interface. The range is from 0 to 2147483647.            |
| <b>GigabitEthernet</b>    |  | (Optional) Displays UDLD operational status of the GigabitEthernet interface. The range is from 0 to 9.            |
| <b>GroupVI</b>            |  | (Optional) Displays UDLD operational status of the group virtual interface. The range is from 1 to 255.            |
| <b>InternalInterface</b>  |  | (Optional) Displays UDLD operational status of the internal interface. The range is from 0 to 9.                   |
| <b>Loopback</b>           |  | (Optional) Displays UDLD operational status of the loopback interface. The range is from 0 to 2147483647.          |
| <b>Null</b>               |  | (Optional) Displays UDLD operational status of the null interface.                                                 |
| <b>Port-channel</b>       |  | (Optional) Displays UDLD operational status of the Ethernet channel interfaces.<br><br>The range is 1 to 128.      |
| <b>TenGigabitEthernet</b> |  | (Optional) Displays UDLD operational status of the Ten Gigabit Ethernet interface. The range is from 0 to 9.       |
| <b>Tunnel</b>             |  | (Optional) Displays UDLD operational status of the tunnel interface. The range is from 0 to 2147483647.            |
| <b>Vlan</b>               |  | (Optional) Displays UDLD operational status of the VLAN interface. The range is from 1 to 4095.                    |
| <i>interface-id</i>       |  | (Optional) ID of the interface and port number. Valid interfaces include physical ports, VLANs, and port channels. |
| <b>neighbors</b>          |  | (Optional) Displays neighbor information only.                                                                     |

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

If you do not enter an interface ID, administrative and operational UDLD status for all interfaces appear.

This is an example of output from the **show udld interface-id** command. For this display, UDLD is enabled on both ends of the link, and UDLD detects that the link is bidirectional. The table that follows describes the fields in this display.

```
Device> show udld gigabitethernet2/0/1
Interface gi2/0/1
---
Port enable administrative configuration setting: Follows device default
Port enable operational state: Enabled
Current bidirectional state: Bidirectional
Current operational state: Advertisement - Single Neighbor detected
Message interval: 60
Time out interval: 5
Entry 1
Expiration time: 146
Device ID: 1
Current neighbor state: Bidirectional
Device name: Switch-A
Port ID: Gi2/0/1
Neighbor echo 1 device: Switch-B
Neighbor echo 1 port: Gi2/0/2
Message interval: 5
CDP Device name: Switch-A
```

**Table 105: show udld Field Descriptions**

| Field                                            | Description                                                                                                                                                                                                                                                              |
|--------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                                        | The interface on the local device configured for UDLD.                                                                                                                                                                                                                   |
| Port enable administrative configuration setting | How UDLD is configured on the port. If UDLD is enabled or disabled, the port enable configuration setting is the same as the operational enable state. Otherwise, the enable operational setting depends on the global enable setting.                                   |
| Port enable operational state                    | Operational state that shows whether UDLD is actually running on this port.                                                                                                                                                                                              |
| Current bidirectional state                      | The bidirectional state of the link. An unknown state appears if the link is down or if it is connected to an UDLD-incapable device. A bidirectional state appears if the link is a normal two-way connection to a UDLD-capable device. All other values mean miswiring. |

| Field                     | Description                                                                                                                                                                                                                                   |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Current operational state | The current phase of the UDLD state machine. For a normal bidirectional link, the state machine is most often in the Advertisement phase.                                                                                                     |
| Message interval          | How often advertisement messages are sent from the local device. Measured in seconds.                                                                                                                                                         |
| Time out interval         | The time period, in seconds, that UDLD waits for echoes from a neighbor device during the detection window.                                                                                                                                   |
| Entry 1                   | Information from the first cache entry, which contains a copy of echo information received from the neighbor.                                                                                                                                 |
| Expiration time           | The amount of time in seconds remaining before this cache entry is aged out.                                                                                                                                                                  |
| Device ID                 | The neighbor device identification.                                                                                                                                                                                                           |
| Current neighbor state    | The neighbor's current state. If both the local and neighbor devices are running UDLD normally, the neighbor state and local state should be bidirectional. If the link is down or the neighbor is not UDLD-capable, no cache entries appear. |
| Device name               | The device name or the system serial number of the neighbor. The system serial number appears if the device name is not set or is set to the default (Switch).                                                                                |
| Port ID                   | The neighbor port ID enabled for UDLD.                                                                                                                                                                                                        |
| Neighbor echo 1 device    | The device name of the neighbors' neighbor from which the echo originated.                                                                                                                                                                    |
| Neighbor echo 1 port      | The port number ID of the neighbor from which the echo originated.                                                                                                                                                                            |
| Message interval          | The rate, in seconds, at which the neighbor is sending advertisement messages.                                                                                                                                                                |
| CDP device name           | The CDP device name or the system serial number. The system serial number appears if the device name is not set or is set to the default (Switch).                                                                                            |

This is an example of output from the **show udld neighbors** command:

```
Device> enable
Device# show udld neighbors
Port      Device Name      Device ID  Port-ID  OperState
-----
Gi2/0/1   Switch-A          1          Gi2/0/1  Bidirectional
```

show uddl

Gi3/0/1 Switch-A 2 Gi3/0/1 Bidirectional

# show vlan dot1q tag native

To display the status of tagging on the native VLAN use the **show vlan dot1q tag native** command.

**show vlan dot1q tag native**

## Syntax Description

This command has no arguments or keywords.

### Command Modes

Privileged EXEC mode (#)

### Command History

| Release                                                        | Modification                 |
|----------------------------------------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a<br>Cisco IOS XE Gibraltar 16.11.1 | This command was introduced. |

## Example

The following is sample output from the **show vlan dot1q tag native** command:

```
Device# show vlan dot1q tag native
*Feb 1 06:47:30.719: %SYS-5-CONFIG_I: Configured from console by console
dot1q native vlan tagging is enabled globally

Per Port Native Vlan Tagging State
-----

Port          Operational      Native VLAN
              Mode           Tagging State
-----
Hu1/0/45     trunk           enabled
```

# source ip interface

To configure the source IP address, use the **source ip interface** command in property transport sub-configuration mode.

**source ip interface** *interface\_id*

|                           |                                                                                          |                              |

## Examples

The following example shows how to configure the source IP address:

```
Device> enable
Device# configure terminal
Device(config)# ptp property cisco1
Device(config-property)# transport unicast ipv4 local loopback 0
Device(config-property-transport)# source ip interface GigabitEthernet 1/0/1
Device(config-property-transport)# end
```

|----------------------------------------------|-----------------------------------------------------------------|
| <b>ptp dot1as extend property</b>            | Extends IEEE 802.1AS profile to a PTP property name.            |
| <b>ptp property</b>                          | Sets the PTP property name.                                     |
| <b>transport unicast ipv4 local loopback</b> | Configures a unicast IPv4 connection from a loopback interface. |

# switchport

To put an interface that is in Layer 3 mode into Layer 2 mode for Layer 2 configuration, use the **switchport** command in interface configuration mode. To put an interface in Layer 3 mode, use the **no** form of this command.

**switchport**  
**no switchport**

|                         |                                                                                                                                                                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | Use the <b>no switchport</b> command (without parameters) to set the interface to the routed-interface status and to erase all Layer 2 configurations. You must use this command before assigning an IP address to a routed port. |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Entering the **no switchport** command shuts the port down and then reenables it, which might generate messages on the device to which the port is connected.

When you put an interface that is in Layer 2 mode into Layer 3 mode (or the reverse), the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration.

|             |                                                                                                                                                                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Note</b> | If an interface is configured as a Layer 3 interface, you must first enter the <b>switchport</b> command to configure the interface as a Layer 2 port. Then you can enter the <b>switchport access vlan</b> and <b>switchport mode</b> commands. |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The **switchport** command is not used on platforms that do not support Cisco-routed ports. All physical ports on such platforms are assumed to be Layer 2-switched interfaces.

You can verify the port status of an interface by entering the **show running-config** privileged EXEC command.

## Examples

This example shows how to cause an interface to cease operating as a Layer 2 port and become a Cisco-routed port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# no switchport
```

This example shows how to cause the port interface to cease operating as a Cisco-routed port and convert to a Layer 2 switched interface:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# switchport
```

# switchport access vlan

To configure a port as a static-access port, use the **switchport access vlan** command in interface configuration mode. To reset the access mode to the default VLAN mode for the device, use the **no** form of this command.

**switchport access vlan** {*vlan-id* }  
**no switchport access vlan**

## Syntax Description

*vlan-id* VLAN ID of the access mode VLAN; the range is 1 to 4094.

## Command Default

The default access VLAN and trunk interface native VLAN is a default VLAN corresponding to the platform or interface hardware.

## Command Modes

Interface configuration

## Command History

### Release

Cisco IOS XE Everest 16.5.1a

### Modification

This command was introduced.

## Usage Guidelines

The port must be in access mode before the **switchport access vlan** command can take effect.

If the switchport mode is set to **access vlan** *vlan-id*, the port operates as a member of the specified VLAN. An access port can be assigned to only one VLAN.

The **no switchport access** command resets the access mode VLAN to the appropriate default VLAN for the device.

## Examples

This example shows how to change a switched port interface that is operating in access mode to operate in VLAN 2 instead of the default VLAN:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# switchport access vlan 2
```

# switchport mode

To configure the VLAN membership mode of a port, use the **switchport mode** command in interface configuration mode. To reset the mode to the appropriate default for the device, use the **no** form of this command.

**switchport mode** {access | dynamic | {auto | desirable} | trunk}  
**no switchport mode** {access | dynamic | {auto | desirable} | trunk}

| <b>Syntax Description</b>    | <table> <tr> <td data-bbox="386 569 581 600"><b>access</b></td><td data-bbox="597 569 1528 737">Sets the port to access mode (either static-access or dynamic-access depending on the setting of the <b>switchport access vlan</b> interface configuration command). | <b>dynamic auto</b>          | Sets the port trunking mode dynamic parameter to auto to specify that the interface convert the link to a trunk link. This is the default switchport mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                |                                                                                                                                                                                                                                                                                                                                                                                   |                              |                                                                                                                                                            |                          |                                                                                                                                                |              |                                                                                                                                                                                                                                                                                |
| <b>dynamic desirable</b>     | Sets the port trunking mode dynamic parameter to desirable to specify that the interface actively attempt to convert the link to a trunk link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                |                                                                                                                                                                                                                                                                                                                                                                                   |                              |                                                                                                                                                            |                          |                                                                                                                                                |              |                                                                                                                                                                                                                                                                                |
| <b>trunk</b>                 | Sets the port to trunk unconditionally. The port is a trunking VLAN Layer 2 interface. The port sends and receives encapsulated (tagged) frames that identify the VLAN of origination. A trunk is a point-to-point link between two switches or between a switch and a router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                |                                                                                                                                                                                                                                                                                                                                                                                   |                              |                                                                                                                                                            |                          |                                                                                                                                                |              |                                                                                                                                                                                                                                                                                |

| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                |                                                                                                                                                                                                                                                                                                                                                                                   |                              |                                                                                                                                                            |                          |                                                                                                                                                |              |                                                                                                                                                                                                                                                                                |
| <b>Usage Guidelines</b>      | <p>A configuration that uses the <b>access</b>, or <b>trunk</b> keywords takes effect only when you configure the port in the appropriate mode by using the <b>switchport mode</b> command. The static-access and trunk configuration are saved, but only one configuration is active at a time.</p> <p>When you enter <b>access</b> mode, the interface changes to permanent nontrunking mode and negotiates to convert the link into a nontrunk link even if the neighboring interface does not agree to the change.</p> <p>When you enter <b>trunk</b> mode, the interface changes to permanent trunking mode and negotiates to convert the link into a trunk link even if the interface connecting to it does not agree to the change.</p> <p>When you enter <b>dynamic auto</b> mode, the interface converts the link to a trunk link if the neighboring interface is set to <b>trunk</b> or <b>desirable</b> mode.</p> <p>When you enter <b>dynamic desirable</b> mode, the interface becomes a trunk interface if the neighboring interface is set to <b>trunk</b>, <b>desirable</b>, or <b>auto</b> mode.</p>                                                                                                                                                                                                                                                                                                |                |                                                                                                                                                                                                                                                                                                                                                                                   |                              |                                                                                                                                                            |                          |                                                                                                                                                |              |                                                                                                                                                                                                                                                                                |

To autonegotiate trunking, the interfaces must be in the same VLAN Trunking Protocol (VTP) domain. Trunk negotiation is managed by the Dynamic Trunking Protocol (DTP), which is a point-to-point protocol. However, some internetworking devices might forward DTP frames improperly, which could cause misconfigurations. To avoid this problem, configure interfaces connected to devices that do not support DTP to not forward DTP frames, which turns off DTP.

- If you do not intend to trunk across those links, use the **switchport mode access** command in interface configuration mode to disable trunking.
- To enable trunking to a device that does not support DTP, use the **switchport mode trunk** and **switchport nonegotiate** commands in interface configuration mode to cause the interface to become a trunk but to not generate DTP frames.

Access ports and trunk ports are mutually exclusive.

The IEEE 802.1x feature interacts with switchport modes in these ways:

- If you try to enable IEEE 802.1x on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, the port mode is not changed.
- If you try to enable IEEE 802.1x on a port set to **dynamic auto** or **dynamic desirable**, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to **dynamic auto** or **dynamic desirable**, the port mode is not changed.
- If you try to enable IEEE 802.1x on a dynamic-access (VLAN Query Protocol [VQP]) port, an error message appears, and IEEE 802.1x is not enabled. If you try to change an IEEE 802.1x-enabled port to dynamic VLAN assignment, an error message appears, and the VLAN configuration is not changed.

You can verify your settings by entering the **show interfaces interface-id switchport** command in privileged EXEC mode and examining information in the *Administrative Mode* and *Operational Mode* rows.

## Examples

This example shows how to configure a port for access mode:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# switchport mode access
```

This example shows how set the port to dynamic desirable mode:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# switchport mode dynamic desirable
```

This example shows how to configure a port for trunk mode:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# switchport mode trunk
```

# switchport nonegotiate

To specify that Dynamic Trunking Protocol (DTP) negotiation packets are not sent on the Layer 2 interface, use the **switchport nonegotiate** command in interface configuration mode. Use the **no** form of this command to return to the default setting.

**switchport nonegotiate**  
**no switchport nonegotiate**

**Command Default** The default is to use DTP negotiation to learn the trunking status.

**Command Modes** Interface configuration

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

The **no switchport nonegotiate** command removes nonegotiate status.

This command is valid only when the interface switchport mode is access or trunk (configured by using the **switchport mode access** or the **switchport mode trunk** interface configuration command). This command returns an error if you attempt to execute it in dynamic (auto or desirable) mode.

Internetworking devices that do not support DTP might forward DTP frames improperly and cause misconfigurations. To avoid this problem, turn off DTP by using the **switchport nonegotiate** command to configure the interfaces connected to devices that do not support DTP to not forward DTP frames.

When you enter the **switchport nonegotiate** command, DTP negotiation packets are not sent on the interface. The device does or does not trunk according to the **mode** parameter: **access** or **trunk**.

- If you do not intend to trunk across those links, use the **switchport mode access** interface configuration command to disable trunking.
- To enable trunking on a device that does not support DTP, use the **switchport mode trunk** and **switchport nonegotiate** interface configuration commands to cause the interface to become a trunk but to not generate DTP frames.

This example shows how to cause a port to refrain from negotiating trunking mode and to act as a trunk or access port (depending on the mode set):

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# switchport nonegotiate
```

You can verify your setting by entering the **show interfaces interface-id switchport** command in privileged EXEC mode.

# switchport trunk

To set the trunk characteristics when the interface is in trunking mode, use the **switchport trunk** command in interface configuration mode. To reset a trunking characteristic to the default, use the **no** form of this command.

**switchport trunk** {**allowed vlan** *vlan-list* | **native vlan** *vlan-id* | **pruning vlan** *vlan-list*}  
**no switchport trunk** {**allowed vlan** | **native vlan** | **pruning vlan**}

## Syntax Description

|                                      |                                                                                                                                                                                       |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>allowed vlan</b> <i>vlan-list</i> | Sets the list of allowed VLANs that can receive and send traffic on this interface in tagged format when in trunking mode. See the Usage Guidelines for the <i>vlan-list</i> choices. |
| <b>native vlan</b> <i>vlan-id</i>    | Sets the native VLAN for sending and receiving untagged traffic when the interface is in IEEE 802.1Q trunking mode. The range is 1 to 4094.                                           |
| <b>pruning vlan</b> <i>vlan-list</i> | Sets the list of VLANs that are eligible for VTP pruning when in trunking mode. See the Usage Guidelines for the <i>vlan-list</i> choices.                                            |

## Command Default

VLAN 1 is the default native VLAN ID on the port.  
 The default for all VLAN lists is to include all VLANs.

## Command Modes

Interface configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The *vlan-list* format is **all** | **none** | [**add** | **remove** | **except**] *vlan-atom* [,*vlan-atom*...]:

- **all** specifies all VLANs from 1 to 4094. This is the default. This keyword is not allowed on commands that do not permit all VLANs in the list to be set at the same time.
- **none** specifies an empty list. This keyword is not allowed on commands that require certain VLANs to be set or at least one VLAN to be set.
- **add** adds the defined list of VLANs to those currently set instead of replacing the list. Valid IDs are from 1 to 1005; extended-range VLANs (VLAN IDs greater than 1005) are valid in some cases.

### Note

You can add extended-range VLANs to the allowed VLAN list, but not to the pruning-eligible VLAN list.

Separate nonconsecutive VLAN IDs with a comma; use a hyphen to designate a range of IDs.

- **remove** removes the defined list of VLANs from those currently set instead of replacing the list. Valid IDs are from 1 to 1005; extended-range VLAN IDs are valid in some cases.

**Note** You can remove extended-range VLANs from the allowed VLAN list, but you cannot remove them from the pruning-eligible list.

- **except** lists the VLANs that should be calculated by inverting the defined list of VLANs. (VLANs are added except the ones specified.) Valid IDs are from 1 to 1005. Separate nonconsecutive VLAN IDs with a comma; use a hyphen to designate a range of IDs.
- *vlan-atom* is either a single VLAN number from 1 to 4094 or a continuous range of VLANs described by two VLAN numbers, the lesser one first, separated by a hyphen.

#### Native VLANs:

- All untagged traffic received on an IEEE 802.1Q trunk port is forwarded with the native VLAN configured for the port.
- If a packet has a VLAN ID that is the same as the sending-port native VLAN ID, the packet is sent without a tag; otherwise, the switch sends the packet with a tag.
- The **no** form of the **native vlan** command resets the native mode VLAN to the appropriate default VLAN for the device.

#### Allowed VLAN:

- To reduce the risk of spanning-tree loops or storms, you can disable VLAN 1 on any individual VLAN trunk port by removing VLAN 1 from the allowed list. When you remove VLAN 1 from a trunk port, the interface continues to send and receive management traffic, for example, Cisco Discovery Protocol (CDP), Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), Dynamic Trunking Protocol (DTP), and VLAN Trunking Protocol (VTP) in VLAN 1.
- The **no** form of the **allowed vlan** command resets the list to the default list, which allows all VLANs.

#### Trunk pruning:

- The pruning-eligible list applies only to trunk ports.
- Each trunk port has its own eligibility list.
- If you do not want a VLAN to be pruned, remove it from the pruning-eligible list. VLANs that are pruning-ineligible receive flooded traffic.
- VLAN 1, VLANs 1002 to 1005, and extended-range VLANs (VLANs 1006 to 4094) cannot be pruned.

This example shows how to configure VLAN 3 as the default for the port to send all untagged traffic:

```
Device> enable
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport trunk native vlan 3
```

This example shows how to add VLANs 1, 2, 5, and 6 to the allowed list:

```
Device> enable
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport trunk allowed vlan add 1,2,5,6
```

This example shows how to remove VLANs 3 and 10 to 15 from the pruning-eligible list:

```
Device> enable
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport trunk pruning vlan remove 3,10-15
```

You can verify your settings by entering the **show interfaces *interface-id* switchport** privileged EXEC command.

## switchport voice vlan

To configure voice VLAN on the port, use the **switchport voice vlan** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

**switchport voice vlan** {*vlan-id* | **dot1p** | **none** | **untagged** | **name** *vlan\_name*}  
**no switchport voice vlan**

| Syntax Description           |            |                                                                                                                                                                                              |
|------------------------------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan-id</i>               |            | The VLAN to be used for voice traffic. The range is 1 to 4094. By default, the IP phone forwards the voice traffic with an IEEE 802.1Q priority of 5.                                        |
| <b>dot1p</b>                 |            | Configures the telephone to use IEEE 802.1p priority tagging and uses VLAN 0 (the native VLAN). By default, the Cisco IP phone forwards the voice traffic with an IEEE 802.1p priority of 5. |
| <b>none</b>                  |            | Does not instruct the IP telephone about the voice VLAN. The telephone uses the configuration from the telephone key pad.                                                                    |
| <b>untagged</b>              |            | Configures the telephone to send untagged voice traffic. This is the default for the telephone.                                                                                              |
| <b>name</b> <i>vlan_name</i> | (Optional) | Specifies the VLAN name to be used for voice traffic. You can enter up to 128 characters.                                                                                                    |

**Command Default** The default is not to automatically configure the telephone (**none**).  
The telephone default is not to tag frames.

**Command Modes** Interface configuration

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** You should configure voice VLAN on Layer 2 access ports.

You must enable Cisco Discovery Protocol (CDP) on the switch port connected to the Cisco IP phone for the device to send configuration information to the phone. CDP is enabled by default globally and on the interface.

When you enter a VLAN ID, the IP phone forwards voice traffic in IEEE 802.1Q frames, tagged with the specified VLAN ID. The device puts IEEE 802.1Q voice traffic in the voice VLAN.

When you select **dot1p**, **none**, or **untagged**, the device puts the indicated voice traffic in the access VLAN.

In all configurations, the voice traffic carries a Layer 2 IP precedence value. The default is 5 for voice traffic.

When you enable port security on an interface that is also configured with a voice VLAN, set the maximum allowed secure addresses on the port to 2. When the port is connected to a Cisco IP phone, the IP phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but not on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure enough secure addresses to allow one for each PC and one for the Cisco IP phone.

If any type of port security is enabled on the access VLAN, dynamic port security is automatically enabled on the voice VLAN.

You cannot configure static secure MAC addresses in the voice VLAN.

A voice-VLAN port cannot be a private-VLAN port.

The Port Fast feature is automatically enabled when voice VLAN is configured. When you disable voice VLAN, the Port Fast feature is not automatically disabled.

This example show how to first populate the VLAN database by associating a VLAN ID with a VLAN name, and then configure the VLAN (using the name) on an interface, in the access mode: You can also verify your configuration by entering the **show interfaces interface-id switchport** in privileged EXEC command and examining information in the Voice VLAN: row.

Part 1 - Making the entry in the VLAN database:

```
Device> enable
Device# configure terminal
Device(config)# vlan 55
Device(config-vlan)# name test
Device(config-vlan)# end
```

Part 2 - Checking the VLAN database:

```
Device> enable
Device# show vlan id 55
VLAN Name Status Ports
-----
55 test active
VLAN Type SAID MTU Parent RingNo BridgeNo Stp BrdgMode Trans1 Trans2
-----
55 enet 100055 1500 - - - - - 0 0
Remote SPAN VLAN
-----
Disabled
Primary Secondary Type Ports
-----
```

Part 3- Assigning VLAN to the interface by using the name of the VLAN:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet3/1/1
Device(config-if)# switchport mode access
Device(config-if)# switchport voice vlan name test
Device(config-if)# end
Device#
```

Part 4 - Verifying configuration:

```
Device> enable
Device# show running-config
interface gigabitethernet3/1/1
Building configuration...
Current configuration : 113 bytes
!
interface GigabitEthernet3/1/1
switchport voice vlan 55
switchport mode access
Switch#
```

Part 5 - Also can be verified in interface switchport:

```
Device> enable
Device# show interface GigabitEthernet3/1/1 switchport
Name: Gi3/1/1
Switchport: Enabled
Administrative Mode: static access
Operational Mode: static access
Administrative Trunking Encapsulation: dot1q
Operational Trunking Encapsulation: native
Negotiation of Trunking: Off
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: enabled
Voice VLAN: 55 (test)
Administrative private-vlan host-association: none
Administrative private-vlan mapping: none
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk Native VLAN tagging: enabled
Administrative private-vlan trunk encapsulation: dot1q
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk associations: none
Administrative private-vlan trunk mappings: none
Operational private-vlan: none
Trunking VLANs Enabled: ALL
Pruning VLANs Enabled: 2-1001
Capture Mode Disabled
Capture VLANs Allowed: ALL
Unknown unicast blocked: disabled
Unknown multicast blocked: disabled
Appliance trust: none
```

# transport unicast ipv4 local loopback

To configure a unicast IPv4 connection from a loopback interface, use the **transport unicast ipv4 local loopback** command in property configuration mode.

**transport unicast ipv4 local loopback** *value*

|                           |                                                                                                                                               |                                                                             |

|                           | Cisco IOS XE Bengaluru 17.5.1                                                                                                                 | This command was introduced.                                                |
| <b>Usage Guidelines</b>   | Configure the PTP property name using the <b>ptp property</b> command before configuring a unicast IPv4 connection from a loopback interface. |                                                                             |

## Examples

The following example shows how to configure a unicast IPv4 connection from a loopback interface:

```
Device> enable
Device# configure terminal
Device(config)# ptp property cisco1
Device(config-property)# transport unicast ipv4 local loopback 0
Device(config-property-transport)# peer ip 192.0.2.1
Device(config-property-transport)# end
```

# udld

To enable aggressive or normal mode in the UniDirectional Link Detection (UDLD) and to set the configurable message timer time, use the **udld** command in global configuration mode. To disable aggressive or normal mode UDLD on all fiber-optic ports, use the **no** form of the command.

```
udld {aggressive | enable | message time message-timer-interval}
no udld {aggressive | enable | message}
```

|                           |                                                      |                                                                                                                                                                                                         |
|---------------------------|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>aggressive</b>                                    | Enables UDLD in aggressive mode on all fiber-optic interfaces.                                                                                                                                          |

|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

UDLD supports two modes of operation: normal (the default) and aggressive. In normal mode, UDLD detects unidirectional links due to misconnected interfaces on fiber-optic connections. In aggressive mode, UDLD also detects unidirectional links due to one-way traffic on fiber-optic and twisted-pair links and due to misconnected interfaces on fiber-optic links.

If you change the message time between probe packets, you are making a compromise between the detection speed and the CPU load. By decreasing the time, you can make the detection-response faster but increase the load on the CPU.

This command affects fiber-optic interfaces only. Use the **udld** interface configuration command to enable UDLD on other interface types.

You can use these commands to reset an interface shut down by UDLD:

- The **udld reset** privileged EXEC command to reset all interfaces shut down by UDLD.
- The **shutdown** and **no shutdown** interface configuration commands.
- The **no udld enable** global configuration command followed by the **udld {aggressive | enable}** global configuration command to reenab UDLD globally.
- The **no udld port** interface configuration command followed by the **udld port** or **udld port aggressive** interface configuration command to reenab UDLD on the specified interface.
- The **errdisable recovery cause udld** and **errdisable recovery interval** *interval* global configuration commands to automatically recover from the UDLD error-disabled state.

This example shows how to enable UDLD on all fiber-optic interfaces:

```
Device> enable
Device# configure terminal
Device(config)# udld enable
```

You can verify your setting by entering the **show udld** command in privileged EXEC mode.

# udld port

To enable UniDirectional Link Detection (UDLD) on an individual interface or to prevent a fiber-optic interface from being enabled by the **udld** command in global configuration mode, use the **udld port** command in interface configuration mode. To return to the **udld** command setting in global configuration mode or to disable UDLD if entered for a nonfiber-optic port, use the **no** form of this command.

**udld port** [**aggressive**]  
**no udld port** [**aggressive**]

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                              |

| <b>Usage Guidelines</b>   | <p>A UDLD-capable port cannot detect a unidirectional link if it is connected to a UDLD-incapable port of another device.</p> <p>UDLD supports two modes of operation: normal (the default) and aggressive. In normal mode, UDLD detects unidirectional links due to misconnected interfaces on fiber-optic connections. In aggressive mode, UDLD also detects unidirectional links due to one-way traffic on fiber-optic and twisted-pair links and due to misconnected interfaces on fiber-optic links.</p> <p>To enable UDLD in normal mode, use the <b>udld port</b> command in interface configuration mode. To enable UDLD in aggressive mode, use the <b>udld port aggressive</b> command in interface configuration mode.</p> <p>Use the <b>no udld port</b> command on fiber-optic ports to return control of UDLD to the <b>udld enable</b> global configuration command or to disable UDLD on nonfiber-optic ports.</p> <p>Use the <b>udld port aggressive</b> command on fiber-optic ports to override the setting of the <b>udld enable</b> or <b>udld aggressive</b> command in global configuration mode. Use the <b>no</b> form on fiber-optic ports to remove this setting and to return control of UDLD enabling to the <b>udld</b> command in global configuration mode or to disable UDLD on nonfiber-optic ports.</p> <p>You can use these commands to reset an interface shut down by UDLD:</p> <ul style="list-style-type: none"> <li>• The <b>udld reset</b> command in privileged EXEC mode resets all interfaces shut down by UDLD.</li> <li>• The <b>shutdown</b> and <b>no shutdown</b> command in interface configuration mode.</li> <li>• The <b>no udld enable</b> command in global configuration mode, followed by the <b>udld {aggressive   enable}</b> command in global configuration mode reenables UDLD globally.</li> <li>• The <b>no udld port</b> command in interface configuration mode, followed by the <b>udld port</b> or <b>udld port aggressive</b> command in interface configuration mode reenables UDLD on the specified interface.</li> </ul> |                              |

- The **errdisable recovery cause udld** and **errdisable recovery interval** *interval* commands in global configuration mode automatically recover from the UDLD error-disabled state.

This example shows how to enable UDLD on an port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet6/0/1
Device(config-if)# udld port
```

This example shows how to disable UDLD on a fiber-optic interface despite the setting of the **udld** command in global configuration mode:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet6/0/1
Device(config-if)# no udld port
```

You can verify your settings by entering the **show running-config** or the **show udld interface** command in privileged EXEC mode.

# udld reset

To reset all interfaces disabled by UniDirectional Link Detection (UDLD) and permit traffic to begin passing through them again (though other features, such as spanning tree, Port Aggregation Protocol (PAgP), and Dynamic Trunking Protocol (DTP) still have their normal effects, if enabled), use the **udld reset** command in privileged EXEC mode.

## udld reset

|                      |                 |
|----------------------|-----------------|
| <b>Command Modes</b> | Privileged EXEC |
|----------------------|-----------------|

|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                           |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | If the interface configuration is still enabled for UDLD, these ports begin to run UDLD again and are disabled for the same reason if the problem has not been corrected. |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

This example shows how to reset all interfaces disabled by UDLD:

```
Device> enable
Device# udld reset
1 ports shutdown by UDLD were reset.
```

## vlan dot1q tag native

To enable tagging of native VLAN frames on all IEEE 802.1Q trunk ports, use the **vlan dot1q tag native** command in global configuration mode. To return to the default setting, use the **no** form of this command.

**vlan dot1q tag native**  
**no vlan dot1q tag native**

|                           |                                            |

|                         |                                                                                        |
|-------------------------|----------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | When enabled, native VLAN packets going out of all IEEE 802.1Q trunk ports are tagged. |
|-------------------------|----------------------------------------------------------------------------------------|

|                                                                                             |
|---------------------------------------------------------------------------------------------|
| When disabled, native VLAN packets going out of all IEEE 802.1Q trunk ports are not tagged. |
|---------------------------------------------------------------------------------------------|

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| You can use this command with the IEEE 802.1Q tunneling feature. This feature operates on an edge device of a service-provider network and expands VLAN space by using a VLAN-in-VLAN hierarchy and tagging the tagged packets. You must use IEEE 802.1Q trunk ports for sending packets to the service-provider network. However, packets going through the core of the service-provider network might also be carried on IEEE 802.1Q trunks. If the native VLANs of an IEEE 802.1Q trunks match the native VLAN of a tunneling port on the same device, traffic on the native VLAN is not tagged on the sending trunk port. This command ensures that native VLAN packets on all IEEE 802.1Q trunk ports are tagged. |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

For more information about IEEE 802.1Q tunneling, see the software configuration guide for this release.

This example shows how to enable IEEE 802.1Q tagging on native VLAN frames:

```
Device> enable
Device# configure terminal
Device(config)# vlan dot1q tag native
Device(config)# end
```

You can verify your settings by entering the **show vlan dot1q tag native** privileged EXEC command.

## vtp mode

To configure the VLAN Trunking Protocol (VTP) device mode, use the **vtp mode** command. To revert to the default server mode, use the **no** form of this command.

**vtp mode** { **client** | **off** | **transparent** }  
**no vtp mode**

| Syntax Description |  |                                           |
|--------------------|--|-------------------------------------------|
| <b>client</b>      |  | Specifies the device as a client.         |
| <b>off</b>         |  | Specifies the device mode as off.         |
| <b>server</b>      |  | Specifies the device as a server.         |
| <b>transparent</b> |  | Specifies the device mode as transparent. |

|                        |         |
|------------------------|---------|
| <b>Command Default</b> | Server. |
|------------------------|---------|

| Command History | Release                   | Modification                 |
|-----------------|---------------------------|------------------------------|
|                 | Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

|                      |                            |
|----------------------|----------------------------|
| <b>Command Modes</b> | Global configuration mode. |
|----------------------|----------------------------|

**Usage Guidelines**

VLAN Trunking Protocol (VTP) is a Cisco Proprietary Layer 2 messaging protocol used to distribute the VLAN configuration information across multiple devices within a VTP domain. Without VTP, you must configure VLANs in each device in the network. Using VTP, you configure VLANs on a VTP server and then distribute the configuration to other VTP devices in the VTP domain.

In VTP transparent mode, you can configure VLANs (add, delete, or modify) and private VLANs. VTP transparent switches do not participate in VTP. A VTP transparent switch does not advertise its VLAN configuration and does not synchronize its VLAN configuration based on received advertisements. The VTP configuration revision number is always set to zero (0). Transparent switches do forward VTP advertisements that they receive out their trunk ports in VTP version 2.

A VTP device mode can be one of the following:

- **server** —You can create, modify, and delete VLANs and specify other configuration parameters, such as VTP version, for the entire VTP domain. VTP servers advertise their VLAN configuration to other switches in the same VTP domain and synchronize their VLAN configuration with other switches based on advertisements received over trunk links. VTP server is the default mode.

**Note** You can configure VLANs 1 to 1005. VLANs 1002 to 1005 are reserved for token ring in VTP version 2.

- **client** —VTP clients behave the same way as VTP servers, but you cannot create, change, or delete VLANs on a VTP client.

- **transparent** —You can configure VLANs (add, delete, or modify) and private VLANs. VTP transparent switches do not participate in VTP. A VTP transparent switch does not advertise its VLAN configuration and does not synchronize its VLAN configuration based on received advertisements. Because of this, the VTP configuration revision number is always set to zero (0). Transparent switches do forward VTP advertisements that they receive out their trunk ports in VTP version 2.
- **off** —In the above three described modes, VTP advertisements are received and transmitted as soon as the switch enters the management domain state. In the VTP off mode, switches behave the same as in VTP transparent mode with the exception that VTP advertisements are not forwarded. You can use this VTP device to monitor the VLANs.

**Note**

If you use the `no vtp mode` command to remove a VTP device, the device will be configured as a VTP server. Use the `vtp mode off` command to remove a VTP device.

**Example**

This example shows how to configure a VTP device in transparent mode and add VLANs 2, 3, and 4:

```
Device> enable
Device(config)#vtp mode transparent
Device(config)# vlan 2-4
```

**Example**

This example shows how to remove a device configured as a VTP device:

```
Device> enable
Device(config)# vtp mode off
```

**Example**

This example shows how to configure a VTP device as a VTP server and adds VLANs 2 and 3:

```
Device> enable
Device# vtp mode server
Device(config)# vlan 2,3
```

**Example**

This example shows how to configure a VTP device as a client:

```
Device> enable
Device# vtp mode client
```

# autodiscovery

To designate a Layer 2 virtual forwarding interface (VFI) as having Border Gateway Protocol (BGP) or Label Distribution Protocol (LDP) autodiscovered pseudowire members, use the **autodiscovery** command in Layer 2 VFI configuration mode. To disable autodiscovery, use the **no** form of this command.

**autodiscovery bgp signaling** {bgp | ldp} [{template template-name}]  
**no autodiscovery bgp signaling** {bgp | ldp} [{template template-name}]

|                    |                                        |                                                                    |
|--------------------|----------------------------------------|--------------------------------------------------------------------|
| Syntax Description | <b>bgp</b>                             | Specifies that BGP should be used for signaling and autodiscovery. |
|                    | <b>ldp</b>                             | Specifies that LDP should be used for signaling.                   |
|                    | <b>template template-name</b>          | Specifies the template to be used for autodiscovered pseudowires.  |
| Command Default    | Layer 2 VFI autodiscovery is disabled. |                                                                    |
| Command Modes      | Layer 2 VFI configuration (config-vfi) |                                                                    |
| Command History    | <b>Release</b>                         | <b>Modification</b>                                                |
|                    | Cisco IOS XE Amsterdam 17.1.1          | This command was introduced.                                       |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | <p>Layer 2 VFI autodiscovery enables each VPLS provider edge (PE) device to discover other PE devices that are part of the same VPLS domain. VPLS autodiscovery also automatically detects when PE devices are added to or removed from the VPLS domain.</p> <p>The <b>bgp</b> keyword specifies that BGP should be used for signaling and autodiscovery, accordance with RFC 4761.</p> <p>The <b>ldp</b> keyword specifies that LDP should be used for signaling. BGP will be used for autodiscovery.</p> <p>Use of the <b>autodiscovery</b> command places the device into Layer 2 VPN VFI autodiscovery configuration mode (config-vfi-autodiscovery).</p> |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

The following example shows how to enable Layer 2 VFI as having BGP autodiscovered pseudowire members and specify that LDP signaling should be used for autodiscovery:

```
Device> enable
Device# configure terminal
Device(config)# l2vpn vfi context vfi1
Device(config-vfi)# vpn id 100
Device(config-vfi)# autodiscovery bgp signaling ldp
Device(config-vfi-autodiscovery)#
```

|                  |                             |                                                                                                              |
|------------------|-----------------------------|--------------------------------------------------------------------------------------------------------------|
| Related Commands | <b>Command</b>              | <b>Description</b>                                                                                           |
|                  | <b>l2 vfi autodiscovery</b> | Enables the VPLS PE device to automatically discover other PE devices that are part of the same VPLS domain. |

| Command | Description                                  |
|---------|----------------------------------------------|
| vpn id  | Sets or updates a VPN ID on a VPLS instance. |

# backup peer

To specify a redundant peer for a pseudowire virtual circuit (VC), use the **backup peer** command in interface configuration mode or Xconnect configuration mode. To remove the redundant peer, use the **no** form of this command.

**backup peer** *peer-router-ip-addr* *vcid* [**pw-class** *pw-class-name*] [**priority** *value*]

**no backup peer** *peer-router-ip-addr* *vcid*

## Syntax Description

|                              |                                                                                                                                                               |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>peer-router-ip-addr</i>   | IP address of the remote peer.                                                                                                                                |
| <i>vcid</i>                  | 32-bit identifier of the VC between the devices at each end of the layer control channel.                                                                     |
| <b>pw-class</b>              | (Optional) Specifies the pseudowire type. If this is not specified, the pseudowire type is inherited from the parent Xconnect.                                |
| <i>pw-class-name</i>         | (Optional) Name of the pseudowire that you created while establishing the pseudowire class.                                                                   |
| <b>priority</b> <i>value</i> | (Optional) Specifies the priority of the backup pseudowire in instances where multiple backup pseudowires exist. The range is from 1 to 10. The default is 1. |

## Command Default

No redundant peer is established.

## Command Modes

Interface configuration (config-if)  
Xconnect configuration (config-if-xconn)

## Command History

| Release                     | Modification                 |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

## Usage Guidelines

The combination of the *peer-router-ip-addr* and *vcid* arguments must be unique on the device.

## Examples

The following example shows how to configure a Multiprotocol Label Switching (MPLS) Xconnect with one redundant peer:

```
Device(config)# interface GigabitEthernet1/0/44
Device(config-if)# xconnect 10.0.0.1 100 encapsulation mpls
Device(config-if-xconn)# backup peer 10.0.0.2 200
```

## Related Commands

| Command         | Description                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------|
| <b>xconnect</b> | Binds an attachment circuit to a pseudowire for Xconnect service, and enters Xconnect configuration mode. |

# encapsulation mpls

To specify Multiprotocol Label Switching (MPLS) as the data encapsulation method, use the **encapsulation mpls** command in interface configuration mode. To remove the encapsulation type, use the **no** form of this command.

**encapsulation mpls**

**no encapsulation mpls**

|                        | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

**Examples**

The following example shows how to configure MPLS as the data encapsulation method for a pseudowire interface:

```
Device> enable
Device# configure terminal
Device(config)# interface pseudowire 100
Device(config-if)# encapsulation mpls
```

| Related Commands | Command                     | Description                                                                                              |
|------------------|-----------------------------|----------------------------------------------------------------------------------------------------------|
|                  | <b>interface pseudowire</b> | Specifies the pseudowire interface.                                                                      |
|                  | <b>xconnect</b>             | Binds an attachment circuit to a pseudowire for Xconnect service and enters Xconnect configuration mode. |

# ip multicast mroute-filter

To filter multicast router information (mroute) request packets, use the **ip multicast mroute-filter** command in global configuration mode. To remove the filter on mroute requests, use the **no** form of this command.

```
ip multicast [vrf vrf-name] mroute-filter access-list
no ip multicast [vrf vrf-name] mroute-filter
```

|                    |                    |                                                                                                                                                        |
|--------------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>vrf</b>         | (Optional) Supports the multicast VPN routing and forwarding (VRF) instance.                                                                           |
|                    | <i>vrf-name</i>    | (Optional) Name assigned to the VRF.                                                                                                                   |
|                    | <i>access-list</i> | IP standard numbered or named access list that determines which networks or hosts can query the local multicast device with the <b>mroute</b> command. |

**Command Default** No default behavior or values

**Command Modes** Global configuration

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **ip multicast mroute-filter** command filters the mroute request packets from all of the sources denied by the specified access list. That is, if the access list denies a source, that source's mroute requests are filtered. mroute requests from any sources permitted by the ACL are allowed to proceed.

**Examples** The following example shows how to filter mroute request packets from all hosts on network 192.168.1.1 while allowing requests from any other hosts:

```
ip multicast mroute-filter 51
access-list 51 deny 192.168.1.1
access list 51 permit any
```

| Related Commands | Command       | Description                                                                               |
|------------------|---------------|-------------------------------------------------------------------------------------------|
|                  | <b>mroute</b> | Queries a multicast device about which neighboring multicast devices are peering with it. |

# ip multicast-routing

To enable IP multicast routing, use the **ip multicast-routing** command in global configuration mode. To disable IP multicast routing, use the **no** form of this command.

**ip multicast-routing** [**vrf** *vrf-name*]  
**no ip multicast-routing** [**vrf** *vrf-name*]

## Syntax Description

|                            |                                                                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i> | (Optional) Enables IP multicast routing for the Multicast VPN routing and forwarding (MVRP) instance specified for the <i>vrf-name</i> argument. |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Default

IP multicast routing is disabled.

## Command Modes

Global configuration (config).

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

When IP multicast routing is disabled, the Cisco IOS software does not forward any multicast packets.

### Note

For IP multicast, after enabling IP multicast routing, PIM must be configured on all interfaces. Disabling IP multicast routing does not remove PIM; PIM still must be explicitly removed from the interface configurations.

## Examples

The following example shows how to enable IP multicast routing:

```
Device(config)# ip multicast-routing
```

The following example shows how to enable IP multicast routing on a specific VRF:

```
Device(config)# ip multicast-routing vrf vrf1
```

The following example shows how to disable IP multicast routing:

```
Device(config)# no ip multicast-routing
```

# l2 vfi manual

To create a Layer 2 virtual forwarding instance (VFI) and enter Layer 2 VFI manual configuration mode, use the **l2 vfi manual** command in global configuration mode. To remove the Layer 2 VFI, use the **no** form of this command.

**l2 vfi name manual**  
**no l2 vfi name manual**

|                           |                                    |                                        |
|---------------------------|------------------------------------|----------------------------------------|
| <b>Syntax Description</b> | <i>name</i>                        | Name of a new or existing Layer 2 VFI. |
| <b>Command Default</b>    | The Layer 2 VFI is not configured. |                                        |
| <b>Command Modes</b>      | Global configuration (config)      |                                        |
| <b>Command History</b>    | <b>Release</b>                     | <b>Modification</b>                    |
|                           | Cisco IOS XE Everest 16.6.1        | This command was introduced.           |

**Usage Guidelines** A VFI is a collection of data structures used by the data plane, software-based or hardware-based, to forward packets to one or more virtual circuits (VC). It is populated and updated by both the control plane and the data plane and also serves as the data structure interface between the control plane and the data plane.

Within the Layer 2 VFI manual configuration mode, you can configure the following parameters:

- VPN ID of a Virtual Private LAN Service (VPLS) domain
- Addresses of other PE devices in this domain
- Type of tunnel signaling and encapsulation mechanism for each peer

Within the Layer 2 VFI manual configuration mode, the following commands are available:

- **vpn id** *vpn-id*
- **[no] neighbor** *remote-router-id* {**encapsulation** **mpls** | **pw-class** *pw-name*| **no-split-horizon**}

## Examples

This example shows how to create a Layer 2 VFI, enter Layer 2 VFI manual configuration mode, and configure a VPN ID:

```
Device> enable
Device# configure terminal
Device(config)# l2 vfi vfitest1 manual
Device(config-vfi)# vpn id 303
```

|                         |                |                                                                                                                                        |

|------------------------|-----------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

|                         |                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The <b>l2vpn vfi context</b> command is used as part of the protocol-CLI mode for configuring Virtual Private LAN Service (VPLS). This command establishes a VFI for specifying core-facing pseudowires in a VPLS. The VFI represents an emulated LAN or a VPLS forwarder from the VPLS architectural model when using an emulated LAN interface. |

## l2vpn xconnect context

To create a Layer 2 VPN (L2VPN) cross-connect context and enter Xconnect configuration mode, use the **l2vpn xconnect context** command in global configuration mode. To remove the connection, use the **no** form of this command.

**l2vpn xconnect context context-name**

**no l2vpn xconnect context** *context-name*

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                    |

|                    | Cisco IOS XE Everest 16.6.1                                                                                                                                                                                                                                                                                                                                                                                                                                 | This command was introduced.                                                                       |
| Usage Guidelines   | Use the <b>l2vpn xconnect context</b> command to define a cross-connect context that specifies the two members in a Virtual Private Wire Service (VPWS), that is, attachment circuit to pseudowire, pseudowire-to-pseudowire (multisegment pseudowire), or attachment circuit-to-attachment circuit (local connection). The type of members specified, that is, attachment circuit interface or pseudowire, automatically define the type of L2VPN service. |                                                                                                    |
| Examples           | <p>The following example shows how to establish an L2VPN cross-connect context:</p> <pre>Device&gt; enable Device# configure terminal Device(config)# l2vpn xconnect context con1 Device(config-xconnect)# interworking ip</pre>                                                                                                                                                                                                                            |                                                                                                    |
| Related Commands   | Command                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Description                                                                                        |
|                    | interworking                                                                                                                                                                                                                                                                                                                                                                                                                                                | Enables L2VPN interworking and specifies the type of traffic that can be sent over the pseudowire. |

# load-balance

To set the load-distribution method for pseudowire, use the **load-balance** command in interface configuration mode. To reset the load-balancing mechanism to the default setting, use the **no** form of this command.

**load-balance** {**flow** [{**ethernet** [**dst-mac** | **src-dst-mac** | **src-mac**] | **ip** [**dst-ip** | **src-dst-ip** | **src-ip**]}] | **flow-label** {**both** | **receive** | **transmit**}[**static** [**advertise**]]}

**no load-balance** {**flow** | **flow-label**}

## Syntax Description

|                    |                                                                                   |
|--------------------|-----------------------------------------------------------------------------------|
| <b>flow</b>        | Enables flow-based load balancing for pseudowire.                                 |
| <b>ethernet</b>    | Specifies Ethernet pseudowire flow classification.                                |
| <b>dst-mac</b>     | Specifies load distribution based on the destination host MAC address.            |
| <b>src-dst-mac</b> | Specifies load distribution based on the source and destination host MAC address. |
| <b>src-mac</b>     | Specifies load distribution based on the source MAC address.                      |
| <b>ip</b>          | Specifies IP pseudowire flow classification.                                      |
| <b>dst-ip</b>      | Specifies load distribution based on the destination host IP address.             |
| <b>src-dst-ip</b>  | Specifies load distribution based on the source and destination host IP address.  |
| <b>src-ip</b>      | Specifies load distribution based on the source host IP address.                  |
| <b>flow-label</b>  | Enables flow-aware transport of pseudowire.                                       |
| <b>both</b>        | Enables flow-aware transport of pseudowire in both directions.                    |
| <b>receive</b>     | Enables flow-aware transport of pseudowire in the receiving direction.            |
| <b>transmit</b>    | Enables flow-aware transport of pseudowire in the transmitting direction.         |
| <b>static</b>      | Enables flow labels even if not signaled by the remote peer.                      |
| <b>advertise</b>   | Sends flow label sub type, length, value (sub-TLV).                               |

## Command Default

The command is disabled by default.

## Command Modes

Interface configuration (config-if)

## Command History

|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

This example shows how to set flow-based load balancing for pseudowire in the context of a specified IP address:

```
Device> enable
Device# configure terminal
Device(config)# interface pseudowire 17
Device(config-if)# load-balance flow ip 192.168.2.25
```

|                  | <b>mdt data</b>    | Configures the multicast group address range for data MDT groups. |
|                  | <b>mdt default</b> | Configures a default MDT group for a VPN VRF.                     |

# mdt default

To configure a default multicast distribution tree (MDT) group for a Virtual Private Network (VPN) routing and forwarding (VRF) instance, use the **mdt default** command in VRF configuration or VRF address family configuration mode. To disable this function, use the **no** form of this command.

**mdt default***group-address*  
**no mdt default***group-address*

## Syntax Description

|                      |                                                                                                                                                                                                                                                         |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>group-address</i> | IP address of the default MDT group. This address serves as an identifier for the community in that provider edge (PE) devices configured with the same group address become members of the group, allowing them to receive packets sent by each other. |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Default

The command is disabled.

## Command Modes

VRF address family configuration (config-vrf-af)  
VRF configuration (config-vrf)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The default MDT group must be the same group configured on all PE devices that belong to the same VPN. If Source Specific Multicast (SSM) is used as the protocol for the default MDT, the source IP address will be the address used to source the Border Gateway Protocol (BGP) sessions.

A tunnel interface is created as a result of this command. By default, the destination address of the tunnel header is the *group-address* argument.

You can access the **mdt default** command by using the **ip vrf** global configuration command. You can also access the **mdt default** command by using the **vrf definition** global configuration command followed by the **address-family ipv4** VRF configuration command.

## Examples

In the following example, Protocol Independent Multicast (PIM) SSM is configured in the backbone. Therefore, the default and data MDT groups are configured within the SSM range of IP addresses. Inside the VPN, PIM sparse mode (PIM-SM) is configured and only Auto-RP announcements are accepted.

```
ip vrf vrf1
 rd 1000:1
  mdt default 236.1.1.1
  mdt data 228.0.0.0 0.0.0.127 threshold 50
  mdt data threshold 50
  route-target export 1000:1
  route-target import 1000:1
!
```

**Related Commands**

| Command         | Description                                                       |
|-----------------|-------------------------------------------------------------------|
| <b>mdt data</b> | Configures the multicast group address range for data MDT groups. |

# mdt data

To specify a range of addresses to be used in the data multicast distribution tree (MDT) pool, use the **mdt data** command in VRF configuration or VRF address family configuration mode. To disable this function, use the **no** form of this command.

**mdt data threshold** *kb/s*

**no mdt data threshold** *kb/s*

|                           |                              |                                                                                                                 |
|---------------------------|------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>threshold</b> <i>kb/s</i> | (Optional) Defines the bandwidth threshold value in kilobits per second (kb/s). The range is from 1 to 4294967. |
|---------------------------|------------------------------|-----------------------------------------------------------------------------------------------------------------|

**Command Default** A data MDT pool is not configured.

**Command Modes** VRF address family configuration (config-vrf-af)  
VRF configuration (config-vrf)

| <b>Command History</b> | Release                      | Modification                 |
|------------------------|------------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** A data MDT can include a maximum of 256 multicast groups per MVPN. Multicast groups used to create the data MDT are dynamically chosen from a pool of configured IP addresses.

Use the **mdt data** command to specify a range of addresses to be used in the data MDT pool. The threshold is specified in kb/s. Using the optional **list** keyword and *access-list* argument, you can define the (S, G) MVPN entries to be used in a data MDT pool, which would further limit the creation of a data MDT pool to the particular (S, G) MVPN entries defined in the access list specified for the *access-list* argument.

You can access the **mdt data** command by using the **ip vrf** global configuration command. You can also access the **mdt data** command by using the **vrf definition** global configuration command followed by the **address-family ipv4** VRF configuration command.

## Examples

The following example shows how to configure the range of group addresses for the MDT data pool. A threshold of 500 kb/s has been set, which means that if a multicast stream exceeds 1 kb/s, then a data MDT is created.

```
ip vrf vrf1
 rd 1000:1
 route-target export 10:27
 route-target import 10:27
 mdt default 236.1.1.1
 mdt data 228.0.0.0 0.0.0.127 threshold 500 list 101
!
.
.
.
!
ip pim ssm default
```

```
ip pim vrf vrf1 accept-rp auto-rp
!
```

**Related Commands**

| Command            | Description                                   |
|--------------------|-----------------------------------------------|
| <b>mdt default</b> | Configures a default MDT group for a VPN VRF. |

## member (l2vpn vfi)

To specify the devices that form a point-to-point Layer 2 VPN virtual forwarding interface (VFI) connection, use the **member** command in Layer 2 VFI configuration mode. To disconnect the devices, use the **no** form of this command.

**member** {*ip-address* [*vc-id*]} {**encapsulation** **mpls** | **template** *name*} | **pseudowire** *pw-int-number* [*ip-address* [*vc-id* ]]{**encapsulation** **mpls** | **template** *name*}}  
**no member** {*ip-address* [*vc-id*]} {**encapsulation** **mpls** | **template** *name*} | **pseudowire** *pw-int-number* [*ip-address* [*vc-id* ]]{**encapsulation** **mpls** | **template** *name*}}

|                           |                                        |                                                                           |
|---------------------------|----------------------------------------|---------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>ip-address</i>                      | IP address of the VFI neighbor.                                           |
|                           | <i>vc-id</i>                           | (Optional) Virtual circuit (VC) identifier.                               |
|                           | <b>encapsulation</b> <b>mpls</b>       | Specifies Multiprotocol Label Switching (MPLS) as the encapsulation type. |
|                           | <b>template</b> <i>name</i>            | Specifies the template name.                                              |
|                           | <b>pseudowire</b> <i>pw-int-number</i> | Specifies the pseudowire interface number.                                |

**Command Default** Devices that form a point-to-point Layer 2 VPN VFI connection are not specified.

**Command Modes** Layer 2 VFI configuration (config-vfi)

|                        |                             |                              |
|------------------------|-----------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>              | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

**Usage Guidelines** This instance of the **member** command is used as part of the protocol-CLI mode for configuring Virtual Private LAN Service (VPLS).

### Examples

The following example shows how to configure an Layer 2 VPN VFI connection as part of the protocol-CLI mode for configuring Virtual Private LAN Service (VPLS). :

```
Device> enable
Device# configure terminal
Device(config)# l2vpn vfi context vfi1
Device(config-vfi)# member 10.10.10.10 1 encapsulation mpls
```

|                         |                        |                                                                                        |
|-------------------------|------------------------|----------------------------------------------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>         | <b>Description</b>                                                                     |
|                         | <b>neighbor (VPLS)</b> | Specifies the type of tunnel signaling and encapsulation mechanism for each VPLS peer. |

# member pseudowire

To specify a pseudowire interface that forms a Layer 2 VPN (L2VPN) cross connect, use the **member pseudowire** command in Xconnect configuration mode. To disconnect the pseudowire interface, use the **no** form of this command.

**member pseudowire** *interface-number* [*ip-address* *vc-id* {**encapsulation mpls** | **template** *template-name*}] [**group** *group-name* [**priority** *number*]]

**no member pseudowire** *interface-number*

|                           |                                      |                                                                                                                                          |
|---------------------------|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>interface-number</i>              | Interface number.                                                                                                                        |
|                           | <i>ip-address</i>                    | IP address of the peer.                                                                                                                  |
|                           | <i>vcid</i>                          | The virtual circuit (VC) ID. The range is from 1 to 4294967295.                                                                          |
|                           | <b>encapsulation mpls</b>            | Specifies Multiprotocol Label Switching (MPLS) as the data encapsulation method.                                                         |
|                           | <b>template</b> <i>template-name</i> | (Optional) Specifies the template to be used for encapsulation and protocol configuration. The maximum size is 32 characters.            |
|                           | <b>group</b> <i>group-name</i>       | (Optional) Specifies the cross-connect member redundancy group name.                                                                     |
|                           | <b>priority</b> <i>number</i>        | (Optional) Specifies the cross-connect member priority. The range is from 0 to 16. The highest priority is 0. The lowest priority is 16. |

**Command Default** Devices that form an L2VPN cross connect are not specified.

**Command Modes** Xconnect configuration (config-xconnect)

|                        |                             |                              |
|------------------------|-----------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>              | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

**Usage Guidelines** The **member** command specifies the two members of the Virtual Private Wired Service (VPWS), multisegment pseudowire or local connect services. For VPWS, one member is an attachment circuit and the other member is a pseudowire interface. For a multisegment pseudowire, both members are pseudowire interfaces. For local connect, both members are active interfaces.

When both the pseudowire interface and the peer information are specified, an interface is dynamically created by using the *interface-number* argument specified in the **pseudowire** command.

Configure the group name to specify which of the two possible groups a member belongs to.

Configure a priority for each member so that the active members can be chosen based on priority when there are multiple redundant members. The default priority for a member is 0 (highest).

There can only be two groups, with a maximum of four members in one group and only one member in the other group (the lone member is for active redundancy and the other three are for backup redundancy). If a group name is not specified, only two members can be configured in the L2VPN cross-connect context.

## Examples

The following example shows how to specify pseudowire as the attachment circuit type:

```
Device> enable
Device# configure terminal
Device(config)# l2vpn xconnect context con1
Device(config-xconnect)# member pseudowire 17
```

## Related Commands

| Command                       | Description                                                                                               |
|-------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>l2vpn xconnect context</b> | Creates a Layer 2 VPN (L2VPN) cross-connect context.                                                      |
| <b>xconnect</b>               | Binds an attachment circuit to a pseudowire for Xconnect service, and enters Xconnect configuration mode. |

# mpls label range

To configure the range of local labels available for use with Multiprotocol Label Switching (MPLS) applications on packet interfaces, use the **mpls label range** command in global configuration mode. To revert to the platform defaults, use the **no** form of this command.

**mpls label range** *minimum-value maximum-value* [**static** *minimum-static-value maximum-static-value*]  
**no mpls label range**

## Syntax Description

|                             |                                                                                                                                                                                                                                   |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>minimum-value</i>        | The value of the smallest label allowed in the label space. The default is 16.                                                                                                                                                    |
| <i>maximum-value</i>        | The value of the largest label allowed in the label space. The default is platform-dependent.                                                                                                                                     |
| <b>static</b>               | (Optional) Reserves a block of local labels for static label assignments. If you omit the <b>static</b> keyword and the <i>minimum-static-value maximum-static-value</i> arguments, no labels are reserved for static assignment. |
| <i>minimum-static-value</i> | (Optional) The minimum value for static label assignments. There is no default value.                                                                                                                                             |
| <i>maximum-static-value</i> | (Optional) The maximum value for static label assignments. There is no default value.                                                                                                                                             |

## Command Default

The platform's default values are used.

## Command Modes

Global configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The labels 0 through 15 are reserved by the IETF (see RFC 3032, MPLS Label Stack Encoding, for details) and cannot be included in the range specified in the **mpls label range** command. If you enter a 0 in the command, you will get a message that indicates that the command is an unrecognized command.

The label range defined by the **mpls label range** command is used by all MPLS applications that allocate local labels (for dynamic label switching, MPLS traffic engineering, MPLS Virtual Private Networks (VPNs), and so on).

You can use label distribution protocols, such as Label Distribution Protocol (LDP), to reserve a generic range of labels from 16 through 1048575 for dynamic assignment.

You specify the optional **static** keyword, to reserve labels for static assignment. The MPLS Static Labels feature requires that you configure a range of labels for static assignment. You can configure static bindings only from the current static range. If the static range is not configured or is exhausted, then you cannot configure static bindings.

The range of label values is 16 to 4096. The maximum value defaults to 4096. You can split for static label space between say 16 to 100 and for dynamic label space between 101 to 4096.

The upper and lower minimum static label values are displayed in the help line.

## Examples

The following example displays the help lines when you configure the dynamic label with a minimum value of 16 and a maximum value of 100:

```
Device(config)# mpls label range 16 100 static ?
<100> Upper Minimum static label value
<16> Lower Minimum static label value
Reserved Label Range --> 0 to 15
Available Label Range --> 16 to 4096
Static Label Range --> 16 to 100
Dynamic Label Range --> 101 to 4096
```

The following example shows how to configure a static range from 16 to 100. If the lower minimum static label space is not available, the lower minimum is not displayed in the help line.

```
Device(config)# mpls label range 16 100 static ?
<16-100> static label value range
```

The following example shows how to configure the size of the local label space. In this example, the minimum static value is set to 200, and the maximum static value is set to 4000.

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# mpls label range 200 4000
Device(config)#
```

If you had specified a new range that overlaps the current range (for example, the new range of the minimum static value set to 16 and the maximum static value set to 1000), then the new range takes effect immediately.

The following example show how to configure a dynamic local label space with a minimum static value set to 100 and the maximum static value set to 1000 and a static label space with a minimum static value set to 16 and a maximum static value set to 99:

```
Device(config)# mpls label range 100 1000 static 16 99
Device(config)#
```

In the following output, the **show mpls label range** command, executed after a reload, shows that the configured range is now in effect:

```
Device# show mpls label range
Downstream label pool: Min/Max label: 100/1000
Range for static labels: Min/Max/Number: 16/99
```

The following example shows how to restore the label range to its default value:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# no mpls label range
Device(config)# end
```

**Related Commands**

| Command               | Description                                       |

| show mpls label range | Displays the range of the MPLS local label space. |

## mpls label protocol (interface configuration)

To specify the label distribution protocol for an interface, use the **mpls label protocol** command in interface configuration mode. To remove the label distribution protocol from the interface, use the **no** form of this command.

**mpls label protocol ldp**  
**no mpls label protocol ldp**

### Syntax Description

|            |                                                                                      |
|------------|--------------------------------------------------------------------------------------|
| <b>ldp</b> | Specifies that the label distribution protocol (LDP) is to be used on the interface. |
|------------|--------------------------------------------------------------------------------------|

### Command Default

If no protocol is explicitly configured for an interface, the label distribution protocol that was configured for the platform is used. To set the platform label distribution protocol, use the global **mpls label protocol** command.

### Command Modes

Interface configuration (config-if)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

To successfully establish a session for label distribution for a link connecting two label switch routers (LSRs), the link interfaces on the LSRs must be configured to use the same label distribution protocol. If there are multiple links connecting two LSRs, all of the link interfaces connecting the two LSRs must be configured to use the same protocol.

### Examples

The following example shows how to establish LDP as the label distribution protocol for the interface:

```
Device(config-if)# mpls label protocol ldp
```

# mpls label protocol (global configuration)

To specify the Label Distribution Protocol (LDP) for a platform, use the **mpls label protocol** command in global configuration mode. To restore the default LDP, use the **no** form of this command.

**mpls label protocol ldp**  
**no mpls label protocol ldp**

## Syntax Description

|            |                                                                |
|------------|----------------------------------------------------------------|
| <b>ldp</b> | Specifies that LDP is the default label distribution protocol. |
|------------|----------------------------------------------------------------|

## Command Default

LDP is the default label distribution protocol.

## Command Modes

Global configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

If neither the global mpls label protocol ldp command nor the interface mpls label protocol ldp command is used, all label distribution sessions use LDP.

## Examples

The following command establishes LDP as the label distribution protocol for the platform:

```
Device(config)# mpls label protocol ldp
```

# mpls ldp logging neighbor-changes

To generate system error logging (syslog) messages when Label Distribution Protocol (LDP) sessions go down, use the **mpls ldp logging neighbor-changes** command in global configuration mode. To disable generating syslog messages, use the **no** form of this command.

**mpls ldp logging neighbor-changes**

**no mpls ldp logging neighbor-changes**

## Syntax Description

This command has no arguments or keywords.

## Command Default

Logging is enabled by default.

## Command Modes

Global configuration (config)

## Command History

| Release                     | Modification                 |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

## Usage Guidelines

Use the **mpls ldp logging neighbor-changes** command to generate syslog messages when an LDP session goes down. The command also provides VRF information about the LDP neighbor and the reason for the LDP session going down. Some of the reasons for an LDP session going down are the following:

- An LDP was disabled globally by configuration.
- An LDP was disabled on an interface.

## Examples

The following example generates syslog messages when LDP sessions go down:

```
Device> enable
Device# configure terminal
Device(config)# mpls ldp logging neighbor-changes
```

The following output shows the log entries when an LDP session with neighbor 192.168.1.100:0 goes down and comes up. The session went down because the discovery hold timer expired. The VRF table identifier for the neighbor is 1.

```
2d00h: %LDP-5-NBRCHG: LDP Neighbor 192.168.1.100:0 (1) is DOWN (Disc hold timer expired)
2d00h: %LDP-5-NBRCHG: LDP Neighbor 192.168.1.100:0 (1) is UP
```

## mpls ip (interface configuration)

To enable Multiprotocol Label Switching (MPLS) forwarding of IPv4 and IPv6 packets along normally routed paths for a particular interface, use the **mpls ip** command in interface configuration mode. To disable this configuration, use the **no** form of this command.

**mpls ip**  
**no mpls ip**

---

**Syntax Description**

This command has no arguments or keywords.

---

**Command Default**

MPLS forwarding of IPv4 and IPv6 packets along normally routed paths for the interface is disabled.

---

**Command Modes**

Interface configuration (config-if)

---

**Command History**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

---

**Usage Guidelines**

MPLS forwarding of IPv4 and IPv6 packets along normally routed paths is sometimes called dynamic label switching. If dynamic label switching has been enabled for the platform when this command is issued on an interface, label distribution for the interface begins with the periodic transmission of neighbor discovery Hello messages on the interface. When the outgoing label for a destination routed through the interface is known, packets for the destination are labeled with that outgoing label and forwarded through the interface.

The **no** form of this command causes packets routed out through the interface to be sent unlabeled; this form of the command also terminates label distribution for the interface. However, the no form of the command does not affect the sending of labeled packets through any link-state packet (LSP) tunnels that might use the interface.

---

**Examples**

The following example shows how to enable label switching on the specified Ethernet interface:

```
Device(config)# configure terminal
Device(config-if)# interface TenGigabitEthernet1/0/3
Device(config-if)# mpls ip
```

The following example shows that label switching is enabled on the specified vlan interface (SVI) on a Cisco Catalyst switch:

```
Device(config)# configure terminal
Device(config-if)# interface vlan 1
Device(config-if)# mpls ip
```

## mpls ip (global configuration)

To enable Multiprotocol Label Switching (MPLS) forwarding of IPv4 and IPv6 packets along normally routed paths for the platform, use the **mpls ip** command in global configuration mode. To disable this feature, use the **no** form of this command.

**mpls ip**  
**no mpls ip**

|                           |                                            |
|---------------------------|--------------------------------------------|
| <b>Syntax Description</b> | This command has no arguments or keywords. |
|---------------------------|--------------------------------------------|

|                        |                                                                                                   |
|------------------------|---------------------------------------------------------------------------------------------------|
| <b>Command Default</b> | Label switching of IPv4 and IPv6 packets along normally routed paths is enabled for the platform. |
|------------------------|---------------------------------------------------------------------------------------------------|

|                      |                      |
|----------------------|----------------------|
| <b>Command Modes</b> | Global configuration |
|----------------------|----------------------|

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                                                                                                                                       |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | MPLS forwarding of IPv4 and IPv6 packets along normally routed paths (sometimes called dynamic label switching) is enabled by this command. For a given interface to perform dynamic label switching, this switching function must be enabled for the interface and for the platform. |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The **no** form of this command stops dynamic label switching for all platform interfaces regardless of the interface configuration; it also stops distribution of labels for dynamic label switching. However, the no form of this command does not affect the sending of labeled packets through label switch path (LSP) tunnels.

|                 |                                                                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Examples</b> | The following example shows that dynamic label switching is disabled for the platform, and all label distribution is terminated for the platform: |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------|

```
Device(config)# no mpls ip
```

| Related Commands | Command                                  | Description                                                                                                |
|------------------|------------------------------------------|------------------------------------------------------------------------------------------------------------|
|                  | <b>mpls ip</b> (interface configuration) | Enables MPLS forwarding of IPv4 and IPv6 packets along normally routed paths for the associated interface. |

# mpls ip default-route

To enable the distribution of labels associated with the IP default route, use the **mpls ip default-route** command in global configuration mode.

## mpls ip default-route

**Syntax Description** This command has no arguments or keywords.

**Command Default** No distribution of labels for the IP default route.

**Command Modes** Global configuration

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Dynamic label switching (that is, distribution of labels based on routing protocols) must be enabled before you can use the **mpls ip default-route** command.

**Examples** The following example shows how to enable the distribution of labels associated with the IP default route:

```
Device# configure terminal
Device(config)# mpls ip
Device(config)# mpls ip default-route
```

| Related Commands | Command                                  | Description                                                                                     |
|------------------|------------------------------------------|-------------------------------------------------------------------------------------------------|
|                  | <b>mpls ip</b> (global configuration)    | Enables MPLS forwarding of IPv4 packets along normally routed paths for the platform.           |
|                  | <b>mpls ip</b> (interface configuration) | Enables MPLS forwarding of IPv4 packets along normally routed paths for a particular interface. |

## neighbor (MPLS)

To specify the peer IP address and virtual circuit (VC) ID value of a Layer 2 VPN (L2VPN) pseudowire, use the **neighbor** command in interface configuration mode. To remove the peer IP address and VC ID value of an L2VPN pseudowire, use the **no** form of this command.

**neighbor** *peer-address* *vcid-value*

**no neighbor**

### Syntax Description

|                     |                                                 |
|---------------------|-------------------------------------------------|
| <i>peer-address</i> | IP address of the provider edge (PE) peer.      |
| <i>vcid-value</i>   | VC ID value. The range is from 1 to 4294967295. |

### Command Default

Peer address and VC ID value of a pseudowire are not specified.

### Command Modes

Interface configuration (config-if)

### Command History

| Release                     | Modification                 |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

### Usage Guidelines

You must configure the **neighbor** command for the pseudowire to be functional.

### Examples

The following example shows how to specify a peer IP address of 10.1.2.3 and a VC ID value of 100:

```
Device> enable
Device# configure terminal
Device(config)# interface pseudowire 100
Device(config-if)# neighbor 10.1.2.3 100
```

# show ip pim mdt send

To display the data multicast distribution tree (MDT) groups in use, use the **show ip pim mdt send** command in privileged EXEC mode.

**show ip pim vrf vrf-name mdt send**

|                           |                                                                                                                                                                        |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>vrf vrf-name</b> Displays the data MDT groups in use by the Multicast VPN (MVPN) routing and forwarding (MVRF) instance specified for the <i>vrf-name</i> argument. |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Command Modes** Privileged EXEC

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Use this command to show the data MDT groups in use by a specified MVRF.

## Examples

The following is sample output from the **show ip pim mdt send** command:

```
Device# show ip pim vrf vpn8 mdt send
MDT-data send list for VRF:vpn8
  (source, group)          MDT-data group      ref_count
(10.100.8.10, 225.1.8.1)   232.2.8.0           1
(10.100.8.10, 225.1.8.2)   232.2.8.1           1
(10.100.8.10, 225.1.8.3)   232.2.8.2           1
(10.100.8.10, 225.1.8.4)   232.2.8.3           1
(10.100.8.10, 225.1.8.5)   232.2.8.4           1
(10.100.8.10, 225.1.8.6)   232.2.8.5           1
(10.100.8.10, 225.1.8.7)   232.2.8.6           1
(10.100.8.10, 225.1.8.8)   232.2.8.7           1
(10.100.8.10, 225.1.8.9)   232.2.8.8           1
(10.100.8.10, 225.1.8.10)  232.2.8.9           1
```

The table below describes the significant fields shown in the display.

**Table 106: show ip pim mdt send Field Descriptions**

| Field          | Description                                                                 |
|----------------|-----------------------------------------------------------------------------|
| source, group  | Source and group addresses that this router has switched over to data MDTs. |
| MDT-data group | Multicast address over which these data MDTs are being sent.                |
| ref_count      | Number of (S, G) pairs that are reusing this data MDT.                      |

# show ip pim mdt receive

To display the data multicast distribution tree (MDT) group mappings received from other provider edge (PE) routers, use the **show ip pim mdt receive** command in privileged EXEC mode.

**show ip pim vrf vrf-name mdt receive [detail]**

## Syntax Description

|                            |                                                                                                                                                      |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf</b> <i>vrf-name</i> | Displays the data MDT group mappings for the Multicast VPN (MVPN) routing and forwarding (MVRF) instance specified for the <i>vrf-name</i> argument. |
| <b>detail</b>              | (Optional) Provides a detailed description of the data MDT advertisements received.                                                                  |

## Command Modes

Privileged EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

When a router wants to switch over from the default MDT to a data MDT, it advertises the VRF source, the group pair, and the global multicast address over which the traffic will be sent. If the remote router wants to receive this data, then it will join this global address multicast group.

## Examples

The following is sample output from the **show ip pim mdt receive** command using the **detail** keyword for further information:

```
Device# show ip pim vrf vpn8 mdt receive detail
Joined MDT-data groups for VRF:vpn8
group:172.16.8.0 source:10.0.0.100 ref_count:13
(10.101.8.10, 225.1.8.1), 1d13h/00:03:28/00:02:26, OIF count:1, flags:TY
(10.102.8.10, 225.1.8.1), 1d13h/00:03:28/00:02:27, OIF count:1, flags:TY
```

The table below describes the significant fields shown in the display.

**Table 107: show ip pim mdt receive Field Descriptions**

| Field             | Description                                                               |
|-------------------|---------------------------------------------------------------------------|
| group:172.16.8.0  | Group that caused the data MDT to be built.                               |
| source:10.0.0.100 | VRF source that caused the data MDT to be built.                          |
| ref_count:13      | Number of (S, G) pairs that are reusing this data MDT.                    |
| OIF count:1       | Number of interfaces out of which this multicast data is being forwarded. |

| Field  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

# show ip pim mdt history

To display information about the history of data multicast distribution tree (MDT) groups that have been reused, use the **show ip pim mdt history** command in privileged EXEC mode.

**show ip pim vrf** *vrf-name* **mdt history** **interval** *minutes*

|                           |                                |                                                                                                                                                                                  |
|---------------------------|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>vrf</b> <i>vrf-name</i>     | Displays the history of data MDT groups that have been reused for the Multicast VPN (MVPN) routing and forwarding (MVRP) instance specified for the <i>vrf-name</i> argument.    |
|                           | <b>interval</b> <i>minutes</i> | Specifies the interval (in minutes) for which to display information about the history of data MDT groups that have been reused. The range is from 1 to 71512 minutes (7 weeks). |

**Command Modes** Privileged EXEC

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The output of the **show ip pim mdt history** command displays the history of reused MDT data groups for the interval specified with the **interval** keyword and *minutes* argument. The interval is from the past to the present, that is, from the time specified for the *minutes* argument to the time at which the command is issued.

## Examples

The following is sample output from the **show ip pim mdt history** command:

```
Device# show ip pim vrf vrfl mdt history interval 20
MDT-data send history for VRF - vrfl for the past 20 minutes
MDT-data group      Number of reuse
10.9.9.8             3
10.9.9.9             2
```

The table below describes the significant fields shown in the display.

**Table 108: show ip pim mdt history Field Descriptions**

| Field           | Description                                                  |
|-----------------|--------------------------------------------------------------|
| MDT-data group  | The MDT data group for which information is being shown.     |
| Number of reuse | The number of data MDTs that have been reused in this group. |

# show ip pim mdt bgp

To show details about the Border Gateway Protocol (BGP) advertisement of the route distinguisher (RD) for the multicast distribution tree (MDT) default group, use the `show ip pim mdt bgp` command in user EXEC or privileged EXEC mode.

**show ip pim** [**vrf vrf-name**] **mdt bgp**

## Syntax Description

|                     |                                                                                                                                                                                                                                             |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | (Optional) Displays information about the BGP advertisement of the RD for the MDT default group associated with Multicast Virtual Private Network (MVPN) routing and forwarding (MVRP) instance specified for the <i>vrf-name</i> argument. |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Modes

User EXEC  
Privileged EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use this command to show detailed BGP advertisement of the RD for the MDT default group.

## Examples

The following is sample output from the **show ip pim mdt bgp** command:

```
Device# show ip pim mdt bgp
MDT-default group 232.2.1.4
  rid:10.1.1.1 next_hop:10.1.1.1
```

The table below describes the significant fields shown in the display.

**Table 109: show ip pim mdt bgp Field Descriptions**

| Field             | Description                                                       |
|-------------------|-------------------------------------------------------------------|
| MDT-default group | The MDT default groups that have been advertised to this router.  |
| rid:10.1.1.1      | The BGP router ID of the advertising router.                      |
| next_hop:10.1.1.1 | The BGP next hop address that was contained in the advertisement. |

# show mpls label range

To display the range of local labels available for use on packet interfaces, use the **show mpls label range** command in privileged EXEC mode.

**show mpls label range**

## Syntax Description

This command has no arguments or keywords.

## Command Modes

Privileged EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

You can use the **mpls label range** command to configure a range for local labels that is different from the default range. The **show mpls label range** command displays both the label range currently in use and the label range that will be in use following the next switch reload.

## Examples

In the following example, the use of the **show mpls label range** command is shown before and after the **mpls label range** command is used to configure a label range that does not overlap the starting label range:

```
Device# show mpls label range
Downstream label pool: Min/Max label: 16/100
Device# configure terminal
Device(config)# mpls label range 101 4000
Device(config)# exit
Device# show mpls label range
Downstream label pool: Min/Max label: 101/4000
```

## Related Commands

## Examples

The following is a sample output of the **show mpls ldp discovery brief** command:

```
Device# show mpls ldp discovery brief

Fri Mar  9 17:39:00.536 UTC

Local LDP Identifier: 1.1.1.1:0

Discovery Source      VRF Name      Peer LDP Id      Holdtime Session
-----
Te0/1/1/10           default       4.4.4.4:0        15             Y
Te0/1/1/12           default       3.3.3.3:0        15             Y
Tgt:87.0.0.1         default       -                -             N
```

The following is a sample output of the **show mpls ldp discovery summary** command:

```
Device# show mpls ldp discovery summary

Fri Mar  9 17:38:55.977 UTC

LDP Identifier: 1.1.1.1:0
Interfaces:
  Configured: 2
  Enabled   : 2
Discovery:
  Hello xmit: 3 (2 link, 1 targeted)
  Hello rcv: 2 (2 link)
  Hello Errors Received:
    Bad Source Address: 0
    Bad Hello PDU:      0
    Bad Xport Address:  0
    Same Router ID:     0
    Wrong Router ID:    0
```

# show mpls ldp neighbor

The **show mpls ldp neighbor** command was introduced. It displays the status of LDP sessions.

**show mpls ldp neighbor** [**all** | **vrf** *vrf-name*] [**brief**] [**summary**]

## Syntax Description

|                            |                                                                       |
|----------------------------|-----------------------------------------------------------------------|
| <b>all</b>                 | Displays all LDP configured VRFs.                                     |
| <b>vrf</b> <i>vrf-name</i> | Displays the VRF information for the specified VRF.                   |
| <b>brief</b>               | Displays concise information about a specified LDP-enabled interface. |
| <b>summary</b>             | Displays summarized information for LDP discovery.                    |

## Command Modes

Privileged EXEC (#)

## Command History

|-------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.3.1 | This command was introduced. |

## Examples

The following is a sample output of the **show mpls ldp neighbor brief** command:

```
Device# show mpls ldp neighbor brief

Fri Mar  9 17:38:11.890 UTC

Peer                GR   NSR   Up Time   Discovery   Addresses   Labels
-----
4.4.4.4:0           N   N     2d02h     1           6           13
3.3.3.3:0           N   N     2d02h     1           7           13
```

The following is a sample output of the **show mpls ldp neighbor summary** command:

```
Device# show mpls ldp neighbor summary
Fri Mar  9 17:38:55.977 UTC
VRF vrf1

Local LDP Identifier: 16.0.0.3:0

Sessions: 2 operational
          1 directly connected
          0 graceful restart
```

## show mpls forwarding-table

To display the contents of the Multiprotocol Label Switching (MPLS) Label Forwarding Information Base (LFIB), use the **show mpls forwarding-table** command in user EXEC or privileged EXEC mode.

**Note** When a local label is present, the forwarding entry for IP imposition will not be showed; if you want to see the IP imposition information, use **show ip cef**.

**show mpls forwarding-table** [{*network* {*masklength*} | **interface** *interface* | **labels** *label* [**dash** *label*] | **lcatm atm** *atm-interface-number* | **next-hop** *address* | **lsp-tunnel** [*tunnel-id*]}] [**vrf** *vrf-name*] [**detail** *slot slot-number*]

|                                              |                                                                                                                                                         |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>network</i>                               | (Optional) Destination network number.                                                                                                                  |
| <i>mask</i>                                  | IP address of the destination mask whose entry is to be shown.                                                                                          |
| <i>length</i>                                | Number of bits in the mask of the destination.                                                                                                          |
| <b>interface</b> <i>interface</i>            | (Optional) Displays entries with the outgoing interface specified.                                                                                      |
| <b>labels</b> <i>label-label</i>             | (Optional) Displays entries with the local labels specified.                                                                                            |
| <b>lcatm atm</b> <i>atm-interface-number</i> | Displays ATM entries with the specified Label Controlled Asynchronous Transfer Mode (LCATM).                                                            |
| <b>next-hop</b> <i>address</i>               | (Optional) Displays only entries with the specified neighbor as the next hop.                                                                           |
| <b>lsp-tunnel</b>                            | (Optional) Displays only entries with the specified label switched path (LSP) tunnel, or with all LSP tunnel entries.                                   |
| <i>tunnel-id</i>                             | (Optional) Specifies the LSP tunnel for which to display entries.                                                                                       |
| <b>vrf</b> <i>vrf-name</i>                   | (Optional) Displays entries with the specified VPN routing and forwarding (VRF) instance.                                                               |
| <b>detail</b>                                | (Optional) Displays information in long form (includes length of encapsulation, length of MAC string, maximum transmission unit [MTU], and all labels). |
| <b>slot</b> <i>slot-number</i>               | (Optional) Specifies the slot number, which is always 0.                                                                                                |

| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

The following is sample output from the **show mpls forwarding-table** command:

```
Device# show mpls forwarding-table
Local Outgoing Prefix Bytes label Outgoing Next Hop
Label Label or VC or Tunnel Id switched interface
26 No Label 10.253.0.0/16 0 Et4/0/0 10.27.32.4
28 1/33 10.15.0.0/16 0 AT0/0.1 point2point
29 Pop Label 10.91.0.0/16 0 Hs5/0 point2point
1/36 10.91.0.0/16 0 AT0/0.1 point2point
30 32 10.250.0.97/32 0 Et4/0/2 10.92.0.7
32 10.250.0.97/32 0 Hs5/0 point2point
34 26 10.77.0.0/24 0 Et4/0/2 10.92.0.7
26 10.77.0.0/24 0 Hs5/0 point2point
35 No Label[T] 10.100.100.101/32 0 Tu301 point2point
36 Pop Label 10.1.0.0/16 0 Hs5/0 point2point
1/37 10.1.0.0/16 0 AT0/0.1 point2point
[T] Forwarding through a TSP tunnel.
View additional labeling info with the 'detail' option
```

The following is sample output from the **show mpls forwarding-table** command when the IPv6 Provider Edge Router over MPLS feature is configured to allow IPv6 traffic to be transported across an IPv4 MPLS backbone. The labels are aggregated because there are several prefixes for one local label, and the prefix column contains “IPv6” instead of a target prefix.

```
Device# show mpls forwarding-table
Local Outgoing Prefix Bytes label Outgoing Next Hop
Label Label or VC or Tunnel Id switched interface
16 Aggregate IPv6 0
17 Aggregate IPv6 0
18 Aggregate IPv6 0
19 Pop Label 192.168.99.64/30 0 Se0/0 point2point
20 Pop Label 192.168.99.70/32 0 Se0/0 point2point
21 Pop Label 192.168.99.200/32 0 Se0/0 point2point
22 Aggregate IPv6 5424
23 Aggregate IPv6 3576
24 Aggregate IPv6 2600
```

The following is sample output from the **show mpls forwarding-table detail** command. If the MPLS EXP level is used as a selection criterion for packet forwarding, a bundle adjacency exp (vcd) field is included in the display. This field includes the EXP value and the corresponding virtual circuit descriptor (VCD) in parentheses. The line in the output that reads “No output feature configured” indicates that the MPLS egress NetFlow accounting feature is not enabled on the outgoing interface for this prefix.

```
Device# show mpls forwarding-table detail
Local Outgoing Prefix Bytes label Outgoing Next Hop
label label or VC or Tunnel Id switched interface
16 Pop label 10.0.0.6/32 0 AT1/0.1 point2point
Bundle adjacency exp(vcd)
0(1) 1(1) 2(1) 3(1) 4(1) 5(1) 6(1) 7(1)
MAC/Encaps=12/12, MTU=4474, label Stack{
00010000AAAA030000008847
No output feature configured
```

## show mpls forwarding-table

```

| Local label          | Label assigned by this device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Outgoing label or VC | Label assigned by the next hop or VPI/VCI used to get to the next hop. The entries in this column are the following: <ul style="list-style-type: none"> <li>• [T]--Forwarding is through an LSP tunnel.</li> <li>• No label--There is no label for the destination from the next hop or that label switching is not enabled on the outgoing interface.</li> <li>• Pop label--The next hop advertised an implicit NULL label for the destination and that this device popped the top label.</li> <li>• Aggregate--There are several prefixes for one local label. This entry is used when IPv6 is configured on edge devices to transport IPv6 traffic over an IPv4 MPLS network.</li> <li>• 0--The explicit null label value = 0.</li> </ul> |
| Prefix or Tunnel Id  | Address or tunnel to which packets with this label are sent. <p><b>Note</b> If IPv6 is configured on edge devices to transport IPv6 traffic over an IPv4 MPLS network, IPv6 is displayed here.</p> <ul style="list-style-type: none"> <li>• [V]--Means that the corresponding prefix is in a VRF.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Bytes label switched | Number of bytes switched with this incoming label. This includes the outgoing label and Layer 2 header.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Outgoing interface   | Interface through which packets with this label are sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Field    | Description                                                  |
|----------|--------------------------------------------------------------|
| Next Hop | IP address of the neighbor that assigned the outgoing label. |

### Cisco IOS Software Modularity: MPLS Layer 3 VPNs Example

The following is sample output from the **show mpls forwarding-table** command:

```
Device# show mpls forwarding-table
Local      Outgoing  Prefix      Bytes Label  Outgoing  Next Hop
Label      Label     or Tunnel Id Switched      interface
16         Pop Label IPv4 VRF[V] 62951000     aggregate/v1
17   [H]   No Label  10.1.1.0/24  0            AT1/0/0.1 point2point

```

The table below describes the Local Label fields relating to the Cisco IOS Software Modularity: MPLS Layer 3 VPNs feature.

Table 112: show mpls forwarding-table Field Descriptions

| Field       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Local Label | <p>Label assigned by this device.</p> <ul style="list-style-type: none"> <li>• [H]--Local labels are in holddown, which means that the application that requested the labels no longer needs them and stops advertising them to its labeling peers.</li> </ul> <p>The label's forwarding-table entry is deleted after a short, application-specific time.</p> <p>If any application starts advertising a held-down label to its labeling peers, the label could come out of holddown.</p> <p><b>Note</b> [H] is not shown if labels are held down globally.</p> <p>A label enters global holddown after a stateful switchover or a restart of certain processes in a Cisco IOS modularity environment.</p> <ul style="list-style-type: none"> <li>• [T]--The label is forwarded through an LSP tunnel.</li> </ul> <p><b>Note</b> Although [T] is still a property of the outgoing interface, it is shown in the Local Label column.</p> <ul style="list-style-type: none"> <li>• [HT]--Both conditions apply.</li> </ul> |

### L2VPN Inter-AS Option B: Example

The following is sample output from the **show mpls forwarding-table interface** command. In this example, the pseudowire identifier (that is, 4096) is displayed in the Prefix or Tunnel Id column. The **show mpls l2transport vc detail** command can be used to obtain more information about the specific pseudowire displayed.

```
Device# show mpls forwarding-table
Local      Outgoing  Prefix          Bytes Label  Outgoing  Next Hop
Label      Label     or Tunnel Id    Switched     interface
1011       No Label  l2ckt(4096)     0            none      point2point
```

The table below describes the fields shown in the display.

Table 113: show mpls forwarding-table interface Field Descriptions

| Field                | Description                                                                                                                   |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Local Label          | Label assigned by this device.                                                                                                |
| Outgoing Label       | Label assigned by the next hop or virtual path identifier (VPI)/virtual channel identifier (VCI) used to get to the next hop. |
| Prefix or Tunnel Id  | Address or tunnel to which packets with this label are going.                                                                 |
| Bytes Label Switched | Number of bytes switched with this incoming label. This includes the outgoing label and Layer 2 header.                       |

| Field              | Description                                                  |
|--------------------|--------------------------------------------------------------|
| Outgoing interface | Interface through which packets with this label are sent.    |
| Next Hop           | IP address of the neighbor that assigned the outgoing label. |

# show mpls static binding

To display Multiprotocol Label Switching (MPLS) static label bindings, use the **show mpls static binding** command in privileged EXEC mode.

**show mpls static binding** [{**ipv4** [{**vrf** *vrf-name*}] }][ {*prefix*{*mask-length**mask*} }][ {**local** | **remote** }][ {**nexthop** *address*}]

|                    |                                                    |                                                                                                                               |
|--------------------|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>ipv4</b>                                        | (Optional) Displays IPv4 static label bindings.                                                                               |
|                    | <b>vrf</b> <i>vrf-name</i>                         | (Optional) The static label bindings for a specified VPN routing and forwarding instance.                                     |
|                    | <i>prefix</i> { <i>mask-length</i>   <i>mask</i> } | (Optional) Labels for a specific prefix.                                                                                      |
|                    | <b>local</b>                                       | (Optional) Displays the incoming (local) static label bindings.                                                               |
|                    | <b>remote</b>                                      | (Optional) Displays the outgoing (remote) static label bindings.                                                              |
|                    | <b>nexthop</b> <i>address</i>                      | (Optional) Displays the label bindings for prefixes with outgoing labels for which the specified next hop is to be displayed. |

**Command Modes**

| Command History              |                              |
| Release                      | Modification                 |
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

If you do not specify any optional arguments, the **show mpls static binding** command displays information about all static label bindings. Or the information can be limited to any of the following:

- Bindings for a specific prefix or mask
- Local (incoming) labels
- Remote (outgoing) labels
- Outgoing labels for a specific next hop router

**Examples**

In the following output, the **show mpls static binding ipv4** command with no optional arguments displays all static label bindings:

```
Device# show mpls static binding ipv4
10.0.0.0/8: Incoming label: none;
  Outgoing labels:
    10.13.0.8          explicit-null
10.0.0.0/8: Incoming label: 55 (in LIB)
  Outgoing labels:
```

```

10.0.0.66          2607
10.66.0.0/16: Incoming label: 17 (in LIB)
Outgoing labels: None

```

In the following output, the **show mpls static binding ipv4** command displays remote (outgoing) statically assigned labels only:

```

Device# show mpls static binding ipv4 remote
10.0.0.0/8:
  Outgoing labels:
    10.13.0.8          explicit-null
10.0.0.0/8:
  Outgoing labels:
    10.0.0.66          2607

```

In the following output, the **show mpls static binding ipv4** command displays local (incoming) statically assigned labels only:

```

Device# show mpls static binding ipv4 local
10.0.0.0/8: Incoming label: 55 (in LIB)
10.66.0.0/16: Incoming label: 17 (in LIB)

```

In the following output, the **show mpls static binding ipv4** command displays statically assigned labels for prefix 10.0.0.0 / 8 only:

```

Device# show mpls static binding ipv4 10.0.0.0/8
10.0.0.0/8: Incoming label: 55 (in LIB)
Outgoing labels:
  10.0.0.66          2607

```

In the following output, the **show mpls static binding ipv4** command displays prefixes with statically assigned outgoing labels for next hop 10.0.0.66:

```

Device# show mpls static binding ipv4 10.0.0.0 8 nexthop 10.0.0.66
10.0.0.0/8: Incoming label: 55 (in LIB)
Outgoing labels:
  10.0.0.66          2607

```

The following output, the **show mpls static binding ipv4 vrf** command displays static label bindings for a VPN routing and forwarding instance vpn100:

```

Device# show mpls static binding ipv4 vrf vpn100
192.168.2.2/32: (vrf: vpn100) Incoming label: 100020
Outgoing labels: None
192.168.0.29/32: Incoming label: 100003 (in LIB)
Outgoing labels: None

```

#### Related Commands

|---------------------------------|----------------------------------------------------------|
| <b>mpls static binding ipv4</b> | Binds an IPv4 prefix or mask to a local or remote label. |

# show mpls static crossconnect

To display statically configured Label Forwarding Information Database (LFIB) entries, use the **show mpls static crossconnect** command in privileged EXEC mode.

**show mpls static crossconnect** [*low label* [*high label*]]

## Syntax Description

|                             |                                                    |
|-----------------------------|----------------------------------------------------|
| <i>low label high label</i> | (Optional) The statically configured LFIB entries. |
|-----------------------------|----------------------------------------------------|

## Command Modes

Privileged EXEC (#)

## Command History

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

If you do not specify any label arguments, then all the configured static cross-connects are displayed.

## Examples

The following sample output from the **show mpls static crossconnect** command shows the local and remote labels:

```
Device# show mpls static crossconnect
Local  Outgoing  Outgoing  Next Hop
label  label      interface
45     46         pos5/0    point2point
```

The table below describes the significant fields shown in the display.

**Table 114: show mpls static crossconnect Field Descriptions**

| Field              | Description                                                                                          |
|--------------------|------------------------------------------------------------------------------------------------------|
| Local label        | Label assigned by this router.                                                                       |
| Outgoing label     | Label assigned by the next hop.                                                                      |
| Outgoing interface | Interface through which packets with this label are sent.                                            |
| Next Hop           | IP address of the next hop router's interface that is connected to this router's outgoing interface. |

## Related Commands

| Command                         | Description                                                                       |
|---------------------------------|-----------------------------------------------------------------------------------|
| <b>mpls static crossconnect</b> | Configures an LFIB entry for the specified incoming label and outgoing interface. |

## mpls static binding ipv4

To bind a prefix to a local or remote label, use the **mpls static binding ipv4** command in global configuration mode. To remove the binding between the prefix and label, use the **no** form of this command.

```
mpls static binding ipv4 prefix mask {label | input label | output nexthop {explicit-null | implicit-nulllabel}}
```

```
no mpls static binding ipv4 prefix mask {label | input label | output nexthop {explicit-null | implicit-nulllabel}}
```

|                                                   |                                                                                                                                                                                                                                                                       |
|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>prefix mask</i>                                | Specifies the prefix and mask to bind to a label. (When you do not use the <b>input</b> or <b>output</b> keyword, the specified label is an incoming label.)<br><br><b>Note</b> Without the arguments, the <b>no</b> form of the command removes all static bindings. |
| <i>label</i>                                      | Binds a prefix or a mask to a local (incoming) label. (When you do not use the <b>input</b> or <b>output</b> keyword, the specified label is an incoming label.)                                                                                                      |
| <b>input</b> <i>label</i>                         | Binds the specified label to the prefix and mask as a local (incoming) label.                                                                                                                                                                                         |
| <b>output</b> <i>nexthop</i> <b>explicit-null</b> | Binds the Internet Engineering Task Force (IETF) Multiprotocol Label Switching (MPLS) IPv4 explicit null label (0) as a remote (outgoing) label.                                                                                                                      |
| <b>output</b> <i>nexthop</i> <b>implicit-null</b> | Binds the IETF MPLS implicit null label (3) as a remote (outgoing) label.                                                                                                                                                                                             |
| <b>output</b> <i>nexthop</i> <i>label</i>         | Binds the specified label to the prefix/mask as a remote (outgoing) label.                                                                                                                                                                                            |

### Command Default

Prefixes are not bound to local or remote labels.

### Command Modes

Global configuration (config)

|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

The **mpls static binding ipv4** command pushes bindings into Label Distribution Protocol (LDP). LDP then needs to match the binding with a route in the Routing Information Base (RIB) or Forwarding Information Base (FIB) before installing forwarding information.

The **mpls static binding ipv4** command installs the specified bindings into the LDP Label Information Base (LIB). LDP will install the binding labels for forwarding use if or when the binding prefix or mask matches a known route.

Static label bindings are not supported for local prefixes, which are connected networks, summarized routes, default routes, and supernets. These prefixes use implicit-null or explicit-null as the local label.

If you do not specify the **input** or the **output** keyword, input (local label) is assumed.

For the **no** form of the command:

- If you specify the command name without any keywords or arguments, all static bindings are removed.
- Specifying the prefix and mask but no label parameters removes all static bindings for that prefix or mask.

## Examples

In the following example, the **mpls static binding ipv4** command configures a static prefix and label binding before the label range is reconfigured to define a range for static assignment. The output of the command indicates that the binding has been accepted, but cannot be used for MPLS forwarding until you configure a range of labels for static assignment that includes that label.

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# mpls static binding ipv4 10.0.0.0 255.0.0.0 55
% Specified label 55 for 10.0.0.0/8 out of configured
% range for static labels. Cannot be used for forwarding until
% range is extended.
Router(config)# end
```

The following **mpls static binding ipv4** commands configure input and output labels for several prefixes:

```
Device(config)# mpls static binding ipv4 10.0.0.0 255.0.0.0 55
Device(config)# mpls static binding ipv4 10.0.0.0 255.0.0.0 output 10.0.0.66 2607
Device(config)# mpls static binding ipv4 10.66.0.0 255.255.0.0 input 17
Device(config)# mpls static binding ipv4 10.66.0.0 255.255.0.0 output 10.13.0.8 explicit-null
Device(config)# end
```

The following **show mpls static binding ipv4** command displays the configured bindings:

```
Device# show mpls static binding ipv4

10.0.0.0/8: Incoming label: 55
    Outgoing labels:
        10.0.0.66    2607
10.66.0.0/24: Incoming label: 17
    Outgoing labels:
        10.13.0.8    explicit-null
```

## Related Commands

Table 115: show platform hardware fed (TCAM utilization) Field Descriptions

| Field   | Description                                         |
|---------|-----------------------------------------------------|
| Table   | Displays the feature configured on the device.      |
| Subtype | Displays resource type.                             |
| Dir     | Displays direction of traffic.                      |
| Max     | Displays maximum number of entries allocated.       |
| Used    | Displays number of entries used.                    |
| %Used   | Displays percentage of entries used.                |
| V4      | Displays number of entries used by IPv4 protocol.   |
| V6      | Displays number of entries used by IPv6 protocol.   |
| MPLS    | Displays number of entries used by MPLS protocol.   |
| Other   | Displays number of entries used by other protocols. |

# show platform software fed switch l2vpn

To display device-specific software information, use the **show platform software fed switch** command.

**show platform software fed switch** {*switch number* | **active** | **standby**} **l2vpn** {**atom-disposition** | **atom-imposition** | **summary** | **vfi-segment** | **xconnect**}

## Note

This topic elaborates on only the Layer 2 VPN-specific (L2VPN-specific) options available with the **show platform software fed switch l2vpn** command.

## Syntax Description

**switch** {*switch number* | **active** | **standby**}

Specifies the device for which you want to display information.

- **switch number**: Switch ID. Displays information about the specified switch.
- **active**: Displays information about the active switch.
- **standby**: Displays information about the standby switch, if available.

## l2vpn

Displays L2VPN information. Choose one of the following options:

- **atom-disposition**: Displays L2VPN atom disposition information.
- **atom-imposition**: Displays L2VPN atom imposition information.
- **summary**: Displays L2VPN summary.
- **vfi-segment**: Displays L2VPN Virtual Forwarder Interface (VFI) segment information.
- **xconnect**: Displays L2VPN Xconnect information.

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                     | Modification                 |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

## Examples

The following is a sample output of the **show platform software fed switch l2vpn** command:

```
Device# show platform software fed switch 1 l2vpn atom-disposition all

# show platform software fed switch mpls

To display device-specific software information, use the **show platform software fed switch** command.

**show platform software fed switch** {*switch number* | **active** | **standby** } **mpls** {**eos** | **forwarding** | **label\_oce** | **lookup** | **summary**}

## Note

This topic elaborates only the Multiprotocol Label Switching-specific options available with the **show platform software fed switch mpls** command.

## Syntax Description

**switch** {*switch number* | **active** | **standby**}

Specifies the device for which you want to display information.

- **switch number**: Switch ID. Displays information about the specified switch.
- **active**: Displays information about the active switch.
- **standby**: Displays information about the standby switch, if available.

**mpls**

Displays MPLS information. Choose one of the following options:

- **eos**: Displays MPLS end of stack (EOS) information.
- **forwarding**: Displays MPLS forwarding information.
- **label\_oce**: Displays MPLS label output chain element (OCE) information.
- **lookup**: Displays MPLS lookup information.
- **summary**: Displays the summary of the MPLS configuration.

## Command Modes

User EXEC (>)

Privileged EXEC (#)

## Command History

| Release                     | Modification                 |

## source template type pseudowire

To configure the name of a source template of type pseudowire, use the **source template type pseudowire** command in interface configuration mode. To remove a source template of type pseudowire, use the **no** form of this command.

**source template type pseudowire** *template-name*  
**no source template type pseudowire**

|                           | <i>ip-address</i>                                                                                                                                                                                                                           | IP address of the host destination expressed in dotted decimal notation.    |
|                           | <i>ipv6-address</i>                                                                                                                                                                                                                         | IPv6 address of the host destination expressed in IPv6 address format.      |
|                           | <b>dynamic</b>                                                                                                                                                                                                                              | Applies the tunnel destination address dynamically to the tunnel interface. |
| <b>Command Default</b>    | No tunnel interface destination is specified.                                                                                                                                                                                               |                                                                             |
| <b>Command Modes</b>      | Interface configuration (config-if)                                                                                                                                                                                                         |                                                                             |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                                              | <b>Modification</b>                                                         |
|                           | Cisco IOS XE Gibraltar 16.11.1                                                                                                                                                                                                              | This command was introduced.                                                |
| <b>Usage Guidelines</b>   | You cannot configure two tunnels to use the same encapsulation mode with exactly the same source and destination addresses. The workaround is to create a loopback interface and configure the packet source off of the loopback interface. |                                                                             |

## Examples

The following example shows how to configure the logical Layer 3 GRE tunnel interface tunnel 2 in a global or non-VRF environment:

```
Device> enable
Device# configure terminal
Device(config)# interface tunnel 2
Device(config-if)# ip address 100.1.1.1 255.255.255.0
Device(config-if)# tunnel source 10.10.10.1
Device(config-if)# tunnel destination 10.10.10.2
Device(config-if)# tunnel mode gre ip
Device(config-if)# end
```

The following example shows how to configure the logical Layer 3 GRE tunnel interface tunnel 2 in a VRF environment. Use the **vrf definition** *vrf-name* and the **vrf forwarding** *vrf-name* commands to configure and apply VRF.

```
Device> enable
Device# configure terminal
Device(config)# interface tunnel 2
Device(config-if)# ip address 100.1.1.1 255.255.255.0
Device(config-if)# tunnel source 10.10.10.1
Device(config-if)# tunnel destination 10.10.10.2
Device(config-if)# tunnel mode gre ip
Device(config-if)# end
```

# tunnel source

To set the source address for a tunnel interface, use the **tunnel source** command in interface configuration mode. To remove the source address, use the **no** form of this command.

**tunnel source** {*ip-address* | *ipv6-address* | *interface-type interface-number* | **dynamic**}  
**no tunnel source**

|                           |                         |                                                                                                                                                                                                                 |
|---------------------------|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>ip-address</i>       | Source IP address of the packets in the tunnel.                                                                                                                                                                 |
|                           | <i>ipv6-address</i>     | Source IPv6 address of the packets in the tunnel.                                                                                                                                                               |
|                           | <i>interface-type</i>   | Interface type.                                                                                                                                                                                                 |
|                           | <i>interface-number</i> | Port, connector, or interface card number. The numbers are assigned at the factory at the time of installation or when added to a system. This number can be displayed with the <b>show interfaces</b> command. |
|                           | <b>dynamic</b>          | Applies the tunnel source address dynamically to the tunnel interface.                                                                                                                                          |

**Command Default** No tunnel interface source address is set.

**Command Modes** Interface configuration (config-if)

| <b>Command History</b> | <b>Release</b>                 | <b>Modification</b>          |
|------------------------|--------------------------------|------------------------------|
|                        | Cisco IOS XE Gibraltar 16.11.1 | This command was introduced. |

**Usage Guidelines** The source address is either an explicitly defined IP address or the IP address assigned to specified interface. You cannot have two tunnels using the same encapsulation mode with exactly the same source and destination addresses. The workaround is to create a loopback interface and source packets from the loopback interface.

## Examples

The following example shows how to configure the logical Layer 3 GRE tunnel interface tunnel 2 in a global or non-VRF environment:

```
Device> enable
Device# configure terminal
Device(config)# interface tunnel 2
Device(config-if)# ip address 100.1.1.1 255.255.255.0
Device(config-if)# tunnel source 10.10.10.1
Device(config-if)# tunnel destination 10.10.10.2
Device(config-if)# tunnel mode gre ip
Device(config-if)# end
```

The following example shows how to configure the logical Layer 3 GRE tunnel interface tunnel 2 in a VRF environment. Use the **vrf definition** *vrf-name* and the **vrf forwarding** *vrf-name* commands to configure and apply VRF.

```
Device> enable
Device# configure terminal
Device(config)# interface tunnel 2
Device(config-if)# ip address 100.1.1.1 255.255.255.0
```

```
Device(config-if)# tunnel source 10.10.10.1
Device(config-if)# tunnel destination 10.10.10.2
Device(config-if)# tunnel mode gre ip
Device(config-if)# end
```

# xconnect

To bind an attachment circuit to a pseudowire, and to configure an Any Transport over MPLS (AToM) static pseudowire, use the **xconnect** command in interface configuration mode. To restore the default values, use the **no** form of this command.

**xconnect** *peer-ip-address* *vc-id* **encapsulation** **mpls** [*pw-type*]

**no xconnect** *peer-ip-address* *vc-id* **encapsulation** **mpls** [*pw-type*]

## Syntax Description

|                           |                                                                                                                                                                                                              |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>peer-ip-address</i>    | IP address of the remote provider edge (PE) peer. The remote router ID can be any IP address, as long as it is reachable.                                                                                    |
| <i>vc-id</i>              | The 32-bit identifier of the virtual circuit (VC) between PE devices.                                                                                                                                        |
| <b>encapsulation mpls</b> | Specifies Multiprotocol Label Switching (MPLS) as the tunneling method.                                                                                                                                      |
| <i>pw-type</i>            | (Optional) Pseudowire type. You can specify one of the following types: <ul style="list-style-type: none"> <li>• <b>4</b>: Specifies Ethernet VLAN.</li> <li>• <b>5</b>: Specifies Ethernet port.</li> </ul> |

## Command Default

The attachment circuit is not bound to the pseudowire.

## Command Modes

Interface configuration (config-if)

## Command History

| Release                     | Modification                 |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

## Usage Guidelines

The use of the **xconnect** command and the interface configuration mode **bridge-group** command is not supported on the same physical interface.

The combination of the *peer-ip-address* and *vcid* arguments must be unique on the device. Each Xconnect configuration must have a unique combination of *peer-ip-address* and *vcid* configuration.

The same *vcid* value that identifies the attachment circuit must be configured using the **xconnect** command on the local and remote PE device. The VC ID creates the binding between a pseudowire and an attachment circuit.

## Examples

The following example shows how to enter Xconnect configuration mode and bind the attachment circuit to a pseudowire VC:

```
Device# configure terminal
Device(config)# interface TenGigabitEthernet1/0/36
Device(config-if)# no ip address
Device(config-if)# xconnect 10.1.10.1 962 encapsulation mpls
```

# cache

To configure a flow cache parameter for a flow monitor, use the **cache** command in flow monitor configuration mode. To remove a flow cache parameter for a flow monitor, use the **no** form of this command.

```
cache {timeout {active | inactive | rate-limit | update} seconds | type normal}
no cache {timeout {active | inactive | rate-limit | update} | type}
```

| Syntax Description |  |                                                                                                                                                                                                             |
|--------------------|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>timeout</b>     |  | Specifies the flow timeout.                                                                                                                                                                                 |
| <b>active</b>      |  | Specifies the active flow timeout.                                                                                                                                                                          |
| <b>inactive</b>    |  | Specifies the inactive flow timeout.                                                                                                                                                                        |
| <b>update</b>      |  | Specifies the update timeout for a permanent flow cache.                                                                                                                                                    |
| <i>seconds</i>     |  | The timeout value in seconds. The range is 30 to 604800 (7 days) for a normal flow cache. For a permanent flow cache the range is 1 to 604800 (7 days).                                                     |
| <b>type</b>        |  | Specifies the type of the flow cache.                                                                                                                                                                       |
| <b>normal</b>      |  | Configures a normal cache type. The entries in the flow cache will be aged out according to the <b>timeout active seconds</b> and <b>timeout inactive seconds</b> settings. This is the default cache type. |

|                        |                                                                                                                                                                                                                                                     |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Command Default</b> | The default flow monitor flow cache parameters are used.<br>The following flow cache parameters for a flow monitor are enabled: <ul style="list-style-type: none"> <li>• Cache type: normal</li> <li>• Active flow timeout: 1800 seconds</li> </ul> |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                      |                            |
|----------------------|----------------------------|

|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                                                                                                                                                                             |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | Each flow monitor has a cache that it uses to store all the flows it monitors. Each cache has various configurable elements, such as the time that a flow is allowed to remain in it. When a flow times out, it is removed from the cache and sent to any exporters that are configured for the corresponding flow monitor. |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The **cache timeout active** command controls the aging behavior of the normal type of cache. If a flow has been active for a long time, it is usually desirable to age it out (starting a new flow for any subsequent packets in the flow). This age out process allows the monitoring application that is receiving the exports to remain up to date. By default, this timeout is 1800 seconds (30 minutes), but it can be adjusted according to system requirements. A larger value ensures that long-lived flows are accounted for in a single flow record; a smaller value results in a shorter delay between starting a new long-lived flow and exporting some data for it. When you change the active flow timeout, the new timeout value takes effect immediately.

The **cache timeout inactive** command also controls the aging behavior of the normal type of cache. If a flow has not seen any activity for a specified amount of time, that flow will be aged out. By default, this timeout is 15 seconds, but this value can be adjusted depending on the type of traffic expected. If a large number of short-lived flows is consuming many cache entries, reducing the inactive timeout can reduce this overhead. If a large number of flows frequently get aged out before they have finished collecting their data, increasing this timeout can result in better flow correlation. When you change the inactive flow timeout, the new timeout value takes effect immediately.

The **cache timeout update** command controls the periodic updates sent by the permanent type of cache. This behavior is similar to the active timeout, except that it does not result in the removal of the cache entry from the cache. By default, this timer value is 1800 seconds (30 minutes).

The **cache type normal** command specifies the normal cache type. This is the default cache type. The entries in the cache will be aged out according to the **timeout active seconds** and **timeout inactive seconds** settings. When a cache entry is aged out, it is removed from the cache and exported via any exporters configured for the monitor associated with the cache.

To return a cache to its default settings, use the **default cache** flow monitor configuration command.

**Note**

When a cache becomes full, new flows will not be monitored.

The following example shows how to configure the active timeout for the flow monitor cache:

```
Device(config)# flow monitor FLOW-MONITOR-1
Device(config-flow-monitor)# cache timeout active 4800
```

The following example shows how to configure the inactive timer for the flow monitor cache:

```
Device(config)# flow monitor FLOW-MONITOR-1
Device(config-flow-monitor)# cache timeout inactive 30
```

The following example shows how to configure the permanent cache update timeout:

```
Device(config)# flow monitor FLOW-MONITOR-1
Device(config-flow-monitor)# cache timeout update 5000
```

The following example shows how to configure a normal cache:

```
Device(config)# flow monitor FLOW-MONITOR-1
Device(config-flow-monitor)# cache type normal
```

# clear flow exporter

To clear the statistics for a Flexible Netflow flow exporter, use the **clear flow exporter** command in privileged EXEC mode.

**clear flow exporter** *[[name] exporter-name] statistics*

## Syntax Description

|                      |                                                                    |
|----------------------|--------------------------------------------------------------------|
| <b>name</b>          | (Optional) Specifies the name of a flow exporter.                  |
| <i>exporter-name</i> | (Optional) Name of a flow exporter that was previously configured. |
| <b>statistics</b>    | Clears the flow exporter statistics.                               |

## Command Modes

Privileged EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **clear flow exporter** command removes all statistics from the flow exporter. These statistics will not be exported and the data gathered in the cache will be lost.

You can view the flow exporter statistics by using the **show flow exporter statistics** privileged EXEC command.

## Examples

The following example clears the statistics for all of the flow exporters configured on the device:

```
Device# clear flow exporter statistics
```

The following example clears the statistics for the flow exporter named FLOW-EXPORTER-1:

```
Device# clear flow exporter FLOW-EXPORTER-1 statistics
```

# clear flow monitor

To clear a flow monitor cache or flow monitor statistics and to force the export of the data in the flow monitor cache, use the **clear flow monitor** command in privileged EXEC mode.

**clear flow monitor** [**name**] *monitor-name* [{**cache**] **force-export** | **statistics**}]

## Syntax Description

|                     |                                                                    |
|---------------------|--------------------------------------------------------------------|
| <b>name</b>         | Specifies the name of a flow monitor.                              |
| <i>monitor-name</i> | Name of a flow monitor that was previously configured.             |
| <b>cache</b>        | (Optional) Clears the flow monitor cache information.              |
| <b>force-export</b> | (Optional) Forces the export of the flow monitor cache statistics. |
| <b>statistics</b>   | (Optional) Clears the flow monitor statistics.                     |

## Command Modes

Privileged EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **clear flow monitor cache** command removes all entries from the flow monitor cache. These entries will not be exported and the data gathered in the cache will be lost.

### Note

The statistics for the cleared cache entries are maintained.

The **clear flow monitor force-export** command removes all entries from the flow monitor cache and exports them using all flow exporters assigned to the flow monitor. This action can result in a short-term increase in CPU usage. Use this command with caution.

The **clear flow monitor statistics** command clears the statistics for this flow monitor.

### Note

The current entries statistic will not be cleared by the **clear flow monitor statistics** command because this is an indicator of how many entries are in the cache and the cache is not cleared with this command.

You can view the flow monitor statistics by using the **show flow monitor statistics** privileged EXEC command.

## Examples

The following example clears the statistics and cache entries for the flow monitor named FLOW-MONITOR-1:

```
Device# clear flow monitor name FLOW-MONITOR-1
```

The following example clears the statistics and cache entries for the flow monitor named FLOW-MONITOR-1 and forces an export:

```
Device# clear flow monitor name FLOW-MONITOR-1 force-export
```

The following example clears the cache for the flow monitor named FLOW-MONITOR-1 and forces an export:

```
Device# clear flow monitor name FLOW-MONITOR-1 cache force-export
```

The following example clears the statistics for the flow monitor named FLOW-MONITOR-1:

```
Device# clear flow monitor name FLOW-MONITOR-1 statistics
```

# clear platform software fed switch swc connection

To clear the connection details and events of the Stealthwatch Cloud integration, use the **clear platform software fed switch** *switch-number* **swc connection** command in privileged EXEC mode.

**clear platform software fed switch** { *switch-number* | **active** } **swc connection**

## Syntax Description

**switch** {*switch-number* | **active** } Device for which you want to clear information.

- *switch\_num*: Switch ID.
- **active**: Clears information for the active switch.

**swc connection** Clears the connection details and events.

## Command Modes

Privileged EXEC (#)

## Command History

| Release                       | Modification                 |
|-------------------------------|------------------------------|
| Cisco IOS XE Bengaluru 17.5.1 | This command was introduced. |

## Examples

The following is a sample output of the **clear platform software fed switch active swc connection** command:

```
Device> enable
Device# clear platform software fed switch active swc connection
```

# clear snmp stats hosts

To clear the NMS IP address, the number of times an NMS polls the agent, and the timestamp of polling, use the **clear snmp stats hosts** command in privileged EXEC mode.

**clear snmp stats hosts**

## Syntax Description

This command has no arguments or keywords.

## Command Default

The details of the SNMP managers polled to the SNMP agent is stored in the system.

## Command Modes

Privileged EXEC (#)

## Command History

| Release                       | Modification                 |
|-------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

## Usage Guidelines

Use the **clear snmp stats hosts** command to delete all the entries polled to the SNMP agent.

The following is sample output of the **clear snmp stats hosts** command.

```
Device# clear snmp stats hosts
Request Count                Last Timestamp                Address
```

# collect

To configure non-key fields for the flow monitor record and to enable capturing the values in the fields for the flow created with the record, use the **collect** command in flow record configuration mode.

**collect** {**counter** | **interface** | **timestamp** | **transport**}

|                           |                  |                                                                                                                                                                                  |
|---------------------------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>counter</b>   | Configures the number of bytes or packets in a flow as a non-key field for a flow record. For more information, see <i>collect counter</i> .                                     |
|                           | <b>interface</b> | Configures the input and output interface name as a non-key field for a flow record. For more information, see <i>collect interface</i> .                                        |
|                           | <b>timestamp</b> | Configures the absolute time of the first seen or last seen packet in a flow as a non-key field for a flow record. For more information, see <i>collect timestamp absolute</i> . |
|                           | <b>transport</b> | Enables the collecting of transport TCP flags from a flow record. For more information, see <i>collect transport tcp flags</i> .                                                 |

|                        |                                                                |
|------------------------|----------------------------------------------------------------|
| <b>Command Default</b> | Non-key fields are not configured for the flow monitor record. |
|------------------------|----------------------------------------------------------------|

|                      |                           |
|----------------------|---------------------------|
| <b>Command Modes</b> | Flow record configuration |
|----------------------|---------------------------|

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                                                                                                                                       |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The values in non-key fields are added to flows to provide additional information about the traffic in the flows. A change in the value of a non-key field does not create a new flow. In most cases, the values for non-key fields are taken from only the first packet in the flow. |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The **collect** commands are used to configure non-key fields for the flow monitor record and to enable capturing the values in the fields for the flow created with the record. The values in non-key fields are added to flows to provide additional information about the traffic in the flows. A change in the value of a non-key field does not create a new flow. In most cases the values for non-key fields are taken from only the first packet in the flow.

|             |                                                                                                            |
|-------------|------------------------------------------------------------------------------------------------------------|
| <b>Note</b> | Although it is visible in the command-line help string, the <b>flow username</b> keyword is not supported. |
|-------------|------------------------------------------------------------------------------------------------------------|

The following example configures the total number of bytes in the flows as a non-key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# collect counter bytes long
```

# collect counter

To configure the number of bytes or packets in a flow as a non-key field for a flow record, use the **collect counter** command in flow record configuration mode. To disable the use of the number of bytes or packets in a flow (counters) as a non-key field for a flow record, use the **no** form of this command.

|                        |                                                                                |
|------------------------|--------------------------------------------------------------------------------|
| <b>Command Default</b> | The number of bytes or packets in a flow is not configured as a non-key field. |
|------------------------|--------------------------------------------------------------------------------|

|                      |                           |
|----------------------|---------------------------|
| <b>Command Modes</b> | Flow record configuration |
|----------------------|---------------------------|

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                        |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | To return this command to its default settings, use the <b>no collect counter</b> or <b>default collect counter</b> flow record configuration command. |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|

The following example configures the total number of bytes in the flows as a non-key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)#collect counter bytes long
```

The following example configures the total number of packets from the flows as a non-key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# collect counter packets long
```

# collect flow sampler

To configure a flow sampler ID as a non-key field for the record, use the **collect flow sampler** command in flow record configuration mode. To disable the use of the flow sampler ID number as a non-key field for a flow record, use the **no** form of this command.

**collect flow sampler**  
**no collect flow sampler**

**Syntax Description** This command has no arguments or keywords.

**Command Default** The flow sampler is not configured as non-key fields.

**Command Modes** Flow record configuration (config-flow-record)

| Command History | Release                       | Modification                 |
|-----------------|-------------------------------|------------------------------|
|                 | Cisco IOS XE Amsterdam 17.2.1 | This command was introduced. |

**Usage Guidelines** The **collect** commands are used to configure non-key fields for the flow monitor record and to enable capturing the values in the fields for the flow created with the record. The values in non-key fields are added to flows to provide additional information about the traffic in the flows. A change in the value of a non-key field does not create a new flow. In most cases the values for non-key fields are taken from only the first packet in the flow.

The **collect flow sampler** command is useful when more than one flow sampler is being used with different sampling rates. The non-key field contains the ID of the flow sampler used to monitor the flow.

## Examples

The following example shows how to configure the ID of the flow sampler that is assigned to the flow as a non-key field:

```
Device> enable
Device# configure terminal
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# collect flow sampler
```

| Related Commands | Command              | Description                                 |

|                  | <b>flow record</b>   | Creates a flow record for Flexible NetFlow. |

# collect interface

To configure the input interface name as a non-key field for a flow record, use the **collect interface** command in flow record configuration mode. To disable the use of the input interface as a non-key field for a flow record, use the **no** form of this command.

**collect interface input**  
**no collect interface input**

| <b>Syntax Description</b>    | <b>input</b> Configures the input interface name as a non-key field and enables collecting the input interface from the flows.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |              |                              |                              |

| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |              |                              |                              |
| <b>Usage Guidelines</b>      | <p>The Flexible NetFlow <b>collect</b> commands are used to configure non-key fields for the flow monitor record and to enable capturing the values in the fields for the flow created with the record. The values in non-key fields are added to flows to provide additional information about the traffic in the flows. A change in the value of a non-key field does not create a new flow. In most cases, the values for non-key fields are taken from only the first packet in the flow.</p> <p>To return this command to its default settings, use the <b>no collect interface</b> or <b>default collect interface</b> flow record configuration command.</p> |         |              |                              |                              |

The following example configures the input interface as a non-key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# collect interface input
```

## collect ipv4 destination

To configure the IPv4 destination as a non-key field for a flow record, use the **collect ipv4 destination** command in flow record configuration mode. To disable the use of an IPv4 destination field as a non-key field for a flow record, use the **no** form of this command.

**collect ipv4 destination** {mask | prefix} [minimum-mask mask]  
**no collect ipv4 destination** {mask | prefix} [minimum-mask mask]

|                           |                          |                                                                                                                                                   |
|---------------------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>mask</b>              | Configures the IPv4 destination mask as a non-key field and enables collecting the value of the IPv4 destination mask from the flows.             |
|                           | <b>prefix</b>            | Configures the prefix for the IPv4 destination as a non-key field and enables collecting the value of the IPv4 destination prefix from the flows. |
|                           | <b>minimum-mask mask</b> | (Optional) Specifies the size, in bits, of the minimum mask. Range: 1 to 32.                                                                      |

**Command Default** The IPv4 destination is not configured as a non-key field.

**Command Modes** Flow record configuration (config-flow-record)

|                        |                               |                              |
|------------------------|-------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>                | <b>Modification</b>          |
|                        | Cisco IOS XE Amsterdam 17.2.1 | This command was introduced. |

**Usage Guidelines** The Flexible NetFlow **collect** commands are used to configure non-key fields for the flow monitor record and to enable capturing the values in the fields for the flow created with the record. The values in non-key fields are added to flows to provide additional information about the traffic in the flows. A change in the value of a non-key field does not create a new flow. In most cases the values for non-key fields are taken from only the first packet in the flow.

### Examples

The following example shows how to configure the IPv4 destination prefix from the flows that have a prefix of 16 bits as a non-key field:

```
Device> enable
Device> configure terminal
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# collect ipv4 destination prefix minimum-mask 16
```

|                         |                    |                                             |
|-------------------------|--------------------|---------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>     | <b>Description</b>                          |
|                         | <b>flow record</b> | Creates a flow record for Flexible NetFlow. |

# collect ipv6 destination

To configure the IPv6 destination as a non-key field for a flow record, use the **collect ipv6 destination** command in flow record configuration mode. To disable the use of an IPv6 destination field as a non-key field for a flow record, use the **no** form of this command.

```
collect ipv6 destination { mask | prefix } [ minimum-mask mask ]
no collect ipv6 destination { mask | prefix } [ minimum-mask mask ]
```

## Syntax Description

|                          |                                                                                                                                                   |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mask</b>              | Configures the IPv6 destination mask as a non-key field and enables collecting the value of the IPv6 destination mask from the flows.             |
| <b>prefix</b>            | Configures the prefix for the IPv6 destination as a non-key field and enables collecting the value of the IPv6 destination prefix from the flows. |
| <b>minimum-mask mask</b> | (Optional) Specifies the size, in bits, of the minimum mask. Range: 1 to 32.                                                                      |

## Command Default

The IPv6 destination is not configured as a non-key field.

## Command Modes

Flow record configuration (config-flow-record)

## Command History

| Release                       | Modification                 |
|-------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.3.1 | This command was introduced. |

## Usage Guidelines

The Flexible NetFlow **collect** commands are used to configure non-key fields for the flow monitor record and to enable capturing the values in the fields for the flow created with the record. The values in non-key fields are added to flows to provide additional information about the traffic in the flows. A change in the value of a non-key field does not create a new flow. In most cases the values for non-key fields are taken from only the first packet in the flow.

## Examples

The following example shows how to configure the IPv6 destination prefix from the flows that have a prefix of 16 bits as a non-key field:

```
Device> enable
Device> configure terminal
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# collect ipv6 destination prefix minimum-mask 16
```

## Related Commands

|--------------------|---------------------------------------------|
| <b>flow record</b> | Creates a flow record for Flexible NetFlow. |

## collect ipv4 source

To configure the IPv4 source as a non-key field for a flow record, use the **collect ipv4 source** command in flow record configuration mode. To disable the use of the IPv4 source field as a non-key field for a flow record, use the **no** form of this command.

**collect ipv4 source** {mask | prefix} [minimum-mask mask]  
**no collect ipv4 source** {mask | prefix} [minimum-mask mask]

|                           |                          |                                                                                                                                         |
|---------------------------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>mask</b>              | Configures the mask for the IPv4 source as a non-key field and enables collecting the value of the IPv4 source mask from the flows.     |
|                           | <b>prefix</b>            | Configures the prefix for the IPv4 source as a non-key field and enables collecting the value of the IPv4 source prefix from the flows. |
|                           | <b>minimum-mask mask</b> | (Optional) Specifies the size, in bits, of the minimum mask. Range: 1 to 32.                                                            |

**Command Default** The IPv4 source is not configured as a non-key field.

**Command Modes** Flow record configuration (config-flow-record)

|                        |                               |                              |
|------------------------|-------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>                | <b>Modification</b>          |
|                        | Cisco IOS XE Amsterdam 17.2.1 | This command was introduced. |

**Usage Guidelines** The **collect** commands are used to configure non-key fields for the flow monitor record and to enable capturing the values in the fields for the flow created with the record. The values in non-key fields are added to flows to provide additional information about the traffic in the flows. A change in the value of a non-key field does not create a new flow. In most cases the values for non-key fields are taken from only the first packet in the flow.

### collect ipv4 source prefix minimum-mask

The source prefix is the network part of an IPv4 source. The optional minimum mask allows more information to be gathered about large networks.

### collect ipv4 source mask minimum-mask

The source mask is the number of bits that make up the network part of the source. The optional minimum mask allows a minimum value to be configured. This command is useful when there is a minimum mask configured for the source prefix field and the mask is to be used with the prefix. In this case, the values configured for the minimum mask should be the same for the prefix and mask fields.

Alternatively, if the collector is aware of the minimum mask configuration of the prefix field, the mask field can be configured without a minimum mask so that the true mask and prefix can be calculated.

## Examples

The following example shows how to configure the IPv4 source prefix from flows that have a prefix of 16 bits as a non-key field:

```
Device> enable
Device# configure terminal
Device(config)# flow record FLOW-RECORD-1
```

```
Device(config-flow-record)# collect ipv4 source prefix minimum-mask 16
```

**Related Commands**

|--------------------|---------------------------------------------|
| <b>flow record</b> | Creates a flow record for Flexible NetFlow. |

# collect ipv6 source

To configure the IPv6 source as a non-key field for a flow record, use the **collect ipv6 source** command in flow record configuration mode. To disable the use of the IPv6 source field as a non-key field for a flow record, use the **no** form of this command.

```
collect ipv6 source { mask | prefix } [ minimum-mask mask ]
no collect ipv6 source { mask | prefix } [ minimum-mask mask ]
```

## Syntax Description

|                          |                                                                                                                                         |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>mask</b>              | Configures the mask for the IPv6 source as a non-key field and enables collecting the value of the IPv6 source mask from the flows.     |
| <b>prefix</b>            | Configures the prefix for the IPv6 source as a non-key field and enables collecting the value of the IPv6 source prefix from the flows. |
| <b>minimum-mask mask</b> | (Optional) Specifies the size, in bits, of the minimum mask. Range: 1 to 32.                                                            |

## Command Default

The IPv6 source is not configured as a non-key field.

## Command Modes

Flow record configuration (config-flow-record)

| Release                       | Modification                 |
|-------------------------------|------------------------------|

## Usage Guidelines

The **collect** commands are used to configure non-key fields for the flow monitor record and to enable capturing the values in the fields for the flow created with the record. The values in non-key fields are added to flows to provide additional information about the traffic in the flows. A change in the value of a non-key field does not create a new flow. In most cases the values for non-key fields are taken from only the first packet in the flow.

### collect ipv6 source prefix minimum-mask

The source prefix is the network part of an IPv6 source. The optional minimum mask allows more information to be gathered about large networks.

### collect ipv6 source mask minimum-mask

The source mask is the number of bits that make up the network part of the source. The optional minimum mask allows a minimum value to be configured. This command is useful when there is a minimum mask configured for the source prefix field and the mask is to be used with the prefix. In this case, the values configured for the minimum mask should be the same for the prefix and mask fields.

Alternatively, if the collector is aware of the minimum mask configuration of the prefix field, the mask field can be configured without a minimum mask so that the true mask and prefix can be calculated.

## Examples

The following example shows how to configure the IPv6 source prefix from flows that have a prefix of 16 bits as a non-key field:

```
Device> enable
Device# configure terminal
Device(config)# flow record FLOW-RECORD-1
```

```
Device(config-flow-record)# collect ipv6 source prefix minimum-mask 16
```

# collect timestamp absolute

To configure the absolute time of the first seen or last seen packet in a flow as a non-key field for a flow record, use the **collect timestamp absolute** command in flow record configuration mode. To disable the use of the first seen or last seen packet in a flow as a non-key field for a flow record, use the **no** form of this command.

**collect timestamp absolute** {first | last}  
**no collect timestamp absolute** {first | last}

|                           |              |                                                                                                                                       |
|---------------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>first</b> | Configures the absolute time of the first seen packet in a flow as a non-key field and enables collecting time stamps from the flows. |
|                           | <b>last</b>  | Configures the absolute time of the last seen packet in a flow as a non-key field and enables collecting time stamps from the flows.  |

**Command Default** The absolute time field is not configured as a non-key field.

**Command Modes** Flow record configuration

| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|------------------------|------------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **collect** commands are used to configure non-key fields for the flow monitor record and to enable capturing the values in the fields for the flow created with the record. The values in non-key fields are added to flows to provide additional information about the traffic in the flows. A change in the value of a non-key field does not create a new flow. In most cases the values for non-key fields are taken from only the first packet in the flow.

The following example configures time stamps based on the absolute time of the first seen packet in a flow as a non-key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# collect timestamp absolute first
```

The following example configures time stamps based on the absolute time of the last seen packet in a flow as a non-key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# collect timestamp absolute last
```

# collect transport tcp flags

To enable the collecting of transport TCP flags from a flow, use the **collect transport tcp flags** command in flow record configuration mode. To disable the collecting of transport TCP flags from the flow, use the **no** form of this command.

**collect transport tcp flags**  
**no collect transport tcp flags**

| <b>Syntax Description</b>    | This command has no arguments or keywords.                                                                                                            |         |              |                              |                              |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|------------------------------|
| <b>Command Default</b>       | The transport layer fields are not configured as a non-key field.                                                                                     |         |              |                              |                              |
| <b>Command Modes</b>         | Flow record configuration                                                                                                                             |         |              |                              |                              |
| <b>Command History</b>       | <table> <tr> <th>Release</th><th>Modification</th></tr> <tr> <td>Cisco IOS XE Everest 16.5.1a</td><td>This command was introduced.</td></tr> </table> | Release | Modification | Cisco IOS XE Everest 16.5.1a | This command was introduced. |
| Release                      | Modification                                                                                                                                          |         |              |                              |                              |
| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                          |         |              |                              |                              |

**Usage Guidelines** The values of the transport layer fields are taken from all packets in the flow. You cannot specify which TCP flag to collect. You can only specify to collect transport TCP flags. All TCP flags will be collected with this command. The following transport TCP flags are collected:

- **ack**—TCP acknowledgement flag
- **cwr**—TCP congestion window reduced flag
- **ece**—TCP ECN echo flag
- **fin**—TCP finish flag
- **psh**—TCP push flag
- **rst**—TCP reset flag
- **syn**—TCP synchronize flag
- **urg**—TCP urgent flag

To return this command to its default settings, use the **no collect transport tcp flags** or **default collect transport tcp flags** flow record configuration command.

The following example collects the TCP flags from a flow:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# collect transport tcp flags
```

## collect routing next-hop address

To configure the next-hop address value as a non-key field and enable collecting information regarding the next hop from the flows, use the **collect routing next-hop address** command in flow record configuration mode. To disable the use of one or more of the routing attributes as a non-key field for a flow record, use the **no** form of this command.

```
collect routing next-hop address { ipv4 | ipv6 }  
no collect routing next-hop address { ipv4 | ipv6 }
```

### Syntax Description

|             |                                                               |
|-------------|---------------------------------------------------------------|
| <b>ipv4</b> | Specifies that the next-hop address value is an IPv4 address. |
| <b>ipv6</b> | Specifies that the next-hop address value is an IPv6 address. |

### Command Default

Next hop address value is not configured as a non-key field.

### Command Modes

Flow record configuration (config-flow-record)

### Command History

| Release                       | Modification                            |
|-------------------------------|-----------------------------------------|
| Cisco IOS XE Amsterdam 17.2.1 | This command was introduced.            |
| Cisco IOS XE Amsterdam 17.3.1 | The <b>ipv6</b> keyword was introduced. |

### Usage Guidelines

The **collect** commands are used to configure non-key fields for the flow monitor record and to enable capturing the values in the fields for the flow created with the record. The values in non-key fields are added to flows to provide additional information about the traffic in the flows. A change in the value of a non-key field does not create a new flow. In most cases the values for non-key fields are taken from only the first packet in the flow.

### Examples

The following example shows how to configure the next-hop address value as a non-key field:

```
Device> enable  
Device# configure terminal  
Device(config)# flow record FLOW-RECORD-1  
Device(config-flow-record)# collect routing next-hop address ipv4
```

### Related Commands

| Command            | Description                                                                        |
|--------------------|------------------------------------------------------------------------------------|
| <b>flow record</b> | Creates a flow record, and enters Flexible NetFlow flow record configuration mode. |

# datalink flow monitor

To apply a Flexible NetFlow flow monitor to an interface, use the **datalink flow monitor** command in interface configuration mode. To disable a Flexible NetFlow flow monitor, use the **no** form of this command.

**datalink flow monitor** *monitor-name* **sampler** *sampler-name* **input**  
**no datalink flow monitor** *monitor-name* **sampler** *sampler-name* **input**

## Syntax Description

|                                    |                                                             |
|------------------------------------|-------------------------------------------------------------|
| <i>monitor-name</i>                | Name of the flow monitor to apply to the interface.         |
| <b>sampler</b> <i>sampler-name</i> | Enables the specified flow sampler for the flow monitor.    |
| <b>input</b>                       | Monitors traffic that the switch receives on the interface. |

## Command Default

A flow monitor is not enabled.

## Command Modes

Interface configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Before you apply a flow monitor to an interface with the **datalink flow monitor** command, you must have already created the flow monitor using the **flow monitor** global configuration command and the flow sampler using the **sampler** global configuration command.

To enable a flow sampler for the flow monitor, you must have already created the sampler.

### Note

The **datalink flow monitor** command only monitors non-IPv4 and non-IPv6 traffic. To monitor IPv4 traffic, use the **ip flow monitor** command. To monitor IPv6 traffic, use the **ipv6 flow monitor** command.

This example shows how to enable Flexible NetFlow datalink monitoring on an interface:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# datalink flow monitor FLOW-MONITOR-1 sampler FLOW-SAMPLER-1 input
```

# debug flow exporter

To enable debugging output for Flexible Netflow flow exporters, use the **debug flow exporter** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

**debug flow exporter** *[[name] exporter-name] [{error | event | packets number}]*  
**no debug flow exporter** *[[name] exporter-name] [{error | event | packets number}]*

## Syntax Description

|                      |                                                                                                                  |
|----------------------|------------------------------------------------------------------------------------------------------------------|
| <b>name</b>          | (Optional) Specifies the name of a flow exporter.                                                                |
| <i>exporter-name</i> | (Optional) The name of a flow exporter that was previously configured.                                           |
| <b>error</b>         | (Optional) Enables debugging for flow exporter errors.                                                           |
| <b>event</b>         | (Optional) Enables debugging for flow exporter events.                                                           |
| <b>packets</b>       | (Optional) Enables packet-level debugging for flow exporters.                                                    |
| <i>number</i>        | (Optional) The number of packets to debug for packet-level debugging of flow exporters. The range is 1 to 65535. |

## Command Modes

Privileged EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

The following example indicates that a flow exporter packet has been queued for process send:

```
Device# debug flow exporter
May 21 21:29:12.603: FLOW EXP: Packet queued for process send
```

# debug flow monitor

To enable debugging output for Flexible NetFlow flow monitors, use the **debug flow monitor** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

```
debug flow monitor [{error | [name] monitor-name [{cache [error] | error | packets packets}]}]  
no debug flow monitor [{error | [name] monitor-name [{cache [error] | error | packets packets}]}]
```

## Syntax Description

|                     |                                                                                                               |
|---------------------|---------------------------------------------------------------------------------------------------------------|
| <b>error</b>        | (Optional) Enables debugging for flow monitor errors for all flow monitors or for the specified flow monitor. |
| <b>name</b>         | (Optional) Specifies the name of a flow monitor.                                                              |
| <i>monitor-name</i> | (Optional) Name of a flow monitor that was previously configured.                                             |
| <b>cache</b>        | (Optional) Enables debugging for the flow monitor cache.                                                      |
| <b>cache error</b>  | (Optional) Enables debugging for flow monitor cache errors.                                                   |
| <b>packets</b>      | (Optional) Enables packet-level debugging for flow monitors.                                                  |
| <i>packets</i>      | (Optional) Number of packets to debug for packet-level debugging of flow monitors. The range is 1 to 65535.   |

## Command Modes

Privileged EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

The following example shows that the cache for FLOW-MONITOR-1 was deleted:

```
Device# debug flow monitor FLOW-MONITOR-1 cache  
May 21 21:53:02.839: FLOW MON: 'FLOW-MONITOR-1' deleted cache
```

# debug flow record

To enable debugging output for Flexible NetFlow flow records, use the **debug flow record** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

```
debug flow record [{[name] record-name | options {sampler-table} | [{detailed | error}]]
no debug flow record [{[name] record-name | options {sampler-table} | [{detailed | error}]]
```

|                    |                      |                                                                               |
|--------------------|----------------------|-------------------------------------------------------------------------------|
| Syntax Description | <b>name</b>          | (Optional) Specifies the name of a flow record.                               |
|                    | <i>record-name</i>   | (Optional) Name of a user-defined flow record that was previously configured. |
|                    | <b>options</b>       | (Optional) Includes information on other flow record options.                 |
|                    | <b>sampler-table</b> | (Optional) Includes information on the sampler tables.                        |
|                    | <b>detailed</b>      | (Optional) Displays detailed information.                                     |
|                    | <b>error</b>         | (Optional) Displays errors only.                                              |

|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Examples**

The following example enables debugging for the flow record:

```
Device# debug flow record FLOW-record-1
```

# debug sampler

To enable debugging output for Flexible NetFlow samplers, use the **debug sampler** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

```
debug sampler [{detailed | error | [name] sampler-name [{detailed | error | sampling samples}]}]  
no debug sampler [{detailed | error | [name] sampler-name [{detailed | error | sampling}]}]
```

## Syntax Description

|                                |                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------|
| <b>detailed</b>                | (Optional) Enables detailed debugging for sampler elements.                             |
| <b>error</b>                   | (Optional) Enables debugging for sampler errors.                                        |
| <b>name</b>                    | (Optional) Specifies the name of a sampler.                                             |
| <i>sampler-name</i>            | (Optional) Name of a sampler that was previously configured.                            |
| <b>sampling</b> <i>samples</i> | (Optional) Enables debugging for sampling and specifies the number of samples to debug. |

## Command Modes

Privileged EXEC

|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

The following sample output shows that the debug process has obtained the ID for the sampler named SAMPLER-1:

```
Device# debug sampler detailed  
*May 28 04:14:30.883: Sampler: Sampler(SAMPLER-1: flow monitor FLOW-MONITOR-1 (ip,Et1/0,0)  
get ID succeeded:1  
*May 28 04:14:30.971: Sampler: Sampler(SAMPLER-1: flow monitor FLOW-MONITOR-1 (ip,Et0/0,I)  
get ID succeeded:1
```

# description

To configure a description for a flow monitor, flow exporter, or flow record, use the **description** command in the appropriate configuration mode. To remove a description, use the **no** form of this command.

**description** *description*  
**no description** *description*

## Syntax Description

*description* Text string that describes the flow monitor, flow exporter, or flow record.

## Command Default

The default description for a flow sampler, flow monitor, flow exporter, or flow record is "User defined."

## Command Modes

The following command modes are supported:

Flow exporter configuration

Flow monitor configuration

Flow record configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

To return this command to its default setting, use the **no description** or **default description** command in the appropriate configuration mode.

The following example configures a description for a flow monitor:

```
Device(config)# flow monitor FLOW-MONITOR-1  
Device(config-flow-monitor)# description Monitors traffic to 172.16.0.1 255.255.0.0
```

# description (ERSPAN)

To describe an Encapsulated Remote Switched Port Analyzer (ERSPAN) source session, use the **description** command in ERSPAN monitor source session configuration mode. To remove a description, use the **no** form of this command.

**description** *description*  
**no description**

| <b>Syntax Description</b>    | <i>description</i> Describes the properties for this session.                                                                                    |         |              |                              |                              |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|------------------------------|
| <b>Command Default</b>       | Description is not configured.                                                                                                                   |         |              |                              |                              |
| <b>Command Modes</b>         | ERSPAN monitor source session configuration mode (config-mon-erspan-src)                                                                         |         |              |                              |                              |

| <b>vrf</b> <i>vrf-id</i>                                                                                                             | <p>Configures virtual routing and forwarding (VRF) in the destination session. Enter the VRF ID.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

ERSPAN traffic is GRE-encapsulated SPAN traffic that can only be processed by an ERSPAN destination session.

## Examples

The following examples show how to configure an ERSPAN source session destination, enter the ERSPAN monitor destination session configuration mode, and configure the various properties.

The following example specifies the destination property **ip**:

```
Device(config)# monitor session 2 type erspan-source
Device(config-mon-erspan-src)# destination
Device(config-mon-erspan-src-dst)# ip address 10.1.1.1
Device(config-mon-erspan-src-dst)#
```

The following example shows how to configure an ERSPAN ID for a destination session:

```
Device(config)# monitor session 2 type erspan-source
Device(config-mon-erspan-src)# destination
Device(config-mon-erspan-src-dst)# erspan-id 3
```

The following example shows how to configure DSCP value for ERSPAN traffic:

```
Device(config)# monitor session 2 type erspan-source
Device(config-mon-erspan-src)# destination
Device(config-mon-erspan-src-dst)# ip dscp 15
```

The following example shows how to configure TTL value for ERSPAN traffic:

```
Device(config)# monitor session 2 type erspan-source
Device(config-mon-erspan-src)# destination
Device(config-mon-erspan-src-dst)# ip ttl 32
```

The following example specifies the destination property **ipv6**:

```
Device(config)# monitor session 3 type erspan-source
Device(config-mon-erspan-src)# destination
Device(config-mon-erspan-src-dst)# ipv6 address 2001:DB8::1
Device(config-mon-erspan-src-dst)#
```

The following example shows how to configure DSCP value for ERSPAN traffic IPv6:

```
Device(config)# monitor session 3 type erspan-source
Device(config-mon-erspan-src)# destination
Device(config-mon-erspan-src-dst)# ipv6 dscp 10
```

The following example shows how to configure flow-label value for ERSPAN traffic IPv6:

```
Device(config)# monitor session 3 type erspan-source
Device(config-mon-erspan-src)# destination
Device(config-mon-erspan-src-dst)# ipv6 flow-label 6
```

The following example shows how to configure TTL value for ERSPAN traffic IPv6:

```
Device(config)# monitor session 3 type erspan-source
Device(config-mon-erspan-src)# destination
Device(config-mon-erspan-src-dst)# ipv6 ttl 32
```

The following example shows how to specify an MTU of 1000 bytes:

```
Device(config)# monitor session 2 type erspan-source
Device(config-mon-erspan-src)# destination
Device(config-mon-erspan-src-dst)# mtu 1000
```

The following example shows how to configure an IP address for an ERSPAN source session:

```
Switch(config)# monitor session 2 type erspan-source
Switch(config-mon-erspan-src)# destination
Switch(config-mon-erspan-src-dst)# origin ip address 192.0.2.1
```

The following example shows how to configure an IPv6 address for an ERSPAN source session:

```
Switch(config)# monitor session 3 type erspan-source
Switch(config-mon-erspan-src)# destination
Switch(config-mon-erspan-src-dst)# origin ipv6 address 2001:DB8:1::1
```

The following example shows how to configure VRF in the destination session:

```
Switch(config)# monitor session 3 type erspan-source
Switch(config-mon-erspan-src)# destination
Switch(config-mon-erspan-src-dst)# vrf vrfexample
```

The following sample output from the **show monitor session all** displays different IP addresses for source session destinations:

```
Device# show monitor session all

Session 1
-----
Type : ERSPAN Source Session
Status : Admin Disabled
Description : session1
Destination IP Address : 10.1.1.1

Session 2
-----
Type : ERSPAN Source Session
Status : Admin Disabled
Description : session2
Destination IP Address : 192.0.2.1

Session 3
-----
Type : ERSPAN Source Session
Status : Admin Disabled
Description : session3
Destination IP Address : 198.51.100.1

Session 4
-----
```

Type : ERSPAN Source Session  
Status : Admin Disabled  
Description : session4  
Destination IP Address : 203.0.113.1

Session 5

-----

Type : ERSPAN Source Session  
Status : Admin Disabled  
Description : session5  
Destination IP Address : 209.165.200.225

| <b>monitorsession type</b> | Configures a local ERSPAN source or destination session. |

# destination

To configure an export destination for a flow exporter, use the **destination** command in flow exporter configuration mode. To remove an export destination for a flow exporter, use the **no** form of this command.

**destination** {hostname|ip-address}

**no destination** {hostname|ip-address}

## Syntax Description

*hostname* Hostname of the device to which you want to send the NetFlow information.

*ip-address* IPv4 address of the workstation to which you want to send the NetFlow information.

## Command Default

An export destination is not configured.

## Command Modes

Flow exporter configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Each flow exporter can have only one destination address or hostname.

When you configure a hostname instead of the IP address for the device, the hostname is resolved immediately and the IPv4 address is stored in the running configuration. If the hostname-to-IP-address mapping that was used for the original Domain Name System (DNS) name resolution changes dynamically on the DNS server, the device does not detect this, and the exported data continues to be sent to the original IP address, resulting in a loss of data.

To return this command to its default setting, use the **no destination** or **default destination** command in flow exporter configuration mode.

The following example shows how to configure the networking device to export the Flexible NetFlow cache entry to a destination system:

```
Device(config)# flow exporter FLOW-EXPORTER-1
Device(config-flow-exporter)# destination 10.0.0.4
```

# dscp

To configure a differentiated services code point (DSCP) value for flow exporter datagrams, use the **dscp** command in flow exporter configuration mode. To remove a DSCP value for flow exporter datagrams, use the **no** form of this command.

```
dscp dscp
no dscp dscp
```

| Syntax Description           | dscp DSCP to be used in the DSCP field in exported datagrams. The range is 0 to 63. The default is 0.                                                                                                                                                                                                                              |         |              |                              |                              |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|------------------------------|
| Command Default              | The differentiated services code point (DSCP) value is 0.                                                                                                                                                                                                                                                                          |         |              |                              |                              |
| Command Modes                | Flow exporter configuration                                                                                                                                                                                                                                                                                                        |         |              |                              |                              |

| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                                                                                                                                                                       |         |              |                              |                              |
| Usage Guidelines             | <p>To return this command to its default setting, use the <b>no dscp</b> or <b>default dscp</b> flow exporter configuration command.</p> <p>The following example sets 22 as the value of the DSCP field in exported datagrams:</p> <pre>Device(config)# flow exporter FLOW-EXPORTER-1 Device(config-flow-exporter)# dscp 22</pre> |         |              |                              |                              |

# et-analytics

To enter the global et-analytics configuration mode, use the **et-analytics** command in the global configuration mode.

## et-analytics

|                           |                               |                                                   |
|---------------------------|-------------------------------|---------------------------------------------------|
| <b>Syntax Description</b> | <b>et-analytics</b>           | Enter the global et-analytics configuration mode. |
| <b>Command Default</b>    | Disabled.                     |                                                   |
| <b>Command Modes</b>      | Global configuration (config) |                                                   |
| <b>Command History</b>    | <b>Release</b>                | <b>Modification</b>                               |
|                           | Cisco IOS XE Everest 16.5.1a  | This command was introduced.                      |

## Example:

The following example shows how to enter the et-analytics configuration mode:

```
Device>enable
Device#configure terminal
Device(config)# et-analytics
```

# et-analytics enable

To enable et-analytics configuration on a particular interface, use the **et-analytics enable** command in the interface configuration mode. To disable et-analytics, use the **no** form of the command.

**et-analytics enable**  
**no et-analytics enable**

|                           |                                                                                    |                              |
|---------------------------|------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <b>et-analytics enable</b><br><br>Enables et-analytics on a particular interface.. |                              |
| <b>Command Default</b>    | Disabled.                                                                          |                              |
| <b>Command Modes</b>      | Interface configuration (config-if)                                                |                              |
| <b>Command History</b>    | <b>Release</b>                                                                     | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.5.1a                                                       | This command was introduced. |

## Example:

The following example shows how to enable et-analytics on interface GigabitEthernet1/0/2.:

```
Device>enable
Device#configure terminal
Device(config)# interface g11/0/2
Device(config-if)# et-analytics enable
```

# event manager applet

To register an applet with the Embedded Event Manager (EEM) and to enter applet configuration mode, use the **event manager applet** command in global configuration mode. To unregister the applet, use the **no** form of this command.

**event manager applet** *applet-name* [**authorization bypass**] [**class** *class-options*] [**trap**]  
**no event manager applet** *applet-name* [**authorization bypass**] [**class** *class-options*] [**trap**]

## Syntax Description

|                      |                                                                                                                                                                                                                                                                                                                                                |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>applet-name</i>   | Name of the applet file.                                                                                                                                                                                                                                                                                                                       |
| <b>authorization</b> | (Optional) Specifies AAA authorization type for applet.                                                                                                                                                                                                                                                                                        |
| <b>bypass</b>        | (Optional) Specifies EEM AAA authorization type bypass.                                                                                                                                                                                                                                                                                        |
| <b>class</b>         | (Optional) Specifies the EEM policy class.                                                                                                                                                                                                                                                                                                     |
| <i>class-options</i> | (Optional) The EEM policy class. You can specify either one of the following: <ul style="list-style-type: none"><li>• <i>class-letter--</i> Letter from A to Z that identifies each policy class. You can specify any one <i>class-letter</i>.</li><li>• <b>default --</b> Specifies the policies registered with the default class.</li></ul> |
| <b>trap</b>          | (Optional) Generates a Simple Network Management Protocol (SNMP) trap when the policy is triggered.                                                                                                                                                                                                                                            |

## Command Default

No EEM applets are registered.

## Command Modes

Global configuration (config)

## Command History

| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

An EEM applet is a concise method for defining event screening criteria and the actions to be taken when that event occurs.

Only one event configuration command is allowed within an applet configuration. When applet configuration submode is exited and no event command is present, a warning is displayed stating that no event is associated with this applet. If no event is specified, this applet is not considered registered and the applet is not displayed. When no action is associated with this applet, events are still triggered but no actions are performed. Multiple action applet configuration commands are allowed within an applet configuration. Use the **show event manager policy registered** command to display a list of registered applets.

Before modifying an EEM applet, use the **no** form of this command to unregister the applet because the existing applet is not replaced until you exit applet configuration mode. While you are in applet configuration mode modifying the applet, the existing applet may be executing. When you exit applet configuration mode, the old applet is unregistered and the new version is registered.

**Note** Do not attempt making any partial modification. EEM does not support partial changes to already registered policies. EEM policy has to be always unregistered before registering again with changes.

Action configuration commands are uniquely identified using the *label* argument, which can be any string value. Actions are sorted in ascending alphanumeric key sequence using the *label* argument as the sort key and are run using this sequence.

The EEM schedules and runs policies on the basis of an event specification that is contained within the policy itself. When applet configuration mode is exited, EEM examines the event and action commands that are entered and registers the applet to be run when a specified event occurs.

The EEM policies will be assigned a class when **class class-letter** is specified when they are registered. EEM policies registered without a class will be assigned to the **default** class. Threads that have **default** as the class will service the default class when the thread is available for work. Threads that are assigned specific class letters will service any policy with a matching class letter when the thread is available for work.

If there is no EEM execution thread available to run the policy in the specified class and a scheduler rule for the class is configured, the policy will wait until a thread of that class is available for execution. Synchronous policies that are triggered from the same input event should be scheduled in the same execution thread. Policies will be queued in a separate queue for each class using the *queue\_priority* as the queuing order.

When a policy is triggered and if AAA is configured it will contact the AAA server for authorization. Using the **authorization bypass** keyword combination, you can skip to contact the AAA server and run the policy immediately. EEM stores AAA bypassed policy names in a list. This list is checked when policies are triggered. If a match is found, AAA authorization is bypassed.

To avoid authorization for commands configured through the EEM policy, EEM will use named method lists, which AAA provides. These named method lists can be configured to have no command authorization.

The following is a sample AAA configuration.

This configuration assumes a TACACS+ server at 192.168.10.1 port 10000. If the TACACS+ server is not enabled, configuration commands are permitted on the console; however, EEM policy and applet CLI interactions will fail.

```
enable password lab
aaa new-model
tacacs-server host 128.107.164.152 port 10000
tacacs-server key cisco
aaa authentication login consoleline none
aaa authorization exec consoleline none
aaa authorization commands 1 consoleline none
aaa authorization commands 15 consoleline none
line con 0
  exec-timeout 0 0
  login authentication consoleline
aaa authentication login default group tacacs+ enable
aaa authorization exec default group tacacs+
aaa authorization commands 1 default group tacacs+
aaa authorization commands 15 default group tacacs+
```

The **authorization**, **class** and **trap** keywords can be used in any combination.

## Examples

The following example shows an EEM applet called IPSLAping1 being registered to run when there is an exact match on the value of a specified SNMP object ID that represents a successful IP SLA

ICMP echo operation (this is equivalent to a **ping** command). Four actions are triggered when the echo operation fails, and event monitoring is disabled until after the second failure. A message that the ICMP echo operation to a server failed is sent to syslog, an SNMP trap is generated, EEM publishes an application-specific event, and a counter called IPSLA1F is incremented by a value of one.

```
Router(config)# event manager applet IPSLAping1
Router(config-applet)# event snmp oid 1.3.6.1.4.1.9.9.42.1.2.9.1.6.4 get-type exact
entry-op eq entry-val 1 exit-op eq exit-val 2 poll-interval 5
Router(config-applet)# action 1.0 syslog priority critical msg "Server IP echo failed:
OID=$_snmp_oid_val"
Router(config-applet)# action 1.1 snmp-trap strdata "EEM detected server reachability
failure to 10.1.88.9"
Router(config-applet)# action 1.2 publish-event sub-system 88000101 type 1 arg1 10.1.88.9
arg2 IPSLAEcho arg3 fail
Router(config-applet)# action 1.3 counter name _IPSLA1F value 1 op inc
```

The following example shows how to register an applet with the name one and class A and enter applet configuration mode where the timer event detector is set to trigger an event every 10 seconds. When the event is triggered, the **action syslog** command writes the message “hello world” to syslog.

```
Router(config)# event manager applet one class A
Router(config-applet)# event timer watchdog time 10
Router(config-applet)# action syslog syslog msg "hello world"
Router(config-applet)# exit
```

The following example shows how to bypass the AAA authorization when registering an applet with the name one and class A.

```
Router(config)# event manager applet one class A authorization bypass
Router(config-applet)#
```

# exporter

To add a flow exporter for a flow monitor, use the **exporter** command in the appropriate configuration mode. To remove a flow exporter for a flow monitor, use the **no** form of this command.

```
exporter exporter-name
no exporter exporter-name
```

|                    |                                                                          |
|--------------------|--------------------------------------------------------------------------|
| Syntax Description | exporter-name    Name of a flow exporter that was previously configured. |
|--------------------|--------------------------------------------------------------------------|

|                 |                                |
|-----------------|--------------------------------|
| Command Default | An exporter is not configured. |
|-----------------|--------------------------------|

|               |                            |

| Command Modes | Flow monitor configuration |
|---------------|----------------------------|

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                  |                                                                                                                                                                                    |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | You must have already created a flow exporter by using the <b>flow exporter</b> command before you can apply the flow exporter to a flow monitor with the <b>exporter</b> command. |
|                  | To return this command to its default settings, use the <b>no exporter</b> or <b>default exporter</b> flow monitor configuration command.                                          |

|          |                                                                                                         |
|----------|---------------------------------------------------------------------------------------------------------|
| Examples | The following example configures an exporter for a flow monitor:                                        |
|          | <pre>Device(config)# flow monitor FLOW-MONITOR-1 Device(config-flow-monitor)# exporter EXPORTER-1</pre> |

# fconfigure

To specify the options in a channel use the **fconfigure** command in the TCL configuration mode.

**fconfigure** *channel-name* **remote** [*host port*] **broadcast** *boolean* **vrf** *vrf-table-name*

|                    |                               |                                                                                                                                                                                                                           |
|--------------------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>remote</b>                 | Configures a remote session. It supports both IPv4 and IPv6 addresses.                                                                                                                                                    |
|                    | <b>broadcast</b>              | Enables or disables broadcasting. The value of the option must be a proper boolean value.                                                                                                                                 |
|                    | <b>vrf</b>                    | Returns the local VRF table name for the specified socket. If no VRF Table has been configured for the given socket, TCL_ERROR will be returned and “No VRF table configured” will be appended to the interpreter result. |
| Command Default    |                               |                                                                                                                                                                                                                           |
| Command Modes      | TCL configuration mode        |                                                                                                                                                                                                                           |
| Command History    | Release                       | Modification                                                                                                                                                                                                              |
|                    | Cisco IOS XE Amsterdam 17.2.1 | The <b>myvrf</b> keyword was introduced.                                                                                                                                                                                  |

## filter (ERSPAN)

To configure the Encapsulated Remote Switched Port Analyzer (ERSPAN) source VLAN filtering when the ERSPAN source is a trunk port, use the **filter** command in ERSPAN monitor source session configuration mode. To remove the configuration, use the **no** form of this command.

**filter** {**ip access-group** {*standard-access-list* *extended-access-list* *acl-name*} | **ipv6 access-group** *acl-name* | **mac access-group** *acl-name* | **sgt** *sgt-id* [{,}] [{-}] | **vlan** *vlan-id* [{,}] [{-}]}

**no filter** {**ip** [{**access-group** | [{ *standard-access-list* *extended-access-list* *acl-name*}] } | **ipv6** [{**access-group**}] | **mac** [{**access-group**}] | **sgt** *sgt-id* [{,}] [{-}] | **vlan** *vlan-id* [{,}] [{-}]}

| Syntax Description          |  |                                                                           |
|-----------------------------|--|---------------------------------------------------------------------------|
| <b>ip</b>                   |  | Specifies the IP access control rules.                                    |
| <b>access-group</b>         |  | Specifies an access control group.                                        |
| <i>standard-access-list</i> |  | Standard IP access list.                                                  |
| <i>extended-access-list</i> |  | Extended IP access list.                                                  |
| <i>acl-name</i>             |  | Access list name.                                                         |
| <b>ipv6</b>                 |  | Specifies the IPv6 access control rules.                                  |
| <b>mac</b>                  |  | Specifies the media access control (MAC) rules.                           |
| <b>sgt</b> <i>sgt-ID</i>    |  | Specifies the Security Group Tag (SGT). Valid values are from 1 to 65535. |
| <b>vlan</b> <i>vlan-ID</i>  |  | Specifies the ERSPAN source VLAN. Valid values are from 1 to 4094.        |
| ,                           |  | (Optional) Specifies another VLAN.                                        |
| -                           |  | (Optional) Specifies a range of VLANs.                                    |

**Command Default** Source VLAN filtering is not configured.

**Command Modes** ERSPAN monitor source session configuration mode (config-mon-erspan-src)

| Command History | Release                        | Modification                           |
|-----------------|--------------------------------|----------------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a   | This command was introduced.           |
|                 | Cisco IOS XE Gibraltar 16.11.1 | The <b>sgt</b> keyword was introduced. |

**Usage Guidelines** You cannot include source VLANs and filter VLANs in the same session.

When you configure the **filter** command on a monitored trunk interface, only traffic on that set of specified VLANs is monitored.

**Examples** The following example shows how to configure source VLAN filtering:

```
Device(config)# monitor session 2 type erspan-source  
Device(config-mon-erspan-src)# filter vlan 3
```

|-----------------------------|----------------------------------------------------------|
| <b>monitor session type</b> | Configures a local ERSPAN source or destination session. |

# flow exporter

To create a Flexible NetFlow flow exporter, or to modify an existing Flexible NetFlow flow exporter, and enter Flexible NetFlow flow exporter configuration mode, use the **flow exporter** command in global configuration mode. To remove a Flexible NetFlow flow exporter, use the **no** form of this command.

**flow exporter** *exporter-name*  
**no flow exporter** *exporter-name*

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                              |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | <i>exporter-name</i> Name of the flow exporter that is being created or modified.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                              |
| <b>Command Default</b>    | Flexible NetFlow flow exporters are not present in the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                              |
| <b>Command Modes</b>      | Global configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                              |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | This command was introduced. |
| <b>Usage Guidelines</b>   | Flow exporters export the data in the flow monitor cache to a remote system, such as a server running NetFlow collector, for analysis and storage. Flow exporters are created as separate entities in the configuration. Flow exporters are assigned to flow monitors to provide data export capability for the flow monitors. You can create several flow exporters and assign them to one or more flow monitors to provide several export destinations. You can create one flow exporter and apply it to several flow monitors. |                              |
| <b>Examples</b>           | The following example creates a flow exporter named FLOW-EXPORTER-1 and enters Flexible NetFlow flow exporter configuration mode:<br><br>Device(config)# <b>flow exporter FLOW-EXPORTER-1</b><br>Device(config-flow-exporter)#                                                                                                                                                                                                                                                                                                    |                              |

# flow monitor

To create a flow monitor, or to modify an existing flow monitor, and enter flow monitor configuration mode, use the **flow monitor** command in global configuration mode. To remove a flow monitor, use the **no** form of this command.

**flow monitor** *monitor-name*  
**no flow monitor** *monitor-name*

|                           |                                                                                 |
|---------------------------|---------------------------------------------------------------------------------|

|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | Flow monitors are the Flexible NetFlow component that is applied to interfaces to perform network traffic monitoring. Flow monitors consist of a flow record and a cache. You add the record to the flow monitor after you create the flow monitor. The flow monitor cache is automatically created at the time the flow monitor is applied to the first interface. Flow data is collected from the network traffic during the monitoring process based on the key and nonkey fields in the flow monitor's record and stored in the flow monitor cache. |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                 |                                                                                                               |
|-----------------|---------------------------------------------------------------------------------------------------------------|
| <b>Examples</b> | The following example creates a flow monitor named FLOW-MONITOR-1 and enters flow monitor configuration mode: |
|-----------------|---------------------------------------------------------------------------------------------------------------|

```
Device(config)# flow monitor FLOW-MONITOR-1  
Device(config-flow-monitor)#
```

# flow record

To create a Flexible NetFlow flow record, or to modify an existing Flexible NetFlow flow record, and enter Flexible NetFlow flow record configuration mode, use the **flow record** command in global configuration mode. To remove a Flexible NetFlow record, use the **no** form of this command.

**flow record** *record-name*  
**no flow record** *record-name*

| <b>Syntax Description</b>    | <i>record-name</i> Name of the flow record that is being created or modified.                                                                                                                                                                                                                                                                                                                                              |         |              |                              |                              |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|------------------------------|
| <b>Command Default</b>       | A Flexible NetFlow flow record is not configured.                                                                                                                                                                                                                                                                                                                                                                          |         |              |                              |                              |

| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                                               |         |              |                              |                              |
| <b>Usage Guidelines</b>      | A flow record defines the keys that Flexible NetFlow uses to identify packets in the flow, as well as other fields of interest that Flexible NetFlow gathers for the flow. You can define a flow record with any combination of keys and fields of interest. The device supports a rich set of keys. A flow record also defines the types of counters gathered per flow. You can configure 64-bit packet or byte counters. |         |              |                              |                              |
| <b>Examples</b>              | <p>The following example creates a flow record named FLOW-RECORD-1, and enters Flexible NetFlow flow record configuration mode:</p> <pre>Device(config)# <b>flow record</b> FLOW-RECORD-1 Device(config-flow-record)#</pre>                                                                                                                                                                                                |         |              |                              |                              |

# header-type

To configure the ERSPAN header type for encapsulation, use the **header-type** command in ERSPAN monitor source session configuration mode. To remove the configuration, use the **no** form of this command.

**header-type** *header-type*  
**no header-type** *header-type*

| <b>Syntax Description</b>      | <i>header-type</i> ERSPAN header type. Valid header types are 2 and 3.                                                                             |              |              |                                |                              |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|--------------|--------------|--------------------------------|------------------------------|
| <b>Command Default</b>         | ERSPAN header type is set to 2.                                                                                                                    |              |              |                                |                              |
| <b>Command Modes</b>           | ERSPAN monitor source session configuration mode (config-mon-erspan-src)                                                                           |              |              |                                |                              |
| <b>Command History</b>         | <table><tr><th>Release</th><th>Modification</th></tr><tr><td>Cisco IOS XE Gibraltar 16.11.1</td><td>This command was introduced.</td></tr></table> | Release      | Modification | Cisco IOS XE Gibraltar 16.11.1 | This command was introduced. |
|                                | Release                                                                                                                                            | Modification |              |                                |                              |
| Cisco IOS XE Gibraltar 16.11.1 | This command was introduced.                                                                                                                       |              |              |                                |                              |

## Examples

The following example shows how to change the ERSPAN header type to 3:

```
Device(config)# monitor session 2 type erspan-source
Device(config-mon-erspan-src)# header-type 3
```

|                         |                             |                                                          |
|-------------------------|-----------------------------|----------------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>              | <b>Description</b>                                       |
|                         | <b>monitor session type</b> | Configures a local ERSPAN source or destination session. |

# inactive time

To configure et-analytics inactive timer value, use the **inactive time** *seconds* command in the et-analytics configuration mode. To disable the timer settings, use the **no** form of the command.

**inactive time** *seconds*  
**no inactive time** *seconds*

|                    |                                                  |                                                                                            |
|--------------------|--------------------------------------------------|--------------------------------------------------------------------------------------------|
| Syntax Description | <b>inactive time</b>                             | Configures the inactive timer value.                                                       |
|                    | <i>seconds</i>                                   | Timer value in seconds. The range is from 1 to 604800 and the default value is 60 seconds. |
| Command Default    | Disabled.                                        |                                                                                            |
| Command Modes      | et-analytics configuration (config-et-analytics) |                                                                                            |
| Command History    | <b>Release</b>                                   | <b>Modification</b>                                                                        |
|                    | Cisco IOS XE Everest 16.5.1a                     | This command was introduced.                                                               |

## Example:

The following example shows how to configure an inactive timer of 10 seconds:

```
Device>enable
Device#configure terminal
Device(config)# et-analytics
Device(config-et-analytics)# inactive time 10
```

# ip flow-export destination

To configure the global collector destination IP address, use the **ip flow-export destination** *ip\_address port* command in the et-analytics configuration mode. To remove the collector destination IP address, use the **no** form of the command.

**ip flow-export destination** *ip\_address port*  
**no ip flow-export destination** *ip\_address port*

|                    |                                                  |                                                                  |

| Syntax Description | <b>ip flow-export destination</b>                | Configures the global collector destination IP address and port. |
|                    | <i>ip_address</i>                                | Destination IP address.                                          |
|                    | <i>port</i>                                      | Destination port.                                                |
| Command Default    | Disabled.                                        |                                                                  |
| Command Modes      | et-analytics configuration (config-et-analytics) |                                                                  |
| Command History    | <b>Release</b>                                   | <b>Modification</b>                                              |
|                    | Cisco IOS XE Everest 16.5.1a                     | This command was introduced.                                     |

## Example:

The following example shows how to configure a flow-exporter destination IP address of 10.1.1.1 and port 2055:

```
Device>enable
Device#configure terminal
Device(config)# et-analytics
Device(config-et)# ip flow-export destination 10.1.1.1 2055
```

# ip wccp

To enable the web cache service, and specify the service number that corresponds to a dynamic service that is defined by the application engine, use the **ip wccp** global configuration command on the device. Use the **no** form of this command to disable the service.

```
ip wccp {web-cache | service-number} [group-address groupaddress] [group-list access-list]
[redirect-list access-list] [password encryption-number password]
no ip wccp {web-cache | service-number} [group-address groupaddress] [group-list access-list]
[redirect-list access-list] [password encryption-number password]
```

| Syntax Description                                          |  |                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------|--|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>web-cache</b>                                            |  | Specifies the web-cache service (WCCP Version 1 and Version 2).                                                                                                                                                                                                                                                                                                                                                          |
| <i>service-number</i>                                       |  | Dynamic service identifier, which means the service definition is dictated by the cache. The dynamic service number can be from 0 to 254. The maximum number of services is 256, which includes the web-cache service specified with the <b>web-cache</b> keyword.                                                                                                                                                       |
| <b>group-address</b> <i>groupaddress</i>                    |  | (Optional) Specifies the multicast group address used by the device and the application engines to participate in the service group.                                                                                                                                                                                                                                                                                     |
| <b>group-list</b> <i>access-list</i>                        |  | (Optional) If a multicast group address is not used, specifies a list of valid IP addresses that correspond to the application engines that are participating in the service group.                                                                                                                                                                                                                                      |
| <b>redirect-list</b> <i>access-list</i>                     |  | (Optional) Specifies the redirect service for specific hosts or specific packets from hosts.                                                                                                                                                                                                                                                                                                                             |
| <b>password</b> <i>encryption-number</i><br><i>password</i> |  | (Optional) Specifies an encryption number. The range is 0 to 7. Use 0 for not encrypted, and use 7 for proprietary. Also, specifies a password name up to seven characters in length. The device combines the password with the MD5 authentication value to create security for the connection between the device and the application engine. By default, no password is configured, and no authentication is performed. |

**Command Default** WCCP services are not enabled on the device.

**Command Modes** Global configuration

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** WCCP transparent caching bypasses Network Address Translation (NAT) when Cisco Express Forwarding switching is enabled. To work around this situation, configure WCCP transparent caching in the outgoing direction, enable Cisco Express Forwarding switching on the content engine interface, and specify the **ip wccp web-cache redirect out** command. Configure WCCP in the incoming direction on the inside interface by

specifying the **ip wccp redirect exclude in** command on the router interface facing the cache. This configuration prevents the redirection of any packets arriving on that interface.

You can also include a redirect list when configuring a service group. The specified redirect list will deny packets with a NAT (source) IP address and prevent redirection.

This command instructs a device to enable or disable support for the specified service number or the web-cache service name. A service number can be from 0 to 254. Once the service number or name is enabled, the router can participate in the establishment of a service group.

When the **no ip wccp** command is entered, the device terminates participation in the service group, deallocates space if none of the interfaces still have the service configured, and terminates the WCCP task if no other services are configured.

The keywords following the **web-cache** keyword and the *service-number* argument are optional and may be specified in any order, but only may be specified once.

### Example

The following example configures a web cache, the interface connected to the application engine or the server, and the interface connected to the client:

```
Device(config)# ip wccp web-cache
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# no switchport
Device(config-if)# ip address 172.20.10.30 255.255.255.0
Device(config-if)# no shutdown
Device(config-if)# exit
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# no switchport
Device(config-if)#
*Dec 6 13:11:29.507: %LINK-3-UPDOWN: Interface GigabitEthernet1/0/3, changed state to down

Device(config-if)# ip address 175.20.20.10 255.255.255.0
Device(config-if)# no shutdown
Device(config-if)# ip wccp web-cache redirect in
Device(config-if)# ip wccp web-cache group-listen
Device(config-if)# exit
```

# ip flow monitor

To enable a Flexible NetFlow flow monitor for IPv4 traffic that the device is receiving, use the **ip flow monitor** command in interface configuration mode. To disable a flow monitor, use the **no** form of this command.

**ip flow monitor** *monitor-name* [**sampler** *sampler-name*] **input**  
**no ip flow monitor** *monitor-name* [**sampler** *sampler-name*] **input**

|                           |                                    |                                                                     |
|---------------------------|------------------------------------|---------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>monitor-name</i>                | Name of the flow monitor to apply to the interface.                 |
|                           | <b>sampler</b> <i>sampler-name</i> | (Optional) Enables the specified flow sampler for the flow monitor. |
|                           | <b>input</b>                       | Monitors IPv4 traffic that the device receives on the interface.    |

**Command Default** A flow monitor is not enabled.

**Command Modes** Interface configuration

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

Before you can apply a flow monitor to an interface with the **ip flow monitor** command, you must have already created the flow monitor using the **flow monitor** global configuration command.

When you add a sampler to a flow monitor, only packets that are selected by the named sampler will be entered into the cache to form flows. Each use of a sampler causes separate statistics to be stored for that usage.

You cannot add a sampler to a flow monitor after the flow monitor has been enabled on the interface. You must first remove the flow monitor from the interface and then enable the same flow monitor with a sampler.

**Note** The statistics for each flow must be scaled to give the expected true usage. For example, with a 1 in 100 sampler it is expected that the packet and byte counters will have to be multiplied by 100.

The following example enables a flow monitor for monitoring input traffic:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip flow monitor FLOW-MONITOR-1 input
```

The following example enables a flow monitor for monitoring input traffic, with a sampler to limit the input packets that are sampled:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip flow monitor FLOW-MONITOR-1 sampler SAMPLER-1 input
```

The following example shows what happens when you try to add a sampler to a flow monitor that has already been enabled on an interface without a sampler:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip flow monitor FLOW-MONITOR-1 sampler SAMPLER-2 input
% Flow Monitor: Flow Monitor 'FLOW-MONITOR-1' is already on in full mode and cannot be
enabled with a sampler.
```

The following example shows how to remove a flow monitor from an interface so that it can be enabled with the sampler:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# no ip flow monitor FLOW-MONITOR-1 input
Device(config-if)# ip flow monitor FLOW-MONITOR-1 sampler SAMPLER-2 input
```

# ipv6 flow monitor

To enable a flow monitor for IPv6 traffic that the device is receiving, use the **ipv6 flow monitor** command in interface configuration mode. To disable a flow monitor, use the **no** form of this command.

**ipv6 flow monitor** *monitor-name* [**sampler** *sampler-name*] **input**  
**no ipv6 flow monitor** *monitor-name* [**sampler** *sampler-name*] **input**

## Syntax Description

|                                    |                                                                     |
|------------------------------------|---------------------------------------------------------------------|
| <i>monitor-name</i>                | Name of the flow monitor to apply to the interface.                 |
| <b>sampler</b> <i>sampler-name</i> | (Optional) Enables the specified flow sampler for the flow monitor. |
| <b>input</b>                       | Monitors IPv6 traffic that the device receives on the interface.    |

## Command Default

A flow monitor is not enabled.

## Command Modes

|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Before you can apply a flow monitor to the interface with the **ipv6 flow monitor** command, you must have already created the flow monitor using the **flow monitor** global configuration command.

When you add a sampler to a flow monitor, only packets that are selected by the named sampler will be entered into the cache to form flows. Each use of a sampler causes separate statistics to be stored for that usage.

You cannot add a sampler to a flow monitor after the flow monitor has been enabled on the interface. You must first remove the flow monitor from the interface and then enable the same flow monitor with a sampler.

### Note

The statistics for each flow must be scaled to give the expected true usage. For example, with a 1 in 100 sampler it is expected that the packet and byte counters will have to be multiplied by 100.

The following example enables a flow monitor for monitoring input traffic:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ipv6 flow monitor FLOW-MONITOR-1 input
```

The following example enables a flow monitor for monitoring input traffic, with a sampler to limit the input packets that are sampled:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ipv6 flow monitor FLOW-MONITOR-1 sampler SAMPLER-1 input
```

The following example shows what happens when you try to add a sampler to a flow monitor that has already been enabled on an interface without a sampler:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ipv6 flow monitor FLOW-MONITOR-1 sampler SAMPLER-2 input
% Flow Monitor: Flow Monitor 'FLOW-MONITOR-1' is already on in full mode and cannot be
enabled with a sampler.
```

The following example shows how to remove a flow monitor from an interface so that it can be enabled with the sampler:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# no ipv6 flow monitor FLOW-MONITOR-1 input
Device(config-if)# ipv6 flow monitor FLOW-MONITOR-1 sampler SAMPLER-2 input
```

# ipv6 deny echo reply

To disable the generation of ICMP IPv6 echo reply message to an IPv6 multicast address or anycast address, use the **ipv6 deny-echo-reply** command in the global configuration mode. To enable the generation of ICMP IPv6 echo reply message, use the **no** form of the command.

**ipv6 deny-echo-reply**  
**no ipv6 deny-echo-reply**

| Command Default  | ICMPv6 Echo Reply messages are sent from the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                             |

# match datalink ethertype

To configure the EtherType of the packet as a key field for a flow record, use the **match datalink ethertype** command in flow record configuration mode. To disable the EtherType of the packet as a key field for a flow record, use the **no** form of this command.

**match datalink ethertype**  
**no match datalink ethertype**

## Syntax Description

This command has no arguments or keywords.

## Command Default

The EtherType of the packet is not configured as a key field.

## Command Modes

Flow record configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

When you configure the EtherType of the packet as a key field for a flow record using the **match datalink ethertype** command, the traffic flow that is created is based on the type of flow monitor that is assigned to the interface:

- When a datalink flow monitor is assigned to an interface using the **datalink flow monitor** interface configuration command, it creates unique flows for different Layer 2 protocols.
- When an IP flow monitor is assigned to an interface using the **ip flow monitor** interface configuration command, it creates unique flows for different IPv4 protocols.
- When an IPv6 flow monitor is assigned to an interface using the **ipv6 flow monitor** interface configuration command, it creates unique flows for different IPv6 protocols.

To return this command to its default settings, use the **no match datalink ethertype** or **default match datalink ethertype** flow record configuration command.

The following example configures the EtherType of the packet as a key field for a Flexible NetFlow flow record:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match datalink ethertype
```

# match datalink mac

To configure the use of MAC addresses as a key field for a flow record, use the **match datalink mac** command in flow record configuration mode. To disable the use of MAC addresses as a key field for a flow record, use the **no** form of this command.

```
match datalink mac {destination address input | source address input}
no match datalink mac {destination address input | source address input}
```

|                    |                            |                                                                   |
|--------------------|----------------------------|-------------------------------------------------------------------|
| Syntax Description | <b>destination address</b> | Configures the use of the destination MAC address as a key field. |
|                    | <b>input</b>               | Specifies the MAC address of input packets.                       |
|                    | <b>source address</b>      | Configures the use of the source MAC address as a key field.      |

**Command Default** MAC addresses are not configured as a key field.

**Command Modes** Flow record configuration

|                 |                              |                              |
|-----------------|------------------------------|------------------------------|
| Command History | <b>Release</b>               | <b>Modification</b>          |
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

The **input** keyword is used to specify the observation point that is used by the **match datalink mac** command to create flows based on the unique MAC addresses in the network traffic.

**Note** When a datalink flow monitor is assigned to an interface or VLAN record, it creates flows only for non-IPv6 or non-IPv4 traffic.

To return this command to its default settings, use the **no match datalink mac** or **default match datalink mac** flow record configuration command.

The following example configures the use of the destination MAC address of packets that are received by the device as a key field for a flow record:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match datalink mac destination address input
```

# match datalink vlan

To configure the VLAN ID as a key field for a flow record, use the **match datalink vlan** command in flow record configuration mode. To disable the use of the VLAN ID value as a key field for a flow record, use the **no** form of this command.

**match datalink vlan input**  
**no match datalink vlan input**

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                              |

# match flow cts

To configure CTS source group tag and destination group tag for a flow record, use the **match flow cts** command in flow record configuration mode. To disable the group tag as key field for a flow record, use the **no** form of this command.

**match flow cts {source | destination} group-tag**  
**no match flow cts {source | destination} group-tag**

|                         |                                                                                                                                                                                                                                                      |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the <b>match</b> command. |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The **match flow direction** command captures the direction of the flow as a key field. This feature is most useful when a single flow monitor is configured for input and output flows. It can be used to find and eliminate flows that are being monitored twice, once on input and once on output. This command can help to match up pairs of flows in the exported data when the two flows are flowing in opposite directions.

The following example configures the direction the flow was monitored in as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match flow direction
```

# match interface

To configure the input and output interfaces as key fields for a flow record, use the **match interface** command in flow record configuration mode. To disable the use of the input and output interfaces as key fields for a flow record, use the **no** form of this command.

**match interface** {input | output}  
**no match interface** {input | output}

## Syntax Description

**input** Configures the input interface as a key field.

**output** Configures the output interface as a key field.

## Command Default

The input and output interfaces are not configured as key fields.

## Command Modes

Flow record configuration

## Command History

## Usage Guidelines

A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

The following example configures the input interface as a key field:

```
Device(config)# flow record FLOW-RECORD-1  
Device(config-flow-record)# match interface input
```

The following example configures the output interface as a key field:

```
Device(config)# flow record FLOW-RECORD-1  
Device(config-flow-record)# match interface output
```

# match ipv4

To configure one or more of the IPv4 fields as a key field for a flow record, use the **match ipv4** command in flow record configuration mode. To disable the use of one or more of the IPv4 fields as a key field for a flow record, use the **no** form of this command.

**match ipv4** {**destination address** | **protocol** | **source address** | **tos** | **version**}

**no match ipv4** {**destination address** | **protocol** | **source address** | **tos** | **version**}

|                           |                            |                                                                                                                          |
|---------------------------|----------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>destination address</b> | Configures the IPv4 destination address as a key field. For more information see <i>match ipv4 destination address</i> . |
|                           | <b>protocol</b>            | Configures the IPv4 protocol as a key field.                                                                             |
|                           | <b>source address</b>      | Configures the IPv4 destination address as a key field. For more information see <i>match ipv4 source address</i> .      |
|                           | <b>tos</b>                 | Configures the IPv4 ToS as a key field.                                                                                  |
|                           | <b>version</b>             | Configures the IP version from IPv4 header as a key field.                                                               |

**Command Default** The use of one or more of the IPv4 fields as a key field for a user-defined flow record is not enabled.

**Command Modes** Flow record configuration

| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|------------------------|------------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

The following example configures the IPv4 protocol as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match ipv4 protocol
```

# match ipv4 destination address

To configure the IPv4 destination address as a key field for a flow record, use the **match ipv4 destination address** command in flow record configuration mode. To disable the IPv4 destination address as a key field for a flow record, use the **no** form of this command.

**match ipv4 destination address**  
**no match ipv4 destination address**

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                              |

| Command History    | Release                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Modification                 |
|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | This command was introduced. |
| Usage Guidelines   | <p>A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the <b>match</b> command.</p> <p>To return this command to its default settings, use the <b>no match ipv4 destination address</b> or <b>default match ipv4 destination address</b> flow record configuration command.</p> <p>The following example configures the IPv4 destination address as a key field for a flow record:</p> <pre>Device(config)# flow record FLOW-RECORD-1 Device(config-flow-record)# match ipv4 destination address</pre> |                              |

# match ipv4 source address

To configure the IPv4 source address as a key field for a flow record, use the **match ipv4 source address** command in flow record configuration mode. To disable the use of the IPv4 source address as a key field for a flow record, use the **no** form of this command.

**match ipv4 source address**  
**no match ipv4 source address**

|                           |                                            |

|------------------------|------------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                                                                                                      |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the <b>match</b> command. |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To return this command to its default settings, use the **no match ipv4 source address** or **default match ipv4 source address** flow record configuration command.

The following example configures the IPv4 source address as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match ipv4 source address
```

# match ipv4 ttl

To configure the IPv4 time-to-live (TTL) field as a key field for a flow record, use the **match ipv4 ttl** command in flow record configuration mode. To disable the use of the IPv4 TTL field as a key field for a flow record, use the **no** form of this command.

**match ipv4 ttl**  
**no match ipv4 ttl**

| <b>Syntax Description</b>    | This command has no arguments or keywords.                                                                                                                                                                                                                                                                                                                                                                                            |         |              |                              |                              |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|------------------------------|
| <b>Command Default</b>       | The IPv4 time-to-live (TTL) field is not configured as a key field.                                                                                                                                                                                                                                                                                                                                                                   |         |              |                              |                              |

| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                                                          |         |              |                              |                              |
| <b>Usage Guidelines</b>      | <p>A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the <b>match ipv4 ttl</b> command.</p> <p>The following example configures IPv4 TTL as a key field:</p> <pre>Device(config)# flow record FLOW-RECORD-1 Device(config-flow-record)# match ipv4 ttl</pre> |         |              |                              |                              |

## match ipv6

To configure one or more of the IPv6 fields as a key field for a flow record, use the **match ipv6** command in flow record configuration mode. To disable the use of one or more of the IPv6 fields as a key field for a flow record, use the **no** form of this command.

**match ipv6** {destination address | protocol | source address | traffic-class | version}  
**no match ipv6** {destination address | protocol | source address | traffic-class | version}

|                    |                                                                                                                                                                                                                                                      |                                                                                                                          |

| Command Modes      | Flow record configuration                                                                                                                                                                                                                            |                                                                                                                          |
| Command History    | <b>Release</b>                                                                                                                                                                                                                                       | <b>Modification</b>                                                                                                      |
|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                         | This command was introduced.                                                                                             |
| Usage Guidelines   | A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the <b>match</b> command. |                                                                                                                          |

The following example configures the IPv6 protocol field as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match ipv6 protocol
```

# match ipv6 destination address

To configure the IPv6 destination address as a key field for a flow record, use the **match ipv6 destination address** command in flow record configuration mode. To disable the IPv6 destination address as a key field for a flow record, use the **no** form of this command.

**match ipv6 destination address**  
**no match ipv6 destination address**

# match ipv6 hop-limit

To configure the IPv6 hop limit as a key field for a flow record, use the **match ipv6 hop-limit** command in flow record configuration mode. To disable the use of a section of an IPv6 packet as a key field for a flow record, use the **no** form of this command.

**match ipv6 hop-limit**  
**no match ipv6 hop-limit**

## Syntax Description

This command has no arguments or keywords.

## Command Default

The use of the IPv6 hop limit as a key field for a user-defined flow record is not enabled by default.

## Command Modes

Flow record configuration

## Command History

| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

The following example configures the hop limit of the packets in the flow as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match ipv6 hop-limit
```

# match ipv6 source address

To configure the IPv6 source address as a key field for a flow record, use the **match ipv6 source address** command in flow record configuration mode. To disable the use of the IPv6 source address as a key field for a flow record, use the **no** form of this command.

**match ipv6 source address**  
**no match ipv6 source address**

|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                                                                                                      |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the <b>match</b> command. |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To return this command to its default settings, use the **no match ipv6 source address** or **default match ipv6 source address** flow record configuration command.

The following example configures a IPv6 source address as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match ipv6 source address
```

# map platform-type

To set the parameter map attribute filter criteria to platform type, use the **map platform-type** command in parameter-map filter mode. To remove this criteria, use the **no** form of this command.

```
map-number map platform-type { {eq | not-eq | regex} platform-type }  
no map-number map platform-type { {eq | not-eq | regex} platform-type }
```

## Syntax Description

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| <i>map-number</i>    | Parameter map number.                                                       |
| <b>eq</b>            | Specifies that the filter type name is equal to the platform type name.     |
| <b>not-eq</b>        | Specifies that the filter type name is not equal to the platform type name. |
| <b>regex</b>         | Specifies that the filter type name is a regular expression.                |
| <i>platform-type</i> | Platform type for the parameter map attribute filter criteria.              |

## Command Default

No default behavior or values.

## Command Modes

Parameter-map filter (config-parameter-map-filter)

## Command History

|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.12.1 | This command was introduced. |

## Examples

The following example shows how to set the parameter map attribute filter criteria to platform type:

```
Device> enable  
Device# configure terminal  
Device(config)# parameter-map type subscriber attribute-to-service Aironet-Policy-para  
Device(config-parameter-map-filter)# 10 map platform-type eq C9xxx
```

# match transport icmp ipv4

To configure the ICMP IPv4 type field and the code field as key fields for a flow record, use the **match transport icmp ipv4** command in flow record configuration mode. To disable the use of the ICMP IPv4 type field and code field as key fields for a flow record, use the **no** form of this command.

**match transport icmp ipv4** {code | type}  
**no match transport icmp ipv4** {code | type}

## Syntax Description

**code** Configures the IPv4 ICMP code as a key field.

**type** Configures the IPv4 ICMP type as a key field.

## Command Default

The ICMP IPv4 type field and the code field are not configured as key fields.

## Command Modes

Flow record configuration

## Usage Guidelines

A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

The following example configures the IPv4 ICMP code field as a key field:

```
Device(config)# flow record FLOW-RECORD-1  
Device(config-flow-record)# match transport icmp ipv4 code
```

The following example configures the IPv4 ICMP type field as a key field:

```
Device(config)# flow record FLOW-RECORD-1  
Device(config-flow-record)# match transport icmp ipv4 type
```

# match transport icmp ipv6

To configure the ICMP IPv6 type field and the code field as key fields for a flow record, use the **match transport icmp ipv6** command in flow record configuration mode. To disable the use of the ICMP IPv6 type field and code field as key fields for a flow record, use the **no** form of this command.

```
match transport icmp ipv6 {code | type}
no match transport icmp ipv6 {code | type}
```

| Usage Guidelines             | <p>A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the <b>match</b> command.</p> <p>The following example configures the IPv6 ICMP code field as a key field:</p> <pre>Device(config)# flow record FLOW-RECORD-1 Device(config-flow-record)# match transport icmp ipv6 code</pre> <p>The following example configures the IPv6 ICMP type field as a key field:</p> <pre>Device(config)# flow record FLOW-RECORD-1 Device(config-flow-record)# match transport icmp ipv6 type</pre> |         |              |                              |                              |

# match platform-type

To evaluate control classes based on the platform type, use the **match platform-type** command in control class-map filter mode. To remove this condition, use the **no** form of this command.

**match platform-type** *platform-name*  
**no match platform-type** *platform-name*

## Syntax Description

*platform-name* Name of the platform.

## Command Default

No default behavior or values.

## Command Modes

Control class-map filter (config-filter-control-classmap)

## Command History

| Release                        | Modification                 |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.12.1 | This command was introduced. |

## Examples

The following example shows how to set a class map filter to match a platform type:

```
Device> enable
Device# configure terminal
Device(config)# class-map type control subscriber match-all DOT1X_NO_AGENT
Device(config-filter-control-classmap)# match platform-type C9xxx
```

|------------------------------------------|-------------------------------------------------------------------|
| <b>class-map type control subscriber</b> | Creates a control class and enters control class-map filter mode. |

# mode random 1 out-of

To enable random sampling and to specify the packet interval for a Flexible NetFlow sampler, use the **mode random 1 out-of** command in sampler configuration mode. To remove the packet interval information for a Flexible NetFlow sampler, use the **no** form of this command.

**mode random 1 out-of** *window-size*  
**no mode**

| Syntax Description                                                                  | <i>window-size</i> Specifies the window size from which to select packets. The range is 2 to 1024.                                                                                                     |         |              |                              |                              |

## Examples

The following example enables random sampling with a window size of 1000:

```
Device(config)# sampler SAMPLER-1
Device(config-sampler)# mode random 1 out-of 1000
```

## monitor capture (interface/control plane)

To configure monitor capture points specifying an attachment point and the packet flow direction or add more attachment points to a capture point, use the **monitor capture** command in privileged EXEC mode. To disable the monitor capture with the specified attachment point and the packet flow direction or disable one of multiple attachment points on a capture point, use the **no** form of this command.

**monitor capture** {*capture-name*} {**interface** *interface-type interface-id* | **control-plane**} {**in** | **out** | **both**}

**no monitor capture** {*capture-name*} {**interface** *interface-type interface-id* | **control-plane**} {**in** | **out** | **both**}

|                           |                                                     |                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>capture-name</i>                                 | The name of the capture to be defined.                                                                                                                                                                                                                                                                                                                                 |
|                           | <b>interface</b> <i>interface-type interface-id</i> | Specifies an interface with <i>interface-type</i> and <i>interface-id</i> as an attachment point. The arguments have these meanings: <ul style="list-style-type: none"> <li>• <b>GigabitEthernet</b> <i>interface-id</i>—A Gigabit Ethernet IEEE 802.3z interface.</li> <li>• <b>vlan</b> <i>vlan-id</i>—A VLAN. The range for <i>vlan-id</i> is 1 to 4095.</li> </ul> |
|                           | <b>control-plane</b>                                | Specifies the control plane as an attachment point.                                                                                                                                                                                                                                                                                                                    |
|                           | <b>in</b>   <b>out</b>   <b>both</b>                | Specifies the traffic direction to be captured.                                                                                                                                                                                                                                                                                                                        |
|                           |                                                     |                                                                                                                                                                                                                                                                                                                                                                        |

**Command Default** A Wireshark capture is not configured.

**Command Modes** Privileged EXEC

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Once an attachment point has been associated with a capture point using this command, the only way to change its direction is to remove the attachment point using the **no** form of the command and reattach the attachment point with the new direction. An attachment point's direction cannot be overridden.

If an attachment point is removed from a capture point and only one attachment point is associated with it, the capture point is effectively deleted.

Multiple attachment points can be associated with a capture point by re-running this command with another attachment point. An example is provided below.

Packets captured in the output direction of an interface might not reflect the changes made by switch rewrite (includes TTL, VLAN tag, CoS, checksum, MAC addresses, DSCP, precedent, UP, etc.).

No specific order applies when defining a capture point; you can define capture point parameters in any order. The Wireshark CLI allows as many parameters as possible on a single line. This limits the number of commands required to define a capture point.

Neither VRFs, management ports, nor private VLANs can be used as attachment points.

Wireshark cannot capture packets on a destination SPAN port.

When a VLAN is used as a Wireshark attachment point, packets are captured in the input direction only.

### Examples

To define a capture point using a physical interface as an attachment point:

```
Device# monitor capture mycap interface GigabitEthernet1/0/1 in
Device# monitor capture mycap match ipv4 any any
```

#### Note

The second command defines the core filter for the capture point. This is required for a functioning capture point.

To define a capture point with multiple attachment points:

```
Device# monitor capture mycap interface GigabitEthernet1/0/1 in
Device# monitor capture mycap match ipv4 any any
Device# monitor capture mycap control-plane in
Device# show monitor capture mycap parameter
      monitor capture mycap interface GigabitEthernet1/0/1 in
      monitor capture mycap control-plane in
```

To remove an attachment point from a capture point defined with multiple attachment points:

```
Device# show monitor capture mycap parameter
      monitor capture mycap interface GigabitEthernet1/0/1 in
      monitor capture mycap control-plane in
Device# no monitor capture mycap control-plane
Device# show monitor capture mycap parameter
      monitor capture mycap interface GigabitEthernet1/0/1 in
```

# monitor capture buffer

To configure the buffer for monitor capture (WireShark), use the **monitor capture buffer** command in privileged EXEC mode. To disable the monitor capture buffer or change the buffer back to a default linear buffer from a circular buffer, use the **no** form of this command.

**monitor capture** {*capture-name*} **buffer** {**circular** [**size** *buffer-size* ] | **size** *buffer-size* }  
**no monitor capture** {*capture-name*} **buffer** [**circular** ]

|                    |                                                                                               |                                                                                                                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <i>capture-name</i>                                                                           | The name of the capture whose buffer is to be configured.                                                                                                                               |
|                    | <b>circular</b>                                                                               | Specifies that the buffer is of a circular type. The circular type of buffer continues to capture data, even after the buffer is consumed, by overwriting the data captured previously. |
|                    | <b>size</b> <i>buffer-size</i>                                                                | (Optional) Specifies the size of the buffer. The range is from 1 MB to 100 MB.                                                                                                          |
| Command Default    | A linear buffer is configured.                                                                |                                                                                                                                                                                         |
| Command Modes      | Privileged EXEC                                                                               |                                                                                                                                                                                         |
| Command History    | <b>Release</b>                                                                                | <b>Modification</b>                                                                                                                                                                     |
|                    | Cisco IOS XE Everest 16.5.1a                                                                  | This command was introduced.                                                                                                                                                            |
| Usage Guidelines   | When you first configure a WireShark capture, a circular buffer of a small size is suggested. |                                                                                                                                                                                         |

## Example

To configure a circular buffer with a size of 1 MB:

```
Device# monitor capture mycap buffer circular size 1
```

# monitor capture clear

To clear the monitor capture (WireShark) buffer, use the **monitor capture clear** command in privileged EXEC mode.

**monitor capture** { *capture-name* } **clear**

## Syntax Description

*capture-name* The name of the capture whose buffer is to be cleared.

## Command Default

The buffer content is not cleared.

## Command Modes

Privileged EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **monitor capture clear** command either during capture or after the capture has stopped either because one or more end conditions has been met, or you entered the **monitor capture stop** command. If you enter the **monitor capture clear** command after the capture has stopped, the **monitor capture export** command that is used to store the contents of the captured packets in a file will have no impact because the buffer has no captured packets.

If you have more than one capture that is storing packets in a buffer, clear the buffer before starting a new capture to avoid memory loss.

## Example

To clear the buffer contents for capture mycap:

```
Device# monitor capture mycap clear
```

# monitor capture export

To export a monitor capture (WireShark) to a file, use the **monitor capture export** command in privileged EXEC mode.

**monitor capture** {*capture-name*} **export** *file-location* : *file-name*

## Syntax Description

|                                         |                                                                                                                                                                                                                                   |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>capture-name</i>                     | The name of the capture to be exported.                                                                                                                                                                                           |
| <i>file-location</i> : <i>file-name</i> | (Optional) Specifies the location and file name of the capture storage file.<br>Acceptable values for <i>file-location</i> : <ul style="list-style-type: none"><li>• flash—On-board flash storage</li><li>• — USB drive</li></ul> |

## Command Default

The captured packets are not stored.

## Command Modes

Privileged EXEC

## Command History

| Release | Modification                 |
|---------|------------------------------|
|         | This command was introduced. |

## Usage Guidelines

Use the **monitor capture export** command only when the storage destination is a capture buffer. The file may be stored either remotely or locally. Use this command either during capture or after the packet capture has stopped. The packet capture is stopped when one or more end conditions have been met or you entered the **monitor capture stop** command.

When WireShark is used on switches in a stack, packet captures can be stored only on the devices specified for *file-location* above that are connected to the active switch. Example: flash1 is connected to the active switch. flash2 is connected to the secondary switch. Only flash1 can be used to store packet captures.

### Note

Attempts to store packet captures on unsupported devices or devices not connected to the active switch will probably result in errors.

## Example

To export the capture buffer contents to mycap.pcap on a flash drive:

# monitor capture file

To configure monitor capture (WireShark) storage file attributes, use the **monitor capture file** command in privileged EXEC mode. To remove a storage file attribute, use the **no** form of this command.

```
monitor capture {capture-name} file{ [ buffer-size temp-buffer-size ] [ location file-location :  
file-name ] [ ring number-of-ring-files ] [ size total-size ]}  
no monitor capture {capture-name} file{ [ buffer-size ] [ location ] [ ring ] [ size ]}
```

| Syntax Description                                      |  |                                                                                                                                                                                                                                   |
|---------------------------------------------------------|--|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>capture-name</i>                                     |  | The name of the capture to be modified.                                                                                                                                                                                           |
| <b>buffer-size</b> <i>temp-buffer-size</i>              |  | (Optional) Specifies the size of the temporary buffer. The range for <i>temp-buffer-size</i> is 1 to 100 MB. This is specified to reduce packet loss.                                                                             |
| <b>location</b> <i>file-location</i> : <i>file-name</i> |  | (Optional) Specifies the location and file name of the capture storage file. Acceptable values for <i>file-location</i> : <ul style="list-style-type: none"> <li>• flash—On-board flash storage</li> <li>• — USB drive</li> </ul> |
| <b>ring</b> <i>number-of-ring-files</i>                 |  | (Optional) Specifies that the capture is to be stored in a circular file chain and the number of files in the file ring.                                                                                                          |
| <b>size</b> <i>total-size</i>                           |  | (Optional) Specifies the total size of the capture files.                                                                                                                                                                         |

**Command Default** None

**Command Modes** Privileged EXEC

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Use the **monitor capture file** command only when the storage destination is a file. The file may be stored either remotely or locally. Use this command after the packet capture has stopped. The packet capture is stopped when one or more end conditions have been met or you entered the **monitor capture stop** command.

When WireShark is used on switches in a stack, packet captures can be stored only on the devices specified for *file-location* above that are connected to the active switch. Example: flash1 is connected to the active switch. flash2 is connected to the secondary switch. Only flash1 can be used to store packet captures.

**Note** Attempts to store packet captures on unsupported devices or devices not connected to the active switch will probably result in errors.

**Example**

To specify that the storage file name is mycap.pcap, stored on a flash drive:

```
Device# monitor capture mycap file location flash:mycap.pcap
```

# monitor capture limit

To configure capture limits, use the **monitor capture limit** command in privileged EXEC mode. To remove the capture limits, use the **no** form of this command.

```
monitor capture {capture-name} limit { [duration seconds] [packet-length size] [packets num] }
no monitor capture {capture-name} limit [duration] [packet-length] [packets]
```

|                    |                                    |                                                                                                                                                                                                  |
|--------------------|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <i>capture-name</i>                | The name of the capture to be assigned capture limits.                                                                                                                                           |
|                    | <b>duration</b> <i>seconds</i>     | (Optional) Specifies the duration of the capture, in seconds. The range is from 1 to 1000000.                                                                                                    |
|                    | <b>packet-length</b> <i>size</i>   | (Optional) Specifies the packet length, in bytes. If the actual packet is longer than the specified length, only the first set of bytes whose number is denoted by the bytes argument is stored. |
|                    | <b>packets</b> <i>num</i>          | (Optional) Specifies the number of packets to be processed for capture.                                                                                                                          |
| Command Default    | Capture limits are not configured. |                                                                                                                                                                                                  |
| Command Modes      | Privileged EXEC                    |                                                                                                                                                                                                  |
| Command History    | <b>Release</b>                     | <b>Modification</b>                                                                                                                                                                              |
|                    | Cisco IOS XE Everest 16.5.1a       | This command was introduced.                                                                                                                                                                     |

## Example

To configure a session limit of 60 seconds and a packet segment length of 400 bytes:

```
Device# monitor capture mycap limit duration 60 packet-len 400
```

# monitor capture match

To define an explicit inline core filter for a monitor (Wireshark) capture, use the **monitor capture match** command in privileged EXEC mode. To remove this filter, use the **no** form of this command.

```
monitor capture {capture-name} match {any | mac mac-match-string | ipv4 {any | host | protocol} {any | host} | ipv6 {any | host | protocol} {any | host}}
no monitor capture {capture-name} match
```

| Syntax Description |                                    |                                                       |
|--------------------|------------------------------------|-------------------------------------------------------|
|                    | <i>capture-name</i>                | The name of the capture to be assigned a core filter. |
|                    | <b>any</b>                         | Specifies all packets.                                |
|                    | <b>mac</b> <i>mac-match-string</i> | Specifies a Layer 2 packet.                           |
|                    | <b>ipv4</b>                        | Specifies IPv4 packets.                               |
|                    | <b>host</b>                        | Specifies the host.                                   |
|                    | <b>protocol</b>                    | Specifies the protocol.                               |
|                    | <b>ipv6</b>                        | Specifies IPv6 packets.                               |

**Command Default** A core filter is not configured.

**Command Modes** Privileged EXEC

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

To define a capture point and the core filter for the capture point that matches to any IP version 4 packets on the source or destination:

```
Device# monitor capture mycap interface GigabitEthernet1/0/1 in
Device# monitor capture mycap match ipv4 any any
```

# monitor capture pktlen-range

To specify a range of packet lengths for packet capture, use the **monitor capture pktlen-range** command in the EXEC configuration mode. To remove the packet length range filter, use the **no** form of this command

**monitor capture** *capture-name* **interface** *interface-id* { **in** | **out** | **both** } **match pktlen-range** [ **max** *packet-length-in bytes* ] [ **min** *packet-length-in bytes* ]  
**no monitor capture** *capture-name* **interface** *interface-id* { **in** | **out** | **both** } **match pktlen-range** [ **max** *packet-length-in bytes* ] [ **min** *packet-length-in bytes* ]

| <b>Syntax Description</b>     | <i>packet-length-in bytes</i> Defines the length of the packet to be captured. The range is from 1-9216.                                         |         |              |                               |                             |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|-------------------------------|-----------------------------|
| <b>Command Default</b>        | The default action is to have no packet length range for packet capture.                                                                         |         |              |                               |                             |
| <b>Command Modes</b>          | Global configuration mode.                                                                                                                       |         |              |                               |                             |
| <b>Command History</b>        | <table><tr><th>Release</th><th>Modification</th></tr><tr><td>Cisco IOS XE Amsterdam 17.3.1</td><td>The command was introduced.</td></tr></table> | Release | Modification | Cisco IOS XE Amsterdam 17.3.1 | The command was introduced. |
| Release                       | Modification                                                                                                                                     |         |              |                               |                             |
| Cisco IOS XE Amsterdam 17.3.1 | The command was introduced.                                                                                                                      |         |              |                               |                             |

This example shows how to define a range of packet lengths for packet capture. In this example the maximum length of packet is set to 100 bytes and the minimum length of packet is set to 50 bytes.

```
Device(config)#mon cap cap1 int FortyGigabitEthernet 1/0/1 in match pktlen-range max 100 min 50
```

# monitor capture start

To start the capture of packet data at a traffic trace point into a buffer, use the **monitor capture start** command in privileged EXEC mode.

**monitor capture** { *capture-name* } **start**

## Syntax Description

*capture-name* The name of the capture to be started.

## Command Default

The buffer content is not cleared.

## Command Modes

Privileged EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **monitor capture clear** command to enable the packet data capture after the capture point is defined. To stop the capture of packet data, use the **monitor capture stop** command.

Ensure that system resources such as CPU and memory are available before starting a capture.

## Example

To start capturing buffer contents:

```
Device# monitor capture mycap start
```

# monitor capture stop

To stop the capture of packet data at a traffic trace point, use the **monitor capture stop** command in privileged EXEC mode.

**monitor capture** { *capture-name* } **stop**

## Syntax Description

*capture-name* The name of the capture to be stopped.

## Command Default

The packet data capture is ongoing.

## Command Modes

Privileged EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **monitor capture stop** command to stop the capture of packet data that you started using the **monitor capture start** command. You can configure two types of capture buffers: linear and circular. When the linear buffer is full, data capture stops automatically. When the circular buffer is full, data capture starts from the beginning and the data is overwritten.

## Example

To stop capturing buffer contents:

```
Device# monitor capture mycap stop
```

# monitor session

To create a new Ethernet Switched Port Analyzer (SPAN) or a Remote Switched Port Analyzer (RSPAN) or Encapsulated Remote Switched Port Analyzer (ERSPAN) session configuration for analyzing traffic between ports or add to an existing session configuration, use the **monitor session** global configuration command. To clear sessions, use the **no** form of this command.

**monitor session** *session-number* { **destination** | **filter** | **source** | **type** { **erspan-destination** | **erspan-source** } }

**no monitor session** { *session-number* [ **destination** | **filter** | **source** | **type** { **erspan-destination** | **erspan-source** } ] | **all** | **local** | **range** *session-range* | **remote** }

|                           |                                   |                                                                       |
|---------------------------|-----------------------------------|-----------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>session-number</i>             | The session number identified with the session. The range is 1 to 66. |
|                           | <b>all</b>                        | Clears all monitor sessions.                                          |
|                           | <b>local</b>                      | Clears all local monitor sessions.                                    |
|                           | <b>range</b> <i>session-range</i> | Clears monitor sessions in the specified range.                       |
|                           | <b>remote</b>                     | Clears all remote monitor sessions.                                   |

**Command Default** No monitor sessions are configured.

**Command Modes** Global configuration

| <b>Command History</b> | <b>Release</b>                 | <b>Modification</b>                                                                            |
|------------------------|--------------------------------|------------------------------------------------------------------------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a   | This command was introduced.                                                                   |
|                        | Cisco IOS XE Gibraltar 16.11.1 | The <b>type</b> { <b>erspan-destination</b>   <b>erspan-source</b> } keywords were introduced. |

**Usage Guidelines** You can set a combined maximum of two local SPAN sessions and RSPAN source sessions. You can have a total of 66 SPAN, RSPAN, and ERSPAN sessions on a switch or switch stack.

You can verify your settings by entering the **show monitor** privileged EXEC command. You can display SPAN, RSPAN, FSPAN, FRSPAN, and ERSPAN configuration on the switch by entering the **show running-config** privileged EXEC command. SPAN information appears near the end of the output.

## Example

This example shows how to create a local SPAN session 1 to monitor traffic on Po13 (an EtherChannel port) and limit SPAN traffic in the session only to VLAN 1281. Egress traffic replicates the source; ingress forwarding is not enabled.

```
Device(config)# monitor session 1 source interface Po13
```

```
Device(config)# monitor session 1 filter vlan 1281
Device(config)# monitor session 1 destination interface GigabitEthernet2/0/36 encapsulation
replicate
Device(config)# monitor session 1 destination interface GigabitEthernet3/0/36 encapsulation
replicate
```

The following is the output of a **show monitor session all** command after completing these setup instructions:

```
Device# show monitor session all

Session 1
-----
Type                : Local Session
Source Ports        :
    Both            : Po13
Destination Ports    : Gi2/0/36,Gi3/0/36
Encapsulation        : Replicate
    Ingress         : Disabled
Filter VLANs         : 1281
...
```

## monitor session destination

To start a new Switched Port Analyzer (SPAN) session or Remote SPAN (RSPAN) destination session, to enable ingress traffic on the destination port for a network security device (such as a Cisco IDS Sensor Appliance), and to add or delete interfaces or VLANs to or from an existing SPAN or RSPAN session, use the **monitor session destination** global configuration command. To remove the SPAN or RSPAN session or to remove destination interfaces from the SPAN or RSPAN session, use the **no** form of this command.

**monitor session** *session-number* **destination** {**interface** *interface-id* [, | -] [**encapsulation** {**replicate** | **dot1q**} ] {**ingress** [**dot1q** | **untagged**] } | {**remote**} **vlan** *vlan-id* }

**no monitor session** *session-number* **destination** {**interface** *interface-id* [, | -] [**encapsulation** {**replicate** | **dot1q**} ] {**ingress** [**dot1q** | **untagged**] } | {**remote**} **vlan** *vlan-id* }

### Syntax Description

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>session-number</i>                | The session number identified with the SPAN or RSPAN session. The range is 1 to 66.                                                                                                                                                                                                                                                                                                                                                       |
| <b>interface</b> <i>interface-id</i> | Specifies the destination or source interface for a SPAN or RSPAN session. Valid interfaces are physical ports (including type, stack member, module, and port number). For source interface, port channel is also a valid interface type, and the valid range is 1 to 128.                                                                                                                                                               |
| ,                                    | (Optional) Specifies a series of interfaces or VLANs, or separates a range of interfaces or VLANs from a previous range. Enter a space before and after the comma.                                                                                                                                                                                                                                                                        |
| -                                    | (Optional) Specifies a range of interfaces or VLANs. Enter a space before and after the hyphen.                                                                                                                                                                                                                                                                                                                                           |
| <b>encapsulation replicate</b>       | (Optional) Specifies that the destination interface replicates the source interface encapsulation method. If not selected, the default is to send packets in native form (untagged).<br><br>These keywords are valid only for local SPAN. For RSPAN, the RSPAN VLAN ID overwrites the original VLAN ID; therefore, packets are always sent untagged. The <b>encapsulation</b> options are ignored with the <b>no</b> form of the command. |
| <b>encapsulation dot1q</b>           | (Optional) Specifies that the destination interface accepts the source interface incoming packets with IEEE 802.1Q encapsulation.<br><br>These keywords are valid only for local SPAN. For RSPAN, the RSPAN VLAN ID overwrites the original VLAN ID; therefore, packets are always sent untagged. The <b>encapsulation</b> options are ignored with the <b>no</b> form of the command.                                                    |

|                            |                                                                                                                                                                                                                                             |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ingress</b>             | Enables ingress traffic forwarding.                                                                                                                                                                                                         |
| <b>dot1q</b>               | (Optional) Accepts incoming packets with IEEE 802.1Q encapsulation with the specified VLAN as the default VLAN.                                                                                                                             |
| <b>untagged</b>            | (Optional) Accepts incoming packets with untagged encapsulation with the specified VLAN as the default VLAN.                                                                                                                                |
| <b>isl</b>                 | Specifies ingress forwarding using ISL encapsulation.                                                                                                                                                                                       |
| <b>remote</b>              | Specifies the remote VLAN for an RSPAN source or destination session. The range is 2 to 1001 and 1006 to 4094.<br><br>The RSPAN VLAN cannot be VLAN 1 (the default VLAN) or VLAN IDs 1002 to 1005 (reserved for Token Ring and FDDI VLANs). |
| <b>vlan <i>vlan-id</i></b> | Sets the default VLAN for ingress traffic when used with only the <b>ingress</b> keyword.                                                                                                                                                   |

**Command Default**

No monitor sessions are configured.

If **encapsulation replicate** is not specified on a local SPAN destination port, packets are sent in native form with no encapsulation tag.

Ingress forwarding is disabled on destination ports.

You can specify **all**, **local**, **range session-range**, or **remote** with the **no monitor session** command to clear all SPAN and RSPAN, all local SPAN, a range, or all RSPAN sessions.

**Command Modes**

Global configuration

**Command History**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

You can set a combined maximum of 8 local SPAN sessions and RSPAN source sessions. You can have a total of 66 SPAN and RSPAN sessions on a switch or switch stack.

A SPAN or RSPAN destination must be a physical port.

You can have a maximum of 64 destination ports on a switch or a switch stack.

Each session can include multiple ingress or egress source ports or VLANs, but you cannot combine source ports and source VLANs in a single session. Each session can include multiple destination ports.

When you use VLAN-based SPAN (VSPAN) to analyze network traffic in a VLAN or set of VLANs, all active ports in the source VLANs become source ports for the SPAN or RSPAN session. Trunk ports are included as source ports for VSPAN, and only packets with the monitored VLAN ID are sent to the destination port.

You can monitor traffic on a single port or VLAN or on a series or range of ports or VLANs. You select a series or range of interfaces or VLANs by using the [, | -] options.

If you specify a series of VLANs or interfaces, you must enter a space before and after the comma. If you specify a range of VLANs or interfaces, you must enter a space before and after the hyphen (-).

EtherChannel ports can be configured as SPAN or RSPAN destination ports. A physical port that is a member of an EtherChannel group can be used as a destination port, but it cannot participate in the EtherChannel group while it is as a SPAN destination.

A port used as a destination port cannot be a SPAN or RSPAN source, nor can a port be a destination port for more than one session at a time.

You can enable IEEE 802.1x authentication on a port that is a SPAN or RSPAN destination port; however, IEEE 802.1x authentication is disabled until the port is removed as a SPAN destination. If IEEE 802.1x authentication is not available on the port, the switch returns an error message. You can enable IEEE 802.1x authentication on a SPAN or RSPAN source port.

If ingress traffic forwarding is enabled for a network security device, the destination port forwards traffic at Layer 2.

Destination ports can be configured to function in these ways:

- When you enter **monitor session session\_number destination interface interface-id** with no other keywords, egress encapsulation is untagged, and ingress forwarding is not enabled.
- When you enter **monitor session session\_number destination interface interface-id ingress**, egress encapsulation is untagged; ingress encapsulation depends on the keywords that follow—**dot1q** or **untagged**.
- When you enter **monitor session session\_number destination interface interface-id encapsulation replicate** with no other keywords, egress encapsulation replicates the source interface encapsulation; ingress forwarding is not enabled. (This applies to local SPAN only; RSPAN does not support encapsulation replication.)
- When you enter **monitor session session\_number destination interface interface-id encapsulation replicate ingress**, egress encapsulation replicates the source interface encapsulation; ingress encapsulation depends on the keywords that follow—**dot1q** or **untagged**. (This applies to local SPAN only; RSPAN does not support encapsulation replication.)

You can verify your settings by entering the **show monitor** privileged EXEC command. You can display SPAN, RSPAN, FSPAN, and FRSPAN configuration on the switch by entering the **show running-config** privileged EXEC command. SPAN information appears near the end of the output.

## Examples

This example shows how to create a local SPAN session 1 to monitor both sent and received traffic on source port 1 on stack member 1 to destination port 2 on stack member 2:

```
Device(config)# monitor session 1 source interface gigabitethernet1/0/1 both
Device(config)# monitor session 1 destination interface gigabitethernet1/0/2
```

This example shows how to delete a destination port from an existing local SPAN session:

```
Device(config)# no monitor session 2 destination interface gigabitethernet1/0/2
```

This example shows how to configure RSPAN source session 1 to monitor a source interface and to configure the destination RSPAN VLAN 900:

```
Device(config)# monitor session 1 source interface gigabitethernet1/0/1
Device(config)# monitor session 1 destination remote vlan 900
Device(config)# end
```

This example shows how to configure an RSPAN destination session 10 in the switch receiving the monitored traffic:

```
Device(config)# monitor session 10 source remote vlan 900
Device(config)# monitor session 10 destination interface gigabitethernet1/0/2
```

This example shows how to configure the destination port for ingress traffic on VLAN 5 by using a security device that supports IEEE 802.1Q encapsulation. Egress traffic replicates the source; ingress traffic uses IEEE 802.1Q encapsulation.

```
Device(config)# monitor session 2 destination interface gigabitethernet1/0/2 encapsulation
dot1q ingress dot1q vlan 5
```

This example shows how to configure the destination port for ingress traffic on VLAN 5 by using a security device that does not support encapsulation. Egress traffic and ingress traffic are untagged.

```
Device(config)# monitor session 2 destination interface gigabitethernet1/0/2 ingress untagged
vlan 5
```

# monitor session filter

To start a new flow-based SPAN (FSPAN) session or flow-based RSPAN (FRSPAN) source or destination session, or to limit (filter) SPAN source traffic to specific VLANs, use the **monitor session filter** global configuration command. To remove filters from the SPAN or RSPAN session, use the **no** form of this command.

**monitor session** *session-number* **filter** {**vlan** *vlan-id* [, | -] }

**no monitor session** *session-number* **filter** {**vlan** *vlan-id* [, | -] }

|                           |                            |                                                                                                                                                   |
|---------------------------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>session-number</i>      | The session number identified with the SPAN or RSPAN session. The range is 1 to 66.                                                               |
|                           | <b>vlan</b> <i>vlan-id</i> | Specifies a list of VLANs as filters on trunk source ports to limit SPAN source traffic to specific VLANs. The <i>vlan-id</i> range is 1 to 4094. |
|                           | ,                          | (Optional) Specifies a series of VLANs, or separates a range of VLANs from a previous range. Enter a space before and after the comma.            |
|                           | -                          | (Optional) Specifies a range of VLANs. Enter a space before and after the hyphen.                                                                 |

**Command Default** No monitor sessions are configured.

**Command Modes** Global configuration

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|

|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

You can set a combined maximum of two local SPAN sessions and RSPAN source sessions. You can have a total of 66 SPAN and RSPAN sessions on a switch or switch stack.

You can monitor traffic on a single VLAN or on a series or range of ports or VLANs. You select a series or range of VLANs by using the [, | -] options.

If you specify a series of VLANs, you must enter a space before and after the comma. If you specify a range of VLANs, you must enter a space before and after the hyphen (-).

VLAN filtering refers to analyzing network traffic on a selected set of VLANs on trunk source ports. By default, all VLANs are monitored on trunk source ports. You can use the **monitor session session\_number filter vlan vlan-id** command to limit SPAN traffic on trunk source ports to only the specified VLANs.

VLAN monitoring and VLAN filtering are mutually exclusive. If a VLAN is a source, VLAN filtering cannot be enabled. If VLAN filtering is configured, a VLAN cannot become a source.

You can verify your settings by entering the **show monitor** privileged EXEC command. You can display SPAN, RSPAN, FSPAN, and FRSPAN configuration on the switch by entering the **show running-config** privileged EXEC command. SPAN information appears near the end of the output.

## Examples

This example shows how to limit SPAN traffic in an existing session only to specific VLANs:

```
Switch(config)# monitor session 1 filter vlan 100 - 110
```

This example shows how to create a local SPAN session 1 to monitor both sent and received traffic on source port 1 on stack member 1 to destination port 2 on stack member 2 and to filter IPv4 traffic using access list number 122 in an FSPAN session:

```
Device(config)# monitor session 1 source interface gigabitethernet1/0/1 both  
Device(config)# monitor session 1 destination interface gigabitethernet1/0/2  
Device(config)# monitor session 1 filter ip access-group 122
```

## monitor session source

To start a new Switched Port Analyzer (SPAN) session or Remote SPAN (RSPAN) source session, or to add or delete interfaces or VLANs to or from an existing SPAN or RSPAN session, use the **monitor session source** global configuration command. To remove the SPAN or RSPAN session or to remove source interfaces from the SPAN or RSPAN session, use the **no** form of this command.

```
monitor session session_number source {interface interface-id [, | -] [both | rx | tx] |
[remote] vlan vlan-id [, | -] [both | rx | tx] }
no monitor session session_number source {interface interface-id [, | -] [both | rx | tx] |
[remote] vlan vlan-id [, | -] [both | rx | tx] }
```

### Syntax Description

|                                      |                                                                                                                                                                                                                                                             |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>session_number</i>                | The session number identified with the SPAN or RSPAN session. The range is 1 to 66.                                                                                                                                                                         |
| <b>interface</b> <i>interface-id</i> | Specifies the source interface for a SPAN or RSPAN session. Valid interfaces are physical ports (including type, stack member, module, and port number). For source interface, port channel is also a valid interface type, and the valid range is 1 to 48. |
| ,                                    | (Optional) Specifies a series of interfaces or VLANs, or separates a range of interfaces or VLANs from a previous range. Enter a space before and after the comma.                                                                                          |
| -                                    | (Optional) Specifies a range of interfaces or VLANs. Enter a space before and after the hyphen.                                                                                                                                                             |
| <b>both</b>   <b>rx</b>   <b>tx</b>  | (Optional) Specifies the traffic direction to monitor. If you do not specify a traffic direction, the source interface sends both transmitted and received traffic.                                                                                         |
| <b>remote</b>                        | (Optional) Specifies the remote VLAN for an RSPAN source or destination session. The range is 2 to 1001 and 1006 to 4094.<br><br>The RSPAN VLAN cannot be VLAN 1 (the default VLAN) or VLAN IDs 1002 to 1005 (reserved for Token Ring and FDDI VLANs).      |
| <b>vlan</b> <i>vlan-id</i>           | When used with only the <b>ingress</b> keyword, sets default VLAN for ingress traffic.                                                                                                                                                                      |

### Command Default

No monitor sessions are configured.

On a source interface, the default is to monitor both received and transmitted traffic.

On a trunk interface used as a source port, all VLANs are monitored.

### Command Modes

Global configuration

**Command History****Release****Modification**

Cisco IOS XE Everest 16.5.1a This command was introduced.

**Usage Guidelines**

Traffic that enters or leaves source ports or source VLANs can be monitored by using SPAN or RSPAN. Traffic routed to source ports or source VLANs cannot be monitored.

You can set a combined maximum of two local SPAN sessions and RSPAN source sessions. You can have a total of 66 SPAN and RSPAN sessions on a switch or switch stack.

A source can be a physical port, a port channel, or a VLAN.

Each session can include multiple ingress or egress source ports or VLANs, but you cannot combine source ports and source VLANs in a single session. Each session can include multiple destination ports.

When you use VLAN-based SPAN (VSPAN) to analyze network traffic in a VLAN or set of VLANs, all active ports in the source VLANs become source ports for the SPAN or RSPAN session. Trunk ports are included as source ports for VSPAN, and only packets with the monitored VLAN ID are sent to the destination port.

You can monitor traffic on a single port or VLAN or on a series or range of ports or VLANs. You select a series or range of interfaces or VLANs by using the [, | -] options.

If you specify a series of VLANs or interfaces, you must enter a space before and after the comma. If you specify a range of VLANs or interfaces, you must enter a space before and after the hyphen (-).

You can monitor individual ports while they participate in an EtherChannel, or you can monitor the entire EtherChannel bundle by specifying the **port-channel** number as the RSPAN source interface.

A port used as a destination port cannot be a SPAN or RSPAN source, nor can a port be a destination port for more than one session at a time.

You can enable IEEE 802.1x authentication on a SPAN or RSPAN source port.

You can verify your settings by entering the **show monitor** privileged EXEC command. You can display SPAN, RSPAN, FSPAN, and FRSPAN configuration on the switch by entering the **show running-config** privileged EXEC command. SPAN information appears near the end of the output.

**Examples**

This example shows how to create a local SPAN session 1 to monitor both sent and received traffic on source port 1 on stack member 1 to destination port 2 on stack member 2:

```
Switch(config)# monitor session 1 source interface gigabitethernet1/0/1 both
Switch(config)# monitor session 1 destination interface gigabitethernet1/0/2
```

This example shows how to configure RSPAN source session 1 to monitor multiple source interfaces and to configure the destination RSPAN VLAN 900.

```
Switch(config)# monitor session 1 source interface gigabitethernet1/0/1
Switch(config)# monitor session 1 source interface port-channel 2 tx
Switch(config)# monitor session 1 destination remote vlan 900
Switch(config)# end
```

# monitor session type

To configure a local Encapsulated Remote Switched Port Analyzer (ERSPAN) session, use the **monitor session type** command in global configuration mode. To remove the ERSPAN configuration, use the **no** form of this command.

**monitor session** *span-session-number* **type** {**erspan-destination** | **erspan-source**}  
**no monitor session** *span-session-number* **type** {**erspan-destination** | **erspan-source**}

## Syntax Description

|                            |                                                                    |
|----------------------------|--------------------------------------------------------------------|
| <i>span-session-number</i> | Number of the local ERSPAN session. Valid values are from 1 to 66. |
|----------------------------|--------------------------------------------------------------------|

## Command Default

ERSPAN source or destination session is not configured.

## Command Modes

Global configuration (config)

## Command History

| Release                        | Modification                                          |
|--------------------------------|-------------------------------------------------------|
| Cisco IOS XE Everest 16.5.1a   | This command was introduced.                          |
| Cisco IOS XE Gibraltar 16.11.1 | The <b>erspan-destination</b> keyword was introduced. |

## Usage Guidelines

The *span-session-number* and the session type cannot be changed once configured. Use the **no** form of this command to remove the session and then re-create the session with a new session ID or a new session type.

The ERSPAN source session destination IP address, which must be configured on an interface on the destination switch, is the source of traffic that an ERSPAN destination session sends to the destination ports. You can configure the same address in both the source and destination sessions with the **ip address** command in ERSPAN monitor destination session configuration mode.

A newly configured ERSPAN session will be in the **shutdown** state by default. The ERSPAN session remains inactive until the **no shutdown** command is configured along with other mandatory configurations such as source interface, ERSPAN ID, ERSPAN IP address, and so on.

The ERSPAN ID differentiates the ERSPAN traffic arriving at the same destination IP address from different ERSPAN source sessions.

The maximum local ERSPAN source session limit is 8.

## Examples

The following example shows how to configure an ERSPAN source session number:

```
Device(config)# monitor session 55 type erspan-source
Device(config-mon-erspan-src)#
```

## Related Commands

| Command                                | Description                                                                                                             |

| <b>Command Default</b>    | The timeout is 600 seconds. All other optional data parameters are not configured.                                                                                                                                                                                                                                                                                  |                                                                                                                          |
| <b>Command Modes</b>      | Flow exporter configuration                                                                                                                                                                                                                                                                                                                                         |                                                                                                                          |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                                                                                                                                                                      | <b>Modification</b>                                                                                                      |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                        | This command was introduced.                                                                                             |
| <b>Usage Guidelines</b>   | The <b>option exporter-stats</b> command causes the periodic sending of the exporter statistics, including the number of records, bytes, and packets sent. This command allows the collector to estimate packet loss for the export records it receives. The optional timeout alters the frequency at which the reports are sent.                                   |                                                                                                                          |
|                           | The <b>option interface-table</b> command causes the periodic sending of an options table, which allows the collector to map the interface SNMP indexes provided in the flow records to interface names. The optional timeout can alter the frequency at which the reports are sent.                                                                                |                                                                                                                          |
|                           | The <b>option sampler-table</b> command causes the periodic sending of an options table, which details the configuration of each sampler and allows the collector to map the sampler ID provided in any flow record to a configuration that it can use to scale up the flow statistics. The optional timeout can alter the frequency at which the reports are sent. |                                                                                                                          |
|                           | To return this command to its default settings, use the <b>no option</b> or <b>default option</b> flow exporter configuration command.                                                                                                                                                                                                                              |                                                                                                                          |
|                           | The following example shows how to enable the periodic sending of the sampler option table, which allows the collector to map the sampler ID to the sampler type and rate:                                                                                                                                                                                          |                                                                                                                          |

```

Device(config)# flow exporter FLOW-EXPORTER-1
Device(config-flow-exporter)# option sampler-table

```

The following example shows how to enable the periodic sending of the exporter statistics, including the number of records, bytes, and packets sent:

```
Device(config)# flow exporter FLOW-EXPORTER-1  
Device(config-flow-exporter)# option exporter-stats
```

The following example shows how to enable the periodic sending of an options table, which allows the collector to map the interface SNMP indexes provided in the flow records to interface names:

```
Device(config)# flow exporter FLOW-EXPORTER-1  
Device(config-flow-exporter)# option interface-table
```

# record

To add a flow record for a Flexible NetFlow flow monitor, use the **record** command in flow monitor configuration mode. To remove a flow record for a Flexible NetFlow flow monitor, use the **no** form of this command.

**record** *record-name*  
**no record**

|                           |                                                                                       |
|---------------------------|---------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>record-name</i> Name of a user-defined flow record that was previously configured. |
|---------------------------|---------------------------------------------------------------------------------------|

|                        |                                  |
|------------------------|----------------------------------|
| <b>Command Default</b> | A flow record is not configured. |
|------------------------|----------------------------------|

|                      |                            |
|----------------------|----------------------------|
| <b>Command Modes</b> | Flow monitor configuration |
|----------------------|----------------------------|

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                                                                                 |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | Each flow monitor requires a record to define the contents and layout of its cache entries. The flow monitor can use one of the wide range of predefined record formats, or advanced users may create their own record formats. |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|             |                                                                                                                                                                                                                              |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Note</b> | You must use the <b>no ip flow monitor</b> command to remove a flow monitor from all of the interfaces to which you have applied it before you can modify the parameters for the <b>record</b> command for the flow monitor. |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                 |                                                                         |
|-----------------|-------------------------------------------------------------------------|
| <b>Examples</b> | The following example configures the flow monitor to use FLOW-RECORD-1: |
|-----------------|-------------------------------------------------------------------------|

```
Device(config)# flow monitor FLOW-MONITOR-1
Device(config-flow-monitor)# record FLOW-RECORD-1
```

## sensor-name (stealthwatch-cloud-monitor)

To set the sensor name for the Stealthwatch Cloud registration, use the **sensor-name** *SwC-sensor-name* command in stealthwatch-cloud-monitor configuration mode.

**sensor-name** *SwC-sensor-name*

|                           |                                                                                                                                                                                                                      |                                     |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------|
| <b>Syntax Description</b> | <i>SwC-sensor-name</i>                                                                                                                                                                                               | Sensor name in alphanumeric format. |
| <b>Command Default</b>    | The device name is configured.                                                                                                                                                                                       |                                     |
| <b>Command Modes</b>      | stealthwatch-cloud-monitor (stealthwatch-cloud-monitor)                                                                                                                                                              |                                     |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                       | <b>Modification</b>                 |
|                           | Cisco IOS XE Bengaluru 17.5.1                                                                                                                                                                                        | This command was introduced.        |
| <b>Usage Guidelines</b>   | Configure the <b>stealthwatch-cloud-monitor</b> command before setting the sensor name.<br><br>Setting the sensor name is optional. If no sensor name is set, by default, the device name is set as the sensor name. |                                     |

### Examples

The following example shows how to set the sensor name:

```
Device> enable
Device# configure terminal
Device(config)# stealthwatch-cloud-monitor
Device(config-stealthwatch-cloud-monitor)# service-key xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
Device(config-stealthwatch-cloud-monitor)# sensor-name mysensor
```

|                         |                                           |                                                                                |
|-------------------------|-------------------------------------------|--------------------------------------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>                            | <b>Description</b>                                                             |
|                         | <b>service-key</b> <i>SwC-service-key</i> | Configures the Stealthwatch Cloud service key.                                 |
|                         | <b>show stealth-watch-cloud detail</b>    | Displays the Stealthwatch Cloud registration status and its configured values. |
|                         | <b>stealthwatch-cloud-monitor</b>         | Configures the Stealthwatch Cloud monitor.                                     |
|                         | <b>url</b> <i>SwC-server-url</i>          | Configures the Stealthwatch Cloud server URL.                                  |

## service-key (stealthwatch-cloud-monitor)

To configure the Stealthwatch Cloud service key, use the **service-key** *SwC-service-key* command in `stealthwatch-cloud-monitor` configuration mode.

**service-key** *SwC-service-key*

|                           |                                                                                                                                                                                                                                                                                                                    |                                |

| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                                                                                                                     | <b>Modification</b>            |
|                           | Cisco IOS XE Bengaluru 17.5.1                                                                                                                                                                                                                                                                                      | This command was introduced.   |
| <b>Usage Guidelines</b>   | <p>Configure the <b>stealthwatch-cloud-monitor</b> command before configuring the Stealthwatch Cloud service key.</p> <p>You can view the service key from the Stealthwatch Cloud portal. See <i>Configuring Stealthwatch Cloud on a Device</i> section on the configuration guide for additional information.</p> |                                |

**Note** A service key can be configured for multiple sensors.

## Examples

The following example shows how to configure a Stealthwatch Cloud service key:

```
Device> enable
Device# configure terminal
Device(config)# stealthwatch-cloud-monitor
Device(config-stealthwatch-cloud-monitor)# service-key xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
```

| Release                      | Modification                                                                                                                                     |         |              |                              |                              |
| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                     |         |              |                              |                              |

### Example:

The following example shows how to display ETA flow monitor cache details:

```
Device>enable
Device#configure terminal
Device# show flow monitor etta-mon cache
Cache type: Normal (Platform cache)
Cache size: 10000
Current entries: 4
Flows added: 6
Flows aged: 2
- Inactive timeout ( 15 secs) 2
IPV4 DESTINATION ADDRESS: 15.15.15.35
IPV4 SOURCE ADDRESS: 72.163.128.140
IP PROTOCOL: 17
TRNS SOURCE PORT: 53
TRNS DESTINATION PORT: 12032
counter bytes long: 128
counter packets long: 1
timestamp abs first: 06:23:24.799
timestamp abs last: 06:23:24.799
interface input: Null
interface output: Null
```

# sampler

To create a Flexible Netflow flow sampler, or to modify an existing Flexible Netflow flow sampler, and to enter Flexible Netflow sampler configuration mode, use the **sampler** command in global configuration mode. To remove a sampler, use the **no** form of this command.

**sampler** *sampler-name*

**no sampler** *sampler-name*

| <b>Syntax Description</b>    | <i>sampler-name</i> Name of the flow sampler that is being created or modified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |              |                              |                              |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|------------------------------|
| <b>Command Default</b>       | Flexible Netflow flow samplers are not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |         |              |                              |                              |
| <b>Command Modes</b>         | Global configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |              |                              |                              |

| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |              |                              |                              |
| <b>Usage Guidelines</b>      | <p>Flow samplers are used to reduce the load placed by Flexible Netflow on the networking device to monitor traffic by limiting the number of packets that are analyzed. You configure a rate of sampling that is 1 out of a range of packets. Flow samplers are applied to interfaces in conjunction with a flow monitor to implement sampled Flexible Netflow.</p> <p>To enable flow sampling, you configure the record that you want to use for traffic analysis and assign it to a flow monitor. When you apply a flow monitor with a sampler to an interface, the sampled packets are analyzed at the rate specified by the sampler and compared with the flow record associated with the flow monitor. If the analyzed packets meet the criteria specified by the flow record, they are added to the flow monitor cache.</p> |         |              |                              |                              |
| <b>Examples</b>              | <p>The following example creates a flow sampler name SAMPLER-1:</p> <pre>Device(config)# <b>sampler</b> SAMPLER-1 Device(config-sampler)#</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |              |                              |                              |

# show capability feature monitor

To display information about monitor features, use the **show capability feature monitor** command in privileged EXEC mode.

**show capability feature monitor {erspan-destination | erspan-source}**

## Syntax Description

|                           |                                                                                                                |
|---------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>erspan-destination</b> | Displays information about the configured Encapsulated Remote Switched Port Analyzer (ERSPAN) source sessions. |
| <b>erspan-source</b>      | Displays all the configured global built-in templates.                                                         |

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

The following is sample output from the **show capability feature monitor erspan-source** command:

```
Switch# show capability feature monitor erspan-source
```

```
ERSPAN Source Session Supported: true
No of Rx ERSPAN source session: 8
No of Tx ERSPAN source session: 8
ERSPAN Header Type supported: II
ACL filter Supported: true
Fragmentation Supported: true
Truncation Supported: false
Sequence number Supported: false
QOS Supported: true
```

The following is sample output from the **show capability feature monitor erspan-destination** command:

```
Switch# show capability feature monitor erspan-destination
```

```
ERSPAN Destination Session Supported: false
```

## Related Commands

|-------------------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>monitor session type erspan-source</b> | Creates an ERSPAN source session number or enters the ERSPAN session configuration mode for the session. |

# show class-map type control subscriber

To display the class map statistics for the configured control policies, use the **show class-map type control subscriber** command in privileged EXEC mode.

**show class-map type control subscriber** {all | name *control-class-name*}

|                           |                                       |                                                                 |
|---------------------------|---------------------------------------|-----------------------------------------------------------------|
| <b>Syntax Description</b> | <b>all</b>                            | Displays class map statistics for all control policies.         |
|                           | <b>name</b> <i>control-class-name</i> | Displays class map statistics for the specified control policy. |
| <b>Command Modes</b>      | Privileged EXEC (#)                   |                                                                 |
| <b>Command History</b>    | <b>Release</b>                        | <b>Modification</b>                                             |
|                           | Cisco IOS XE Everest 16.6.1           | This command was introduced.                                    |

## Examples

The following is a sample output of the **show class-map type control subscriber name control-class-name** command:

```
Device# show class-map type control subscriber name platform

Class-map          Action          Exec  Hit  Miss  Comp
-----          -
match-all platform match platform-type C9xxx    0    0    0    0

Key:
  "Exec" - The number of times this line was executed
  "Hit"  - The number of times this line evaluated to TRUE
  "Miss" - The number of times this line evaluated to FALSE
  "Comp" - The number of times this line completed the execution of its
           condition without a need to continue on to the end
```

# show flow exporter

To display flow exporter status and statistics, use the **show flow exporter** command in privileged EXEC mode.

**show flow exporter** [{**export-ids netflow-v9** | [**name**] *exporter-name* [{**statistics** | **templates**}]} | **statistics** | **templates**}]

|                    |                              |                                                                                                     |
|--------------------|------------------------------|-----------------------------------------------------------------------------------------------------|
| Syntax Description | <b>export-ids netflow-v9</b> | (Optional) Displays the NetFlow Version 9 export fields that can be exported and their IDs.         |
|                    | <b>name</b>                  | (Optional) Specifies the name of a flow exporter.                                                   |
|                    | <i>exporter-name</i>         | (Optional) Name of a flow exporter that was previously configured.                                  |
|                    | <b>statistics</b>            | (Optional) Displays statistics for all flow exporters or for the specified flow exporter.           |
|                    | <b>templates</b>             | (Optional) Displays template information for all flow exporters or for the specified flow exporter. |

|                 |      |

|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

The following example displays the status and statistics for all of the flow exporters configured on a device:

```
Device# show flow exporter
Flow Exporter FLOW-EXPORTER-1:
  Description:           Exports to the datacenter
  Export protocol:       NetFlow Version 9
  Transport Configuration:
    Destination IP address: 192.168.0.1
    Source IP address:     192.168.0.2
    Transport Protocol:    UDP
    Destination Port:      9995
    Source Port:           55864
    DSCP:                  0x0
    TTL:                   255
    Output Features:       Used
```

This table describes the significant fields shown in the display:

**Table 116: show flow exporter Field Descriptions**

| Field         | Description                                        |
|---------------|----------------------------------------------------|
| Flow Exporter | The name of the flow exporter that you configured. |

| Field                   | Description                                                                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description             | The description that you configured for the exporter, or the default description User defined.                                                             |
| Transport Configuration | The transport configuration fields for this exporter.                                                                                                      |
| Destination IP address  | The IP address of the destination host.                                                                                                                    |
| Source IP address       | The source IP address used by the exported packets.                                                                                                        |
| Transport Protocol      | The transport layer protocol used by the exported packets.                                                                                                 |
| Destination Port        | The destination UDP port to which the exported packets are sent.                                                                                           |
| Source Port             | The source UDP port from which the exported packets are sent.                                                                                              |
| DSCP                    | The differentiated services code point (DSCP) value.                                                                                                       |
| TTL                     | The time-to-live value.                                                                                                                                    |
| Output Features         | Specifies whether the <b>output-features</b> command, which causes the output features to be run on Flexible NetFlow export packets, has been used or not. |

The following example displays the status and statistics for all of the flow exporters configured on a device:

```
Device# show flow exporter name FLOW-EXPORTER-1 statistics
Flow Exporter FLOW-EXPORTER-1:
  Packet send statistics (last cleared 2w6d ago):
    Successfully sent:          0          (0 bytes)
```

# show flow interface

To display the Flexible Netflow configuration and status for an interface, use the **show flow interface** command in privileged EXEC mode.

**show flow interface** [*type number*]

|                           |               |                                                                                                                            |
|---------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>type</i>   | (Optional) The type of interface on which you want to display Flexible Netflow accounting configuration information.       |
|                           | <i>number</i> | (Optional) The number of the interface on which you want to display Flexible Netflow accounting configuration information. |

**Command Modes** Privileged EXEC

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|

|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Examples** The following example displays the Flexible Netflow accounting configuration on Ethernet interfaces 0/0 and 0/1:

```
Device# show flow interface gigabitethernet1/0/1

Interface Ethernet1/0
  monitor:          FLOW-MONITOR-1
  direction:        Output
  traffic(ip):       on
Device# show flow interface gigabitethernet1/0/2
Interface Ethernet0/0
  monitor:          FLOW-MONITOR-1
  direction:        Input
  traffic(ip):       sampler SAMPLER-2#
```

The table below describes the significant fields shown in the display.

**Table 117: show flow interface Field Descriptions**

| Field      | Description                                                                                                                                                                                                                                                                         |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface  | The interface to which the information applies.                                                                                                                                                                                                                                     |
| monitor    | The name of the flow monitor that is configured on the interface.                                                                                                                                                                                                                   |
| direction: | <p>The direction of traffic that is being monitored by the flow monitor.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>• Input—Traffic is being received by the interface.</li> <li>• Output—Traffic is being transmitted by the interface.</li> </ul> |

| Field       | Description                                                                                                                                                                                                                                                                                                       |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| traffic(ip) | <p>Indicates if the flow monitor is in normal mode or sampler mode.</p> <p>The possible values are:</p> <ul style="list-style-type: none"><li>• on—The flow monitor is in normal mode.</li><li>• sampler—The flow monitor is in sampler mode (the name of the sampler will be included in the display).</li></ul> |

# show flow monitor

To display the status and statistics for a Flexible NetFlow flow monitor, use the **show flow monitor** command in privileged EXEC mode.

|                           |                     |                                                                                                |
|---------------------------|---------------------|------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>name</b>         | (Optional) Specifies the name of a flow monitor.                                               |
|                           | <i>monitor-name</i> | (Optional) Name of a flow monitor that was previously configured.                              |
|                           | <b>cache</b>        | (Optional) Displays the contents of the cache for the flow monitor.                            |
|                           | <b>format</b>       | (Optional) Specifies the use of one of the format options for formatting the display output.   |
|                           | <b>csv</b>          | (Optional) Displays the flow monitor cache contents in comma-separated variables (CSV) format. |
|                           | <b>record</b>       | (Optional) Displays the flow monitor cache contents in record format.                          |
|                           | <b>table</b>        | (Optional) Displays the flow monitor cache contents in table format.                           |
|                           | <b>statistics</b>   | (Optional) Displays the statistics for the flow monitor.                                       |
|                           |                     |                                                                                                |

**Command Modes** Privileged EXEC

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **cache** keyword uses the record format by default.

The uppercase field names in the display output of the **show flowmonitor monitor-name cache** command are key fields that Flexible netFlow uses to differentiate flows. The lowercase field names in the display output of the **show flow monitor monitor-name cache** command are nonkey fields from which Flexible NetFlow collects values as additional data for the cache.

## Examples

The following example displays the status for a flow monitor:

```
Device# show flow monitor FLOW-MONITOR-1

Flow Monitor FLOW-MONITOR-1:
  Description:      Used for basic traffic analysis
  Flow Record:      flow-record-1
  Flow Exporter:     flow-exporter-1
                   flow-exporter-2
  Cache:
    Type:            normal
    Status:           allocated
    Size:             4096 entries / 311316 bytes
    Inactive Timeout: 15 secs
    Active Timeout:   1800 secs
```

This table describes the significant fields shown in the display.

**Table 118: show flow monitor monitor-name Field Descriptions**

| Field            | Description                                                                                                                                                                                                                                                   |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flow Monitor     | Name of the flow monitor that you configured.                                                                                                                                                                                                                 |
| Description      | Description that you configured or the monitor, or the default description User defined.                                                                                                                                                                      |
| Flow Record      | Flow record assigned to the flow monitor.                                                                                                                                                                                                                     |
| Flow Exporter    | Exporters that are assigned to the flow monitor.                                                                                                                                                                                                              |
| Cache            | Information about the cache for the flow monitor.                                                                                                                                                                                                             |
| Type             | Flow monitor cache type. The value is always normal, as it is the only supported cache type.                                                                                                                                                                  |
| Status           | Status of the flow monitor cache.<br>The possible values are: <ul style="list-style-type: none"> <li>• allocated—The cache is allocated.</li> <li>• being deleted—The cache is being deleted.</li> <li>• not allocated—The cache is not allocated.</li> </ul> |
| Size             | Current cache size.                                                                                                                                                                                                                                           |
| Inactive Timeout | Current value for the inactive timeout in seconds.                                                                                                                                                                                                            |
| Active Timeout   | Current value for the active timeout in seconds.                                                                                                                                                                                                              |

The following example displays the status, statistics, and data for the flow monitor named FLOW-MONITOR-1:

This table describes the significant fields shown in the display.

The following example displays the status, statistics, and data for the flow monitor named FLOW-MONITOR-1 in a table format:

The following example displays the status, statistics, and data for the flow monitor named FLOW-MONITOR-IPv6 (the cache contains IPv6 data) in record format:

The following example displays the status and statistics for a flow monitor:

# show flow record

To display the status and statistics for a Flexible Netflow flow record, use the **show flow record** command in privileged EXEC mode.

**show flow record** [{**name**] *record-name*}]

| <b>Syntax Description</b>    | <b>name</b> (Optional) Specifies the name of a flow record.                                                                                      |         |              |                              |                              |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|------------------------------|
|                              | <i>record-name</i> (Optional) Name of a user-defined flow record that was previously configured.                                                 |         |              |                              |                              |
| <b>Command Default</b>       | None                                                                                                                                             |         |              |                              |                              |

| Release                      | Modification                                                                                                                                     |         |              |                              |                              |
| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                     |         |              |                              |                              |

The following example displays the status and statistics for FLOW-RECORD-1:

```
Device# show flow record FLOW-RECORD-1
flow record FLOW-RECORD-1:
  Description:      User defined
  No. of users:     0
  Total field space: 24 bytes
  Fields:
    match ipv6 destination address
    match transport source-port
    collect interface input
```

# show ip sla statistics

To display current or aggregated operational status and statistics of all Cisco IOS IP Service Level Agreement (SLA) operations or a specified operation, use the **show ip sla statistics** command in user EXEC or privileged EXEC mode.

**show ip sla statistics** [*operation-number* [**details**] | **aggregated** [*operation-number* | **details**] | **details**]

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                         |

| Usage Guidelines   | Use the <b>show ip sla statistics</b> to display the current state of IP SLA operations, including how much life the operation has left, whether the operation is active, and the completion time. The output also includes the monitoring data returned for the last (most recently completed) operation. This generated operation ID is displayed when you use the <b>show ip sla</b> configuration command for the base multicast operation, and as part of the summary statistics for the entire operation. |                                                                                                                                         |
|                    | Enter the <b>show</b> command for a specific operation ID to display details for that one responder.                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                         |

## Examples

The following is sample output from the **show ip sla statistics** command:

```
Device# show ip sla statistics
```

```
Current Operational State
Entry Number: 3

TCP Connection RTT: 28  
HTTP Transaction RTT: 504  
HTTP Message Size: 9707
```

# show monitor

To display information about all Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) sessions, use the **show monitor** command in EXEC mode.

**show monitor** [**session** {*session\_number* | **all** | **local** | **range list** | **remote**} [**detail**]]

## Syntax Description

|                       |                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>session</b>        | (Optional) Displays information about specified SPAN sessions.                                                                                                                                                                                                                                                                                                                                         |
| <i>session_number</i> | The session number identified with the SPAN or RSPAN session. The range is 1 to 66.                                                                                                                                                                                                                                                                                                                    |
| <b>all</b>            | (Optional) Displays all SPAN sessions.                                                                                                                                                                                                                                                                                                                                                                 |
| <b>local</b>          | (Optional) Displays only local SPAN sessions.                                                                                                                                                                                                                                                                                                                                                          |
| <b>range list</b>     | (Optional) Displays a range of SPAN sessions, where <i>list</i> is the range of valid sessions. The range is either a single session or a range of sessions described by two numbers, the lower one first, separated by a hyphen. Do not enter any spaces between comma-separated parameters or in hyphen-specified ranges.<br><br><b>Note</b> This keyword is available only in privileged EXEC mode. |
| <b>remote</b>         | (Optional) Displays only remote SPAN sessions.                                                                                                                                                                                                                                                                                                                                                         |
| <b>detail</b>         | (Optional) Displays detailed information about the specified sessions.                                                                                                                                                                                                                                                                                                                                 |

## Command Modes

User EXEC  
Privileged EXEC

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The output is the same for the **show monitor** command and the **show monitor session all** command.  
Maximum number of SPAN source sessions: 2 (applies to source and local sessions)

## Examples

This is an example of output for the **show monitor** user EXEC command:

```
Device# show monitor
```

```
Session 1
-----
Type : Local Session
Source Ports :
RX Only : Gi4/0/1
Both : Gi4/0/2-3,Gi4/0/5-6
Destination Ports : Gi4/0/20
Encapsulation : Replicate
Ingress : Disabled
Session 2
-----
Type : Remote Source Session
Source VLANs :
TX Only : 10
Both : 1-9
Dest RSPAN VLAN : 105
```

This is an example of output for the **show monitor** user EXEC command for local SPAN source session 1:

```
Device# show monitor session 1
Session 1
-----
Type : Local Session
Source Ports :
RX Only : Gi4/0/1
Both : Gi4/0/2-3,Gi4/0/5-6
Destination Ports : Gi4/0/20
Encapsulation : Replicate
Ingress : Disabled
```

This is an example of output for the **show monitor session all** user EXEC command when ingress traffic forwarding is enabled:

```
Device# show monitor session all
Session 1
-----
Type : Local Session
Source Ports :
Both : Gi4/0/2
Destination Ports : Gi4/0/3
Encapsulation : Native
Ingress : Enabled, default VLAN = 5
Ingress encap : DOT1Q
Session 2
-----
Type : Local Session
Source Ports :
Both : Gi4/0/8
Destination Ports : Gi4/0/12
Encapsulation : Replicate
Ingress : Enabled, default VLAN = 4
Ingress encap : Untagged
```

# show monitor capture

To display monitor capture (WireShark) content, use the **show monitor capture file** command in privileged EXEC mode.

**show monitor capture** [*capture-name* [ **buffer** ] | **file** *file-location* : *file-name* ] [ **brief** | **detailed** | **display-filter** *display-filter-string* ]

|                           |                                                     |                                                                                              |
|---------------------------|-----------------------------------------------------|----------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>capture-name</i>                                 | (Optional) Specifies the name of the capture to be displayed.                                |
|                           | <b>buffer</b>                                       | (Optional) Specifies that a buffer associated with the named capture is to be displayed.     |
|                           | <b>file</b> <i>file-location</i> : <i>file-name</i> | (Optional) Specifies the file location and name of the capture storage file to be displayed. |
|                           | <b>brief</b>                                        | (Optional) Specifies the display content in brief.                                           |
|                           | <b>detailed</b>                                     | (Optional) Specifies detailed display content.                                               |
|                           | <b>display-filter</b> <i>display-filter-string</i>  | Filters the display content according to the <i>display-filter-string</i> .                  |
| <b>Command Default</b>    | Displays all capture content.                       |                                                                                              |
| <b>Command Modes</b>      | Privileged EXEC                                     |                                                                                              |
| <b>Command History</b>    | <b>Release</b>                                      | <b>Modification</b>                                                                          |
|                           | Cisco IOS XE Everest 16.5.1a                        | This command was introduced.                                                                 |
| <b>Usage Guidelines</b>   | none                                                |                                                                                              |

## Example

To display the capture for a capture called mycap:

```
Device# show monitor capture mycap
```

```
Status Information for Capture mycap
Target Type:
Interface: CAPWAP,
  Ingress:
0
  Egress:
0
  Status : Active
Filter Details:
  Capture all packets
Buffer Details:
  Buffer Type: LINEAR (default)
File Details:
  Associated file name: flash:mycap.pcap
  Size of buffer(in MB): 1
```

```
Limit Details:
Number of Packets to capture: 0 (no limit)
Packet Capture duration: 0 (no limit)
Packet Size to capture: 0 (no limit)
Packets per second: 0 (no limit)
Packet sampling rate: 0 (no sampling)
```

# show monitor session

To display information about Switched Port Analyzer (SPAN), Remote SPAN (RSPAN), and Encapsulated Remote Switched Port Analyzer (ERSPAN) sessions, use the **show monitor session** command in EXEC mode.

**show monitor session** {*session\_number* | **all** | **erspan-destination** | **erspan-source** | **local** | **range** *list* | **remote**} [**detail**]

|                           |                                                     |                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>session_number</i>                               | The session number identified with the SPAN or RSPAN session. The range is 1 to 66.                                                                                                                                                                                                                                                                                                         |
|                           | <b>all</b>                                          | Displays all SPAN sessions.                                                                                                                                                                                                                                                                                                                                                                 |
|                           | <b>erspan-source</b>                                | Displays only source ERSPAN sessions.                                                                                                                                                                                                                                                                                                                                                       |
|                           | <b>erspan-destination</b>                           | Displays only destination ERSPAN sessions.                                                                                                                                                                                                                                                                                                                                                  |

| <b>Usage Guidelines</b>   | The maximum local ERSPAN source session limit is 8. |                                                                                                                                                                                                                                                                                                                                                                                             |

## Examples

The following is sample output from the **show monitor session** command for local SPAN source session 1:

```
Device# show monitor session 1
Session 1
-----
Type : Local Session
Source Ports :
RX Only : Gi4/0/1
Both : Gi4/0/2-3,Gi4/0/5-6
Destination Ports : Gi4/0/20
Encapsulation : Replicate
Ingress : Disabled
```

The following is sample output from the **show monitor session all** command when ingress traffic forwarding is enabled:

```
Device# show monitor session all
Session 1
-----
Type : Local Session
Source Ports :
Both : Gi4/0/2
Destination Ports : Gi4/0/3
Encapsulation : Native
Ingress : Enabled, default VLAN = 5
Ingress encap : DOT1Q
Session 2
-----
Type : Local Session
Source Ports :
Both : Gi4/0/8
Destination Ports : Gi4/0/12
Encapsulation : Replicate
Ingress : Enabled, default VLAN = 4
Ingress encap : Untagged
```

The following is sample output from the **show monitor session erspan-source** command:

```
Device# show monitor session erspan-source

Type : ERSPAN Source Session
Status : Admin Enabled
Source Ports :
RX Only : Gi1/4/33
Destination IP Address : 20.20.163.20
Destination ERSPAN ID : 110
Origin IP Address : 10.10.10.216
IPv6 Flow Label : None
```

The following is sample output from the **show monitor session erspan-destination** command:

```
Device# show monitor session erspan-destination

Type : ERSPAN Destination Session
Status : Admin Enabled
Source IP Address : 10.10.10.210
```

Source ERSPAN ID : 40

# show parameter-map type subscriber attribute-to-service

To display parameter map statistics, use the **show parameter-map type subscriber attribute-to-service** command in privileged EXEC mode.

**show parameter-map type subscriber attribute-to-service** {all | name *parameter-map-name*}

|                    |                                |                                                      |
|--------------------|--------------------------------|------------------------------------------------------|
| Syntax Description | all                            | Displays statistics for all parameter maps.          |
|                    | name <i>parameter-map-name</i> | Displays statistics for the specified parameter map. |
| Command Modes      | Privileged EXEC (#)            |                                                      |
| Command History    | Release                        | Modification                                         |
|                    | Cisco IOS XE Everest 16.6.1    | This command was introduced.                         |

## Examples

The following is a sample output of the **show parameter-map type subscriber attribute-to-service** **name** *parameter-map-name* command:

```
Device# show parameter-map type subscriber attribute-to-service name platform

Parameter-map name: platform
Map: 10 platform-type regex "C9xxx"
Action(s):
    10 interface-template critical
```

# show platform software et-analytics

To display et-analytics configuration, use the **show platform software et-analytics** command in privileged EXEC mode.

**show platform software et-analytics {global | interfaces}**

|                    |                              |                                                |
|--------------------|------------------------------|------------------------------------------------|
| Syntax Description | <b>global</b>                | Displays global et-analytics configuration.    |
|                    | <b>interfaces</b>            | Displays interface et-analytics configuration. |
| Command Default    | None                         |                                                |
| Command Modes      | Privileged EXEC              |                                                |
| Command History    | <b>Release</b>               | <b>Modification</b>                            |
|                    | Cisco IOS XE Everest 16.5.1a | This command was introduced.                   |

## Example:

The following example shows how to display global et-analytics configuration:

```
Device>enable
Device#configure terminal
Device# show platform software et-analytics global
```

```
ET-Analytics Global state
=====
All Interfaces : Off
IP Flow-record Destination: 10.126.71.20 : 2055
Inactive timer: 0
ET-Analytics interfaces
GigabitEthernet1/0/3
```

The following example shows how to display global et-analytics configuration:

```
Device>enable
Device#configure terminal
Device# show platform software et-analytics interfaces
```

```
ET-Analytics interfaces
GigabitEthernet1/0/3
```

# show platform software fed switch active fnf et-analytics-flow-dump

To display interface et-analytics flow dump, use the **show platform software fed switch active fnf et-analytics-flow-dump** command in privileged EXEC mode.

**show platform software fed switch active fnf et-analytics-flow-dump**

## Command Default

None

## Command Modes

Privileged EXEC

## Command History

# show platform software fed switch ip wccp

To display platform-dependent Web Cache Communication Protocol (WCCP) information, use the **show platform software fed switch ip wccp** privileged EXEC command.

```
show platform software fed switch{switch-number|active|standby}ip
wccp{cache-engines |interfaces |service-groups}
```

## Syntax Description

**switch** { *switch\_num* | **active** | **standby** } The device for which you want to display information.

- *switch\_num*—Enter the switch ID. Displays information for the specified switch.
- **active**—Displays information for the active switch.
- **standby**—Displays information for the standby switch, if available.

**cache-engines** Displays WCCP cache engines.

**interfaces** Displays WCCP interfaces.

**service-groups** Displays WCCP service groups.

## Command Modes

Privileged EXEC

## Command History

## Usage Guidelines

Use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.

This command is available only if your device is running the IP Services feature set.

The following example displays WCCP interfaces:

```
Device# show platform software fed switch 1 ip wccp interfaces
```

```
WCCP Interface Info
```

```
=====
```

```

# show platform software fed switch swc connection

To display the connection details and events of the Stealthwatch Cloud integration, use the **show platform software fed switch *switch-number* swc connection** command in privileged EXEC mode.

**show platform software fed switch { *switch-number* | active } swc connection**

## Syntax Description

**switch** {*switch-number* | **active**} Displays switch information.

- *switch\_num*: Switch ID.
- **active** : Displays information for the active switch.

**swc connection** Displays the connection details and events.

## Command Modes

Privileged EXEC (#)

## Command History

# show platform software fed switch swc statistics

To display the statistical information of the Stealthwatch Cloud integration, use the **show platform software fed switch *switch-number* swc statistics** command in privileged EXEC mode.

**show platform software fed switch** { *switch-number* | **active** } **swc statistics**

## Syntax Description

**switch** {*switch-number* | **active** } Displays switch information.

- *switch\_num*: Switch ID.
- **active**: Displays information for the active switch.

**swc statistics** Displays the statistical information.

## Command Modes

Privileged EXEC (#)

## Command History

## Command Modes

Privileged EXEC (#)

## Command History

| Release                      | Modification                                                                  |
|------------------------------|-------------------------------------------------------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced in a release prior to Cisco IOS XE Denali 16.1.1. |

## Usage Guidelines

If the session number does not exist or if the SPAN session is a remote destination session, the command output will display the following message "% Error: No Information Available."

## Examples

The following is sample output from the **show platform software swspan FP active source** command:

```
Switch# show platform software swspan FP active source sess-id 0
```

```
Showing SPAN source detail info
```

```
Session ID : 0
Intf Type : PORT
Port dpidx : 30
PD Sess ID : 1
Session Type : Local
Direction : Ingress
Filter Enabled : No
ACL Configured : No
AOM Object id : 579
```

```
AOM Object Status : Done
Parent AOM object Id : 118
Parent AOM object Status : Done
```

```
Session ID : 9
Intf Type : PORT
Port dpidx : 8
PD Sess ID : 0
Session Type : Local
Direction : Ingress
Filter Enabled : No
ACL Configured : No
AOM Object id : 578
AOM Object Status : Done
Parent AOM object Id : 70
Parent AOM object Status : Done
```

The following is sample output from the **show platform software swspan RP active destination** command:

```
Switch# show platform software swspan RP active destination
```

```
Showing SPAN destination table summary info
```

```
Sess-id IF-type IF-id Sess-type
-----
1 PORT 19 Remote
```

# show sampler

To display the status and statistics for a Flexible NetFlow sampler, use the **show sampler** command in privileged EXEC mode.

**show sampler** *[[name] sampler-name]*

|                           |                                                                                  |
|---------------------------|----------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>name</b> (Optional) Specifies the name of a sampler.                          |
|                           | <b>sampler-name</b> (Optional) Name of a sampler that was previously configured. |
| <b>Command Default</b>    | None                                                                             |
| <b>Command Modes</b>      | Privileged EXEC                                                                  |
| <b>Command History</b>    | <b>Release</b>                                                                   |
|                           | <b>Modification</b>                                                              |
|                           | Cisco IOS XE Everest 16.5.1a This command was introduced.                        |

The following example displays the status and statistics for all of the flow samplers configured:

```
Device# show sampler
Sampler SAMPLER-1:
  ID:                2083940135
  export ID:         0
  Description:       User defined
  Type:              Invalid (not in use)
  Rate:              1 out of 32
  Samples:           0
  Requests:          0
  Users (0):
Sampler SAMPLER-2:
  ID:                3800923489
  export ID:         1
  Description:       User defined
  Type:              random
  Rate:              1 out of 100
  Samples:           1
  Requests:          124
  Users (1):
    flow monitor FLOW-MONITOR-1 (datalink,vlan1) 0 out of 0
```

This table describes the significant fields shown in the display.

**Table 119: show sampler Field Descriptions**

| Field     | Description                    |
|-----------|--------------------------------|
| ID        | ID number of the flow sampler. |
| Export ID | ID of the flow sampler export. |

| Field       | Description                                                                                                                                                                                                                                                                                                     |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description | Description that you configured for the flow sampler, or the default description User defined.                                                                                                                                                                                                                  |
| Type        | Sampling mode that you configured for the flow sampler.                                                                                                                                                                                                                                                         |
| Rate        | Window size (for packet selection) that you configured for the flow sampler. The range is 2 to 32768.                                                                                                                                                                                                           |
| Samples     | Number of packets sampled since the flow sampler was configured or the device was restarted. This is equivalent to the number of times a positive response was received when the sampler was queried to determine if the traffic needed to be sampled. See the explanation of the Requests field in this table. |
| Requests    | Number of times the flow sampler was queried to determine if the traffic needed to be sampled.                                                                                                                                                                                                                  |
| Users       | Interfaces on which the flow sampler is configured.                                                                                                                                                                                                                                                             |

# show snmp stats

To display the SNMP statistics, use the **show snmp stats** command in privileged EXEC mode.

**show snmp stats** { **hosts** | **oid** }

## Syntax Description

**hosts** Displays the details of the SNMP servers polled to the SNMP agent.

**oid** Displays recently requested object identifiers (OIDs).

## Command Default

Displays the SNMP manager entries polled to the SNMP agent.

## Command Modes

Privileged EXEC (#)

## Command History

| Release                       | Modification                 |
|-------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

## Usage Guidelines

Use the **show snmp stats hosts** command to list the NMS IP address, the number of times an NMS polls the agent, and the timestamp of polling. To delete the entries polled to the SNMP agent, use the **clear snmp stats hosts** command.

Before running the **show snmp stats oid** command, connect the device to the NMS. The command output displays the list of OIDs recently requested by the NMS. It also displays the number of times an object identifier is requested by the NMS. This information is useful for troubleshooting memory leaks and network failures when little information is available about the MIBs that the NMS is querying. You can use the **show snmp stats oid** command at any time to view OIDs recently requested by the NMS.

The following is sample output of the **show snmp stats hosts** command.

```
Device# show snmp stats hosts
Request Count      Last Timestamp      Address
2                 00:00:01 ago        3.3.3.3
1                 1w2d ago            2.2.2.2
```

The table below describes the significant fields shown in the display:

**Table 120: show snmp stats hosts Field Descriptions**

| Field          | Description                                                                            |
|----------------|----------------------------------------------------------------------------------------|
| Request Count  | Displays the number of times an SNMP Manager has sent requests to the SNMP Agent.      |
| Last Timestamp | Displays the time at which the request was sent to the SNMP Agent by the SNMP Manager. |

| Field   | Description                                                            |
|---------|------------------------------------------------------------------------|
| Address | Displays the IP Address of the SNMP Manager that has sent the request. |

The following is sample output of the **show snmp stats oid** command.

Device# **show snmp stats oid**

| time-stamp               | #of times requested | OID                 |

The table below describes the significant fields shown in the display.

**Table 121: show snmp stats oid Field Descriptions**

| Field               | Description                                                                     |
|---------------------|---------------------------------------------------------------------------------|
| time-stamp          | Displays the time and date when the object identifiers is requested by the NMS. |
| #of times requested | Displays the number of times an object identifier is requested.                 |
| OID                 | Displays the object identifiers recently requested by the NMS.                  |

# show stealth-watch-cloud detail

To display the status of the Stealthwatch Cloud registration details, use the **show stealth-watch-cloud detail** command in privileged EXEC mode.

## show stealth-watch-cloud detail

### Command Modes

Privileged EXEC (#)

### Command History

| Release                       | Modification                 |
|-------------------------------|------------------------------|
| Cisco IOS XE Bengaluru 17.5.1 | This command was introduced. |

### Examples

The following is a sample output of the **show stealth-watch-cloud detail** command:

```
Device> enable
Device# show stealth-watch-cloud detail
=====
Stealthwatch Cloud Parameters
=====
Service Key : XXXXXXXXXXXXXXXXXXXXXXXX
Sensor Name : C9200
URL : https://sensor.eu-prod.obsrvbl.com
=====
Stealthwatch Cloud Sensor Info
=====
Sensor Status : Registered
Last heartbeat : 2020-08-21T10:35:16
```

|----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| <b>show platform software fed switch</b> {switch-number   active }swc connection | Displays the connection details and events of the Stealthwatch Cloud integration. |
| <b>show platform software fed switch</b> {switch-number   active }swc statistics | Displays the statistics of the Stealthwatch Cloud integration.                    |
| <b>stealthwatch-cloud-monitor</b>                                                | Configures the Stealthwatch Cloud monitor.                                        |

# shutdown (monitor session)

To disable a configured ERSPAN session, use the **shutdown** command in ERSPAN monitor source session configuration mode. To enable configured ERSPAN session, use the **no** form of this command.

**shutdown**  
**no shutdown**

## Syntax Description

This command has no arguments or keywords.

## Command Default

A newly configured ERSPAN session will be in the shutdown state.

## Command Modes

ERSPAN monitor source session configuration mode (config-mon-erspan-src)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The ERSPAN session remains inactive until the **no shutdown** command is configured.

## Examples

The following example shows how to activate an ERSPAN session using the **no shutdown** command:

```
Device> enable
Device# configure terminal
Device(config)# monitor session 1 type erspan-source
Device(config-mon-erspan-src)# description source1
Device(config-mon-erspan-src)# source interface GigabitEthernet1/0/1 rx
Device(config-mon-erspan-src)# destination
Device(config-mon-erspan-src-dst)# erspan-id 100
Device(config-mon-erspan-src-dst)# origin ip address 10.10.0.1
Device(config-mon-erspan-src-dst)# ip address 10.1.0.2
Device(config-mon-erspan-src-dst)# ip dscp 10
Device(config-mon-erspan-src-dst)# ip ttl 32
Device(config-mon-erspan-src-dst)# mtu 512
Device(config-mon-erspan-src-dst)# vrf monitoring
Device(config-mon-erspan-src-dst)# exit
Device(config-mon-erspan-src)# no shutdown
Device(config-mon-erspan-src)# end
```

## Related Commands

|-----------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>monitor session type</b> | Creates an ERSPAN source and destination session number or enters the ERSPAN session configuration mode for the session. |

## snmp ifmib ifindex persist

To globally enable ifIndex values to persist , which will remain constant across reboots, for use by the Simple Network Management Protocol (SNMP), use the **snmp ifmib ifindex persist** command in global configuration mode. To globally disable ifIndex persistence, use the **no** form of this command.

**snmp ifmib ifindex persist**  
**no snmp ifmib ifindex persist**

|                           |                                            |
|---------------------------|--------------------------------------------|

|----------------------|-------------------------------|
| <b>Command Modes</b> | Global configuration (config) |
|----------------------|-------------------------------|

|                         |                                                                                                                                                                                                                                                                                             |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The <b>snmp ifmib ifindex persist</b> command does not override an interface-specific configuration. The interface-specific configuration of ifIndex persistence is configured with the <b>snmp ifindex persist</b> and <b>snmp ifindex clear</b> commands in interface configuration mode. |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The **snmp ifmib ifindex persist** command enables ifIndex persistence for all interfaces on a routing device by using the ifDescr and ifIndex entries in the ifIndex table of interface MIB (IF-MIB).

ifIndex persistence means that the ifIndex values in the IF-MIB persist across reboots, allowing for the consistent identification of specific interfaces that use SNMP.

If ifIndex persistence was previously disabled for a specific interface by using the **no snmp ifindex persist** command, ifIndex persistence will remain disabled for that interface.

### Examples

The following example shows how to enable ifIndex persistence for all interfaces:

```
Device(config)# snmp ifmib ifindex persist
```

| <b>Usage Guidelines</b>   | To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance. |                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Use the **snmp-server community** command to configure the community access string to permit access to SNMP.

To remove the specified community string, use the **no** form of this command.

Use the **clear** keyword to specify that the clear text community string you enter is displayed encrypted in the **show running** command output. To enter an encrypted string, use the **encrypted** keyword. To enter a clear text community string that is not encrypted by the system, use neither of these keywords.

When the **snmp-server community** command is entered with the **SDROwner** keyword, SNMP access is granted only to the MIB object instances in the owner SDR. When the **snmp-server community** command is entered with the **SystemOwner** keyword, SNMP access is granted to all SDRs in the system.

**Note**

In a non-owner SDR, a community name provides access only to the object instances that belong to that SDR, regardless of the access privilege assigned to the community name. Access to the owner SDR and system-wide access privileges are available only from the owner SDR.

**Examples**

This example shows how to assign the string comaccess to SNMP, allowing read-only access, and to specify that IP access list 4 can use the community string:

```
RP/0/RP0/CPU0:router(config)# snmp-server community comaccess ro 4
```

The following example shows how to assign the string mgr to SNMP, allowing read-write access to the objects in the restricted view:

```
RP/0/RP0/CPU0:router(config)# snmp-server community mgr view restricted rw
```

This example shows how to remove the community comaccess:

```
RP/0/RP0/CPU0:router(config)# no snmp-server community comaccess
```

**Related Commands**

| Command          | Description                            |
|------------------|----------------------------------------|
| snmp-server view | Creates or updates an SNMP view entry. |

## snmp-server enable traps

To enable the device to send Simple Network Management Protocol (SNMP) notifications for various traps or inform requests to the network management system (NMS), use the **snmp-server enable traps** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps [ auth-framework [ sec-violation ] | bridge | call-home |
config | config-copy | config-ctid | copy-config | cpu | dot1x | energywise | entity
| envmon | errdisable | event-manager | flash | fru-ctrl | license | mac-notification
| port-security | power-ethernet | rep | snmp | stackwise | storm-control | stpx
| syslog | transceiver | tty | vlan-membership | vlancreate | vlandelete | vstack
| vtp ]
no snmp-server enable traps [ auth-framework [ sec-violation ] | bridge | call-home
| config | config-copy | config-ctid | copy-config | cpu | dot1x | energywise |
entity | envmon | errdisable | event-manager | flash | fru-ctrl | license |
mac-notification | port-security | power-ethernet | rep | snmp | stackwise |
storm-control | stpx | syslog | transceiver | tty | vlan-membership | vlancreate |
vlandelete | vstack | vtp ]
```

### Syntax Description

|                       |                                                                  |
|-----------------------|------------------------------------------------------------------|
| <b>auth-framework</b> | (Optional) Enables SNMP CISCO-AUTH-FRAMEWORK-MIB traps.          |
| <b>sec-violation</b>  | (Optional) Enables SNMP camSecurityViolationNotif notifications. |
| <b>bridge</b>         | (Optional) Enables SNMP STP Bridge MIB traps.*                   |
| <b>call-home</b>      | (Optional) Enables SNMP CISCO-CALLHOME-MIB traps.*               |
| <b>config</b>         | (Optional) Enables SNMP configuration traps.                     |
| <b>config-copy</b>    | (Optional) Enables SNMP configuration copy traps.                |
| <b>config-ctid</b>    | (Optional) Enables SNMP configuration CTID traps.                |
| <b>copy-config</b>    | (Optional) Enables SNMP copy-configuration traps.                |
| <b>cpu</b>            | (Optional) Enables CPU notification traps.*                      |
| <b>dot1x</b>          | (Optional) Enables SNMP dot1x traps.*                            |
| <b>energywise</b>     | (Optional) Enables SNMP energywise traps.*                       |
| <b>entity</b>         | (Optional) Enables SNMP entity traps.                            |
| <b>envmon</b>         | (Optional) Enables SNMP environmental monitor traps.*            |
| <b>errdisable</b>     | (Optional) Enables SNMP errdisable notification traps.*          |
| <b>event-manager</b>  | (Optional) Enables SNMP Embedded Event Manager traps.            |
| <b>flash</b>          | (Optional) Enables SNMP FLASH notification traps.*               |

|                         |                                                                                                                                                                   |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>fru-ctrl</b>         | (Optional) Generates entity field-replaceable unit (FRU) control traps. In a device stack, this trap refers to the insertion or removal of a device in the stack. |
| <b>license</b>          | (Optional) Enables license traps.*                                                                                                                                |
| <b>mac-notification</b> | (Optional) Enables SNMP MAC Notification traps.*                                                                                                                  |
| <b>port-security</b>    | (Optional) Enables SNMP port security traps.*                                                                                                                     |
| <b>power-ethernet</b>   | (Optional) Enables SNMP power Ethernet traps.*                                                                                                                    |
| <b>rep</b>              | (Optional) Enables SNMP Resilient Ethernet Protocol traps.                                                                                                        |
| <b>snmp</b>             | (Optional) Enables SNMP traps.*                                                                                                                                   |
| <b>stackwise</b>        | (Optional) Enables SNMP stackwise traps.*                                                                                                                         |
| <b>storm-control</b>    | (Optional) Enables SNMP storm-control trap parameters.*                                                                                                           |
| <b>stpx</b>             | (Optional) Enables SNMP STPX MIB traps.*                                                                                                                          |
| <b>syslog</b>           | (Optional) Enables SNMP syslog traps.                                                                                                                             |
| <b>transceiver</b>      | (Optional) Enables SNMP transceiver traps.*                                                                                                                       |
| <b>tty</b>              | (Optional) Sends TCP connection traps. This is enabled by default.                                                                                                |
| <b>vlan-membership</b>  | (Optional) Enables SNMP VLAN membership traps.                                                                                                                    |
| <b>vlancreate</b>       | (Optional) Enables SNMP VLAN-created traps.                                                                                                                       |
| <b>vlandelete</b>       | (Optional) Enables SNMP VLAN-deleted traps.                                                                                                                       |
| <b>vstack</b>           | (Optional) Enables SNMP Smart Install traps.*                                                                                                                     |
| <b>vtp</b>              | (Optional) Enables VLAN Trunking Protocol (VTP) traps.                                                                                                            |

**Command Default**

The sending of SNMP traps is disabled.

**Command Modes**

Global configuration

**Command History**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

The command options marked with an asterisk in the table above have subcommands. For more information on these subcommands, see the Related Commands section below.

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

When supported, use the **snmp-server enable traps** command to enable sending of traps or informs.

**Note** Though visible in the command-line help strings, the **fru-ctrl**, **insertion**, and **removal** keywords are not supported on the device. The **snmp-server enable informs** global configuration command is not supported. To enable the sending of SNMP inform notifications, use the **snmp-server enable traps** global configuration command combined with the **snmp-server host *host-addr* informs** global configuration command.

**Note** Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

### Examples

This example shows how to enable more than one type of SNMP trap:

```
Device(config)# snmp-server enable traps config
Device(config)# snmp-server enable traps vtp
```

# snmp-server enable traps bridge

To generate STP bridge MIB traps, use the **snmp-server enable traps bridge** command in global configuration mode. Use the **no** form of this command to return to the default setting.

**snmp-server enable traps bridge** [**newroot**] [**topologychange**]  
**no snmp-server enable traps bridge** [**newroot**] [**topologychange**]

## Syntax Description

|                       |                                                               |
|-----------------------|---------------------------------------------------------------|
| <b>newroot</b>        | (Optional) Enables SNMP STP bridge MIB new root traps.        |
| <b>topologychange</b> | (Optional) Enables SNMP STP bridge MIB topology change traps. |

## Command Default

The sending of bridge SNMP traps is disabled.

## Command Modes

Global configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

### Note

Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

## Examples

This example shows how to send bridge new root traps to the NMS:

```
Device(config)# snmp-server enable traps bridge newroot
```

# snmp-server enable traps bulkstat

To enable data-collection-MIB traps, use the **snmp-server enable traps bulkstat** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps bulkstat [collection | transfer]
no snmp-server enable traps bulkstat [collection | transfer]
```

|                    |                                                                                                                                                                                                             |                              |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| Syntax Description | <div> <b>collection</b> (Optional) Enables data-collection-MIB collection traps.                 </div> <div> <b>transfer</b> (Optional) Enables data-collection-MIB transfer traps.                 </div> |                              |
| Command Default    | The sending of data-collection-MIB traps is disabled.                                                                                                                                                       |                              |
| Command Modes      | Global configuration                                                                                                                                                                                        |                              |
| Command History    | Release                                                                                                                                                                                                     | Modification                 |
|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                | This command was introduced. |

**Usage Guidelines** Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

**Note** Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

**Examples** This example shows how to generate data-collection-MIB collection traps:

```
Device(config)# snmp-server enable traps bulkstat collection
```

# snmp-server enable traps call-home

To enable SNMP CISCO-CALLHOME-MIB traps, use the **snmp-server enable traps call-home** command in global configuration mode. Use the **no** form of this command to return to the default setting.

**snmp-server enable traps call-home** [message-send-fail | server-fail]  
**no snmp-server enable traps call-home** [message-send-fail | server-fail]

## Syntax Description

**message-send-fail** (Optional) Enables SNMP message-send-fail traps.

**server-fail** (Optional) Enables SNMP server-fail traps.

## Command Default

The sending of SNMP CISCO-CALLHOME-MIB traps is disabled.

## Command Modes

Global configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

### Note

Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

## Examples

This example shows how to generate SNMP message-send-fail traps:

```
Device(config)# snmp-server enable traps call-home message-send-fail
```

## snmp-server enable traps cef

To enable SNMP Cisco Express Forwarding (CEF) traps, use the **snmp-server enable traps cef** command in global configuration mode. Use the **no** form of this command to return to the default setting.

**snmp-server enable traps cef** [**inconsistency** | **peer-fib-state-change** | **peer-state-change** | **resource-failure**]  
**no snmp-server enable traps cef** [**inconsistency** | **peer-fib-state-change** | **peer-state-change** | **resource-failure**]

### Syntax Description

|                              |                                                          |
|------------------------------|----------------------------------------------------------|
| <b>inconsistency</b>         | (Optional) Enables SNMP CEF Inconsistency traps.         |
| <b>peer-fib-state-change</b> | (Optional) Enables SNMP CEF Peer FIB State change traps. |
| <b>peer-state-change</b>     | (Optional) Enables SNMP CEF Peer state change traps.     |
| <b>resource-failure</b>      | (Optional) Enables SNMP CEF Resource Failure traps.      |

### Command Default

The sending of SNMP CEF traps is disabled.

### Command Modes

Global configuration

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

#### Note

Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

### Examples

This example shows how to generate SNMP CEF inconsistency traps:

```
Device(config)# snmp-server enable traps cef inconsistency
```

## snmp-server enable traps cpu

To enable CPU notifications, use the **snmp-server enable traps cpu** command in global configuration mode. Use the **no** form of this command to return to the default setting.

**snmp-server enable traps cpu** [**threshold**]  
**no snmp-server enable traps cpu** [**threshold**]

---

**Syntax Description**

---

**threshold** (Optional) Enables CPU threshold notification.

---

---

**Command Default**

The sending of CPU notifications is disabled.

---

**Command Modes**

Cisco IOS XE Everest 16.5.1a

This command was introduced.

---

---

**Usage Guidelines**

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

---

**Note**

Informs are not supported in SNMPv1.

---

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

---

**Examples**

This example shows how to generate CPU threshold notifications:

```
Device(config)# snmp-server enable traps cpu threshold
```

## snmp-server enable traps envmon

To enable SNMP environmental traps, use the **snmp-server enable traps envmon** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps envmon [fan] [shutdown] [status] [supply] [temperature]
no snmp-server enable traps envmon [fan] [shutdown] [status] [supply] [temperature]
```

### Syntax Description

|                    |                                                              |
|--------------------|--------------------------------------------------------------|
| <b>fan</b>         | (Optional) Enables fan traps.                                |
| <b>shutdown</b>    | (Optional) Enables environmental monitor shutdown traps.     |
| <b>status</b>      | (Optional) Enables SNMP environmental status-change traps.   |
| <b>supply</b>      | (Optional) Enables environmental monitor power-supply traps. |
| <b>temperature</b> | (Optional) Enables environmental monitor temperature traps.  |

### Command Default

The sending of environmental SNMP traps is disabled.

### Command Modes

Global configuration

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|

### Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

#### Note

Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

### Examples

This example shows how to generate fan traps:

```
Device(config)# snmp-server enable traps envmon fan
```

## snmp-server enable traps errdisable

To enable SNMP notifications of error-disabling, use the **snmp-server enable traps errdisable** command in global configuration mode. Use the **no** form of this command to return to the default setting.

**snmp-server enable traps errdisable** [**notification-rate** *number-of-notifications*]  
**no snmp-server enable traps errdisable** [**notification-rate** *number-of-notifications*]

|                    |                                                                   |                                                                                                                        |
|--------------------|-------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>notification-rate</b><br><i>number-of-notifications</i>        | (Optional) Specifies number of notifications per minute as the notification rate. Accepted values are from 0 to 10000. |
|                    |                                                                   |                                                                                                                        |
| Command Default    | The sending of SNMP notifications of error-disabling is disabled. |                                                                                                                        |
| Command Modes      | Global configuration                                              |                                                                                                                        |
| Command History    | <b>Release</b>                                                    | <b>Modification</b>                                                                                                    |
|                    | Cisco IOS XE Everest 16.5.1a                                      | This command was introduced.                                                                                           |

**Usage Guidelines** Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

**Note**

Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

**Examples**

This example shows how to set the number SNMP notifications of error-disabling to 2:

```
Device(config)# snmp-server enable traps errdisable notification-rate 2
```

# snmp-server enable traps flash

To enable SNMP flash notifications, use the **snmp-server enable traps flash** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps flash [insertion] [removal]
no snmp-server enable traps flash [insertion] [removal]
```

|                    |                                                                         |                              |
|--------------------|-------------------------------------------------------------------------|------------------------------|
| Syntax Description | <b>insertion</b> (Optional) Enables SNMP flash insertion notifications. |                              |
|                    | <b>removal</b> (Optional) Enables SNMP flash removal notifications.     |                              |
|                    |                                                                         |                              |
| Command Default    | The sending of SNMP flash notifications is disabled.                    |                              |
| Command Modes      | Global configuration                                                    |                              |
| Command History    | <b>Release</b>                                                          | <b>Modification</b>          |
|                    | Cisco IOS XE Everest 16.5.1a                                            | This command was introduced. |

**Usage Guidelines** Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

**Note** Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

**Examples** This example shows how to generate SNMP flash insertion notifications:

```
Device(config)# snmp-server enable traps flash insertion
```

# snmp-server enable traps isis

To enable intermediate system-to-intermediate system (IS-IS) link-state routing protocol traps, use the **snmp-server enable traps isis** command in global configuration mode. Use the **no** form of this command to return to the default setting.

**snmp-server enable traps isis** [**errors** | **state-change**]  
**no snmp-server enable traps isis** [**errors** | **state-change**]

## Syntax Description

**errors** (Optional) Enables IS-IS error traps.

**state-change** (Optional) Enables IS-IS state change traps.

## Command Default

The sending of IS-IS traps is disabled.

## Command Modes

Global configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

### Note

Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

## Examples

This example shows how to generate IS-IS error traps:

```
Device(config)# snmp-server enable traps isis errors
```

# snmp-server enable traps license

To enable license traps, use the **snmp-server enable traps license** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps license [deploy] [error] [usage]
no snmp-server enable traps license [deploy] [error] [usage]
```

|                    |                                                                                                                                                                                                                                                             |

# snmp-server enable traps mac-notification

To enable SNMP MAC notification traps, use the **snmp-server enable traps mac-notification** command in global configuration mode. Use the **no** form of this command to return to the default setting.

**snmp-server enable traps mac-notification** [**change**] [**move**] [**threshold**]  
**no snmp-server enable traps mac-notification** [**change**] [**move**] [**threshold**]

## Syntax Description

**change** (Optional) Enables SNMP MAC change traps.

**move** (Optional) Enables SNMP MAC move traps.

**threshold** (Optional) Enables SNMP MAC threshold traps.

## Command Default

The sending of SNMP MAC notification traps is disabled.

## Command Modes

Global configuration

## Command History

### Release

Cisco IOS XE Everest 16.5.1a

### Modification

This command was introduced.

## Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

### Note

Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

## Examples

This example shows how to generate SNMP MAC notification change traps:

```
Device(config)# snmp-server enable traps mac-notification change
```

## snmp-server enable traps ospf

To enable SNMP Open Shortest Path First (OSPF) traps, use the **snmp-server enable traps ospf** command in global configuration mode. Use the **no** form of this command to return to the default setting.

**snmp-server enable traps ospf** [**cisco-specific** | **errors** | **lsa** | **rate-limit** *rate-limit-time* *max-number-of-traps* | **retransmit** | **state-change**]  
**no snmp-server enable traps ospf** [**cisco-specific** | **errors** | **lsa** | **rate-limit** *rate-limit-time* *max-number-of-traps* | **retransmit** | **state-change**]

| Syntax Description         |                                                                                                   |
|----------------------------|---------------------------------------------------------------------------------------------------|
| <b>cisco-specific</b>      | (Optional) Enables Cisco-specific traps.                                                          |
| <b>errors</b>              | (Optional) Enables error traps.                                                                   |
| <b>lsa</b>                 | (Optional) Enables link-state advertisement (LSA) traps.                                          |
| <b>rate-limit</b>          | (Optional) Enables rate-limit traps.                                                              |
| <i>rate-limit-time</i>     | (Optional) Specifies window of time in seconds for rate-limit traps. Accepted values are 2 to 60. |
| <i>max-number-of-traps</i> | (Optional) Specifies maximum number of rate-limit traps to be sent in window time.                |
| <b>retransmit</b>          | (Optional) Enables packet-retransmit traps.                                                       |
| <b>state-change</b>        | (Optional) Enables state-change traps.                                                            |

**Command Default** The sending of OSPF SNMP traps is disabled.

**Command Modes** Global configuration

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

**Note** Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

### Examples

This example shows how to enable LSA traps:

```
Device(config)# snmp-server enable traps ospf lsa
```

## snmp-server enable traps pim

To enable SNMP Protocol-Independent Multicast (PIM) traps, use the **snmp-server enable traps pim** command in global configuration mode. Use the **no** form of this command to return to the default setting.

**snmp-server enable traps pim** [**invalid-pim-message**] [**neighbor-change**] [**rp-mapping-change**]  
**no snmp-server enable traps pim** [**invalid-pim-message**] [**neighbor-change**] [**rp-mapping-change**]

### Syntax Description

**invalid-pim-message** (Optional) Enables invalid PIM message traps.

**neighbor-change** (Optional) Enables PIM neighbor-change traps.

**rp-mapping-change** (Optional) Enables rendezvous point (RP)-mapping change traps.

### Command Default

The sending of PIM SNMP traps is disabled.

### Command Modes

Global configuration

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

#### Note

Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

### Examples

This example shows how to enable invalid PIM message traps:

```
Device(config)# snmp-server enable traps pim invalid-pim-message
```

## snmp-server enable traps port-security

To enable SNMP port security traps, use the **snmp-server enable traps port-security** command in global configuration mode. Use the **no** form of this command to return to the default setting.

**snmp-server enable traps port-security** [**trap-rate** *value*]  
**no snmp-server enable traps port-security** [**trap-rate** *value*]

| <b>Syntax Description</b>    | <b>trap-rate</b> <i>value</i> (Optional) Sets the maximum number of port-security traps sent per second. The range is from 0 to 1000; the default is 0 (no limit imposed; a trap is sent at every occurrence). |         |              |                              |                              |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|------------------------------|
| <b>Command Default</b>       | The sending of port security SNMP traps is disabled.                                                                                                                                                           |         |              |                              |                              |
| <b>Command Modes</b>         | Global configuration                                                                                                                                                                                           |         |              |                              |                              |
| <b>Command History</b>       | <table><tr><th>Release</th><th>Modification</th></tr><tr><td>Cisco IOS XE Everest 16.5.1a</td><td>This command was introduced.</td></tr></table>                                                               | Release | Modification | Cisco IOS XE Everest 16.5.1a | This command was introduced. |
| Release                      | Modification                                                                                                                                                                                                   |         |              |                              |                              |
| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                                                   |         |              |                              |                              |
| <b>Usage Guidelines</b>      | Specify the host (NMS) that receives the traps by using the <b>snmp-server host</b> global configuration command. If no trap types are specified, all trap types are sent.                                     |         |              |                              |                              |

**Note** Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

### Examples

This example shows how to enable port-security traps at a rate of 200 per second:

```
Device(config)# snmp-server enable traps port-security trap-rate 200
```

## snmp-server enable traps power-ethernet

To enable SNMP power-over-Ethernet (PoE) traps, use the **snmp-server enable traps power-ethernet** command in global configuration mode. Use the **no** form of this command to return to the default setting.

**snmp-server enable traps power-ethernet** {group *number* | **police**}  
**no snmp-server enable traps power-ethernet** {group *number* | **police**}

|                           |                               |                                                                                                         |
|---------------------------|-------------------------------|---------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>group</b><br><i>number</i> | Enables inline power group-based traps for the specified group number. Accepted values are from 1 to 9. |
|                           | <b>police</b>                 | Enables inline power policing traps.                                                                    |

|                        |                                                            |
|------------------------|------------------------------------------------------------|
| <b>Command Default</b> | The sending of power-over-Ethernet SNMP traps is disabled. |
|------------------------|------------------------------------------------------------|

|                      |                      |
|----------------------|----------------------|
| <b>Command Modes</b> | Global configuration |
|----------------------|----------------------|

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                            |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | Specify the host (NMS) that receives the traps by using the <b>snmp-server host</b> global configuration command. If no trap types are specified, all trap types are sent. |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|             |                                      |
|-------------|--------------------------------------|
| <b>Note</b> | Informs are not supported in SNMPv1. |
|-------------|--------------------------------------|

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

### Examples

This example shows how to enable power-over-Ethernet traps for group 1:

```
Device(config)# snmp-server enable traps power-over-ethernet group 1
```

## snmp-server enable traps snmp

To enable SNMP traps, use the **snmp-server enable traps snmp** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps snmp  [authentication] [coldstart] [linkdown] [linkup] [warmstart]
no snmp-server enable traps snmp  [authentication] [coldstart] [linkdown] [linkup]
] [warmstart]
```

### Syntax Description

|                       |                                          |
|-----------------------|------------------------------------------|
| <b>authentication</b> | (Optional) Enables authentication traps. |
| <b>coldstart</b>      | (Optional) Enables cold start traps.     |
| <b>linkdown</b>       | (Optional) Enables linkdown traps.       |
| <b>linkup</b>         | (Optional) Enables linkup traps.         |
| <b>warmstart</b>      | (Optional) Enables warmstart traps.      |

### Command Default

The sending of SNMP traps is disabled.

### Command Modes

Global configuration

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

#### Note

Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

### Examples

This example shows how to enable a warmstart SNMP trap:

```
Device(config)# snmp-server enable traps snmp warmstart
```

## snmp-server enable traps stackwise

To enable SNMP StackWise traps, use the **snmp-server enable traps stackwise** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps stackwise [GLS] [ILS] [SRLS]
[insufficient-power] [invalid-input-current]
[invalid-output-current] [member-removed] [member-upgrade-notification]
[new-master] [new-member] [port-change] [power-budget-warning] [power-invalid-topology]
[power-link-status-changed] [power-oper-status-changed]
[power-priority-conflict] [power-version-mismatch] [ring-redundant]
[stack-mismatch] [unbalanced-power-supplies] [under-budget] [under-voltage]
no snmp-server enable traps stackwise [GLS] [ILS] [SRLS]
[insufficient-power] [invalid-input-current]
[invalid-output-current] [member-removed] [member-upgrade-notification]
[new-master] [new-member] [port-change] [power-budget-warning] [power-invalid-topology]
[power-link-status-changed] [power-oper-status-changed]
[power-priority-conflict] [power-version-mismatch] [ring-redundant]
[stack-mismatch] [unbalanced-power-supplies] [under-budget] [under-voltage]
```

| Syntax Description                 |                                                                          |
|------------------------------------|--------------------------------------------------------------------------|
| <b>GLS</b>                         | (Optional) Enables StackWise stack power GLS trap.                       |
| <b>ILS</b>                         | (Optional) Enables StackWise stack power ILS trap.                       |
| <b>SRLS</b>                        | (Optional) Enables StackWise stack power SRLS trap.                      |
| <b>insufficient-power</b>          | (Optional) Enables StackWise stack power unbalanced power supplies trap. |
| <b>invalid-input-current</b>       | (Optional) Enables StackWise stack power invalid input current trap.     |
| <b>invalid-output-current</b>      | (Optional) Enables StackWise stack power invalid output current trap.    |
| <b>member-removed</b>              | (Optional) Enables StackWise stack member removed trap.                  |
| <b>member-upgrade-notification</b> | (Optional) Enables StackWise member to be reloaded for upgrade trap.     |
| <b>new-master</b>                  | (Optional) Enables StackWise new primary trap.                           |
| <b>new-member</b>                  | (Optional) Enables StackWise stack new member trap.                      |
| <b>port-change</b>                 | (Optional) Enables StackWise stack port change trap.                     |
| <b>power-budget-warning</b>        | (Optional) Enables StackWise stack power budget warning trap.            |
| <b>power-invalid-topology</b>      | (Optional) Enables StackWise stack power invalid topology trap.          |
| <b>power-link-status-changed</b>   | (Optional) Enables StackWise stack power link status changed trap.       |
| <b>power-oper-status-changed</b>   | (Optional) Enables StackWise stack power port oper status changed trap.  |
| <b>power-priority-conflict</b>     | (Optional) Enables StackWise stack power priority conflict trap.         |

|                                  |                                                                            |
|----------------------------------|----------------------------------------------------------------------------|
| <b>power-version-mismatch</b>    | (Optional) Enables StackWise stack power version mismatch discovered trap. |
| <b>ring-redundant</b>            | (Optional) Enables StackWise stack ring redundant trap.                    |
| <b>stack-mismatch</b>            | (Optional) Enables StackWise stack mismatch trap.                          |
| <b>unbalanced-power-supplies</b> | (Optional) Enables StackWise stack power unbalanced power supplies trap.   |
| <b>under-budget</b>              | (Optional) Enables StackWise stack power under budget trap.                |
| <b>under-voltage</b>             | (Optional) Enables StackWise stack power under voltage trap.               |

**Command Default**

The sending of SNMP StackWise traps is disabled.

**Command Modes**

Global configuration

**Command History**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

**Note**

Inform is not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

**Examples**

This example shows how to generate StackWise stack power GLS traps:

```
Device(config)# snmp-server enable traps stackwise GLS
```

# snmp-server enable traps storm-control

To enable SNMP storm-control trap parameters, use the **snmp-server enable traps storm-control** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps storm-control { trap-rate number-of-minutes }  
no snmp-server enable traps storm-control { trap-rate }
```

## Syntax Description

|                                              |                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>trap-rate</b><br><i>number-of-minutes</i> | (Optional) Specifies the SNMP storm-control trap rate in minutes. Accepted values are from 0 to 1000. The default is 0.<br><br>Value 0 indicates that no limit is imposed and a trap is sent at every occurrence. When configured, <b>show run all</b> command output displays <code>snmp-server enable traps storm-control</code> . |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Default

The sending of SNMP storm-control trap parameters is disabled.

## Command Modes

Global configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

### Note

Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

## Examples

This example shows how to set the SNMP storm-control trap rate to 10 traps per minute:

```
Device(config)# snmp-server enable traps storm-control trap-rate 10
```

# snmp-server enable traps stpx

To enable SNMP STPX MIB traps, use the **snmp-server enable traps stpx** command in global configuration mode. Use the **no** form of this command to return to the default setting.

**snmp-server enable traps stpx** [**inconsistency**] [**loop-inconsistency**] [**root-inconsistency**]  
**no snmp-server enable traps stpx** [**inconsistency**] [**loop-inconsistency**] [**root-inconsistency**]

|                                                                                                    |                                                                                                                                                                            |                                                                   |

## snmp-server enable traps transceiver

To enable SNMP transceiver traps, use the **snmp-server enable traps transceiver** command in global configuration mode. Use the **no** form of this command to return to the default setting.

**snmp-server enable traps transceiver {all}**  
**no snmp-server enable traps transceiver {all}**

---

### Syntax Description

**a** (Optional) Enables all SNMP transceiver traps.

---

---

### Command Default

The sending of SNMP transceiver traps is disabled.

---

### Command Modes

Global configuration

---

### Command History

---

#### Release

---

#### Modification

Cisco IOS XE Everest 16.5.1a

This command was introduced.

---

---

### Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

---

#### Note

Informs are not supported in SNMPv1.

---

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

---

### Examples

This example shows how to set all SNMP transceiver traps:

```
Device(config)# snmp-server enable traps transceiver all
```

## snmp-server enable traps vrfmib

To allow SNMP vrfmib traps, use the **snmp-server enable traps vrfmib** command in global configuration mode. Use the **no** form of this command to return to the default setting.

**snmp-server enable traps vrfmib** [vnet-trunk-down | vnet-trunk-up | vrf-down | vrf-up]  
**no snmp-server enable traps vrfmib** [vnet-trunk-down | vnet-trunk-up | vrf-down | vrf-up]

### Syntax Description

**vnet-trunk-down** (Optional) Enables vrfmib trunk down traps.

**vnet-trunk-up** (Optional) Enables vrfmib trunk up traps.

**vrf-down** (Optional) Enables vrfmib vrf down traps.

**vrf-up** (Optional) Enables vrfmib vrf up traps.

### Command Default

The sending of SNMP vrfmib traps is disabled.

### Command Modes

Global configuration

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

#### Note

Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

### Examples

This example shows how to generate vrfmib trunk down traps:

```
Device(config)# snmp-server enable traps vrfmib vnet-trunk-down
```

# snmp-server enable traps vstack

To enable SNMP smart install traps, use the **snmp-server enable traps vstack** command in global configuration mode. Use the **no** form of this command to return to the default setting.

**snmp-server enable traps vstack** [**addition**] [**failure**] [**lost**] [**operation**]  
**no snmp-server enable traps vstack** [**addition**] [**failure**] [**lost**] [**operation**]

## Syntax Description

|                  |                                                            |
|------------------|------------------------------------------------------------|
| <b>addition</b>  | (Optional) Enables client added traps.                     |
| <b>failure</b>   | (Optional) Enables file upload and download failure traps. |
| <b>lost</b>      | (Optional) Enables client lost trap.                       |
| <b>operation</b> | (Optional) Enables operation mode change traps.            |

## Command Default

The sending of SNMP smart install traps is disabled.

## Command Modes

Global configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

### Note

Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

## Examples

This example shows how to generate SNMP Smart Install client-added traps:

```
Device(config)# snmp-server enable traps vstack addition
```

## snmp-server engineID

To configure a name for either the local or remote copy of SNMP, use the **snmp-server engineID** command in global configuration mode.

```
snmp-server engineID {local engineid-string | remote ip-address [udp-port port-number]
engineid-string}
```

|                    |                                     |                                                                                                                                                                                                                                                        |
|--------------------|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>local</b> <i>engineid-string</i> | Specifies a 24-character ID string with the name of the copy of SNMP. You need not specify the entire 24-character engine ID if it has trailing zeros. Specify only the portion of the engine ID up to the point where only zeros remain in the value. |
|                    | <b>remote</b> <i>ip-address</i>     | Specifies the remote SNMP copy. Specify the <i>ip-address</i> of the device that contains the remote copy of SNMP.                                                                                                                                     |
|                    | <b>udp-port</b> <i>port-number</i>  | (Optional) Specifies the User Datagram Protocol (UDP) port on the remote device. The default is 162.                                                                                                                                                   |
|                    |                                     |                                                                                                                                                                                                                                                        |
| Command Modes      | Global configuration                |                                                                                                                                                                                                                                                        |
| Command History    | <b>Release</b>                      | <b>Modification</b>                                                                                                                                                                                                                                    |
|                    | Cisco IOS XE Everest 16.5.1a        | This command was introduced.                                                                                                                                                                                                                           |
| Usage Guidelines   | None                                |                                                                                                                                                                                                                                                        |

## Examples

The following example configures a local engine ID of 1234000000000000000000:

```
Device(config)# snmp-server engineID local 1234
```

## snmp-server group

To configure a new Simple Network Management Protocol (SNMP) group, use the **snmp-server group** command in global configuration mode. To remove a specified SNMP group, use the **no** form of this command.

**snmp-server group** *group-name* {**v1** | **v2c** | **v3** {**auth** | **noauth** | **priv**}} [**context** *context-name*] [**match** {**exact** | **prefix**}] [**read** *read-view*] [**write** *write-view*] [**notify** *notify-view*] [**access** [**ipv6** *named-access-list*] [{*acl-number* *acl-name*}]]

**no snmp-server group** *group-name* {**v1** | **v2c** | **v3** {**auth** | **noauth** | **priv**}} [**context** *context-name*]

### Syntax Description

|                     |                                                                                                                                                                                                                                                                                       |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>group-name</i>   | Name of the group.                                                                                                                                                                                                                                                                    |
| <b>v1</b>           | Specifies that the group is using the SNMPv1 security model. SNMPv1 is the least secure of the possible SNMP security models.                                                                                                                                                         |
| <b>v2c</b>          | Specifies that the group is using the SNMPv2c security model.<br><br>The SNMPv2c security model allows informs to be transmitted and supports 64-character strings.                                                                                                                   |
| <b>v3</b>           | Specifies that the group is using the SNMPv3 security model.<br><br>SNMPv3 is the most secure of the supported security models. It allows you to explicitly configure authentication characteristics.                                                                                 |
| <b>auth</b>         | Specifies authentication of a packet without encrypting it.                                                                                                                                                                                                                           |
| <b>noauth</b>       | Specifies no authentication of a packet.                                                                                                                                                                                                                                              |
| <b>priv</b>         | Specifies authentication of a packet with encryption.                                                                                                                                                                                                                                 |
| <b>context</b>      | (Optional) Specifies the SNMP context to associate with this SNMP group and its views.                                                                                                                                                                                                |
| <i>context-name</i> | (Optional) Context name.                                                                                                                                                                                                                                                              |
| <b>match</b>        | (Optional) Specifies an exact context match or matches only the context prefix.                                                                                                                                                                                                       |
| <i>exact</i>        | (Optional) Matches the exact context.                                                                                                                                                                                                                                                 |
| <i>prefix</i>       | (Optional) Matches only the context prefix.                                                                                                                                                                                                                                           |
| <b>read</b>         | (Optional) Specifies a read view for the SNMP group. This view enables you to view only the contents of the agent.                                                                                                                                                                    |
| <i>read-view</i>    | (Optional) String of a maximum of 64 characters that is the name of the view.<br><br>The default is that the read-view is assumed to be every object belonging to the Internet object identifier (OID) space (1.3.6.1), unless the <b>read</b> option is used to override this state. |
| <b>write</b>        | (Optional) Specifies a write view for the SNMP group. This view enables you to enter data and configure the contents of the agent.                                                                                                                                                    |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>write-view</i>        | (Optional) String of a maximum of 64 characters that is the name of the view.<br><br>The default is that nothing is defined for the write view (that is, the null OID). You must configure write access.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>notify</b>            | (Optional) Specifies a notify view for the SNMP group. This view enables you to specify a notify, inform, or trap.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <i>notify-view</i>       | (Optional) String of a maximum of 64 characters that is the name of the view.<br><br>By default, nothing is defined for the notify view (that is, the null OID) until the <b>snmp-server host</b> command is configured. If a view is specified in the <b>snmp-server group</b> command, any notifications in that view that are generated will be sent to all users associated with the group (provided a SNMP server host configuration exists for the user).<br><br>Cisco recommends that you let the software autogenerate the notify view. See the “Configuring Notify Views” section in this document. |
| <b>access</b>            | (Optional) Specifies a standard access control list (ACL) to associate with the group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>ipv6</b>              | (Optional) Specifies an IPv6 named access list. If both IPv6 and IPv4 access lists are indicated, the IPv6 named access list must appear first in the list.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <i>named-access-list</i> | (Optional) Name of the IPv6 access list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>acl-number</i>        | (Optional) The <i>acl-number</i> argument is an integer from 1 to 99 that identifies a previously configured standard access list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <i>acl-name</i>          | (Optional) The <i>acl-name</i> argument is a string of a maximum of 64 characters that is the name of a previously configured standard access list.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Command Default**

No SNMP server groups are configured.

**Command Modes**

Global configuration (config)

**Command History**

| Release                   | Modification                 |
|---------------------------|------------------------------|
| Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

**Usage Guidelines**

When a community string is configured internally, two groups with the name public are autogenerated, one for the v1 security model and the other for the v2c security model. Similarly, deleting a community string will delete a v1 group with the name public and a v2c group with the name public.

No default values exist for authentication or privacy algorithms when you configure the **snmp-server group** command. Also, no default passwords exist. For information about specifying a Message Digest 5 (MD5) password, see the documentation of the **snmp-server user** command.

**Configuring Notify Views**

The notify-view option is available for two reasons:

- If a group has a notify view that is set using SNMP, you may need to change the notify view.

- The **snmp-server host** command may have been configured before the **snmp-server group** command. In this case, you must either reconfigure the **snmp-server host** command, or specify the appropriate notify view.

Specifying a notify view when configuring an SNMP group is not recommended, for the following reasons:

- The **snmp-server host** command autogenerates a notify view for the user, and then adds it to the group associated with that user.
- Modifying the group's notify view will affect all users associated with that group.

Instead of specifying the notify view for a group as part of the **snmp-server group** command, use the following commands in the order specified:

1. **snmp-server user**—Configures an SNMP user.
2. **snmp-server group**—Configures an SNMP group, without adding a notify view .
3. **snmp-server host**—Autogenerates the notify view by specifying the recipient of a trap operation.

### SNMP Contexts

SNMP contexts provide VPN users with a secure way of accessing MIB data. When a VPN is associated with a context, that VPN's specific MIB data exists in that context. Associating a VPN with a context enables service providers to manage networks with multiple VPNs. Creating and associating a context with a VPN enables a provider to prevent the users of one VPN from accessing information about users of other VPNs on the same networking device.

Use this command with the **context** *context-name* keyword and argument to associate a read, write, or notify SNMP view with an SNMP context.

### Create an SNMP Group

The following example shows how to create the SNMP server group “public,” allowing read-only access for all objects to members of the standard named access list “lmnop”:

```
Device(config)# snmp-server group public v2c access lmnop
```

### Remove an SNMP Server Group

The following example shows how to remove the SNMP server group “public” from the configuration:

```
Device(config)# no snmp-server group public v2c
```

### Associate an SNMP Server Group with Specified Views

The following example shows SNMP context “A” associated with the views in SNMPv2c group “GROUP1”:

```
Device(config)# snmp-server context A
Device(config)# snmp mib community commA
```

```
Device(config)# snmp mib community-map commA context A target-list commAVpn  
Device(config)# snmp-server group GROUP1 v2c context A read viewA write viewA notify viewB
```

**Related Commands**

| Command                       | Description                                                                                                                               |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show snmp group</b>        | Displays the names of groups on the device and the security model, the status of the different views, and the storage type of each group. |
| <b>snmp mib community-map</b> | Associates a SNMP community with an SNMP context, engine ID, security name, or VPN target list.                                           |
| <b>snmp-server host</b>       | Specifies the recipient of a SNMP notification operation.                                                                                 |
| <b>snmp-server user</b>       | Configures a new user to a SNMP group.                                                                                                    |

## snmp-server host

To specify the recipient (host) of a Simple Network Management Protocol (SNMP) notification operation, use the **snmp-server host** global configuration command on the device. Use the **no** form of this command to remove the specified host.

```
snmp-server host {host-addr} [vrf vrf-instance] [informs | traps] [version {1 | 2c | 3}
{auth | noauth | priv} } ] {community-string [notification-type] }
no snmp-server host {host-addr} [vrf vrf-instance] [informs | traps] [version {1 | 2c | 3}
{auth | noauth | priv} } ] {community-string [notification-type] }
```

### Syntax Description

|                                                |                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>host-addr</i>                               | Name or Internet address of the host (the targeted recipient).                                                                                                                                                                                                                                                                                                                           |
| <b>vrf</b> <i>vrf-instance</i>                 | (Optional) Specifies the virtual private network (VPN) routing instance and name for this host.                                                                                                                                                                                                                                                                                          |
| <b>informs</b>   <b>traps</b>                  | (Optional) Sends SNMP traps or informs to this host.                                                                                                                                                                                                                                                                                                                                     |
| <b>version</b> <b>1</b>   <b>2c</b>   <b>3</b> | (Optional) Specifies the version of the SNMP used to send the traps.<br><b>1</b> —SNMPv1. This option is not available with informs.<br><b>2c</b> —SNMPv2C.<br><b>3</b> —SNMPv3. One of the authorization keywords (see next table row) must follow the Version 3 keyword.                                                                                                               |
| <b>auth</b>   <b>noauth</b>   <b>priv</b>      | <b>auth</b> (Optional)—Enables Message Digest 5 (MD5) and Secure Hash Algorithm (SHA) packet authentication.<br><b>noauth</b> (Default)—The noAuthNoPriv security level. This is the default if the <b>auth</b>   <b>noauth</b>   <b>priv</b> keyword choice is not specified.<br><b>priv</b> (Optional)—Enables Data Encryption Standard (DES) packet encryption (also called privacy). |
| <i>community-string</i>                        | Password-like community string sent with the notification operation. Though you can set this string by using the <b>snmp-server host</b> command, we recommend that you define this string by using the <b>snmp-server community</b> global configuration command before using the <b>snmp-server host</b> command.                                                                      |
| <b>Note</b>                                    | The @ symbol is used for delimiting the context information. Avoid using the @ symbol as part of the SNMP community string when configuring this command.                                                                                                                                                                                                                                |

---

*notification-type* (Optional) Type of notification to be sent to the host. If no type is specified, all notifications are sent. The notification type can be one or more of the these keywords:

- **auth-framework**—Sends SNMP CISCO-AUTH-FRAMEWORK-MIB traps.
  - **bridge**—Sends SNMP Spanning Tree Protocol (STP) bridge MIB traps.
  - **bulkstat**—Sends Data-Collection-MIB Collection notification traps.
  - **call-home**—Sends SNMP CISCO-CALLHOME-MIB traps.
  - **cef**—Sends SNMP CEF traps.
  - **config**—Sends SNMP configuration traps.
  - **config-copy**—Sends SNMP config-copy traps.
  - **config-ctid**—Sends SNMP config-ctid traps.
  - **copy-config**—Sends SNMP copy configuration traps.
  - **cpu**—Sends CPU notification traps.
  - **cpu threshold**—Sends CPU threshold notification traps.
  - **eigrp**—Sends SNMP EIGRP traps.
  - **entity**—Sends SNMP entity traps.
-

- 
- **envmon**—Sends environmental monitor traps.
  - **errdisable**—Sends SNMP errdisable notification traps.
  - **event-manager**—Sends SNMP Embedded Event Manager traps.
  - **flash**—Sends SNMP FLASH notifications.
  - **flowmon**—Sends SNMP flowmon notification traps.
  - **ipmulticast**—Sends SNMP IP multicast routing traps.
  - **ipsla**—Sends SNMP IP SLA traps.
  - **isis**—Sends IS-IS traps.
  - **license**—Sends license traps.
  - **local-auth**—Sends SNMP local auth traps.
  - **mac-notification**—Sends SNMP MAC notification traps.
  - **ospf**—Sends Open Shortest Path First (OSPF) traps.
  - **pim**—Sends SNMP Protocol-Independent Multicast (PIM) traps.
  - **port-security**—Sends SNMP port-security traps.
  - **power-ethernet**—Sends SNMP power Ethernet traps.
  - **snmp**—Sends SNMP-type traps.
  - **storm-control**—Sends SNMP storm-control traps.
  - **stpx**—Sends SNMP STP extended MIB traps.
  - **syslog**—Sends SNMP syslog traps.
  - **transceiver**—Sends SNMP transceiver traps.
  - **tty**—Sends TCP connection traps.
  - **vlan-membership**—Sends SNMP VLAN membership traps.
  - **vlancreate**—Sends SNMP VLAN-created traps.
  - **vlandelete**—Sends SNMP VLAN-deleted traps.
  - **vrfmib**—Sends SNMP vrfmib traps.
  - **vstack**—Sends SNMP Smart Install traps.
  - **vtp**—Sends SNMP VLAN Trunking Protocol (VTP) traps.
  - **wireless**—Sends wireless traps.
- 

### Command Default

This command is disabled by default. No notifications are sent.

If you enter this command with no keywords, the default is to send all trap types to the host. No informs are sent to this host.

If no **version** keyword is present, the default is Version 1.

If Version 3 is selected and no authentication keyword is entered, the default is the **noauth** (noAuthNoPriv) security level.

**Note** Though visible in the command-line help strings, the **fru-ctrl** keyword is not supported.

**Command Modes** Global configuration

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** SNMP notifications can be sent as traps or inform requests. Traps are unreliable because the receiver does not send acknowledgments when it receives traps. The sender cannot determine if the traps were received. However, an SNMP entity that receives an inform request acknowledges the message with an SNMP response PDU. If the sender never receives the response, the inform request can be sent again, so that informs are more likely to reach their intended destinations.

However, informs consume more resources in the agent and in the network. Unlike a trap, which is discarded as soon as it is sent, an inform request must be held in memory until a response is received or the request times out. Traps are also sent only once, but an inform might be retried several times. The retries increase traffic and contribute to a higher overhead on the network.

If you do not enter an **snmp-server host** command, no notifications are sent. To configure the device to send SNMP notifications, you must enter at least one **snmp-server host** command. If you enter the command with no keywords, all trap types are enabled for the host. To enable multiple hosts, you must enter a separate **snmp-server host** command for each host. You can specify multiple notification types in the command for each host.

If a local user is not associated with a remote host, the device does not send informs for the **auth** (authNoPriv) and the **priv** (authPriv) authentication levels.

When multiple **snmp-server host** commands are given for the same host and kind of notification (trap or inform), each succeeding command overwrites the previous command. Only the last **snmp-server host** command is in effect. For example, if you enter an **snmp-server host inform** command for a host and then enter another **snmp-server host inform** command for the same host, the second command replaces the first.

The **snmp-server host** command is used with the **snmp-server enable traps** global configuration command. Use the **snmp-server enable traps** command to specify which SNMP notifications are sent globally. For a host to receive most notifications, at least one **snmp-server enable traps** command and the **snmp-server host** command for that host must be enabled. Some notification types cannot be controlled with the **snmp-server enable traps** command. For example, some notification types are always enabled. Other notification types are enabled by a different command.

The **no snmp-server host** command with no keywords disables traps, but not informs, to the host. To disable informs, use the **no snmp-server host informs** command.

## Examples

This example shows how to configure a unique SNMP community string named comaccess for traps and prevent SNMP polling access with this string through access-list 10:

```
Device(config)# snmp-server community comaccess ro 10
Device(config)# snmp-server host 172.20.2.160 comaccess
Device(config)# access-list 10 deny any
```

This example shows how to send the SNMP traps to the host specified by the name myhost.cisco.com. The community string is defined as comaccess:

```
Device(config)# snmp-server enable traps
Device(config)# snmp-server host myhost.cisco.com comaccess snmp
```

This example shows how to enable the device to send all traps to the host myhost.cisco.com by using the community string public:

```
Device(config)# snmp-server enable traps
Device(config)# snmp-server host myhost.cisco.com public
```

You can verify your settings by entering the **show running-config** privileged EXEC command.

# snmp-server manager

To start the Simple Network Management Protocol (SNMP) manager process, use the **snmp-server manager** command in global configuration mode. To stop the SNMP manager process, use the **no** form of this command.

**snmp-server manager**  
**no snmp-server manager**

## Command Default

Global configuration (config)

## Command History

| Release                      | Modification                |
|------------------------------|-----------------------------|
| Cisco IOS XE Everest 16.5.1a | The command was introduced. |

## Usage Guidelines

The SNMP manager process sends SNMP requests to agents and receives SNMP responses and notifications from agents. When the SNMP manager process is enabled, the router can query other SNMP agents and process incoming SNMP traps.

Most network security policies assume that routers will be accepting SNMP requests, sending SNMP responses, and sending SNMP notifications. With the SNMP manager functionality enabled, the router may also be sending SNMP requests, receiving SNMP responses, and receiving SNMP notifications. The security policy implementation may need to be updated prior to enabling this functionality.

SNMP requests are typically sent to UDP port 161. SNMP responses are typically sent from UDP port 161. SNMP notifications are typically sent to UDP port 162.

The following example shows how to enable the SNMP manager process:

```
Router(config)# snmp-server manager
```

## Related Commands

| Command                     | Description                                                                                                                                |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show running-config</b>  | Displays the contents of the currently running configuration file or the configuration for a specific interface, or map class information. |
| <b>show snmp user</b>       | Displays information on each SNMP username in the group username table.                                                                    |
| <b>snmp-server engineID</b> | Displays the identification of the local SNMP engine and all remote engines that have been configured on the device.                       |

## snmp-server user

To configure a new user to a Simple Network Management Protocol (SNMP) group, use the **snmp-server user** command in global configuration mode. To remove a user from an SNMP group, use the **no** form of this command.

**snmp-server user** *username group-name* [**remote** *host* [**udp-port** *port*] [**vrf** *vrf-name*]] {**v1** | **v2c** | **v3** [**encrypted**] [**auth** {**md5** | **sha**} *auth-password*]} [**access** [**ipv6** *nacl*] [**priv** {**des** | **3des** | **aes** {**128** | **192** | **256**}}] *privpassword*] {*acl-number* *acl-name*}]

**no snmp-server user** *username group-name* [**remote** *host* [**udp-port** *port*] [**vrf** *vrf-name*]] {**v1** | **v2c** | **v3** [**encrypted**] [**auth** {**md5** | **sha**} *auth-password*]} [**access** [**ipv6** *nacl*] [**priv** {**des** | **3des** | **aes** {**128** | **192** | **256**}}] *privpassword*] {*acl-number* *acl-name*}]

### Syntax Description

|                      |                                                                                                                                                                                                                                               |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>username</i>      | Name of the user on the host that connects to the agent.                                                                                                                                                                                      |
| <i>group-name</i>    | Name of the group to which the user belongs.                                                                                                                                                                                                  |
| <b>remote</b>        | (Optional) Specifies a remote SNMP entity to which the user belongs, and the hostname or IPv6 address or IPv4 IP address of that entity. If both an IPv6 address and IPv4 IP address are being specified, the IPv6 host must be listed first. |
| <i>host</i>          | (Optional) Name or IP address of the remote SNMP host.                                                                                                                                                                                        |
| <b>udp-port</b>      | (Optional) Specifies the User Datagram Protocol (UDP) port number of the remote host.                                                                                                                                                         |
| <i>port</i>          | (Optional) Integer value that identifies the UDP port. The default is 162.                                                                                                                                                                    |
| <b>vrf</b>           | (Optional) Specifies an instance of a routing table.                                                                                                                                                                                          |
| <i>vrf-name</i>      | (Optional) Name of the Virtual Private Network (VPN) routing and forwarding (VRF) table to use for storing data.                                                                                                                              |
| <b>v1</b>            | Specifies that SNMPv1 should be used.                                                                                                                                                                                                         |
| <b>v2c</b>           | Specifies that SNMPv2c should be used.                                                                                                                                                                                                        |
| <b>v3</b>            | Specifies that the SNMPv3 security model should be used. Allows the use of the <b>encrypted</b> keyword or <b>auth</b> keyword or both.                                                                                                       |
| <b>encrypted</b>     | (Optional) Specifies whether the password appears in encrypted format.                                                                                                                                                                        |
| <b>auth</b>          | (Optional) Specifies which authentication level should be used.                                                                                                                                                                               |
| <b>md5</b>           | (Optional) Specifies the HMAC-MD5-96 authentication level.                                                                                                                                                                                    |
| <b>sha</b>           | (Optional) Specifies the HMAC-SHA-96 authentication level.                                                                                                                                                                                    |
| <i>auth-password</i> | (Optional) String (not to exceed 64 characters) that enables the agent to receive packets from the host.                                                                                                                                      |
| <b>access</b>        | (Optional) Specifies an Access Control List (ACL) to be associated with this SNMP user.                                                                                                                                                       |
| <b>ipv6</b>          | (Optional) Specifies an IPv6 named access list to be associated with this SNMP user.                                                                                                                                                          |

|                     |                                                                                                                                                                                    |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>nacl</i>         | (Optional) Name of the ACL. IPv4, IPv6, or both IPv4 and IPv6 access lists may be specified. If both are specified, the IPv6 named access list must appear first in the statement. |
| <b>priv</b>         | (Optional) Specifies the use of the User-based Security Model (USM) for SNMP version 3 for SNMP message level security.                                                            |
| <b>des</b>          | (Optional) Specifies the use of the 56-bit Digital Encryption Standard (DES) algorithm for encryption.                                                                             |
| <b>3des</b>         | (Optional) Specifies the use of the 168-bit 3DES algorithm for encryption.                                                                                                         |
| <b>aes</b>          | (Optional) Specifies the use of the Advanced Encryption Standard (AES) algorithm for encryption.                                                                                   |
| <b>128</b>          | (Optional) Specifies the use of a 128-bit AES algorithm for encryption.                                                                                                            |
| <b>192</b>          | (Optional) Specifies the use of a 192-bit AES algorithm for encryption.                                                                                                            |
| <b>256</b>          | (Optional) Specifies the use of a 256-bit AES algorithm for encryption.                                                                                                            |
| <i>privpassword</i> | (Optional) String (not to exceed 64 characters) that specifies the privacy user password.                                                                                          |
| <i>acl-number</i>   | (Optional) Integer in the range from 1 to 99 that specifies a standard access list of IP addresses.                                                                                |
| <i>acl-name</i>     | (Optional) String (not to exceed 64 characters) that is the name of a standard access list of IP addresses.                                                                        |

**Command Default**

See the table in the “Usage Guidelines” section for default behaviors for encryption, passwords, and access lists.

**Command Modes**

Global configuration (config)

**Command History**

| Release                   | Modification                 |
|---------------------------|------------------------------|
| Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

**Usage Guidelines**

To configure a remote user, specify the IP address or port number for the remote SNMP agent of the device where the user resides. Also, before you configure remote users for a particular agent, configure the SNMP engine ID, using the **snmp-server engineID** command with the **remote** keyword. The remote agent’s SNMP engine ID is needed when computing the authentication and privacy digests from the password. If the remote engine ID is not configured first, the configuration command will fail.

For the *privpassword* and *auth-password* arguments, the minimum length is one character; the recommended length is at least eight characters, and should include both letters and numbers. The recommended maximum length is 64 characters.

The table below describes the default user characteristics for encryption, passwords, and access lists.

Table 122: snmp-server user Default Descriptions

| Characteristic | Default                                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Access lists   | Access from all IP access lists is permitted.                                                                                                                   |
| Encryption     | Not present by default. The <b>encrypted</b> keyword is used to specify that the passwords are message digest algorithm 5 (MD5) digests and not text passwords. |
| Passwords      | Assumed to be text strings.                                                                                                                                     |
| Remote users   | All users are assumed to be local to this SNMP engine unless you specify they are remote with the <b>remote</b> keyword.                                        |

SNMP passwords are localized using the SNMP engine ID of the authoritative SNMP engine. For informs, the authoritative SNMP agent is the remote agent. You need to configure the remote agent's SNMP engine ID in the SNMP database before you can send proxy requests or informs to it.

**Note**

Changing the engine ID after configuring the SNMP user, does not allow to remove the user. To remove the user, you need to first reconfigure the SNMP user.

**Working with Passwords and Digests**

No default values exist for authentication or privacy algorithms when you configure the command. Also, no default passwords exist. The minimum length for a password is one character, although Cisco recommends using at least eight characters for security. The recommended maximum length of a password is 64 characters. If you forget a password, you cannot recover it and will need to reconfigure the user. You can specify either a plain-text password or a localized MD5 digest.

If you have the localized MD5 or Secure Hash Algorithm (SHA) digest, you can specify that string instead of the plain-text password. The digest should be formatted as aa:bb:cc:dd where aa, bb, and cc are hexadecimal values. Also, the digest should be exactly 16 octets long.

**Examples**

The following example shows how to add the user abcd to the SNMP server group named public. In this example, no access list is specified for the user, so the standard named access list applied to the group applies to the user.

```
Device(config)# snmp-server user abcd public v2c
```

The following example shows how to add the user abcd to the SNMP server group named public. In this example, access rules from the standard named access list qrst apply to the user.

```
Device(config)# snmp-server user abcd public v2c access qrst
```

In the following example, the plain-text password cisco123 is configured for the user abcd in the SNMP server group named public:

```
Device(config)# snmp-server user abcd public v3 auth md5 cisco123
```

When you enter a **show running-config** command, a line for this user will be displayed. To learn if this user has been added to the configuration, use the **show snmp user** command.

**Note** The **show running-config** command does not display any of the active SNMP users created in **authPriv** or **authNoPriv** mode, though it does display the users created in **noAuthNoPriv** mode. To display any active SNMPv3 users created in **authPriv**, **authNoPriv**, or **noAuthNoPriv** mode, use the **show snmp user** command.

If you have the localized MD5 or SHA digest, you can specify that string instead of the plain-text password. The digest should be formatted as **aa:bb:cc:dd** where **aa**, **bb**, and **cc** are hexadecimal values. Also, the digest should be exactly 16 octets long.

In the following example, the MD5 digest string is used instead of the plain-text password:

```
Device(config)# snmp-server user abcd public v3 encrypted auth md5
00:11:22:33:44:55:66:77:88:99:AA:BB:CC:DD:EE:FF
```

In the following example, the user **abcd** is removed from the SNMP server group named **public**:

```
Device(config)# no snmp-server user abcd public v2c
```

In the following example, the user **abcd** from the SNMP server group named **public** specifies the use of the 168-bit 3DES algorithm for privacy encryption with **secure3des** as the password.

```
Device(config)# snmp-server user abcd public priv v2c 3des secure3des
```

| Command                     | Description                                                                                                                                |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show running-config</b>  | Displays the contents of the currently running configuration file or the configuration for a specific interface, or map class information. |
| <b>show snmp user</b>       | Displays information on each SNMP username in the group username table.                                                                    |
| <b>snmp-server engineID</b> | Displays the identification of the local SNMP engine and all remote engines that have been configured on the device.                       |

## snmp-server view

To create or update a view entry, use the **snmp-server view** command in global configuration mode. To remove the specified Simple Network Management Protocol (SNMP) server view entry, use the **no** form of this command.

**snmp-server view** *view-name oid-tree* {**included** | **excluded**}  
**no snmp-server view** *view-name*

### Syntax Description

|                  |                                                                                                                                                                                                                                                                                                                      |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>view-name</i> | Label for the view record that you are updating or creating. The name is used to reference the record.                                                                                                                                                                                                               |
| <i>oid-tree</i>  | Object identifier of the ASN.1 subtree to be included or excluded from the view. To identify the subtree, specify a text string consisting of numbers, such as 1.3.6.2.4, or a word, such as system. Replace a single subidentifier with the asterisk (*) wildcard to specify a subtree family; for example 1.3.*.4. |
| <b>included</b>  | Configures the OID (and subtree OIDs) specified in <i>oid-tree</i> argument to be included in the SNMP view.                                                                                                                                                                                                         |
| <b>excluded</b>  | Configures the OID (and subtree OIDs) specified in <i>oid-tree</i> argument to be explicitly excluded from the SNMP view.                                                                                                                                                                                            |

### Command Default

No view entry exists.

### Command Modes

Global configuration

### Command History

| Release                   | Modification                 |
|---------------------------|------------------------------|
| Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

### Usage Guidelines

Other SNMP commands require an SMP view as an argument. You use this command to create a view to be used as arguments for other commands.

Two standard predefined views can be used when a view is required, instead of defining a view. One is *everything*, which indicates that the user can see all objects. The other is *restricted*, which indicates that the user can see three groups: system, snmpStats, and snmpParties. The predefined views are described in RFC 1447.

The first **snmp-server** command that you enter enables SNMP on your routing device.

### Examples

The following example creates a view that includes all objects in the MIB-II subtree:

```
snmp-server view mib2 mib-2 included
```

The following example creates a view that includes all objects in the MIB-II system group and all objects in the Cisco enterprise MIB:

```
snmp-server view root_view system included
snmp-server view root_view cisco included
```

The following example creates a view that includes all objects in the MIB-II system group except for sysServices (System 7) and all objects for interface 1 in the MIB-II interfaces group:

```
snmp-server view agon system included
snmp-server view agon system.7 excluded
snmp-server view agon ifEntry.*.1 included
```

In the following example, the USM, VACM, and Community MIBs are explicitly included in the view “test” with all other MIBs under the root parent “internet”:

```
! -- include all MIBs under the parent tree "internet"
snmp-server view test internet included
! -- include snmpUsmMIB
snmp-server view test 1.3.6.1.6.3.15 included
! -- include snmpVacmMIB
snmp-server view test 1.3.6.1.6.3.16 included
! -- exclude snmpCommunityMIB
snmp-server view test 1.3.6.1.6.3.18 excluded
```

**Related Commands**

| Command                      | Description                                                                |
|------------------------------|----------------------------------------------------------------------------|
| <b>snmp-server community</b> | Sets up the community access string to permit access to the SNMP protocol. |
| <b>snmp-server manager</b>   | Starts the SNMP manager process.                                           |

## source

To configure the source IP address interface for all of the packets sent by a Flexible Netflow flow exporter, use the **source** command in flow exporter configuration mode. To remove the source IP address interface for all of the packets sent by a Flexible Netflow flow exporter, use the **no** form of this command.

**source** *interface-type interface-number*

**no source**

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                       |

|                    | Cisco IOS XE Everest 16.5.1a This command was introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                       |
| Usage Guidelines   | <p>The benefits of using a consistent IP source address for the datagrams that Flexible Netflow sends include the following:</p> <ul style="list-style-type: none"><li>• The source IP address of the datagrams exported by Flexible Netflow is used by the destination system to determine from which device the Flexible Netflow data is arriving. If your network has two or more paths that can be used to send Flexible Netflow datagrams from the device to the destination system and you do not specify the source interface from which the source IP address is to be obtained, the device uses the IP address of the interface over which the datagram is transmitted as the source IP address of the datagram. In this situation the destination system might receive Flexible Netflow datagrams from the same device , but with different source IP addresses. When the destination system receives Flexible Netflow datagrams from the same device with different source IP addresses, the destination system treats the Flexible Netflow datagrams as if they were being sent from different devices . To avoid having the destination system treat the Flexible Netflow datagrams as if they were being sent from different devices, you must configure the destination system to aggregate the Flexible Netflow datagrams it receives from all of the possible source IP addresses in the device into a single Flexible Netflow flow.</li><li>• If your device has multiple interfaces that can be used to transmit datagrams to the destination system, and you do not configure the <b>source</b> command, you will have to add an entry for the IP address of each interface into any access lists that you create for permitting Flexible Netflow traffic. Creating and maintaining access lists for permitting Flexible Netflow traffic from known sources and blocking it from unknown sources is easier when you limit the source IP address for Flexible Netflow datagrams to a single IP address for each device that is exporting Flexible Netflow traffic.</li></ul> |                                                                                                                                       |

**Caution**

The interface that you configure as the **source** interface must have an IP address configured, and it must be up.

**Tip**

When a transient outage occurs on the interface that you configured with the **source** command, the Flexible Netflow exporter reverts to the default behavior of using the IP address of the interface over which the datagrams are being transmitted as the source IP address for the datagrams. To avoid this problem, use a loopback interface as the source interface because loopback interfaces are not subject to the transient outages that can occur on physical interfaces.

To return this command to its default settings, use the **no source** or **default source** flow exporter configuration command.

**Examples**

The following example shows how to configure Flexible Netflow to use a loopback interface as the source interface for NetFlow traffic:

```
Device(config)# flow exporter FLOW-EXPORTER-1  
Device(config-flow-exporter)# source loopback 0
```

## source (ERSPAN)

To configure the Encapsulated Remote Switched Port Analyzer (ERSPAN) source interface or VLAN, and the traffic direction to be monitored, use the **source** command in ERSPAN monitor source session configuration mode. To disable the configuration, use the **no** form of this command.

**source** *{interface type number | vlan vlan-ID}* [{, | - | **both** | **rx** | **tx**}

### Syntax Description

|                                     |                                                                                          |
|-------------------------------------|------------------------------------------------------------------------------------------|
| <b>interface</b> <i>type number</i> | Specifies an interface type and number.                                                  |
| <b>vlan</b> <i>vlan-ID</i>          | Associates the ERSPAN source session number with VLANs. Valid values are from 1 to 4094. |
| ,                                   | (Optional) Specifies another interface.                                                  |
| -                                   | (Optional) Specifies a range of interfaces.                                              |
| <b>both</b>                         | (Optional) Monitors both received and transmitted ERSPAN traffic.                        |
| <b>rx</b>                           | (Optional) Monitors only received traffic.                                               |
| <b>tx</b>                           | (Optional) Monitors only transmitted traffic.                                            |

### Command Default

Source interface or VLAN is not configured.

### Command Modes

ERSPAN monitor source session configuration mode (config-mon-erspan-src)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

You cannot include source VLANs and filter VLANs in the same session.

### Examples

The following example shows how to configure ERSPAN source session properties:

```
Device(config)# monitor session 2 type erspan-source
Device(config-mon-erspan-src)# source interface fastethernet 0/1 rx
```

|-----------------------------|----------------------------------------------------------|
| <b>monitor session type</b> | Configures a local ERSPAN source or destination session. |

# socket

To specify the client socket and allow a TCL interpreter to connect via TCP over IPv4/IPv6 and open a TCP network connection use the **socket** comand in the TCL configuration mode.

**socket myaddr address myport port myvrf vrf-table-name host port**

| Syntax Description            | <div> <b>myaddr</b> Specifies domain name or numerical IP address of the client-side network interface required for the connection. Use this option especially if the client machine has multiple network interfaces. </div> <div> <b>myport</b> Specifies port number that is required for the client's connection. </div> <div> <b>myvrf</b> Specifies the vrf table name. If the vrf table is not configured, then the command will return a TCL_ERROR. </div> |         |              |                               |                                          |

# stealthwatch-cloud-monitor

To configure the Stealthwatch Cloud monitor, use the **stealthwatch-cloud-monitor** command in global configuration mode.

## stealthwatch-cloud-monitor

**Command Default** Stealthwatch Cloud is not configured.

**Command Modes** Global configuration (config)

| Command History | Release                       | Modification                 |
|-----------------|-------------------------------|------------------------------|
|                 | Cisco IOS XE Bengaluru 17.5.1 | This command was introduced. |

**Usage Guidelines** Before configuring Stealthwatch Cloud monitor on a device, the following root certificates must be installed:

- Starfield Services Root certificate from <https://www.amazontrust.com/repository/%20SFC2CA-SFSRootCAG2.pem>
- Baltimore CyberTrust Root PEM certificate from <https://www.digicert.com/kb/digicert-root-certificates.htm>

After configuring Stealthwatch Cloud monitor on a device, configure the service key using the **service-key** *SwC-service-key* command.

## Examples

The following example shows how to configure a Stealthwatch Cloud monitor:

```
Device> enable
Device# configure terminal
Device(config)# stealthwatch-cloud-monitor
Device(config-stealthwatch-cloud-monitor)#
```

|                           | Cisco IOS XE Everest 16.5.1a                                                                                | This command was introduced. |

## Examples

This example shows how to set a single-VLAN interface

```
Device(config-template)# switchport mode access
```

# switchport voice vlan

To specify to forward all voice traffic through the specified VLAN, use the **switchport voice vlan** command in template configuration mode. Use the **no** form of this command to return to the default setting.

**switchport voice vlan***vlan\_id*  
**no switchport voice vlan**

|                           |                                                                                                                |
|---------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>switchport voice vlan</b> <i>vlan_id</i> Specifies to forward all voice traffic through the specified VLAN. |
|---------------------------|----------------------------------------------------------------------------------------------------------------|

|                        |                                         |
|------------------------|-----------------------------------------|
| <b>Command Default</b> | You can specify a value from 1 to 4094. |
|------------------------|-----------------------------------------|

|                      |                        |

|-----------------|-------------------------------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

|                 |                                                                                            |
|-----------------|--------------------------------------------------------------------------------------------|
| <b>Examples</b> | This example shows how to specify to forward all voice traffic through the specified VLAN. |
|-----------------|--------------------------------------------------------------------------------------------|

```
Device(config-template)# switchport voice vlan 20
```

# ttn

To configure the time-to-live (TTL) value, use the **ttn** command in flow exporter configuration mode. To remove the TTL value, use the **no** form of this command.

```
ttn ttl
no ttn ttl
```

| Syntax Description           | ttn Time-to-live (TTL) value for exported datagrams. The range is 1 to 255. The default is 255.                                                                                                                                                                                           |         |              |                              |                              |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|------------------------------|
| Command Default              | Flow exporters use a TTL of 255.                                                                                                                                                                                                                                                          |         |              |                              |                              |
| Command Modes                | Flow exporter configuration                                                                                                                                                                                                                                                               |         |              |                              |                              |

# transport

To configure the transport protocol for a flow exporter for Flexible Netflow, use the **transport** command in flow exporter configuration mode. To remove the transport protocol for a flow exporter, use the **no** form of this command.

**transport udp** *udp-port*  
**no transport udp** *udp-port*

|                    |                                                                                                                                              |                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| Syntax Description | <b>udp</b> <i>udp-port</i> Specifies User Datagram Protocol (UDP) as the transport protocol and the UDP port number.                         |                              |
| Command Default    | Flow exporters use UDP on port 9995.                                                                                                         |                              |
| Command Modes      | Flow exporter configuration                                                                                                                  |                              |
| Command History    | Release                                                                                                                                      | Modification                 |
|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                 | This command was introduced. |
| Usage Guidelines   | To return this command to its default settings, use the <b>no transport</b> or <b>default transport flow exporter</b> configuration command. |                              |

The following example configures UDP as the transport protocol and a UDP port number of 250:

```
Device(config)# flow exporter FLOW-EXPORTER-1  
Device(config-flow-exporter)# transport udp 250
```

# template data timeout

To specify a timeout period for resending flow exporter template data, use the **template data timeout** command in flow exporter configuration mode. To remove the template resend timeout for a flow exporter, use the **no** form of this command.

**template data timeout** *seconds*  
**no template data timeout** *seconds*

| <b>Syntax Description</b>    | <i>seconds</i> Timeout value in seconds. The range is 1 to 86400. The default is 600.                                                                                                                                                                                                                                                                                                                     |         |              |                              |                              |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|------------------------------|
| <b>Command Default</b>       | The default template resend timeout for a flow exporter is 600 seconds.                                                                                                                                                                                                                                                                                                                                   |         |              |                              |                              |
| <b>Command Modes</b>         | Flow exporter configuration                                                                                                                                                                                                                                                                                                                                                                               |         |              |                              |                              |
| <b>Command History</b>       | <table><tr><th>Release</th><th>Modification</th></tr><tr><td>Cisco IOS XE Everest 16.5.1a</td><td>This command was introduced.</td></tr></table>                                                                                                                                                                                                                                                          | Release | Modification | Cisco IOS XE Everest 16.5.1a | This command was introduced. |
| Release                      | Modification                                                                                                                                                                                                                                                                                                                                                                                              |         |              |                              |                              |
| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                              |         |              |                              |                              |
| <b>Usage Guidelines</b>      | <p>Flow exporter template data describes the exported data records. Data records cannot be decoded without the corresponding template. The <b>template data timeout</b> command controls how often those templates are exported.</p> <p>To return this command to its default settings, use the <b>no template data timeout</b> or <b>default template data timeout</b> flow record exporter command.</p> |         |              |                              |                              |

The following example configures resending templates based on a timeout of 1000 seconds:

```
Device(config)# flow exporter FLOW-EXPORTER-1
Device(config-flow-exporter)# template data timeout 1000
```

# udp peek

To enable peeking into a UDP socket use the **udp\_peek** command in the TCL configuration mode.

**udp\_peek** *socket* **buffersize** *buffer-size*

| <b>Syntax Description</b> | <i>SwC-server-url</i>                                                                                                                                                                                                                                                                                                                                                                                                                         | Stealthwatch Cloud server URL. |
| <b>Command Default</b>    | The URL of the Stealthwatch Cloud server located in the U.S is configured.                                                                                                                                                                                                                                                                                                                                                                    |                                |
| <b>Command Modes</b>      | stealthwatch-cloud-monitor (stealthwatch-cloud-monitor)                                                                                                                                                                                                                                                                                                                                                                                       |                                |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>Modification</b>            |
|                           | Cisco IOS XE Bengaluru 17.5.1                                                                                                                                                                                                                                                                                                                                                                                                                 | This command was introduced.   |
| <b>Usage Guidelines</b>   | <p>Configuring the Stealthwatch Cloud URL is optional. Configure the <b>stealthwatch-cloud-monitor</b> and the <b>service-key</b> <i>SwC-service-key</i> commands before setting the Stealthwatch Cloud URL.</p> <p>If no URL is configured, by default, the URL of the Stealthwatch Cloud server, located in the U.S, is configured. Based on your location, the default URL redirects you to the nearest Stealthwatch Cloud server URL.</p> |                                |

**Note** All encrypted traffic must use HTTPS (TCP port 443) to reach the Stealthwatch Cloud portal.

### Examples

The following example shows how to configure the URL of a Stealthwatch Cloud server:

```
Device> enable
Device# configure terminal
Device(config)# stealthwatch-cloud-monitor
Device(config-stealthwatch-cloud-monitor)# service-key xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
Device(config-stealthwatch-cloud-monitor)# url https://sensors.eu-2.obsrvbl.com
```

|                         |                                           |                                                                                |
|-------------------------|-------------------------------------------|--------------------------------------------------------------------------------|
| <b>Related Commands</b> | <b>Command</b>                            | <b>Description</b>                                                             |
|                         | <b>sensor-name</b> <i>SwC-sensor-name</i> | Sets the sensor name for the Stealthwatch Cloud registration.                  |
|                         | <b>service-key</b> <i>SwC-service-key</i> | Configures the Stealthwatch Cloud service key.                                 |
|                         | <b>show stealth-watch-cloud detail</b>    | Displays the Stealthwatch Cloud registration status and its configured values. |
|                         | <b>stealthwatch-cloud-monitor</b>         | Configures the Stealthwatch Cloud monitor.                                     |

# auto qos classify

To automatically configure quality of service (QoS) classification for untrusted devices within a QoS domain, use the **auto qos classify** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

**auto qos classify** [**police**]  
**no auto qos classify** [**police**]

| <b>Syntax Description</b>    | <b>police</b> (Optional) Configure QoS policing for untrusted devices.                                                                                |         |              |                              |                              |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|------------------------------|
| <b>Command Default</b>       | Auto-QoS classify is disabled on the port.                                                                                                            |         |              |                              |                              |
| <b>Command Modes</b>         | Interface configuration                                                                                                                               |         |              |                              |                              |
| <b>Command History</b>       | <table> <tr> <th>Release</th><th>Modification</th></tr> <tr> <td>Cisco IOS XE Everest 16.5.1a</td><td>This command was introduced.</td></tr> </table> | Release | Modification | Cisco IOS XE Everest 16.5.1a | This command was introduced. |
| Release                      | Modification                                                                                                                                          |         |              |                              |                              |
| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                          |         |              |                              |                              |

**Usage Guidelines**

Use this command to configure the QoS for trusted interfaces within the QoS domain. The QoS domain includes the device, the network interior, and edge devices that can classify incoming traffic for QoS.

When auto-QoS is enabled, it uses the ingress packet label to categorize traffic, to assign packet labels, and to configure the ingress and egress queues.

Auto-QoS configures the device for connectivity with a trusted interface. The QoS labels of incoming packets are trusted. For nonrouted ports, the CoS value of the incoming packets is trusted. For routed ports, the DSCP value of the incoming packet is trusted.

To take advantage of the auto-QoS defaults, you should enable auto-QoS before you configure other QoS commands. You can fine-tune the auto-QoS configuration *after* you enable auto-QoS.

**Note** The device applies the auto-QoS-generated commands as if the commands were entered from the command-line interface (CLI). An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the device without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored.

After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes *AutoQoS* in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the **debug auto qos** privileged EXEC command to enable auto-QoS debugging.

The following policy maps and class maps are created and applied when running the **auto qos classify** and **auto qos classify police** commands:

Policy maps (For the **auto qos classify police** command):

- AutoQos-4.0-Classify-Police-Input-Policy
- AutoQos-4.0-Output-Policy

Class maps:

- AutoQos-4.0-Multimedia-Conf-Class (match-any)
- AutoQos-4.0-Bulk-Data-Class (match-any)
- AutoQos-4.0-Transaction-Class (match-any)
- AutoQos-4.0-Scavenger-Class (match-any)
- AutoQos-4.0-Signaling-Class (match-any)
- AutoQos-4.0-Default-Class (match-any)
- class-default (match-any)
- AutoQos-4.0-Output-Priority-Queue (match-any)
- AutoQos-4.0-Output-Control-Mgmt-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Conf-Queue (match-any)
- AutoQos-4.0-Output-Trans-Data-Queue (match-any)
- AutoQos-4.0-Output-Bulk-Data-Queue (match-any)
- AutoQos-4.0-Output-Scavenger-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Strm-Queue (match-any)

To disable auto-QoS on a port, use the **no auto qos classify** interface configuration command. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the **no auto qos classify** command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration).

## Examples

This example shows how to enable auto-QoS classification of an untrusted device and police traffic:

You can verify your settings by entering the **show auto qos interface interface-id** privileged EXEC command.

# auto qos trust

To automatically configure quality of service (QoS) for trusted interfaces within a QoS domain, use the **auto qos trust** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

```
auto qos trust {cos | dscp}
no auto qos trust {cos | dscp}
```

## Syntax Description

**cos** Trusts the CoS packet classification.

**dscp** Trusts the DSCP packet classification.

## Command Default

Auto-QoS trust is disabled on the port.

## Command Modes

Interface configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use this command to configure the QoS for trusted interfaces within the QoS domain. The QoS domain includes the device, the network interior, and edge devices that can classify incoming traffic for QoS. When auto-QoS is enabled, it uses the ingress packet label to categorize traffic, to assign packet labels, and to configure the ingress and egress queues.

**Table 123: Traffic Types, Packet Labels, and Queues**

|                   | VOIP Data Traffic | VOIP Control Traffic | Routing Protocol Traffic | STP <sup>3</sup> BPDU <sup>4</sup> Traffic | Real-Time Video Traffic | All Other Traffic |
|-------------------|-------------------|----------------------|--------------------------|--------------------------------------------|-------------------------|-------------------|
| DSCP <sup>5</sup> | 46                | 24, 26               | 48                       | 56                                         | 34                      | —                 |
| CoS <sup>6</sup>  | 5                 | 3                    | 6                        | 7                                          | 3                       | —                 |

<sup>3</sup> STP = Spanning Tree Protocol

<sup>4</sup> BPDU = bridge protocol data unit

<sup>5</sup> DSCP = Differentiated Services Code Point

<sup>6</sup> CoS = class of service

**Note** The device applies the auto-QoS-generated commands as if the commands were entered from the command-line interface (CLI). An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the device without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored.

After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes *AutoQoS* in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the **debug auto qos** privileged EXEC command to enable auto-QoS debugging.

The following policy maps and class maps are created and applied when running the **auto qos trust cos** command.

Policy maps:

- AutoQos-4.0-Trust-Cos-Input-Policy
- AutoQos-4.0-Output-Policy

Class maps:

- class-default (match-any)
- AutoQos-4.0-Output-Priority-Queue (match-any)
- AutoQos-4.0-Output-Control-Mgmt-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Conf-Queue (match-any)
- AutoQos-4.0-Output-Trans-Data-Queue (match-any)
- AutoQos-4.0-Output-Bulk-Data-Queue (match-any)
- AutoQos-4.0-Output-Scavenger-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Strm-Queue (match-any)

The following policy maps and class maps are created and applied when running the **auto qos trust dscp** command:

Policy maps:

- AutoQos-4.0-Trust-Dscp-Input-Policy
- AutoQos-4.0-Output-Policy

Class maps:

- class-default (match-any)

- AutoQos-4.0-Output-Priority-Queue (match-any)
- AutoQos-4.0-Output-Control-Mgmt-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Conf-Queue (match-any)
- AutoQos-4.0-Output-Trans-Data-Queue (match-any)
- AutoQos-4.0-Output-Bulk-Data-Queue (match-any)
- AutoQos-4.0-Output-Scavenger-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Strm-Queue (match-any)

To disable auto-QoS on a port, use the **no auto qos trust** interface configuration command. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the **no auto qos trust** command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration).

## Examples

This example shows how to enable auto-QoS for a trusted interface with specific CoS classification.

```
Device(config)# interface gigabitethernet1/0/17
Device(config-if)# auto qos trust cos
Device(config-if)# end
Device# show policy-map interface gigabitethernet1/0/17
```

```

You can verify your settings by entering the **show auto qos interface *interface-id*** privileged EXEC command.

## auto qos video

To automatically configure quality of service (QoS) for video within a QoS domain, use the **auto qos video** command in interface configuration mode. Use the **no** form of this command to return to the default setting.

```
auto qos video { cts | ip-camera | media-player }
no auto qos video { cts | ip-camera | media-player }
```

|                           |                     |                                                                                                                    |
|---------------------------|---------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>cts</b>          | Specifies a port connected to a Cisco TelePresence System and automatically configures QoS for video.              |
|                           | <b>ip-camera</b>    | Specifies a port connected to a Cisco IP camera and automatically configures QoS for video.                        |
|                           | <b>media-player</b> | Specifies a port connected to a CDP-capable Cisco digital media player and automatically configures QoS for video. |

**Command Default** Auto-QoS video is disabled on the port.

**Command Modes** Interface configuration

| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|------------------------|------------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Use this command to configure the QoS appropriate for video traffic within the QoS domain. The QoS domain includes the device, the network interior, and edge devices that can classify incoming traffic for QoS. When auto-QoS is enabled, it uses the ingress packet label to categorize traffic, to assign packet labels, and to configure the ingress and egress queues. For more information, see the queue tables at the end of this section.

Auto-QoS configures the device for video connectivity to a Cisco TelePresence system, a Cisco IP camera, or a Cisco digital media player.

To take advantage of the auto-QoS defaults, you should enable auto-QoS before you configure other QoS commands. You can fine-tune the auto-QoS configuration *after* you enable auto-QoS.

The device applies the auto-QoS-generated commands as if the commands were entered from the command-line interface (CLI). An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the device without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored.

If this is the first port on which you have enabled auto-QoS, the auto-QoS-generated global configuration commands are executed followed by the interface configuration commands. If you enable auto-QoS on another port, only the auto-QoS-generated interface configuration commands for that port are executed.

After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes *AutoQoS* in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy

map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the **debug auto qos** privileged EXEC command to enable auto-QoS debugging.

The following policy maps and class maps are created and applied when running the **auto qos video cts** command:

Policy maps:

- AutoQos-4.0-Trust-Cos-Input-Policy
- AutoQos-4.0-Output-Policy

Class maps

- class-default (match-any)
- AutoQos-4.0-Output-Priority-Queue (match-any)
- AutoQos-4.0-Output-Control-Mgmt-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Conf-Queue (match-any)
- AutoQos-4.0-Output-Trans-Data-Queue (match-any)
- AutoQos-4.0-Output-Bulk-Data-Queue (match-any)
- AutoQos-4.0-Output-Scavenger-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Strm-Queue (match-any)

The following policy maps and class maps are created and applied when running the **auto qos video ip-camera** command:

Policy maps:

- AutoQos-4.0-Trust-Dscp-Input-Policy
- AutoQos-4.0-Output-Policy

Class maps:

- class-default (match-any)
- AutoQos-4.0-Output-Priority-Queue (match-any)
- AutoQos-4.0-Output-Control-Mgmt-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Conf-Queue (match-any)
- AutoQos-4.0-Output-Trans-Data-Queue (match-any)
- AutoQos-4.0-Output-Bulk-Data-Queue (match-any)
- AutoQos-4.0-Output-Scavenger-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Strm-Queue (match-any)

The following policy maps and class maps are created and applied when running the **auto qos video media-player** command:

Policy maps:

- AutoQos-4.0-Trust-Dscp-Input-Policy
- AutoQos-4.0-Output-Policy

Class maps:

- class-default (match-any)
- AutoQos-4.0-Output-Priority-Queue (match-any)
- AutoQos-4.0-Output-Control-Mgmt-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Conf-Queue (match-any)
- AutoQos-4.0-Output-Trans-Data-Queue (match-any)
- AutoQos-4.0-Output-Bulk-Data-Queue (match-any)
- AutoQos-4.0-Output-Scavenger-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Strm-Queue (match-any)

To disable auto-QoS on a port, use the **no auto qos video** interface configuration command. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled, and you enter the **no auto qos video** command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration).

**Table 124: Traffic Types, Packet Labels, and Queues**

|                   | VOIP Data Traffic | VOIP Control Traffic | Routing Protocol Traffic | STP <sup>7</sup> BPDUs <sup>8</sup> Traffic | Real-Time Video Traffic | All Other Traffic |
|-------------------|-------------------|----------------------|--------------------------|---------------------------------------------|-------------------------|-------------------|
| DSCP <sup>9</sup> | 46                | 24, 26               | 48                       | 56                                          | 34                      | —                 |
| CoS <sup>10</sup> | 5                 | 3                    | 6                        | 7                                           | 3                       | —                 |

<sup>7</sup> STP = Spanning Tree Protocol

<sup>8</sup> BPDUs = bridge protocol data unit

<sup>9</sup> DSCP = Differentiated Services Code Point

<sup>10</sup> CoS = class of service

## Examples

The following is an example of the **auto qos video cts** command and the applied policies and class maps:

```
Device(config)# interface gigabitethernet1/0/12
Device(config-if)# auto qos video cts
Device(config-if)# end
Device# show policy-map interface gigabitethernet1/0/12
Gigabitethernet1/0/12
```

Service-policy input: AutoQos-4.0-Trust-Cos-Input-Policy

```

You can verify your settings by entering the **show auto qos video interface *interface-id*** privileged EXEC command.

## auto qos voip

To automatically configure quality of service (QoS) for voice over IP (VoIP) within a QoS domain, use the **auto qos voip** command in interface configuration mode. Use the **no** form of this command to return to the default setting.

```
auto qos voip {cisco-phone | cisco-softphone | trust}
no auto qos voip {cisco-phone | cisco-softphone | trust}
```

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                      |

| Syntax Description | <b>cisco-phone</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Specifies a port connected to a Cisco IP phone, and automatically configures QoS for VoIP. The QoS labels of incoming packets are trusted only when the telephone is detected.                                                                                                       |
|                    | <b>cisco-softphone</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Specifies a port connected to a device running the Cisco SoftPhone, and automatically configures QoS for VoIP.                                                                                                                                                                       |
|                    | <b>trust</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Specifies a port connected to a trusted device, and automatically configures QoS for VoIP. The QoS labels of incoming packets are trusted. For nonrouted ports, the CoS value of the incoming packet is trusted. For routed ports, the DSCP value of the incoming packet is trusted. |
| Command Default    | Auto-QoS is disabled on the port.<br><br>When auto-QoS is enabled, it uses the ingress packet label to categorize traffic, to assign packet labels, and to configure the ingress and egress queues.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                      |
| Command Default    | Interface configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                      |
| Command History    | <b>Release</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>Modification</b>                                                                                                                                                                                                                                                                  |
|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | This command was introduced.                                                                                                                                                                                                                                                         |
| Usage Guidelines   | <p>Use this command to configure the QoS appropriate for VoIP traffic within the QoS domain. The QoS domain includes the device, the network interior, and edge devices that can classify incoming traffic for QoS.</p> <p>Auto-QoS configures the device for VoIP with Cisco IP phones on device and routed ports and for devices running the Cisco SoftPhone application. These releases support only Cisco IP SoftPhone Version 1.3(3) or later. Connected devices must use Cisco Call Manager Version 4 or later.</p> <p>To take advantage of the auto-QoS defaults, you should enable auto-QoS before you configure other QoS commands. You can fine-tune the auto-QoS configuration <i>after</i> you enable auto-QoS.</p> |                                                                                                                                                                                                                                                                                      |

**Note**

The device applies the auto-QoS-generated commands as if the commands were entered from the command-line interface (CLI). An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the device without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored.

If this is the first port on which you have enabled auto-QoS, the auto-QoS-generated global configuration commands are executed followed by the interface configuration commands. If you enable auto-QoS on another port, only the auto-QoS-generated interface configuration commands for that port are executed.

When you enter the **auto qos voip cisco-phone** interface configuration command on a port at the edge of the network that is connected to a Cisco IP phone, the device enables the trusted boundary feature. The device uses the Cisco Discovery Protocol (CDP) to detect the presence of a Cisco IP phone. When a Cisco IP phone is detected, the ingress classification on the port is set to trust the QoS label received in the packet. The device also uses policing to determine whether a packet is in or out of profile and to specify the action on the packet. If the packet does not have a DSCP value of 24, 26, or 46 or is out of profile, the device changes the DSCP value to 0. When a Cisco IP phone is absent, the ingress classification is set to not trust the QoS label in the packet. The policing is applied to those traffic matching the policy-map classification before the device enables the trust boundary feature.

- When you enter the **auto qos voip cisco-softphone** interface configuration command on a port at the edge of the network that is connected to a device running the Cisco SoftPhone, the device uses policing to decide whether a packet is in or out of profile and to specify the action on the packet. If the packet does not have a DSCP value of 24, 26, or 46 or is out of profile, the device changes the DSCP value to 0.
- When you enter the **auto qos voip trust** interface configuration command on a port connected to the network interior, the device trusts the CoS value for nonrouted ports or the DSCP value for routed ports in ingress packets (the assumption is that traffic has already been classified by other edge devices).

You can enable auto-QoS on static, dynamic-access, and voice VLAN access, and trunk ports. When enabling auto-QoS with a Cisco IP phone on a routed port, you must assign a static IP address to the IP phone.

**Note**

When a device running Cisco SoftPhone is connected to a device or routed port, the device supports only one Cisco SoftPhone application per port.

After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes *AutoQoS* in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the **debug auto qos** privileged EXEC command to enable auto-QoS debugging.

The following policy maps and class maps are created and applied when running the **auto qos voip trust** command:

Policy maps:

- AutoQos-4.0-Trust-Cos-Input-Policy
- AutoQos-4.0-Output-Policy

Class maps:

- class-default (match-any)
- AutoQos-4.0-Output-Priority-Queue (match-any)
- AutoQos-4.0-Output-Control-Mgmt-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Conf-Queue (match-any)
- AutoQos-4.0-Output-Trans-Data-Queue (match-any)
- AutoQos-4.0-Output-Bulk-Data-Queue (match-any)
- AutoQos-4.0-Output-Scavenger-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Strm-Queue (match-any)

The following policy maps and class maps are created and applied when running the **auto qos voip cisco-softphone** command:

Policy maps:

- AutoQos-4.0-CiscoSoftPhone-Input-Policy
- AutoQos-4.0-Output-Policy

Class maps:

- AutoQos-4.0-Voip-Data-Class (match-any)
- AutoQos-4.0-Voip-Signal-Class (match-any)
- AutoQos-4.0-Multimedia-Conf-Class (match-any)
- AutoQos-4.0-Bulk-Data-Class (match-any)
- AutoQos-4.0-Transaction-Class (match-any)
- AutoQos-4.0-Scavenger-Class (match-any)
- AutoQos-4.0-Signaling-Class (match-any)
- AutoQos-4.0-Default-Class (match-any)
- class-default (match-any)
- AutoQos-4.0-Output-Priority-Queue (match-any)
- AutoQos-4.0-Output-Control-Mgmt-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Conf-Queue (match-any)
- AutoQos-4.0-Output-Trans-Data-Queue (match-any)
- AutoQos-4.0-Output-Bulk-Data-Queue (match-any)
- AutoQos-4.0-Output-Scavenger-Queue (match-any)

- AutoQos-4.0-Output-Multimedia-Strm-Queue (match-any)

The following policy maps and class maps are created and applied when running the **auto qos voip cisco-phone** command:

Policy maps:

- service-policy input AutoQos-4.0-CiscoPhone-Input-Policy
- service-policy output AutoQos-4.0-Output-Policy

Class maps:

- class AutoQos-4.0-Voip-Data-CiscoPhone-Class
- class AutoQos-4.0-Voip-Signal-CiscoPhone-Class
- class AutoQos-4.0-Default-Class

To disable auto-QoS on a port, use the **no auto qos voip** interface configuration command. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the **no auto qos voip** command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration).

The device configures egress queues on the port according to the settings in this table.

**Table 125: Auto-QoS Configuration for the Egress Queues**

| Egress Queue      | Queue Number | CoS-to-Queue Map | Queue Weight (Bandwidth) | Queue (Buffer) Size for Gigabit-Capable Ports | Queue (Buffer) Size for 10/100 Ethernet Ports |
|-------------------|--------------|------------------|--------------------------|-----------------------------------------------|-----------------------------------------------|
| Priority (shaped) | 1            | 4, 5             | Up to 100 percent        | 25 percent                                    | 15 percent                                    |
| SRR shared        | 2            | 2, 3, 6, 7       | 10 percent               | 25 percent                                    | 25 percent                                    |
| SRR shared        | 3            | 0                | 60 percent               | 25 percent                                    | 40 percent                                    |
| SRR shared        | 4            | 1                | 20 percent               | 25 percent                                    | 20 percent                                    |

## Examples

The following is an example of the **auto qos voip trust** command and the applied policies and class maps:

```
Device(config)# interface gigabitethernet1/0/31
Device(config-if)# auto qos voip trust
Device(config-if)# end
Device# show policy-map interface gigabitethernet1/0/31
```

**Gigabitethernet1/0/31**

```

You can verify your settings by entering the **show auto qos interface *interface-id*** privileged EXEC command.

# class

To define a traffic classification match criteria for the specified class-map name, use the **class** command in policy-map configuration mode. Use the **no** form of this command to delete an existing class map.

```
class {class-map-name | class-default}
no class {class-map-name | class-default}
```

## Syntax Description

**class-map-name** The class map name.

**class-default** Refers to a system default class that matches unclassified packets.

## Command Default

No policy map class-maps are defined.

## Command Modes

Policy-map configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Before using the **class** command, you must use the **policy-map** global configuration command to identify the policy map and enter policy-map configuration mode. After specifying a policy map, you can configure a policy for new classes or modify a policy for any existing classes in that policy map. You attach the policy map to a port by using the **service-policy** interface configuration command.

After entering the **class** command, you enter the policy-map class configuration mode. These configuration commands are available:

- **admit**—Admits a request for Call Admission Control (CAC)
- **bandwidth**—Specifies the bandwidth allocated to the class.
- **exit**—Exits the policy-map class configuration mode and returns to policy-map configuration mode.
- **no**—Returns a command to its default setting.
- **police**—Defines a policer or aggregate policer for the classified traffic. The policer specifies the bandwidth limitations and the action to take when the limits are exceeded. For more information about this command, see *Cisco IOS Quality of Service Solutions Command Reference* available on Cisco.com.
- **priority**—Assigns scheduling priority to a class of traffic belonging to a policy map.
- **queue-buffers**—Configures the queue buffer for the class.
- **queue-limit**—Specifies the maximum number of packets the queue can hold for a class policy configured in a policy map.
- **service-policy**—Configures a QoS service policy.
- **set**—Specifies a value to be assigned to the classified traffic. For more information, see the *set* command.
- **shape**—Specifies average or peak rate traffic shaping. For more information about this command, see *Cisco IOS Quality of Service Solutions Command Reference* available on Cisco.com.

To return to policy-map configuration mode, use the **exit** command. To return to privileged EXEC mode, use the **end** command.

The **class** command performs the same function as the **class-map** global configuration command. Use the **class** command when a new classification, which is not shared with any other ports, is needed. Use the **class-map** command when the map is shared among many ports.

You can configure a default class by using the **class class-default** policy-map configuration command. Unclassified traffic (traffic that does not meet the match criteria specified in the traffic classes) is treated as default traffic.

You can verify your settings by entering the **show policy-map** privileged EXEC command.

## Examples

This example shows how to create a policy map called policy1. When attached to the ingress direction, it matches all the incoming traffic defined in class1 and polices the traffic at an average rate of 1 Mb/s and bursts at 1000 bytes, marking down exceeding traffic via a table-map.

```
Device(config)# policy-map policy1
Device(config-pmap)# class class1
Device(config-pmap-c)# police cir 1000000 bc 1000 conform-action
transmit exceed-action set-dscp-transmit dscp table EXEC_TABLE
Device(config-pmap-c)# exit
```

This example shows how to configure a default traffic class to a policy map. It also shows how the default traffic class is automatically placed at the end of policy-map pm3 even though **class-default** was configured first:

```
Device# configure terminal
Device(config)# class-map cm-3
Device(config-cmap)# match ip dscp 30
Device(config-cmap)# exit

Device(config)# class-map cm-4
Device(config-cmap)# match ip dscp 40
Device(config-cmap)# exit

Device(config)# policy-map pm3
Device(config-pmap)# class class-default
Device(config-pmap-c)# set dscp 10
Device(config-pmap-c)# exit

Device(config-pmap)# class cm-3
Device(config-pmap-c)# set dscp 4
Device(config-pmap-c)# exit

Device(config-pmap)# class cm-4
Device(config-pmap-c)# set precedence 5
Device(config-pmap-c)# exit
Device(config-pmap)# exit

Device# show policy-map pm3
Policy Map pm3
  Class cm-3
    set dscp 4
  Class cm-4
    set precedence 5
  Class class-default
    set dscp af11
```

# class-map

To create a class map to be used for matching packets to the class whose name you specify and to enter class-map configuration mode, use the **class-map** command in global configuration mode. Use the **no** form of this command to delete an existing class map and to return to global or policy map configuration mode.

**class-map** *class-map name* {**match-any** | **match-all**}  
**no class-map** *class-map name* {**match-any** | **match-all**}

|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | This command was introduced.                                                                                           |
| <b>Usage Guidelines</b>   | Use this command to specify the name of the class for which you want to create or modify class-map match criteria and to enter class-map configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                        |
|                           | <p>The <b>class-map</b> command and its subcommands are used to define packet classification, marking, and aggregate policing as part of a globally named service policy applied on a per-port basis.</p> <p>After you are in quality of service (QoS) class-map configuration mode, these configuration commands are available:</p> <ul style="list-style-type: none"> <li>• <b>description</b>—Describes the class map (up to 200 characters). The <b>show class-map</b> privileged EXEC command displays the description and the name of the class map.</li> <li>• <b>exit</b>—Exits from QoS class-map configuration mode.</li> <li>• <b>match</b>—Configures classification criteria.</li> <li>• <b>no</b>—Removes a match statement from a class map.</li> </ul> <p>If you enter the <b>match-any</b> keyword, you can only use it to specify an extended named access control list (ACL) with the <b>match access-group</b> class-map configuration command.</p> <p>To define packet classification on a physical-port basis, only one <b>match</b> command per class map is supported. The ACL can have multiple access control entries (ACEs).</p> |                                                                                                                        |

**Note** You cannot configure IPv4 and IPv6 classification criteria simultaneously in the same class-map. However, they can be configured in different class-maps in the same policy.

## Examples

This example shows how to configure the class map called class1 with one match criterion, which is an access list called 103:

```
Device(config)# access-list 103 permit ip any any dscp 10
Device(config)# class-map class1
Device(config-cmap)# match access-group 103
Device(config-cmap)# exit
```

This example shows how to delete the class map class1:

```
Device(config)# no class-map class1
```

You can verify your settings by entering the **show class-map** privileged EXEC command.

# debug auto qos

To enable debugging of the automatic quality of service (auto-QoS) feature, use the **debug auto qos** command in privileged EXEC mode. Use the **no** form of this command to disable debugging.

**debug auto qos**  
**no debug auto qos**

|                      |                 |
|----------------------|-----------------|
| <b>Command Modes</b> | Privileged EXEC |
|----------------------|-----------------|

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                                                                             |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. You enable debugging by entering the <b>debug auto qos</b> privileged EXEC command. |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The **undebg auto qos** command is the same as the **no debug auto qos** command.

When you enable debugging on a device stack, it is enabled only on the active device. To enable debugging on a stack member, you can start a session from the active device by using the **session switch-number** privileged EXEC command. Then enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command stack-member-number LINE** privileged EXEC command on the active device to enable debugging on a member device without first starting a session.

## Examples

This example shows how to display the QoS configuration that is automatically generated when auto-QoS is enabled:

```
Device# debug auto qos
AutoQoS debugging is on
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# interface gigabitethernet 2/0/1
Device(config-if)# auto qos voip cisco-phone
```

# match (class-map configuration)

To define the match criteria to classify traffic, use the **match** command in class-map configuration mode. Use the **no** form of this command to remove the match criteria.

## Cisco IOS XE Everest 16.5.x and Earlier Releases

```
match {access-group {name acl-name acl-index} | class-map class-map-name | cos cos-value | dscp
dscp-value | [ip] dscp dscp-list | [ip] precedence ip-precedence-list | precedence
precedence-value1...value4 | qos-group qos-group-value | vlan vlan-id}
no match {access-group {name acl-name acl-index} | class-map class-map-name | cos cos-value | dscp
dscp-value | [ip] dscp dscp-list | [ip] precedence ip-precedence-list | precedence
precedence-value1...value4 | qos-group qos-group-value | vlan vlan-id}
```

## Cisco IOS XE Everest 16.6.x and Later Releases

```
match {access-group {name acl-name acl-index} | cos cos-value | dscp dscp-value | [ip] dscp dscp-list
| [ip] precedence ip-precedence-list | mpls experimental-value | non-client-nrt | precedence
precedence-value1...value4 | protocol protocol-name | qos-group qos-group-value | vlan vlan-id | wlan
wlan-id}
no match {access-group {name acl-name acl-index} | cos cos-value | dscp dscp-value | [ip] dscp
dscp-list | [ip] precedence ip-precedence-list | mpls experimental-value | non-client-nrt | precedence
precedence-value1...value4 | protocol protocol-name | qos-group qos-group-value | vlan vlan-id | wlan
wlan-id}
```

### Syntax Description

|                                        |                                                                                                                                                                                                                                               |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>access-group</b>                    | Specifies an access group.                                                                                                                                                                                                                    |
| <b>name</b> <i>acl-name</i>            | Specifies the name of an IP standard or extended access control list (ACL) or MAC ACL.                                                                                                                                                        |
| <i>acl-index</i>                       | Specifies the number of an IP standard or extended access control list (ACL) or MAC ACL. For an IP standard ACL, the ACL index range is 1 to 99 and 1300 to 1999. For an IP extended ACL, the ACL index range is 100 to 199 and 2000 to 2699. |
| <b>class-map</b> <i>class-map-name</i> | Uses a traffic class as a classification policy and specifies a traffic class name to use as the match criterion.                                                                                                                             |
| <b>cos</b> <i>cos-value</i>            | Matches a packet on the basis of a Layer 2 class of service (CoS)/Inter-Switch Link (ISL) marking. The cos-value is from 0 to 7. You can specify up to four CoS values in one <b>match cos</b> statement, separated by a space.               |
| <b>dscp</b> <i>dscp-value</i>          | Specifies the parameters for each DSCP value. You can specify a value in the range 0 to 63 specifying the differentiated services code point value.                                                                                           |

|                                                     |                                                                                                                                                                                                                                              |
|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip dscp</b> <i>dscp-list</i>                     | Specifies a list of up to eight IP Differentiated Services Code Point (DSCP) values to match against incoming packets. Separate each value with a space. The range is 0 to 63. You also can enter a mnemonic name for a commonly used value. |
| <b>ip precedence</b> <i>ip-precedence-list</i>      | Specifies a list of up to eight IP-precedence values to match against incoming packets. Separate each value with a space. The range is 0 to 7. You also can enter a mnemonic name for a commonly used value.                                 |
| <b>precedence</b> <i>precedence-value1...value4</i> | Assigns an IP precedence value to the classified traffic. The range is 0 to 7. You also can enter a mnemonic name for a commonly used value.                                                                                                 |
| <b>qos-group</b> <i>qos-group-value</i>             | Identifies a specific QoS group value as a match criterion. The range is 0 to 31.                                                                                                                                                            |
| <b>vlan</b> <i>vlan-id</i>                          | Identifies a specific VLAN as a match criterion. The range is 1 to 4094.                                                                                                                                                                     |
| <b>mpls</b> <i>experimental-value</i>               | Specifies Multi Protocol Label Switching specific values.                                                                                                                                                                                    |
| <b>non-client-nrt</b>                               | Matches a non-client NRT (non-real-time).                                                                                                                                                                                                    |
| <b>protocol</b> <i>protocol-name</i>                | Specifies the type of protocol.                                                                                                                                                                                                              |
| <b>wlan</b> <i>wlan-id</i>                          | Identifies 802.11 specific values.                                                                                                                                                                                                           |

**Command Default** No match criteria are defined.

**Command Modes** Class-map configuration

| Command History | Release                      | Modification                                                                                                                                                  |
|-----------------|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                  |
|                 | Cisco IOS XE Everest 16.6.1  | The <b>class-map</b> <i>class-map-name</i> keyword is removed.                                                                                                |
|                 |                              | The <b>mpls</b> <i>experimental-value</i> , <b>non-client-nrt</b> , <b>protocol</b> <i>protocol-name</i> , and <b>wlan</b> <i>wlan-id</i> keywords are added. |

**Usage Guidelines** The **match** command is used to specify which fields in the incoming packets are examined to classify the packets. Only the IP access group or the MAC access group matching to the Ether Type/Len are supported.

If you enter the **class-map match-any***class-map-name* global configuration command, you can enter the following **match** commands:

- **match access-group name** *acl-name*

---

**Note** The ACL must be an extended named ACL.

---

- **match ip dscp** *dscp-list*
- **match ip precedence** *ip-precedence-list*

The **match access-group** *acl-index* command is not supported.

To define packet classification on a physical-port basis, only one **match** command per class map is supported. In this situation, the **match-any** keyword is equivalent.

For the **match ip dscp** *dscp-list* or the **match ip precedence** *ip-precedence-list* command, you can enter a mnemonic name for a commonly used value. For example, you can enter the **match ip dscp af11** command, which is the same as entering the **match ip dscp 10** command. You can enter the **match ip precedence critical** command, which is the same as entering the **match ip precedence 5** command. For a list of supported mnemonics, enter the **match ip dscp ?** or the **match ip precedence ?** command to see the command-line help strings.

Use the **input-interface** *interface-id-list* keyword when you are configuring an interface-level class map in a hierarchical policy map. For the *interface-id-list*, you can specify up to six entries.

## Examples

This example shows how to create a class map called class2, which matches all the incoming traffic with DSCP values of 10, 11, and 12:

```
Device(config)# class-map class2
Device(config-cmap)# match ip dscp 10 11 12
Device(config-cmap)# exit
```

This example shows how to create a class map called class3, which matches all the incoming traffic with IP-precedence values of 5, 6, and 7:

```
Device(config)# class-map class3
Device(config-cmap)# match ip precedence 5 6 7
Device(config-cmap)# exit
```

This example shows how to delete the IP-precedence match criteria and to classify traffic using acl1:

```
Device(config)# class-map class2
Device(config-cmap)# match ip precedence 5 6 7
Device(config-cmap)# no match ip precedence
Device(config-cmap)# match access-group acl1
Device(config-cmap)# exit
```

This example shows how to specify a list of physical ports to which an interface-level class map in a hierarchical policy map applies:

```
Device(config)# class-map match-any class4
Device(config-cmap)# match cos 4
Device(config-cmap)# exit
```

This example shows how to specify a range of physical ports to which an interface-level class map in a hierarchical policy map applies:

```
Device(config)# class-map match-any class4  
Device(config-cmap)# match cos 4  
Device(config-cmap)# exit
```

You can verify your settings by entering the **show class-map** privileged EXEC command.

# policy-map

To create or modify a policy map that can be attached to multiple physical ports or switch virtual interfaces (SVIs) and to enter policy-map configuration mode, use the **policy-map** command in global configuration mode. Use the **no** form of this command to delete an existing policy map and to return to global configuration mode.

**policy-map** *policy-map-name*  
**no policy-map** *policy-map-name*

## Syntax Description

*policy-map-name* Name of the policy map.

## Command Default

No policy maps are defined.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

After entering the **policy-map** command, you enter policy-map configuration mode, and these configuration commands are available:

- **class**—Defines the classification match criteria for the specified class map.
- **description**—Describes the policy map (up to 200 characters).
- **exit**—Exits policy-map configuration mode and returns you to global configuration mode.
- **no**—Removes a previously defined policy map.
- **sequence-interval**—Enables sequence number capability.

To return to global configuration mode, use the **exit** command. To return to privileged EXEC mode, use the **end** command.

Before configuring policies for classes whose match criteria are defined in a class map, use the **policy-map** command to specify the name of the policy map to be created, added to, or modified. Entering the **policy-map** command also enables the policy-map configuration mode in which you can configure or modify the class policies for that policy map.

You can configure class policies in a policy map only if the classes have match criteria defined for them. To configure the match criteria for a class, use the **class-map** global configuration and **match** class-map configuration commands. You define packet classification on a physical-port basis.

Only one policy map per ingress port is supported. You can apply the same policy map to multiple physical ports.

You can apply a nonhierarchical policy maps to physical ports. A nonhierarchical policy map is the same as the port-based policy maps in the device.

A hierarchical policy map has two levels in the format of a parent-child policy. The parent policy cannot be modified but the child policy (port-child policy) can be modified to suit the QoS configuration.

In VLAN-based QoS, a service policy is applied to an SVI interface.

**Note** Not all MQC QoS combinations are supported for wired ports. For information about these restrictions, see chapters "Restrictions for QoS on Wired Targets" in the QoS configuration guide.

## Examples

This example shows how to create a policy map called policy1. When attached to the ingress port, it matches all the incoming traffic defined in class1, sets the IP DSCP to 10, and polices the traffic at an average rate of 1 Mb/s and bursts at 20 KB. Traffic less than the profile is sent.

```
Device(config)# policy-map policy1
Device(config-pmap)# class class1
Device(config-pmap-c)# set dscp 10
Device(config-pmap-c)# police 1000000 20000 conform-action transmit
Device(config-pmap-c)# exit
```

This example show you how to configure hierarchical policies:

```
Device# configure terminal
Device(config)# class-map c1
Device(config-cmap)# exit

Device(config)# class-map c2
Device(config-cmap)# exit

Device(config)# policy-map child
Device(config-pmap)# class c1
Device(config-pmap-c)# priority level 1
Device(config-pmap-c)# police rate percent 20 conform-action transmit exceed action drop
Device(config-pmap-c-police)# exit
Device(config-pmap-c)# exit

Device(config-pmap)# class c2
Device(config-pmap-c)# bandwidth 20000
Device(config-pmap-c)# exit

Device(config-pmap)# class class-default
Device(config-pmap-c)# bandwidth 20000
Device(config-pmap-c)# exit
Device(config-pmap)# exit

Device(config)# policy-map parent
Device(config-pmap)# class class-default
Device(config-pmap-c)# shape average 1000000
Device(config-pmap-c)# service-policy child
Device(config-pmap-c)# end
```

This example shows how to delete a policy map:

```
Device(config)# no policy-map policymap2
```

You can verify your settings by entering the **show policy-map** privileged EXEC command.

# priority

To assign priority to a class of traffic belonging to a policy map, use the **priority** command in policy-map class configuration mode. To remove a previously specified priority for a class, use the **no** form of this command.

```
priority [Kbps [burst -in-bytes] ] | level level-value [Kbps [burst -in-bytes] ] | percent
percentage [Kb/s [burst -in-bytes] ] ]
no priority [Kb/s [burst -in-bytes] ] | level level value [Kb/s [burst -in-bytes] ] | percent
percentage [Kb/s [burst -in-bytes] ] ]
```

## Syntax Description

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Kb/s</i>                      | (Optional) Guaranteed allowed bandwidth, in kilobits per second (kbps), for the priority traffic. The amount of guaranteed bandwidth varies according to the interface and platform in use. Beyond the guaranteed bandwidth, the priority traffic will be dropped in the event of congestion to ensure that the nonpriority traffic is not starved. The value must be between 1 and 2,000,000 kbps. |
| <i>burst -in-bytes</i>           | (Optional) Burst size in bytes. The burst size configures the network to accommodate temporary bursts of traffic. The default burst value, which is computed as 200 milliseconds of traffic at the configured bandwidth rate, is used when the burst argument is not specified. The range of the burst is from 32 to 2000000 bytes.                                                                 |
| <b>level</b> <i>level-value</i>  | (Optional) Assigns priority level. Available values for <i>level-value</i> are 1 and 2. Level 1 is a higher priority than Level 2. Level 1 reserves bandwidth and goes first, so latency is very low.                                                                                                                                                                                               |
| <b>percent</b> <i>percentage</i> | (Optional) Specifies the amount of guaranteed bandwidth to be specified by the percent of available bandwidth.                                                                                                                                                                                                                                                                                      |

## Command Default

No priority is set.

## Command Modes

Policy-map class configuration (config-pmap-c)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The bandwidth and priority commands cannot be used in the same class, within the same policy map. However, these commands can be used together in the same policy map.

When the policy map containing class policy configurations is attached to the interface to stipulate the service policy for that interface, available bandwidth is assessed. If a policy map cannot be attached to a particular interface because of insufficient interface bandwidth, the policy is removed from all interfaces to which it was successfully attached.

### Example

The following example shows how to configure the priority of the class in policy map policy1:

```
Device(config)# class-map cm1
Device(config-cmap)#match precedence 2
Device(config-cmap)#exit

Device(config)#class-map cm2
Device(config-cmap)#match dscp 30
Device(config-cmap)#exit

Device(config)# policy-map policy1
Device(config-pmap)# class cm1
Device(config-pmap-c)# priority level 1
Device(config-pmap-c)# police 1m
Device(config-pmap-c-police)#exit
Device(config-pmap-c)#exit
Device(config-pmap)#exit

Device(config)#policy-map policy1
Device(config-pmap)#class cm2
Device(config-pmap-c)#priority level 2
Device(config-pmap-c)#police 1m
```

# qos stack-buffer

To change the stacking mode of the device use the **qos stack-buffer** command in the global configuration mode.

**qos stack-buffer** { **enable** | **disable** }

|                    |                |                                                                 |
|--------------------|----------------|-----------------------------------------------------------------|
| Syntax Description | <b>enable</b>  | Enables stacking mode on the device.                            |
|                    | <b>disable</b> | Disables stacking on the device and puts it to standalone mode. |

**Command Default** By default, the device boots up with stacking mode enabled.

**Command Modes** Global configuration (config)

|                 |                                |                              |
|-----------------|--------------------------------|------------------------------|
| Command History | <b>Release</b>                 | <b>Modification</b>          |
|                 | Cisco IOS XE Gibraltar 16.12.1 | This command was introduced. |

## Usage Guidelines

**Note** This command is introduced only on the C9300-24UB and C9300-48UB switches. Ensure that you save the configuration and then reload the switches after executing the command.

C9300-24UXB does not support this command and is always in the stacking mode.

By default, the switch comes up in the stacking mode, when it is booted. Run the **qos stack-buffer disable** command, save the configuration (**write memory**) and then reload the switch to bring it up in the standalone mode.

## Examples

The following example puts the device in the standalone mode:

```
Device#configure terminal
Device(config)#qos stack-buffer disable
Device(config)#
*Jul  2 09:56:21.642: %FMANRP_QOS-4-STACKBUFFER: Stack-buffer configuration has been modified.
  Current setting is stack-buffer Disabled. This change will take an effect once the
configuration is written in flash (write memory) and then reload the switch.
*Jul  2 09:56:21.643: %FED_QOS_ERRMSG-4-STACK_BUFFER_CONFIG_MGIG: Switch 1 R0/0: fed: mGIG
platform's default is stack-buffer enabled. Configured stack-buffer disabled (1).
```

## Related Commands

# qos queue-softmax-multiplier

To increase the value of the soft buffers used by an interface, use the **qos queue-softmax-multiplier** command in the global configuration mode.

**qos queue-softmax-multiplier** *range-of-multiplier*  
**no qos queue-softmax-multiplier** *range-of-multiplier*

|                           |                               |                                                                                |
|---------------------------|-------------------------------|--------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>range-of-multiplier</i>    | You can specify a value in the range of 100 to 1200. The default value is 100. |
| <b>Command Default</b>    | None                          |                                                                                |
| <b>Command Modes</b>      | Global configuration (config) |                                                                                |

|                           | Cisco IOS XE Everest 16.5.1a  | This command was introduced.                                                   |

## Examples

This example shows how to set the value of softmax buffer to 500:

```
Device> enable
Device# configure terminal
Device(config)# qos queue-softmax-multiplier 500
```

# queue-buffers ratio

To configure the queue buffer for the class, use the **queue-buffers ratio** command in policy-map class configuration mode. Use the **no** form of this command to remove the ratio limit.

**queue-buffers ratio** *ratio limit*  
**no queue-buffers ratio** *ratio limit*

## Syntax Description

*ratio limit* (Optional) Configures the queue buffer for the class. Enter the queue buffers ratio limit (0-100).

## Command Default

No queue buffer for the class is defined.

## Command Modes

Policy-map class configuration (config-pmap-c)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Either the **bandwidth**, **shape**, or **priority** command must be used before using this command. For more information about these commands, see *Cisco IOS Quality of Service Solutions Command Reference* available on Cisco.com

The device allows you to allocate buffers to queues. If buffers are not allocated, then they are divided equally amongst all queues. You can use the queue-buffer ratio to divide it in a particular ratio. The buffers are soft buffers because Dynamic Threshold and Scaling (DTS) is active on all queues by default.

## Example

The following example sets the queue buffers ratio to 10 percent:

```
Device(config)# policy-map policy_queuebuf01
Device(config-pmap)# class-map class_queuebuf01
Device(config-cmap)# exit
Device(config)# policy policy_queuebuf01
Device(config-pmap)# class class_queuebuf01
Device(config-pmap-c)# bandwidth percent 80
Device(config-pmap-c)# queue-buffers ratio 10
Device(config-pmap)# end
```

You can verify your settings by entering the **show policy-map** privileged EXEC command.

# queue-limit

To specify or modify the maximum number of packets the queue can hold for a class policy configured in a policy map, use the **queue-limit** policy-map class configuration command. To remove the queue packet limit from a class, use the **no** form of this command.

**queue-limit** *queue-limit-size* [{**packets**}] {**cos** *cos-value* | **dscp** *dscp-value*} **percent** *percentage-of-packets*  
**no queue-limit** *queue-limit-size* [{**packets**}] {**cos** *cos-value* | **dscp** *dscp-value*} **percent** *percentage-of-packets*

|                           |                                             |                                                                                                                                                                                     |
|---------------------------|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>queue-limit-size</i>                     | The maximum size of the queue. The maximum varies according to the optional unit of measure keyword specified ( bytes, ms, us, or packets).                                         |
|                           | <b>cos</b> <i>cos-value</i>                 | Specifies parameters for each cos value. CoS values are from 0 to 7.                                                                                                                |
|                           | <b>dscp</b> <i>dscp-value</i>               | Specifies parameters for each DSCP value.<br><br>You can specify a value in the range 0 to 63 specifying the differentiated services code point value for the type of queue limit . |
|                           | <b>percent</b> <i>percentage-of-packets</i> | A percentage in the range 1 to 100 specifying the maximum percentage of packets that the queue for this class can accumulate.                                                       |

**Command Default** None

**Command Modes** Policy-map class configuration (policy-map-c)

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Although visible in the command line help-strings, the **packets** unit of measure is not supported; use the **percent** unit of measure.

**Note** This command is supported only on wired ports in the egress direction.

Weighted fair queuing (WFQ) creates a queue for every class for which a class map is defined. Packets satisfying the match criteria for a class accumulate in the queue reserved for the class until they are sent, which occurs when the queue is serviced by the fair queuing process. When the maximum packet threshold you defined for the class is reached, queuing of any further packets to the class queue causes tail drop.

You use queue limits to configure Weighted Tail Drop (WTD). WTD ensures the configuration of more than one threshold per queue. Each class of service is dropped at a different threshold value to provide for QoS differentiation.

You can configure the maximum queue thresholds for the different subclasses of traffic, that is, DSCP and CoS and configure the maximum queue thresholds for each subclass.

### Example

The following example configures a policy map called port-queue to contain policy for a class called dscp-1. The policy for this class is set so that the queue reserved for it has a maximum packet limit of 20 percent:

```
Device(config)# policy-map policy11
Device(config-pmap)# class dscp-1
Device(config-pmap-c)# bandwidth percent 20
Device(config-pmap-c)# queue-limit dscp 1 percent 20
```

## random-detect cos

To change the minimum and maximum packet thresholds for the Class of service (CoS) value, use the **random-detect cos** command in QoS policy-map class configuration mode. To return the minimum and maximum packet thresholds to the default for the CoS value, use the **no** form of this command.

**random-detect cos** *cos-value* **percent** *min-threshold* *max-threshold*  
**no random-detect cos** *cos-value* **percent** *min-threshold* *max-threshold*

### Syntax Description

|                      |                                                                                                                                                                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>cos-value</i>     | The CoS value, which is IEEE 802.1Q/ISL class of service/user priority value. The CoS value can be a number from 0 to 7.                                                                                                                                                |
| <i>percent</i>       | Specifies that the minimum and threshold values are in percentage.                                                                                                                                                                                                      |
| <i>min-threshold</i> | Minimum threshold in number of packets. The value range of this argument is from 1 to 512000000. When the average queue length reaches the minimum threshold, Weighted Random Early Detection (WRED) randomly drop some packets with the specified CoS value.           |
| <i>max-threshold</i> | Maximum threshold in number of packets. The value range of this argument is from the value of the <i>min-threshold</i> argument to 512000000. When the average queue length exceeds the maximum threshold, WRED or dWRED drop all packets with the specified CoS value. |

### Command Modes

QoS policy-map class configuration (config-pmap-c)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Use the **random-detect cos** command in conjunction with the **random-detect** command in QoS policy-map class configuration mode.

The **random-detect cos** command is available only if you have specified the *cos-based* argument when using the **random-detect** command in interface configuration mode.

### Examples

The following example enables WRED to use the CoS value 8. The minimum threshold for the CoS value 8 is 20, the maximum threshold is 40.

```
random-detect cos-based
random-detect cos percent 5 20 40
```

### Related Commands

| Command              | Description                                           |
|----------------------|-------------------------------------------------------|
| <b>random-detect</b> | Enables WRED                                          |
| <b>show queueing</b> | Lists all or selected configured queueing strategies. |

# random-detect cos-based

To enable weighted random early detection (WRED) on the basis of the class of service (CoS) value of a packet, use the **random-detect cos-based** command in policy-map class configuration mode. To disable WRED, use the **no** form of this command.

**random-detect cos-based**

**no random-detect cos-based**

## Command Default

When WRED is configured, the default minimum and maximum thresholds are determined on the basis of output buffering capacity and the transmission speed for the interface.

## Command Modes

Policy-map class configuration (config-pmap-c)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

In the following example, WRED is configured on the basis of the CoS value.

```
Device> enable
Device# configure terminal
Device(config)# policy-map policymap1
Device(config-pmap)# class class1
Device(config-pmap-c)# random-detect cos-based
Device(config-pmap-c)#

end
```

## Related Commands

| Command                          | Description                                                                                                                                                                         |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>random-detect cos</b>         | Specifies the CoS value of a packet, the minimum and maximum thresholds, and the maximum probability denominator used for enabling WRED.                                            |
| <b>show policy-map</b>           | Displays the configuration of all classes for a specified service policy map or all classes for all existing policy maps.                                                           |
| <b>show policy-map interface</b> | Displays the packet statistics of all classes that are configured for all service policies either on the specified interface or subinterface or on a specific PVC on the interface. |

## random-detect dscp

To change the minimum and maximum packet thresholds for the differentiated services code point (DSCP) value, use the **random-detect dscp** command in QoS policy-map class configuration mode. To return the minimum and maximum packet thresholds to the default for the DSCP value, use the **no** form of this command.

**random-detect dscp** *dscp-value* **percent** *min-threshold* *max-threshold*  
**no random-detect dscp** *dscp-value* **percent** *min-threshold* *max-threshold*

### Syntax Description

|                      |                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>dscp-value</i>    | The DSCP value. The DSCP value can be a number from 0 to 63, or it can be one of the following keywords: <b>af11</b> , <b>af12</b> , <b>af13</b> , <b>af21</b> , <b>af22</b> , <b>af23</b> , <b>af31</b> , <b>af32</b> , <b>af33</b> , <b>af41</b> , <b>af42</b> , <b>af43</b> , <b>cs1</b> , <b>cs2</b> , <b>cs3</b> , <b>cs4</b> , <b>cs5</b> , <b>cs7</b> , <b>ef</b> , or <b>rsvp</b> . |
| <i>percent</i>       | Specifies that the minimum and threshold values are in percentage.                                                                                                                                                                                                                                                                                                                          |
| <i>min-threshold</i> | Minimum threshold in number of packets. The value range of this argument is from 1 to 512000000. When the average queue length reaches the minimum threshold, Weighted Random Early Detection (WRED) randomly drop some packets with the specified DSCP value.                                                                                                                              |
| <i>max-threshold</i> | Maximum threshold in number of packets. The value range of this argument is from the value of the <i>min-threshold</i> argument to 512000000. When the average queue length exceeds the maximum threshold, WRED or dWRED drop all packets with the specified DSCP value.                                                                                                                    |

### Command Modes

QoS policy-map class configuration (config-pmap-c)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Use the **random-detect dscp** command in conjunction with the **random-detect** command in QoS policy-map class configuration mode.

The **random-detect dscp** command is available only if you specified the *dscp-based* argument when using the **random-detect** command in interface configuration mode.

### Specifying the DSCP Value

The **random-detect dscp** command allows you to specify the DSCP value per traffic class. The DSCP value can be a number from 0 to 63, or it can be one of the following keywords: **af11**, **af12**, **af13**, **af21**, **af22**, **af23**, **af31**, **af32**, **af33**, **af41**, **af42**, **af43**, **cs1**, **cs2**, **cs3**, **cs4**, **cs5**, **cs7**, **ef**, or **rsvp**.

On a particular traffic class, eight DSCP values can be configured per traffic class. Overall, 29 values can be configured on a traffic class: 8 precedence values, 12 Assured Forwarding (AF) code points, 1 Expedited Forwarding code point, and 8 user-defined DSCP values.

### Assured Forwarding Code Points

The AF code points provide a means for a domain to offer four different levels (four different AF classes) of forwarding assurances for IP packets received from other (such as customer) domains. Each one of the four AF classes is allocated a certain amount of forwarding services (buffer space and bandwidth).

Within each AF class, IP packets are marked with one of three possible drop precedence values (binary 2{010}, 4{100}, or 6{110}), which exist as the three lowest bits in the DSCP header. In congested network environments, the drop precedence value of the packet determines the importance of the packet within the AF class. Packets with higher drop precedence values are discarded before packets with lower drop precedence values.

The upper three bits of the DSCP value determine the AF class; the lower three values determine the drop probability.

### Examples

The following example enables WRED to use the DSCP value 8. The minimum threshold for the DSCP value 8 is 20, the maximum threshold is 40, and the mark probability is 1/10.

```
random-detect dscp percent 8 20 40
```

### Related Commands

| Command              | Description                                           |
|----------------------|-------------------------------------------------------|
| <b>random-detect</b> | Enables WRED                                          |
| <b>show queueing</b> | Lists all or selected configured queueing strategies. |

# random-detect dscp-based

To base weighted random early detection (WRED) on the Differentiated Services Code Point (dscp) value of a packet, use the **random-detectdscp-based** command in policy-map class configuration mode. To disable this feature, use the **no** form of this command.

**random-detect dscp-based**  
**no random-detect dscp-based**

**Syntax Description** This command has no arguments or keywords.

**Command Default** WRED is disabled by default.

**Command Modes** Policy-map class configuration (config-pmap-c)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** With the **random-detectdscp-based** command, WRED is based on the dscp value of the packet. Use the **random-detectdscp-based** command before configuring the **random-detectdscp** command.

**Examples** The following example shows that random detect is based on the precedence value of a packet:

```
Device> enable
Device# configure terminal
Device(config)#

policy-map policy1
Device(config-pmap)# class class1
Device(config-pmap-c)# bandwidth percent 80
Device(config-pmap-c)# random-detect dscp-based
Device(config-pmap-c)# random-detect dscp 2 percent 10 40
Device(config-pmap-c)# exit
```

| Related Commands | Command                   | Description                                                                                    |
|------------------|---------------------------|------------------------------------------------------------------------------------------------|
|                  | <b>random-detect</b>      | Enables WRED.                                                                                  |
|                  | <b>random-detect dscp</b> | Configures the WRED parameters for a particular DSCP value for a class policy in a policy map. |

# random-detect precedence

To configure Weighted Random Early Detection (WRED) parameters for a particular IP precedence for a class policy in a policy map, use the **random-detect precedence** command in QoS policy-map class configuration mode. To return the values to the default for the precedence, use the **no** form of this command.

**random-detect precedence** *precedence percent min-threshold max-threshold*  
**no random-detect precedence**

## Syntax Description

|                      |                                                                                                                                                                                                                                                                             |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>precedence</i>    | IP precedence number. The value range is from 0 to 7; see Table 1 in the “Usage Guidelines” section.                                                                                                                                                                        |
| <b>percent</b>       | Indicates that the threshold values are in percentage.                                                                                                                                                                                                                      |
| <i>min-threshold</i> | Minimum threshold in number of packets. The value range of this argument is from 1 to 512000000. When the average queue length reaches the minimum threshold, WRED randomly drops some packets with the specified IP precedence.                                            |
| <i>max-threshold</i> | Maximum threshold in number of packets. The value range of this argument is from the value of the <i>min-threshold</i> argument to 512000000. When the average queue length exceeds the maximum threshold, WRED or dWRED drop all packets with the specified IP precedence. |

## Command Default

The default *min-threshold* value depends on the precedence. The *min-threshold* value for IP precedence 0 corresponds to half of the *max-threshold* value. The values for the remaining precedences fall between half the *max-threshold* value and the *max-threshold* value at evenly spaced intervals. See the table in the “Usage Guidelines” section of this command for a list of the default minimum threshold values for each IP precedence.

## Command Modes

Interface configuration (config-if)  
 QoS policy-map class configuration (config-pmap-c)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

WRED is a congestion avoidance mechanism that slows traffic by randomly dropping packets when congestion exists.

When you configure the **random-detect** command on an interface, packets are given preferential treatment based on the IP precedence of the packet. Use the **random-detect precedence** command to adjust the treatment for different precedences.

If you want WRED to ignore the precedence when determining which packets to drop, enter this command with the same parameters for each precedence. Remember to use appropriate values for the minimum and maximum thresholds.

Note that if you use the **random-detect precedence** command to adjust the treatment for different precedences within class policy, you must ensure that WRED is not configured for the interface to which you attach that service policy.

**Note** Although the range of values for the *min-threshold* and *max-threshold* arguments is from 1 to 512000000, the actual values that you can specify depend on the type of random detect you are configuring. For example, the maximum threshold value cannot exceed the queue limit.

### Examples

The following example shows the configuration to enable WRED on the interface and to specify parameters for the different IP precedences:

```
interface FortyGigE1/0/1
description 45Mbps to R1
ip address 10.200.14.250 255.255.255.252
random-detect
random-detect precedence 7 percent 20 50
```

|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bandwidth (policy-map class)</b> | Specifies or modifies the bandwidth allocated for a class belonging to a policy map.                                                                                                         |
| <b>random-detect dscp</b>           | Changes the minimum and maximum packet thresholds for the DSCP value.                                                                                                                        |
| <b>show policy-map interface</b>    | Displays the configuration of all classes configured for all service policies on the specified interface or displays the classes for the service policy for a specific PVC on the interface. |
| <b>show queuing</b>                 | Lists all or selected configured queuing strategies.                                                                                                                                         |

# random-detect precedence-based

To base weighted random early detection (WRED) on the precedence value of a packet, use the **random-detect precedence-based** command in policy-map class configuration mode. To disable this feature, use the **no** form of this command.

**random-detect precedence-based**  
**no random-detect precedence-based**

**Syntax Description** This command has no arguments or keywords.

**Command Default** WRED is disabled by default.

**Command Modes** Policy-map class configuration (config-pmap-c)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** With the **random-detect precedence-based** command, WRED is based on the IP precedence value of the packet.

Use the **random-detect precedence-based** command before configuring the **random-detect precedence-based** command.

**Examples** The following example shows that random detect is based on the precedence value of a packet:

```
Device> enable
Device# configure terminal
Device(config)#

policy-map policy1
Device(config-pmap)# class class1
Device(config-pmap-c)# bandwidth percent 80
Device(config-pmap-c)# random-detect precedence-based
Device(config-pmap-c)# random-detect precedence 2 percent 30 50
Device(config-pmap-c)# exit
```

| Related Commands | Command                         | Description                                                                                       |
|------------------|---------------------------------|---------------------------------------------------------------------------------------------------|
|                  | <b>random-detect</b>            | Enables WRED.                                                                                     |
|                  | <b>random-detect precedence</b> | Configures the WRED parameters for a particular IP precedence for a class policy in a policy map. |

## service-policy (Wired)

To apply a policy map to a physical port or a switch virtual interface (SVI), use the **service-policy** command in interface configuration mode. Use the **no** form of this command to remove the policy map and port association.

**service-policy** {input | output} *policy-map-name*  
**no service-policy** {input | output} *policy-map-name*

|                    |                                                                                                                 |                              |
|--------------------|-----------------------------------------------------------------------------------------------------------------|------------------------------|
| Syntax Description | <b>input</b> <i>policy-map-name</i> Apply the specified policy map to the input of a physical port or an SVI.   |                              |
|                    | <b>output</b> <i>policy-map-name</i> Apply the specified policy map to the output of a physical port or an SVI. |                              |
|                    |                                                                                                                 |                              |
| Command Default    | No policy maps are attached to the port.                                                                        |                              |
| Command Modes      | WLAN interface configuration                                                                                    |                              |
| Command History    | Release                                                                                                         | Modification                 |
|                    | Cisco IOS XE Everest 16.5.1a                                                                                    | This command was introduced. |

**Usage Guidelines**

- A policy map is defined by the **policy map** command.
- Only one policy map is supported per port, per direction. In other words, only one input policy and one output policy is allowed on any one port.
- You can apply a policy map to incoming traffic on a physical port or on an SVI.

### Examples

This example shows how to apply plcmap1 to an physical ingress port:

```
Device(config)# interface gigabitethernet 2/0/1
Device(config-if)# service-policy input plcmap1
```

This example shows how to remove plcmap2 from a physical port:

```
Device(config)# interface gigabitethernet 2/0/2
Device(config-if)# no service-policy input plcmap2
```

The following example displays a VLAN policer configuration. At the end of this configuration, the VLAN policy map is applied to an interface for QoS:

```
Device# configure terminal
Device(config)# class-map vlan100
Device(config-cmap)# match vlan 100
Device(config-cmap)# exit
Device(config)# policy-map vlan100
Device(config-pmap)# policy-map class vlan100
Device(config-pmap-c)# police 100000 bc conform-action transmit exceed-action drop
Device(config-pmap-c-police)# end
Device# configure terminal
```

```
Device(config)# interface gigabitethernet 1/0/5  
Device(config-if)# service-policy input vlan100
```

You can verify your settings by entering the **show running-config** privileged EXEC command.

# set

To classify IP traffic by setting a Differentiated Services Code Point (DSCP) or an IP-precedence value in the packet, use the **set** command in policy-map class configuration mode. Use the **no** form of this command to remove traffic classification.

**set**

**cos | dscp | precedence | ip | qos-group**

**set cos**

{*cos-value* } | {**cos | dscp | precedence | qos-group**} [{**table** *table-map-name*}]

**set dscp**

{*dscp-value* } | {**cos | dscp | precedence | qos-group**} [{**table** *table-map-name*}]

**set ip {dscp | precedence}**

**set precedence** {*precedence-value* } | {**cos | dscp | precedence | qos-group**} [{**table** *table-map-name*}]

**set qos-group**

{*qos-group-value* | **dscp** [{**table** *table-map-name*}]} | **precedence** [{**table** *table-map-name*}]}

**Syntax Description****cos**

Sets the Layer 2 class of service (CoS) value or user priority of an outgoing packet. You can specify these values:

- *cos-value*—CoS value from 0 to 7. You also can enter a mnemonic name for a commonly used value.
  - Specify a packet-marking category to set the CoS value of the packet. If you also configure a table map for mapping and converting packet-marking values, this establishes the "map from" packet-marking category. Packet-marking category keywords:
    - **cos**—Sets a value from the CoS value or user priority.
    - **dscp**—Sets a value from packet differentiated services code point (DSCP).
    - **precedence**—Sets a value from packet precedence.
    - **qos-group**—Sets a value from the QoS group.
  - (Optional) **table** *table-map-name*—Indicates that the values set in a specified table map are used to set the CoS value. Enter the name of the table map used to specify the CoS value. The table map name can be a maximum of 64 alphanumeric characters.
- If you specify a packet-marking category but do not specify the table map, the default action is to copy the value associated with the packet-marking category as the CoS value. For example, if you enter the **set cos precedence** command, the precedence (packet-marking category) value is copied and used as the CoS value.

---

**dscp**

Sets the differentiated services code point (DSCP) value to mark IP(v4) and IPv6 packets. You can specify these values:

- *cos-value*—Number that sets the DSCP value. The range is from 0 to 63. You also can enter a mnemonic name for a commonly used value.
- Specify a packet-marking category to set the DSCP value of the packet. If you also configure a table map for mapping and converting packet-marking values, this establishes the "map from" packet-marking category. Packet-marking category keywords:
  - **cos**—Sets a value from the CoS value or user priority.
  - **dscp**—Sets a value from packet differentiated services code point (DSCP).
  - **precedence**—Sets a value from packet precedence.
  - **qos-group**—Sets a value from the QoS group.
- (Optional)**table** *table-map-name*—Indicates that the values set in a specified table map will be used to set the DSCP value. Enter the name of the table map used to specify the DSCP value. The table map name can be a maximum of 64 alphanumeric characters.

If you specify a packet-marking category but do not specify the table map, the default action is to copy the value associated with the packet-marking category as the DSCP value. For example, if you enter the **set dscp cos** command, the CoS value (packet-marking category) is copied and used as the DSCP value.

---

**ip**

Sets IP values to the classified traffic. You can specify these values:

- **dscp**—Specify an IP DSCP value from 0 to 63 or a packet marking category.
  - **precedence**—Specify a precedence-bit value in the IP header; valid values are from 0 to 7 or specify a packet marking category.
-

---

**precedence**

Sets the precedence value in the packet header. You can specify these values:

- *precedence-value*—Sets the precedence bit in the packet header; valid values are from 0 to 7. You also can enter a mnemonic name for a commonly used value.
- Specify a packet marking category to set the precedence value of the packet.
  - **cos**—Sets a value from the CoS or user priority.
  - **dscp**—Sets a value from packet differentiated services code point (DSCP).
  - **precedence**—Sets a value from packet precedence.
  - **qos-group**—Sets a value from the QoS group.
- (Optional) **table** *table-map-name*—Indicates that the values set in a specified table map will be used to set the precedence value. Enter the name of the table map used to specify the precedence value. The table map name can be a maximum of 64 alphanumeric characters.

If you specify a packet-marking category but do not specify the table map, the default action is to copy the value associated with the packet-marking category as the precedence value. For example, if you enter the **set precedence cos** command, the CoS value (packet-marking category) is copied and used as the precedence value.

---

**qos-group**

Assigns a QoS group identifier that can be used later to classify packets.

- **qos-group-value**—Sets a QoS value to the classified traffic. The range is 0 to 31. You also can enter a mnemonic name for a commonly used value.
- **dscp**—Sets the original DSCP field value of the packet as the QoS group value.
- **precedence**—Sets the original precedence field value of the packet as the QoS group value.
- (Optional) **table table-map-name**—Indicates that the values set in a specified table map will be used to set the DSCP or precedence value. Enter the name of the table map used to specify the value. The table map name can be a maximum of 64 alphanumeric characters.

If you specify a packet-marking category (**dscp** or **precedence**) but do not specify the table map, the default action is to copy the value associated with the packet-marking category as the QoS group value. For example, if you enter the **set qos-group precedence** command, the precedence value (packet-marking category) is copied and used as the QoS group value.

**Command Default**

No traffic classification is defined.

**Command Modes**

Policy-map class configuration

**Command History****Release****Modification**

Cisco IOS XE Everest 16.5.1a

This command was introduced.

**Usage Guidelines**

For the **set dscp dscp-value** command, the **set cos cos-value** command, and the **set ip precedence precedence-value** command, you can enter a mnemonic name for a commonly used value. For example, you can enter the **set dscp af11** command, which is the same as entering the **set dscp 10** command. You can enter the **set ip precedence critical** command, which is the same as entering the **set ip precedence 5** command. For a list of supported mnemonics, enter the **set dscp ?** or the **set ip precedence ?** command to see the command-line help strings.

When you configure the **set dscp cos** command, note the following: The CoS value is a 3-bit field, and the DSCP value is a 6-bit field. Only the three bits of the CoS field are used.

When you configure the **set dscp qos-group** command, note the following:

- The valid range for the DSCP value is a number from 0 to 63. The valid value range for the QoS group is a number from 0 to 99.
- If a QoS group value falls within both value ranges (for example, 44), the packet-marking value is copied and the packets is marked.

- If QoS group value exceeds the DSCP range (for example, 77), the packet-marking value is not be copied and the packet is not marked. No action is taken.

The **set qos-group** command cannot be applied until you create a service policy in policy-map configuration mode and then attach the service policy to an interface or ATM virtual circuit (VC).

To return to policy-map configuration mode, use the **exit** command. To return to privileged EXEC mode, use the **end** command.

---

## Examples

This example shows how to assign DSCP 10 to all FTP traffic without any policers:

```
Device(config)# policy-map policy_ftp
Device(config-pmap)# class-map ftp_class
Device(config-cmap)# exit
Device(config)# policy policy_ftp
Device(config-pmap)# class ftp_class
Device(config-pmap-c)# set dscp 10
Device(config-pmap)# exit
```

You can verify your settings by entering the **show policy-map** privileged EXEC command.

# show auto qos

To display the quality of service (QoS) commands entered on the interfaces on which automatic QoS (auto-QoS) is enabled, use the **show auto qos** command in privileged EXEC mode.

**show auto qos** [**interface** *[interface-id]*]

|                           |                                           |                                                                                                                            |

|                         |                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The <b>show auto qos</b> command output shows only the <b>auto qos</b> command entered on each interface. The <b>show auto qos interface interface-id</b> command output shows the <b>auto qos</b> command entered on a specific interface. Use the <b>show running-config</b> privileged EXEC command to display the auto-QoS configuration and the user modifications. |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Examples

This is an example of output from the **show auto qos** command after the **auto qos voip cisco-phone** and the **auto qos voip cisco-softphone** interface configuration commands are entered:

```
Device# show auto qos
GigabitEthernet 2/0/4
auto qos voip cisco-softphone

GigabitEthernet 2/0/5
auto qos voip cisco-phone

GigabitEthernet 2/0/6
auto qos voip cisco-phone
```

This is an example of output from the **show auto qos interface interface-id** command when the **auto qos voip cisco-phone** interface configuration command is entered:

```
Device# show auto qos interface GigabitEthernet 2/0/5
GigabitEthernet 2/0/5
auto qos voip cisco-phone
```

These are examples of output from the **show auto qos interface interface-id** command when auto-QoS is disabled on an interface:

```
Device# show auto qos interface GigabitEthernet 3/0/1
```

```
AutoQoS is disabled
```

# show class-map

To display quality of service (QoS) class maps, which define the match criteria to classify traffic, use the **show class-map** command in EXEC mode.

```
show class-map [class-map-name | type control subscriber {all | class-map-name}]
```

|                    |                                |                                                               |
|--------------------|--------------------------------|---------------------------------------------------------------|
| Syntax Description | <i>class-map-name</i>          | (Optional) Class map name.                                    |
|                    | <b>type control subscriber</b> | (Optional) Displays information about control class maps.     |
|                    | <b>all</b>                     | (Optional) Displays information about all control class maps. |
| Command Modes      | User EXEC                      |                                                               |
|                    | Privileged EXEC                |                                                               |
| Command History    | <b>Release</b>                 | <b>Modification</b>                                           |
|                    | Cisco IOS XE Everest 16.5.1a   | This command was introduced.                                  |

## Examples

This is an example of output from the **show class-map** command:

```
Device# show class-map
Class Map match-any videowizard_10-10-10-10 (id 2)
  Match access-group name videowizard_10-10-10-10

Class Map match-any class-default (id 0)
  Match any
Class Map match-any dscp5 (id 3)
  Match ip dscp 5
```

# show platform hardware fed switch

To display device-specific hardware information, use the **show platform hardware fed switch***switch\_number* command.

This topic elaborates only the QoS-specific options, that is, the options available with the **show platform hardware fed switch** {*switch\_num* | **active** | **standby** } **qos** command.

**show platform hardware fed switch** {*switch\_num* | **active** | **standby**} **qos** {**afd** | {**config type** *type* | [{**asic** *asic\_num*}] | **stats clients** {**all** | **bssid** *id* | **wlanid** *id*} | **dscp-cos counters** {**iifd\_id** *id* | **interface** *type number*} | **le-info** | {**iifd\_id** *id* | **interface** *type number*} | **policer config** {**iifd\_id** *id* | **interface** *type number*} | **queue** | {**config** | {**iifd\_id** *id* | **interface** *type number* | **internal port-type** *type* {**asic number** [{**port\_num**}]}} | **label2qmap** | [{**aqmrepqostbl** | **iqslabtable** | **sqlabtable**}] | {**asicnumber**} | **stats** | {**iifd\_id** *id* | **interface** *type number* | **internal** {**cpu policer** | **port-type** *type* **asic number**} {**asicnumber** [{**port\_num**}]}} | **resource**}

## Syntax Description

|                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>switch</b> { <i>switch_num</i>   <b>active</b>   <b>standby</b> } | Switch for which you want to display information. You have the following options: <ul style="list-style-type: none"> <li>• <i>switch_num</i>—ID of the switch.</li> <li>• <b>active</b>—Displays information relating to the active switch.</li> <li>• <b>standby</b>—Displays information relating to the standby switch, if available.</li> </ul>                                                                                                                                                                                                                                                                                                           |

# show platform software fed switch qos

To display device-specific software information, use the **show platform hardware fed switch** *switch\_number* command.

This topic elaborates only the QoS-specific options available with the **show platform software fed switch** {*switch\_num* | **active** | **standby** } **qos** command.

**show platform software fed switch**{*switch number* | **active** | **standby** }**qos**{**avc** | **internal** | **label2qmap** | **nflqos** | **policer** | **policy** | **qsb** | **tablemap**}

## Syntax Description

|                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**qsb {brief | iif\_id | brief  
interface}**

- **all**—Displays information for all client.
- **type**—Displays qosb information for the specified target type:
  - **client**—Displays QoS qosb information for wireless clients
  - **port**—Displays port-specific information
  - **radio**—Displays QoS qosb information for wireless radios
  - **ssid**—Displays QoS qosb information for wireless networks

**iif\_id**—Displays information for the iif\_ID

**interface**—Displays QoS qosb information for the specified interface:

- **Auto-Template**—Auto-template interface between 1 and 999.
- **BDI**—Bridge-domain interface between 1 and 16000.
- **Capwap**—CAPWAP interface between 0 and 2147483647.
- **GigabitEthernet**—GigabitEthernet interface between 0 and 9.
- **InternalInterface**—Internal interface between 0 and 9.
- **Loopback**—Loopback interface between 0 and 2147483647.
- **Null**—Null interface 0-0
- **Port-Channel**—Port-channel interface between 1 and 128.
- **TenGigabitEthernet**—TenGigabitEthernet interface between 0 and 9.
- **Tunnel**—Tunnel interface between 0 and 2147483647.
- **Vlan**—VLAN interface between 1 and 4094.

# show tech-support qos

To display quality of service (QoS)-related information for use by technical support, use the **show tech-support qos** command in privileged EXEC mode.

**show tech-support qos** [{switch {switch-number | active | all | standby} | [{control-plane | interface {interface-name | all}]}]]

|                    |                                        |                                                                                     |
|--------------------|----------------------------------------|-------------------------------------------------------------------------------------|
| Syntax Description | <b>switch</b> <i>switch-number</i>     | (Optional) Displays QoS-related information for a specific switch.                  |
|                    | <b>active</b>                          | (Optional) Displays QoS-related information for the active instance of the switch.  |
|                    | <b>all</b>                             | (Optional) Displays QoS-related information for all instances of the switch.        |
|                    | <b>standby</b>                         | (Optional) Displays QoS-related information for the standby instance of the switch. |
|                    | <b>control-plane</b>                   | (Optional) Displays QoS-related information for the control-plane.                  |
|                    | <b>interface</b> <i>interface-name</i> | (Optional) Displays QoS-related information for a specified interface.              |
|                    | <b>all</b>                             | (Optional) Displays QoS-related information for all interfaces.                     |

**Usage Guidelines**

The output of this command is very long. To better manage this output, you can redirect the output to an external file (for example, **show tech-support qos | redirect flash: filename**) in the local writable storage file system or remote file system.

The output of the **show tech-support qos** command displays a list of commands and their output. These commands differ based on the platform.

## Examples

The following is sample output from the **show tech-support qos** command:

```
Device# show tech-support qos
.
```

```

.
----- show platform software fed switch 1 qos policy target brief
-----

```

TCG summary for policy: system-cpp-policy

# trust device

To configure trust for supported devices connected to an interface, use the **trust device** command in interface configuration mode. Use the **no** form of this command to disable trust for the connected device.

```
trust device {cisco-phone | cts | ip-camera | media-player}
no trust device {cisco-phone | cts | ip-camera | media-player}
```

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                    |

|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | This command was introduced.                       |
| <b>Usage Guidelines</b>   | <p>Use the <b>trust device</b> command on the following types of interfaces:</p> <ul style="list-style-type: none"> <li>• <b>Auto</b>— auto-template interface</li> <li>• <b>Capwap</b>—CAPWAP tunnel interface</li> <li>• <b>GigabitEthernet</b>—Gigabit Ethernet IEEE 802</li> <li>• <b>GroupVI</b>—Group virtual interface</li> <li>• <b>Internal Interface</b>—Internal interface</li> <li>• <b>Loopback</b>—Loopback interface</li> <li>• <b>Null</b>—Null interface</li> <li>• <b>Port-channel</b>—Ethernet Channel interface</li> <li>• <b>TenGigabitEthernet</b>—10-Gigabit Ethernet</li> <li>• <b>Tunnel</b>—Tunnel interface</li> <li>• <b>Vlan</b>—Catalyst VLANs</li> <li>• <b>range</b>—<b>interface range</b> command</li> </ul> |                                                    |

### Example

The following example configures trust for a Cisco IP phone in Interface GigabitEthernet 1/0/1:

```
Device(config)# interface gigabitethernet 1/0/1  
Device(config-if)# trust device cisco-phone
```

# accept-lifetime

To set the time period during which the authentication key on a key chain is received as valid, use the **accept-lifetime** command in key chain key configuration mode. To revert to the default value, use the **no** form of this command.

**accept-lifetime** [ **local** ] *start-time* { **infinite** *end-time* | **duration** *seconds* }  
**no** **accept-lifetime**

| Syntax Description | local                          | Specifies the time in local timezone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | <i>start-time</i>              | Beginning time that the key specified by the <b>key</b> command is valid to be received. The syntax can be either of the following:<br><br><i>hh : mm : ss month date year</i><br><i>hh : mm : ss date month year</i> <ul style="list-style-type: none"> <li>• <i>hh</i>: Hours</li> <li>• <i>mm</i>: Minutes</li> <li>• <i>ss</i>: Seconds</li> <li>• <i>month</i>: First three letters of the month</li> <li>• <i>date</i>: Date (1-31)</li> <li>• <i>year</i>: Year (four digits)</li> </ul> <p>The default start time and the earliest acceptable date is January 1, 1993.</p> |
|                    | <b>infinite</b>                | Key is valid to be received from the <i>start-time</i> value on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                    | <i>end-time</i>                | Key is valid to be received from the <i>start-time</i> value until the <i>end-time</i> value. The syntax is the same as that for the <i>start-time</i> value. The <i>end-time</i> value must be after the <i>start-time</i> value. The default end time is an infinite time period.                                                                                                                                                                                                                                                                                                |
|                    | <b>duration</b> <i>seconds</i> | Length of time (in seconds) that the key is valid to be received. The range is from 1 to 2147483646.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Command Default** The authentication key on a key chain is received as valid forever (the starting time is January 1, 1993, and the ending time is infinite).

**Command Modes** Key chain key configuration (config-keychain-key)

| Command History | Release                       | Modification                                                          |
|-----------------|-------------------------------|-----------------------------------------------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a  | This command was introduced.                                          |
|                 | Cisco IOS XE Bengaluru 17.5.1 | The new range of the <b>duration</b> keyword is from 1 to 2147483646. |

## Usage Guidelines

Only DRP Agent, Enhanced Interior Gateway Routing Protocol (EIGRP), and Routing Information Protocol (RIP) Version 2 use key chains.

Specify a *start-time* value and one of the following values: **infinite**, *end-time*, or **duration seconds**.

We recommend running Network Time Protocol (NTP) or some other time synchronization method if you assign a lifetime to a key.

If the last key expires, authentication will continue and an error message will be generated. To disable authentication, you must manually delete the last valid key.

## Examples

The following example configures a key chain named chain1. The key named key1 will be accepted from 1:30 p.m. to 3:30 p.m. and will be sent from 2:00 p.m. to 3:00 p.m. The key named key2 will be accepted from 2:30 p.m. to 4:30 p.m. and will be sent from 3:00 p.m. to 4:00 p.m. The overlap allows for migration of keys or a discrepancy in the set time of the router. There is a 30-minute leeway on each side to handle time differences.

```
Device(config)# interface GigabitEthernet1/0/1
Device(config-if)# ip rip authentication key-chain chain1
Device(config-if)# ip rip authentication mode md5
Device(config-if)# exit
Device(config)# router rip
Device(config-router)# network 172.19.0.0
Device(config-router)# version 2
Device(config-router)# exit
Device(config)# key chain chain1
Device(config-keychain)# key 1
Device(config-keychain-key)# key-string key1
Device(config-keychain-key)# accept-lifetime 13:30:00 Jan 25 1996 duration 7200
Device(config-keychain-key)# send-lifetime 14:00:00 Jan 25 1996 duration 3600
Device(config-keychain-key)# exit
Device(config-keychain)# key 2
Device(config-keychain)# key-string key2
Device(config-keychain)# accept-lifetime 14:30:00 Jan 25 1996 duration 7200
Device(config-keychain)# send-lifetime 15:00:00 Jan 25 1996 duration 3600
```

The following example configures a key chain named chain1 for EIGRP address-family. The key named key1 will be accepted from 1:30 p.m. to 3:30 p.m. and be sent from 2:00 p.m. to 3:00 p.m. The key named key2 will be accepted from 2:30 p.m. to 4:30 p.m. and be sent from 3:00 p.m. to 4:00 p.m. The overlap allows for migration of keys or a discrepancy in the set time of the router. There is a 30-minute leeway on each side to handle time differences.

```
Device(config)# router eigrp 10
Device(config-router)# address-family ipv4 autonomous-system 4453
Device(config-router-af)# network 10.0.0.0
Device(config-router-af)# af-interface ethernet0/0
Device(config-router-af-interface)# authentication key-chain trees
Device(config-router-af-interface)# authentication mode md5
Device(config-router-af-interface)# exit
Device(config-router-af)# exit
Device(config-router)# exit
Device(config)# key chain chain1
Device(config-keychain)# key 1
Device(config-keychain-key)# key-string key1
Device(config-keychain-key)# accept-lifetime 13:30:00 Jan 25 1996 duration 7200
Device(config-keychain-key)# send-lifetime 14:00:00 Jan 25 1996 duration 3600
Device(config-keychain-key)# exit
Device(config-keychain)# key 2
Device(config-keychain-key)# key-string key2
```

```
Device(config-keychain-key)# accept-lifetime 14:30:00 Jan 25 1996 duration 7200
Device(config-keychain-key)# send-lifetime 15:00:00 Jan 25 1996 duration 3600
```

**Related Commands**

| Command                            | Description                                                                                 |
|------------------------------------|---------------------------------------------------------------------------------------------|
| <b>key</b>                         | Identifies an authentication key on a key chain.                                            |
| <b>key chain</b>                   | Defines an authentication key-chain needed to enable authentication for routing protocols.  |
| <b>key-string (authentication)</b> | Specifies the authentication string for a key.                                              |
| <b>send-lifetime</b>               | Sets the time period during which an authentication key on a key chain is valid to be sent. |
| <b>show key chain</b>              | Displays authentication key information.                                                    |

# address-family ipv6 (OSPF)

To enter the address family configuration mode for configuring routing sessions, such as Open Shortest Path First (OSPF), that uses the standard IPv6 address prefixes, use the **address-family ipv6** command in the router configuration mode. To disable the address family configuration mode, use the **no** form of this command.

**address-family ipv6** [**unicast** ][**{vrf vrf-name }**]  
**no address-family ipv6** [**unicast** ][**{vrf vrf-name }**]

|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| Syntax Description | <b>unicast</b>                                                                                                                                                                                                                                                                                  | (Optional) Specifies the IPv6 unicast address prefixes.                                                                    |
|                    | <b>vrf</b>                                                                                                                                                                                                                                                                                      | (Optional) Specifies all the VPN routing and forwarding (VRF) instance tables or a specific VRF table for an IPv6 address. |
|                    | <i>vrf-name</i>                                                                                                                                                                                                                                                                                 | (Optional) A specific VRF table for an IPv6 address.                                                                       |
| Command Default    | IPv6 address prefixes are not enabled. Unicast address prefixes are the default when the IPv6 address prefixes are configured.                                                                                                                                                                  |                                                                                                                            |
| Command Modes      | Router configuration (config-router)                                                                                                                                                                                                                                                            |                                                                                                                            |
| Command History    | <b>Release</b>                                                                                                                                                                                                                                                                                  | <b>Modification</b>                                                                                                        |
|                    | Cisco IOS XE Everest 16.5.1a                                                                                                                                                                                                                                                                    | This command was introduced.                                                                                               |
| Usage Guidelines   | The <b>address-family ipv6</b> command places the router in address family configuration mode (prompt: config-router-af), from which you can configure routing sessions that use the standard IPv6 address prefixes.                                                                            |                                                                                                                            |
| Examples           | The following example shows how to place the router in address family configuration mode:<br><br>Device> <b>enable</b><br>Device# <b>configure terminal</b><br>Device(config)# <b>router ospfv3 1</b><br>Device(config-router)# <b>address-family ipv6 unicast</b><br>Device(config-router-af)# |                                                                                                                            |
| Related Commands   | <b>Command</b>                                                                                                                                                                                                                                                                                  | <b>Description</b>                                                                                                         |
|                    | <b>router ospfv3</b>                                                                                                                                                                                                                                                                            | Enters OSPFv3 router configuration mode.                                                                                   |

# address-family l2vpn

To enter address family configuration mode to configure a routing session using Layer 2 Virtual Private Network (VPN) endpoint provisioning address information, use the **address-family l2vpn** command in router configuration mode. To remove the Layer 2 VPN address family configuration from the running configuration, use the **no** form of this command.

**address-family l2vpn** [{**evpn** | **vpls**}]  
**no address-family l2vpn** [{**evpn** | **vpls**}]

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                               |

|                           | Cisco IOS XE Everest 16.6.1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | This command was introduced.                                                                                  |
| <b>Usage Guidelines</b>   | The <b>address-family l2vpn</b> command places the device in address family configuration mode (prompt: config-router-af), from which you can configure routing sessions that support Layer 2 VPN endpoint provisioning.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                               |
|                           | BGP support for the Layer 2 VPN address family introduces a BGP-based autodiscovery mechanism to distribute Layer 2 VPN endpoint provisioning information. BGP uses a separate Layer 2 VPN routing information base (RIB) to store endpoint provisioning information, which is updated each time any Layer 2 virtual forwarding instance (VFI) is configured. Prefix and path information is stored in the Layer 2 VPN database, allowing BGP to make best-path decisions. When BGP distributes the endpoint provisioning information in an update message to all its BGP neighbors, the endpoint information is used to set up a pseudowire mesh to support Layer 2 VPN-based services. |                                                                                                               |
|                           | The BGP autodiscovery mechanism facilitates the setting up of Layer 2 VPN services, which are an integral part of the Cisco IOS Virtual Private LAN Service (VPLS) feature. VPLS enables flexibility in deploying services by connecting geographically dispersed sites as a large LAN over high-speed Ethernet in a robust and scalable IP MPLS network.                                                                                                                                                                                                                                                                                                                                |                                                                                                               |
|                           | The multiprotocol capability for address family Layer 2 VPN EVPN is advertised when the Address Family Identifier (AFI) is enabled under the internal BGP (iBGP) and external BGP (eBGP) neighbors for both IPv4 and IPv6 neighbors.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                               |

**Note**

Routing information for address family IPv4 is advertised by default for each BGP routing session configured with the **neighbor remote-as** command unless you configure the **no bgp default ipv4-unicast** command before configuring the **neighbor remote-as** command.

**Examples**

In this example, two provider edge (PE) devices are configured with VPLS endpoint provisioning information that includes Layer 2 VFI, VPN, and VPLS IDs. BGP neighbors are configured and activated under Layer 2 VPN address family to ensure that the VPLS endpoint provisioning information is saved to a separate Layer 2 VPN RIB and then distributed to other BGP peers in BGP update messages. When the endpoint information is received by the BGP peers, a pseudowire mesh is set up to support Layer 2 VPN-based services.

**Device A**

```
Device> enable
Device# configure terminal
Device(config)# 12 vfi customerA autodiscovery
Device(config-vfi)# vpn id 100
Device(config-vfi)# vpls-id 45000:100
Device(config-vfi)# exit
Device(config)# 12 vfi customerB autodiscovery
Device(config-vfi)# vpn id 200
Device(config-vfi)# vpls-id 45000:200
Device(config-vfi)# exit
Device(config)# router bgp 45000
Device(config-router)# no bgp default ipv4-unicast
Device(config-router)# bgp log-neighbor-changes
Device(config-router)# neighbor 172.16.1.2 remote-as 45000
Device(config-router)# neighbor 172.21.1.2 remote-as 45000
Device(config-router)# address-family l2vpn vpls
Device(config-router-af)# neighbor 172.16.1.2 activate
Device(config-router-af)# neighbor 172.16.1.2 send-community extended
Device(config-router-af)# neighbor 172.21.1.2 activate
Device(config-router-af)# neighbor 172.21.1.2 send-community extended
Device(config-router-af)# end
```

**Device B**

```
Device> enable
Device# configure terminal
Device(config)# 12 vfi customerA autodiscovery
Device(config-vfi)# vpn id 100
Device(config-vfi)# vpls-id 45000:100
Device(config-vfi)# exit
Device(config)# 12 vfi customerB autodiscovery
Device(config-vfi)# vpn id 200
Device(config-vfi)# vpls-id 45000:200
Device(config-vfi)# exit

# aggregate-address

To create an aggregate entry in a Border Gateway Protocol (BGP) database, use the **aggregate-address** command in address family or router configuration mode. To disable this function, use the **no** form of this command.

**aggregate-address** *address mask* [**as-set**] [**as-confed-set**] [**summary-only**] [**suppress-map** *map-name*] [**advertise-map** *map-name*] [**attribute-map** *map-name*]  
**no aggregate-address** *address mask* [**as-set**] [**as-confed-set**] [**summary-only**] [**suppress-map** *map-name*] [**advertise-map** *map-name*] [**attribute-map** *map-name*]

## Syntax Description

|                                      |                                                                                                               |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <i>address</i>                       | Aggregate address.                                                                                            |
| <i>mask</i>                          | Aggregate mask.                                                                                               |
| <b>as-set</b>                        | (Optional) Generates autonomous system set path information.                                                  |
| <b>as-confed-set</b>                 | (Optional) Generates autonomous confederation set path information.                                           |
| <b>summary-only</b>                  | (Optional) Filters all more-specific routes from updates.                                                     |
| <b>suppress-map</b> <i>map-name</i>  | (Optional) Specifies the name of the route map used to select the routes to be suppressed.                    |
| <b>advertise-map</b> <i>map-name</i> | (Optional) Specifies the name of the route map used to select the routes to create AS_SET origin communities. |
| <b>attribute-map</b> <i>map-name</i> | (Optional) Specifies the name of the route map used to set the attribute of the aggregate route.              |

## Command Default

The atomic aggregate attribute is set automatically when an aggregate route is created with this command unless the **as-set** keyword is specified.

## Command Modes

Address family configuration (config-router-af)  
 Router configuration (config-router)

## Command History

Table 126:

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

You can implement aggregate routing in BGP and Multiprotocol BGP (mBGP) either by redistributing an aggregate route into BGP or mBGP, or by using the conditional aggregate routing feature.

Using the **aggregate-address** command with no keywords will create an aggregate entry in the BGP or mBGP routing table if any more-specific BGP or mBGP routes are available that fall within the specified range. (A longer prefix that matches the aggregate must exist in the Routing Information Base (RIB).) The aggregate route will be advertised as coming from your autonomous system and will have the atomic aggregate attribute

set to show that information might be missing. (By default, the atomic aggregate attribute is set unless you specify the **as-set** keyword.)

Using the **as-set** keyword creates an aggregate entry using the same rules that the command follows without this keyword, but the path advertised for this route will be an AS\_SET consisting of all elements contained in all paths that are being summarized. Do not use this form of the **aggregate-address** command when aggregating many paths, because this route must be continually withdrawn and updated as autonomous system path reachability information for the summarized routes changes.

Using the **as-confed-set** keyword creates an aggregate entry using the same rules that the command follows without this keyword. This keyword performs the same function as the **as-set** keyword, except that it generates autonomous confed set path information.

Using the **summary-only** keyword not only creates the aggregate route (for example, 192.\*.\*) but also suppresses advertisements of more-specific routes to all neighbors. If you want to suppress only advertisements to certain neighbors, you may use the **neighbor distribute-list** command, with caution. If a more-specific route leaks out, all BGP or mBGP routers will prefer that route over the less-specific aggregate you are generating (using longest-match routing).

Using the **suppress-map** keyword creates the aggregate route but suppresses advertisement of specified routes. You can use the **match** clauses of route maps to selectively suppress some more-specific routes of the aggregate and leave others unsuppressed. IP access lists and autonomous system path access lists match clauses are supported.

Using the **advertise-map** keyword selects specific routes that will be used to build different components of the aggregate route, such as AS\_SET or community. This form of the **aggregate-address** command is useful when the components of an aggregate are in separate autonomous systems and you want to create an aggregate with AS\_SET, and advertise it back to some of the same autonomous systems. You must remember to omit the specific autonomous system numbers from the AS\_SET to prevent the aggregate from being dropped by the BGP loop detection mechanism at the receiving router. IP access lists and autonomous system path access lists **match** clauses are supported.

Using the **attribute-map** keyword allows attributes of the aggregate route to be changed. This form of the **aggregate-address** command is useful when one of the routes forming the AS\_SET is configured with an attribute such as the community no-export attribute, which would prevent the aggregate route from being exported. An attribute map route map can be created to change the aggregate attributes.

### AS-Set Example

In the following example, an aggregate BGP address is created in router configuration mode. The path advertised for this route will be an AS\_SET consisting of all elements contained in all paths that are being summarized.

```
Device(config)#router bgp 50000
Device(config-router)#aggregate-address 10.0.0.0 255.0.0.0 as-set
```

### Summary-Only Example

In the following example, an aggregate BGP address is created in address family configuration mode and applied to the multicast database under the IP Version 4 address family. Because the **summary-only** keyword is configured, more-specific routes are filtered from updates.

```
Device(config)#router bgp 50000
```

```
Device(config-router)#address-family ipv4 multicast
Device(config-router-af)#aggregate-address 10.0.0.0 255.0.0.0 summary-only
```

### Conditional Aggregation Example

In the following example, a route map called MAP-ONE is created to match on an AS-path access list. The path advertised for this route will be an AS\_SET consisting of elements contained in paths that are matched in the route map.

```
Device(config)#ip as-path access-list 1 deny ^1234_
Device(config)#ip as-path access-list 1 permit .*
Device(config)#!
Device(config)#route-map MAP-ONE
Device(config-route-map)#match ip as-path 1
Device(config-route-map)#exit
Device(config)#router bgp 50000
Device(config-router)#address-family ipv4
Device(config-router-af)#aggregate-address 10.0.0.0 255.0.0.0 as-set advertise-map
MAP-ONE
Router(config-router-af)#end
```

#### Related Commands

| Command                          | Description                                                                                                                                                                   |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>address-family ipv4 (BGP)</b> | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard IPv4 address prefixes. |
| <b>ip as-path access-list</b>    | Defines a BGP autonomous system path access list.                                                                                                                             |
| <b>match ip address</b>          | Distributes any routes that have a destination network number address that is permitted by a standard or extended access list, and performs policy routing on packets.        |
| <b>neighbor distribute-list</b>  | Distributes BGP neighbor information in an access list.                                                                                                                       |
| <b>route-map (IP)</b>            | Defines the conditions for redistributing routes from one routing protocol into another, or enables policy routing.                                                           |

## area nssa

To configure a not-so-stubby area (NSSA), use the **area nssa** command in router address family topology or router configuration mode. To remove the NSSA distinction from the area, use the **no** form of this command.

**area nssa command**  
**area** *area-id* **nssa** [**no-redistribution**] [**default-information-originate** [**metric**] [**metric-type**]] [**no-summary**] [**nssa-only**]  
**no area** *area-id* **nssa** [**no-redistribution**] [**default-information-originate** [**metric**] [**metric-type**]] [**no-summary**] [**nssa-only**]

### Syntax Description

|                                      |                                                                                                                                                                                           |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area-id</i>                       | Identifier for the stub area or NSSA. The identifier can be specified as either a decimal value or an IP address.                                                                         |
| <b>no-redistribution</b>             | (Optional) Used when the router is an NSSA Area Border Router (ABR) and you want the <b>redistribute</b> command to import routes only into the normal areas, but not into the NSSA area. |
| <b>default-information-originate</b> | (Optional) Used to generate a Type 7 default into the NSSA area. This keyword takes effect only on the NSSA ABR or the NSSA Autonomous System Boundary Router (ASBR).                     |
| <b>metric</b>                        | (Optional) Specifies the OSPF default metric.                                                                                                                                             |
| <b>metric-type</b>                   | (Optional) Specifies the OSPF metric type for default routes.                                                                                                                             |
| <b>no-summary</b>                    | (Optional) Allows an area to be an NSSA but not have summary routes injected into it.                                                                                                     |
| <b>nssa-only</b>                     | (Optional) Limits the default advertisement to this NSSA area by setting the propagate (P) bit in the type-7 LSA to zero.                                                                 |

### Command Default

No NSSA area is defined.

### Command Modes

Router address family topology configuration (config-router-af-topology) Router configuration (config-router)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

To remove the specified area from the software configuration, use the **no area** *area-id* command (with no other keywords). That is, the **no area** *area-id* command removes all area options, including **area authentication**, **area default-cost**, **area nssa**, **area range**, **area stub**, and **area virtual-link**.

#### Release 12.2(33)SRB

If you plan to configure the Multi-Topology Routing (MTR) feature, you need to enter the **area nssa** command in router address family topology configuration mode in order for this OSPF router configuration command to become topology-aware.

### Examples

The following example makes area 1 an NSSA area:

```
router ospf 1
 redistribute rip subnets
 network 172.19.92.0 0.0.0.255 area 1
 area 1 nssa
```

**Related Commands**

| Command             | Description                                                               |
|---------------------|---------------------------------------------------------------------------|
| <b>redistribute</b> | Redistributes routes from one routing domain into another routing domain. |

## area virtual-link

To define an Open Shortest Path First (OSPF) virtual link, use the **area virtual-link** command in router address family topology, router configuration, or address family configuration mode. To remove a virtual link, use the **no** form of this command.

```
area area-id virtual-link router-id authentication key-chain chain-name [hello-interval seconds]
[retransmit-interval seconds] [transmit-delay seconds] [dead-interval seconds] [ttl-security hops
hop-count]
no area area-id virtual-link router-id authentication key-chain chain-name
```

### Syntax Description

Table 127:

|                                           |                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area-id</i>                            | Area ID assigned to the virtual link. This can be either a decimal value or a valid IPv6 prefix. There is no default.                                                                                                                                                                                                                                                |
| <i>router-id</i>                          | Router ID associated with the virtual link neighbor. The router ID appears in the <b>show ip ospf</b> or <b>show ipv6 display</b> command. There is no default.                                                                                                                                                                                                      |
| <b>authentication</b>                     | Enables virtual link authentication.                                                                                                                                                                                                                                                                                                                                 |
| <b>key-chain</b>                          | Configures a key-chain for cryptographic authentication keys.                                                                                                                                                                                                                                                                                                        |
| <i>chain-name</i>                         | Name of the authentication key that is valid.                                                                                                                                                                                                                                                                                                                        |
| <b>hello-interval</b> <i>seconds</i>      | (Optional) Specifies the time (in seconds) between the hello packets that the Cisco IOS software sends on an interface. The hello interval is an unsigned integer value to be advertised in the hello packets. The value must be the same for all routers and access servers attached to a common network. The range is from 1 to 8192. The default is 10.           |
| <b>retransmit-interval</b> <i>seconds</i> | (Optional) Specifies the time (in seconds) between link-state advertisement (LSA) retransmissions for adjacencies belonging to the interface. The retransmit interval is the expected round-trip delay between any two routers on the attached network. The value must be greater than the expected round-trip delay. The range is from 1 to 8192. The default is 5. |
| <b>transmit-delay</b> <i>seconds</i>      | (Optional) Specifies the estimated time (in seconds) required to send a link-state update packet on the interface. The integer value that must be greater than zero. LSAs in the update packet have their age incremented by this amount before transmission. The range is from 1 to 8192. The default value is 1.                                                   |

|                                           |                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dead-interval</b> <i>seconds</i>       | (Optional) Specifies the time (in seconds) that hello packets are not seen before a neighbor declares the router down. The dead interval is an unsigned integer value. The default is four times the hello interval, or 40 seconds. As with the hello interval, this value must be the same for all routers and access servers attached to a common network. |
| <b>ttl-security hops</b> <i>hop-count</i> | (Optional) Configures Time-to-Live (TTL) security on a virtual link. The <i>hop-count</i> argument range is from 1 to 254.                                                                                                                                                                                                                                   |

**Command Default**

No OSPF virtual link is defined.

**Command Modes**

Router address family topology configuration (config-router-af-topology)

Router configuration (config-router)

Address family configuration (config-router-af)

**Command History**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

In OSPF, all areas must be connected to a backbone area. A lost connection to the backbone can be repaired by establishing a virtual link.

The shorter the hello interval, the faster topological changes will be detected, but more routing traffic will ensue. The setting of the retransmit interval should be conservative, or needless retransmissions will result. The value should be larger for serial lines and virtual links.

You should choose a transmit delay value that considers the transmission and propagation delays for the interface.

To configure a virtual link in OSPF for IPv6, you must use a router ID instead of an address. In OSPF for IPv6, the virtual link takes the router ID rather than the IPv6 prefix of the remote router.

Use the **ttl-security hops** *hop-count* keywords and argument to enable checking of TTL values on OSPF packets from neighbors or to set TTL values sent to neighbors. This feature adds an extra layer of protection to OSPF.

**Note**

In order for a virtual link to be properly configured, each virtual link neighbor must include the transit area ID and the corresponding virtual link neighbor router ID. To display the router ID, use the **show ip ospf** or the **show ipv6 ospf** command in privileged EXEC mode.

**Note**

To remove the specified area from the software configuration, use the **no area** *area-id* command (with no other keywords). That is, the **no area** *area-id* command removes all area options, such as **area default-cost**, **area nssa**, **area range**, **area stub**, and **area virtual-link**.

**Release 12.2(33)SRB**

If you plan to configure the Multitopology Routing (MTR) feature, you need to enter the **area virtual-link** command in router address family topology configuration mode in order for this OSPF router configuration command to become topology-aware.

**Examples**

The following example establishes a virtual link with default values for all optional parameters:

```
ipv6 router ospf 1
log-adjacency-changes
area 1 virtual-link 192.168.255.1
```

The following example establishes a virtual link in OSPF for IPv6:

```
ipv6 router ospf 1
log-adjacency-changes
area 1 virtual-link 192.168.255.1 hello-interval 5
```

The following example shows how to configure TTL security for a virtual link in OSPFv3 for IPv6:

```
Device(config)#router ospfv3 1
Device(config-router)#address-family ipv6 unicast vrf vrf1
Device(config-router-af)#area 1 virtual-link 10.1.1.1 ttl-security hops 10
```

The following example shows how to configure the authentication using a key chain for virtual-links:

```
area 1 virtual-link 1.1.1.1 authentication key-chain ospf-chain-1
```

# auto-summary (BGP)

To configure automatic summarization of subnet routes into network-level routes, use the **auto-summary** command in address family or router configuration mode. To disable automatic summarization and send subprefix routing information across classful network boundaries, use the **no** form of this command.

**auto-summary**  
**no auto-summary**

## Syntax Description

This command has no arguments or keywords.

## Command Default

Automatic summarization is disabled by default (the software sends subprefix routing information across classful network boundaries).

## Command Modes

Address family configuration (config-router-af)  
 Router configuration (config-router)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

BGP automatically summarizes routes to classful network boundaries when this command is enabled. Route summarization is used to reduce the amount of routing information in routing tables. Automatic summarization applies to connected, static, and redistributed routes.

### Note

The MPLS VPN Per VRF Label feature does not support auto-summary.

By default, automatic summarization is disabled and BGP accepts subnets redistributed from an Interior Gateway Protocol (IGP). To block subnets and create summary subprefixes to the classful network boundary when crossing classful network boundaries, use the **auto-summary** command.

To advertise and carry subnet routes in BGP when automatic summarization is enabled, use an explicit **network** command to advertise the subnet. The **auto-summary** command does not apply to routes injected into BGP via the **network** command or through iBGP or eBGP.

### Why auto-summary for BGP Is Disabled By Default

When **auto-summary** is enabled, routes injected into BGP via redistribution are summarized on a classful boundary. Remember that a 32-bit IP address consists of a network address and a host address. The subnet mask determines the number of bits used for the network address and the number of bits used for the host address. The IP address classes have a natural or standard subnet mask, as shown in the table below.

**Table 128: IP Address Classes**

| Class | Address Range            | Standard Mask      |
|-------|--------------------------|--------------------|
| A     | 1.0.0.0 to 126.0.0.0     | 255.0.0.0 or /8    |
| B     | 128.1.0.0 to 191.254.0.0 | 255.255.0.0 or /16 |

| Class | Address Range              | Standard Mask        |
|-------|----------------------------|----------------------|
| C     | 192.0.1.0 to 223.255.254.0 | 255.255.255.0 or /24 |

Reserved addresses include 128.0.0.0, 191.255.0.0, 192.0.0.0, and 223.255.255.0.

When using the standard subnet mask, Class A addresses have one octet for the network, Class B addresses have two octets for the network, and Class C addresses have three octets for the network.

Consider the Class B address 156.26.32.1 with a 24-bit subnet mask, for example. The 24-bit subnet mask selects three octets, 156.26.32, for the network. The last octet is the host address. If the network 156.26.32.1/24 is learned via an IGP and is then redistributed into BGP, if **auto-summary** were enabled, the network would be automatically summarized to the natural mask for a Class B network. The network that BGP would advertise is 156.26.0.0/16. BGP would be advertising that it can reach the entire Class B address space from 156.26.0.0 to 156.26.255.255. If the only network that can be reached via the BGP router is 156.26.32.0/24, BGP would be advertising 254 networks that cannot be reached via this router. This is why the **auto-summary (BGP)** command is disabled by default.

## Examples

In the following example, automatic summarization is enabled for IPv4 address family prefixes:

```
Device(config)#router bgp 50000

Device(config-router)#address-family ipv4 unicast

Device(config-router-af)#auto-summary

Device(config-router-af)#network 7.7.7.7 255.255.255.255
```

In the example, there are different subnets, such as 7.7.7.6 and 7.7.7.7 on Loopback interface 6 and Loopback interface 7, respectively. Both **auto-summary** and a **network** command are configured.

```
Device#show ip interface brief
Interface          IP-Address      OK? Method Status        Protocol
Ethernet0/0        100.0.1.7       YES NVRAM    up            up
Ethernet0/1        unassigned      YES NVRAM    administratively down down
Ethernet0/2        unassigned      YES NVRAM    administratively down down
Ethernet0/3        unassigned      YES NVRAM    administratively down down
Ethernet1/0        108.7.9.7       YES NVRAM    up            up
Ethernet1/1        unassigned      YES NVRAM    administratively down down
Ethernet1/2        unassigned      YES NVRAM    administratively down down
Ethernet1/3        unassigned      YES NVRAM    administratively down down
Loopback6          7.7.7.6         YES NVRAM    up            up
Loopback7          7.7.7.7         YES NVRAM    up            up
```

Note that in the output below, because of the **auto-summary** command, the BGP routing table displays the summarized route 7.0.0.0 instead of 7.7.7.6. The 7.7.7.7/32 network is displayed because it was configured with the **network** command, which is not affected by the **auto-summary** command.

```
Device#show ip bgp

|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                  |                                                                                                                                                                                                                                                                |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Usage Guidelines | You can configure authentication in single hop templates. We recommend that you configure authentication to enhance security. Authentication must be configured on each BFD source-destination pair, and authentication parameters must match on both devices. |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|          |                                                                                                        |
|----------|--------------------------------------------------------------------------------------------------------|
| Examples | The following example shows how to configure authentication for the template1 BFD single-hop template: |
|----------|--------------------------------------------------------------------------------------------------------|

```
Device>enable
Device#configuration terminal
Device(config)#bfd-template single-hop template1
Device(config-bfd)#authentication sha-1 keychain bfd-singlehop
```

# bfd

To set the baseline Bidirectional Forwarding Detection (BFD) session parameters on an interface, use the **bfd** interface configuration mode. To remove the baseline BFD session parameters, use the **no** form of this command

**bfd interval** *milliseconds* **min\_rx** *milliseconds* **multiplier** *multiplier-value*  
**no bfd interval** *milliseconds* **min\_rx** *milliseconds* **multiplier** *multiplier-value*

|                           |                                           |                                                                                                                                                                                                                                                                      |
|---------------------------|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>interval</b> <i>milliseconds</i>       | Specifies the rate, in milliseconds, at which BFD control packets will be sent to BFD peers. The valid range for the milliseconds argument is from 50 to 9999.                                                                                                       |
|                           | <b>min_rx</b> <i>milliseconds</i>         | Specifies the rate, in milliseconds, at which BFD control packets will be expected to be received from BFD peers. The valid range for the milliseconds argument is from 50 to 9999.                                                                                  |
|                           | <b>multiplier</b> <i>multiplier-value</i> | Specifies the number of consecutive BFD control packets that must be missed from a BFD peer before BFD declares that the peer is unavailable and the Layer 3 BFD peer is informed of the failure. The valid range for the multiplier-value argument is from 3 to 50. |

**Command Default** No baseline BFD session parameters are set.

**Command Modes** Interface configuration (config-if)

| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|------------------------|------------------------------|------------------------------|
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The bfd command can be configured on SVI, Ethernet and port-channel interfaces. If BFD runs on a port channel interface, BFD has a timer value restriction of 750 \* 3 milliseconds.

The bfd interval configuration is not removed when:

- an IPv4 address is removed from an interface
- an IPv6 address is removed from an interface
- IPv6 is disabled from an interface
- an interface is shutdown
- IPv4 CEF is disabled globally or locally on an interface
- IPv6 CEF is disabled globally or locally on an interface

The bfd interval configuration is removed when the subinterface on which its is configured is removed.

**Note** If we configure bfd interval command in interface config mode, then bfd echo mode is enabled by default. We need to enable either no ip redirect (if BFD echo is needed) or no bfd echo in interface config mode.

Before using BFD echo mode, you must disable sending Internet Control Message Protocol (ICMP) redirect messages by entering the no ip redirect command, in order to avoid high CPU utilization.

## Examples

The following example shows the BFD session parameters set for Gigabit Ethernet 1/0/3:

```
Device>enable
Device#configuration terminal
Device(config)#interface gigabitethernet 1/0/3
Device(config-if)#bfd interval 100 min_rx 100 multiplier 3
```

# bfd all-interfaces

To enable Bidirectional Forwarding Detection (BFD) for all interfaces participating in the routing process, use the **bfd all-interfaces** command in router configuration or address family interface configuration mode. To disable BFD for all neighbors on a single interface, use the **no** form of this command

**bfd all-interfaces**  
**no bfd all-interfaces**

|                           |                                                                                                                                                               |                              |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Syntax Description</b> | This command has no arguments or keywords.                                                                                                                    |                              |
| <b>Command Default</b>    | BFD is disabled on the interfaces participating in the routing process.                                                                                       |                              |
| <b>Command Modes</b>      | Router configuration (config-router)                                                                                                                          |                              |
| <b>Command History</b>    | <b>Release</b>                                                                                                                                                | <b>Modification</b>          |
|                           | Cisco IOS XE Everest 16.5.1a                                                                                                                                  | This command was introduced. |
| <b>Usage Guidelines</b>   | To enable BFD for all interfaces, enter the bfd all-interfaces command in router configuration mode                                                           |                              |
| <b>Examples</b>           | The following example shows how to enable BFD for all Enhanced Interior Gateway Routing Protocol (EIGRP) neighbors:                                           |                              |
|                           | <pre>Device&gt;enable Device#configuration terminal Device(config)#router eigrp 123 Device(config-router)#bfd all-interfaces Device(config-router)#end</pre>  |                              |
|                           | The following example shows how to enable BFD for all Intermediate System-to-Intermediate System (IS-IS) neighbors:                                           |                              |
|                           | <pre>Device&gt; enable Device#configuration terminal Device(config)#router isis tag1 Device(config-router)#bfd all-interfaces Device(config-router)#end</pre> |                              |

# bfd check-ctrl-plane-failure

To enable Bidirectional Forwarding Detection (BFD) control plane failure checking for the Intermediate System-to-Intermediate System (IS-IS) routing protocol, use the **bfd check-control-plane-failure** command in router configuration mode. To disable control plane failure detection, use the **no** form of this command

**bfd check-ctrl-plane-failure**  
**no bfd check-ctrl-plane-failure**

|                           |                                            |
|---------------------------|--------------------------------------------|
| <b>Syntax Description</b> | This command has no arguments or keywords. |
|---------------------------|--------------------------------------------|

|                        |                                                 |
|------------------------|-------------------------------------------------|
| <b>Command Default</b> | BFD control plane failure checking is disabled. |
|------------------------|-------------------------------------------------|

|                      |                                      |
|----------------------|--------------------------------------|
| <b>Command Modes</b> | Router configuration (config-router) |
|----------------------|--------------------------------------|

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                       |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | The <b>bfd check-ctrl-plane-failure</b> command can be configured for an IS-IS routing process only. The command is not supported on other protocols. |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|

When a switch restarts, a false BFD session failure can occur, where neighboring routers behave as if a true forwarding failure has occurred. However, if the **bfd check-ctrl-plane-failure** command is enabled on a switch, the router can ignore control plane related BFD session failures. We recommend that you add this command to the configuration of all neighboring routers just prior to a planned router restart, and that you remove the command from all neighboring routers when the restart is complete.

## Examples

The following example enables BFD control plane failure checking for the IS-IS routing protocol:

```
Device>enable
Device#configuration terminal
Device(config)#router isis
Device(config-router)#bfd check-ctrl-plane-failure
Device(config-router)#end
```

# bfd echo

To enable Bidirectional Forwarding Detection (BFD) echo mode, use the **bfd echo** command in interface configuration mode. To disable BFD echo mode, use the **no** form of this command

**bfd echo**  
**no bfd echo**

## Syntax Description

This command has no arguments or keywords.

## Command Default

BFD echo mode is enabled by default if BFD is configured using **bfd interval** command in interface configuration mode.

## Command Modes

Interface configuration (config-if)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Echo mode is enabled by default. Entering the **no bfd echo** command without any keywords turns off the sending of echo packets and signifies that the switch is unwilling to forward echo packets received from BFD neighbor switches.

When echo mode is enabled, the desired minimum echo transmit interval and required minimum transmit interval values are taken from the **bfd interval milliseconds min\_rx milliseconds** parameters, respectively.

### Note

Before using BFD echo mode, you must disable sending Internet Control Message Protocol (ICMP) redirect messages by entering the **no ip redirects** command, in order to avoid high CPU utilization.

## Examples

The following example configures echo mode between BFD neighbors:

```
Device>enable
Device#configuration terminal
Device(config)#interface GigabitEthernet 1/0/3
Device(config-if)#bfd echo
```

The following output from the **show bfd neighbors details** command shows that the BFD session neighbor is up and using BFD echo mode. The relevant command output is shown in bold in the output.

```
Device#show bfd neighbors details
OurAddr      NeighAddr    LD/RD  RH/RS  Holdown(mult)  State  Int
172.16.1.2   172.16.1.1   1/6    Up      0 (3 )         Up     Fa0/1
Session state is UP and using echo function with 100 ms interval.
Local Diag: 0, Demand mode: 0, Poll bit: 0
MinTxInt: 1000000, MinRxInt: 1000000, Multiplier: 3
Received MinRxInt: 1000000, Received Multiplier: 3
Holdown (hits): 3000(0), Hello (hits): 1000(337)
Rx Count: 341, Rx Interval (ms) min/max/avg: 1/1008/882 last: 364 ms ago
Tx Count: 339, Tx Interval (ms) min/max/avg: 1/1016/886 last: 632 ms ago
Registered protocols: EIGRP
```

```
Uptime: 00:05:00
Last packet: Version: 1          - Diagnostic: 0
              State bit: Up      - Demand bit: 0
              Poll bit: 0        - Final bit: 0
              Multiplier: 3      - Length: 24
              My Discr.: 6       - Your Discr.: 1
              Min tx interval: 1000000 - Min rx interval: 1000000
              Min Echo interval: 50000
```

# bfd slow-timers

To configure the Bidirectional Forwarding Detection (BFD) slow timers value, use the **bfd slow-timers** command in interface configuration mode. To change the slow timers used by BFD, use the **no** form of this command

**bfd slow-timers** [*milliseconds*]  
**no bfd slow-timers**

## Command Default

The BFD slow timer value is 1000 milliseconds

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

The following example shows how to configure the BFD slow timers value to 14,000 milliseconds:

```
Device(config)#bfd slow-timers 14000
```

The following output from the show bfd neighbors details command shows that the BFD slow timers value of 14,000 milliseconds has been implemented. The values for the MinTxInt and MinRxInt will correspond to the configured value for the BFD slow timers. The relevant command output is shown in bold.

```
Device#show bfd neighbors details
OurAddr      NeighAddr  LD/RD  RH/RS  Holdown(mult)  State  Int
172.16.1.2   172.16.1.1  1/6    Up      0 (3 )         Up     Fa0/1
Session state is UP and using echo function with 100 ms interval.
Local Diag: 0, Demand mode: 0, Poll bit: 0
MinTxInt: 14000, MinRxInt: 14000, Multiplier: 3
Received MinRxInt: 1000000, Received Multiplier: 3
Holdown (hits): 3600(0), Hello (hits): 1200(337)
Rx Count: 341, Rx Interval (ms) min/max/avg: 1/1008/882 last: 364 ms ago
Tx Count: 339, Tx Interval (ms) min/max/avg: 1/1016/886 last: 632 ms ago
Registered protocols: EIGRP
Uptime: 00:05:00
Last packet: Version: 1          - Diagnostic: 0
              State bit: Up      - Demand bit: 0
              Poll bit: 0        - Final bit: 0
              Multiplier: 3       - Length: 24
              My Discr.: 6        - Your Discr.: 1
              Min tx interval: 1000000 - Min rx interval: 1000000
              Min Echo interval: 50000
```

**Note**

- If the BFD session is down, then the BFD control packets will be sent with the slow timer interval.
- If the BFD session is up, then if echo is enabled, then BFD control packets will be sent in negotiated slow timer interval and echo packets will be sent in negotiated configured BFD interval. If echo is not enabled, then BFD control packets will be sent in negotiated configured interval.

# bfd template

To create a Bidirectional Forwarding Detection (BFD) template and to enter BFD configuration mode, use the **bfd-template** command in global configuration mode. To remove a BFD template, use the **no** form of this command

**bfd template** *template-name*  
**no bfd template** *template-name*

|                        |                                              |
|------------------------|----------------------------------------------|
| <b>Command Default</b> | A BFD template is not bound to an interface. |
|------------------------|----------------------------------------------|

|                      |                                     |
|----------------------|-------------------------------------|
| <b>Command Modes</b> | Interface configuration (config-if) |
|----------------------|-------------------------------------|

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                                                                                                                                                                  |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | Even if you have not created the template by using the <b>bfd-template</b> command, you can configure the name of the template under an interface, but the template is considered invalid until you define the template. You do not have to reconfigure the template name again. It becomes valid automatically. |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                 |                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Examples</b> | <pre>Device&gt; enable Device#configuration terminal Device(config)#interface GigabitEthernet 1/3/0 Device(config-if)#bfd template template1</pre> |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------|

# bfd-template single-hop

To bind a single hop Bidirectional Forwarding Detection (BFD) template to an interface, use the **bfd template** command in interface configuration mode. To unbind single-hop BFD template from an interface, use the **no** form of this command

**bfd-template single-hop** *template-name*  
**no bfd-template single-hop** *template-name*

| <b>Syntax Description</b>    | <div><b>single-hop</b> Creates the single-hop BFD template.</div> <div><i>template-name</i> Template name.</div>                                                                                                                                                                  |         |              |                              |                              |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|------------------------------|------------------------------|
| <b>Command Default</b>       | A BFD template does not exist.                                                                                                                                                                                                                                                    |         |              |                              |                              |
| <b>Command Modes</b>         | Global configuration (config)                                                                                                                                                                                                                                                     |         |              |                              |                              |
| <b>Command History</b>       | <table> <tr> <th>Release</th><th>Modification</th></tr> <tr> <td>Cisco IOS XE Everest 16.5.1a</td><td>This command was introduced.</td></tr> </table>                                                                                                                             | Release | Modification | Cisco IOS XE Everest 16.5.1a | This command was introduced. |
| Release                      | Modification                                                                                                                                                                                                                                                                      |         |              |                              |                              |
| Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                                                                                                                      |         |              |                              |                              |
| <b>Usage Guidelines</b>      | The bfd-template command allows you to create a BFD template and places the device in BFD configuration mode. The template can be used to specify a set of BFD interval values. BFD interval values specified as part of the BFD template are not specific to a single interface. |         |              |                              |                              |

## Examples

The following example shows how to create a BFD template and specify BFD interval values:

```
Device>enable
Device#configuration terminal
Device(config)#bfd-template single-hop node1
Device(bfd-config)#interval min-tx 100 min-rx 100 multiplier 3
Device(bfd-config)#echo
```

The following example shows how to create a BFD single-hop template and configure BFD interval values and an authentication key chain:

```
Device> enable
Device#configuration terminal
Device(config)#bfd-template single-hop template1
Device(bfd-config)#interval min-tx 200 min-rx 200 multiplier 3
Device(bfd-config)#authentication keyed-sha-1 keychain bfd_singlehop
```

**Note** BFD echo is not enabled by default in the bfd-template configuration. This needs to be configured explicitly.

# bgp graceful-restart

To enable the Border Gateway Protocol (BGP) graceful restart capability globally for all BGP neighbors, use the **bgp graceful-restart** command in address family or in router configuration mode. To disable the BGP graceful restart capability globally for all BGP neighbors, use the **no** form of this command.

**bgp graceful-restart** [{**extended** | **restart-time** *seconds* | **stalepath-time** *seconds*}] [**all**]  
**no bgp graceful-restart**

## Syntax Description

|                                      |                                                                                                                                                                                                                                                                                             |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>extended</b>                      | (Optional) Enables BGP graceful restart extension.                                                                                                                                                                                                                                          |
| <b>restart-time</b> <i>seconds</i>   | (Optional) Sets the maximum time period that the local router will wait for a graceful-restart-capable neighbor to return to normal operation after a restart event occurs. The default value for this argument is 120 seconds. The configurable range of values is from 1 to 3600 seconds. |
| <b>stalepath-time</b> <i>seconds</i> | (Optional) Sets the maximum time period that the local router will hold stale paths for a restarting peer. All stale paths are deleted after this timer expires. The default value for this argument is 360 seconds. The configurable range of values is from 1 to 3600 seconds.            |
| <b>all</b>                           | (Optional) Enables BGP graceful restart capability for all address family modes.                                                                                                                                                                                                            |

## Command Default

The following default values are used when this command is entered without any keywords or arguments:  
**restart-time** : 120 seconds **stalepath-time**: 360 seconds

### Note

Changing the restart and stalepath timer values is not required to enable the BGP graceful restart capability. The default values are optimal for most network deployments, and these values should be adjusted only by an experienced network operator.

## Command Modes

Address-family configuration (config-router-af)  
 Router configuration (config-router)

## Command History

*Table 129:*

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **bgp graceful-restart** command is used to enable or disable the graceful restart capability globally for all BGP neighbors in a BGP network. The graceful restart capability is negotiated between nonstop forwarding (NSF)-capable and NSF-aware peers in OPEN messages during session establishment. If the graceful restart

capability is enabled after a BGP session has been established, the session will need to be restarted with a hard reset.

The graceful restart capability is supported by NSF-capable and NSF-aware routers. A router that is NSF-capable can perform a stateful switchover (SSO) operation (graceful restart) and can assist restarting peers by holding routing table information during the SSO operation. A router that is NSF-aware functions like a router that is NSF-capable but cannot perform an SSO operation.

The BGP graceful restart capability is enabled by default when a supporting version of Cisco IOS software is installed. The default timer values for this feature are optimal for most network deployments. We recommend that they are adjusted only by experienced network operators. When adjusting the timer values, the restart timer should not be set to a value greater than the hold time that is carried in the OPEN message. If consecutive restart operations occur, routes (from a restarting router) that were previously marked as stale will be deleted.

**Note** Changing the restart and stalepath timer values is not required to enable the BGP graceful restart capability. The default values are optimal for most network deployments, and these values should be adjusted only by an experienced network operator.

## Examples

In the following example, the BGP graceful restart capability is enabled:

```
Device#configure terminal
Device(config)#router bgp 65000
Device(config-router)#bgp graceful-restart
```

In the following example, the restart timer is set to 130 seconds:

```
Device#configure terminal
Device(config)#router bgp 65000
Device(config-router)#bgp graceful-restart restart-time 130
```

In the following example, the stalepath timer is set to 350 seconds:

```
Device#configure terminal
Device(config)#router bgp 65000
Device(config-router)#bgp graceful-restart stalepath-time 350
```

In the following example, the **extended** keyword is used:

```
Device#configure terminal
Device(config)#router bgp 65000
Device(config-router)#bgp graceful-restart extended
```

## Related Commands

**Table 130:**

| Command                      | Description                                                          |
|------------------------------|----------------------------------------------------------------------|
| <b>show ip bgp</b>           | Displays entries in the BGP routing table.                           |
| <b>show ip bgp neighbors</b> | Displays information about the TCP and BGP connections to neighbors. |

## clear proximity ip bgp

To reset Border Gateway Protocol (BGP) connections using hard or soft reconfiguration, use the **clear proximity ip bgp** command in privileged EXEC mode.

```
clear proximity ip bgp [* | all autonomous-system-number neighbor-address | peer-group group-name]
[ {in [prefix-filter] | out | slow | soft [ {in [prefix-filter] | out | slow} ]}]
```

### Syntax Description

|                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>*</b>                            | Specifies that all current BGP sessions will be reset.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>all</b>                          | (Optional) Specifies the reset of all address family sessions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <i>autonomous-system-number</i>     | <p>Number of the autonomous system in which all BGP peer sessions will be reset. Number in the range from 1 to 65535.</p> <ul style="list-style-type: none"> <li>• In Cisco IOS Release 12.0(32)SY8, 12.0(33)S3, 12.2(33)SRE, 12.2(33)XNE, 12.2(33)SXI1, Cisco IOS XE Release 2.4, and later releases, 4-byte autonomous system numbers are supported in the range from 65536 to 4294967295 in asplain notation and in the range from 1.0 to 65535.65535 in asdot notation.</li> <li>• In Cisco IOS Release 12.0(32)S12, 12.4(24)T, and Cisco IOS XE Release 2.3, 4-byte autonomous system numbers are supported in the range from 1.0 to 65535.65535 in asdot notation only.</li> </ul> <p>For more details about autonomous system number formats, see the <b>router bgp</b> command.</p> |
| <i>neighbor-address</i>             | Specifies that only the identified BGP neighbor will be reset. The value for this argument can be an IPv4 or IPv6 address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>peer-group</b> <i>group-name</i> | Specifies that only the identified BGP peer group will be reset.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>in</b>                           | (Optional) Initiates inbound reconfiguration. If neither the <b>in</b> nor <b>out</b> keywords are specified, both inbound and outbound sessions are reset.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>prefix-filter</b>                | (Optional) Clears the existing outbound route filter (ORF) prefix list to trigger a new route refresh or soft reconfiguration, which updates the ORF prefix list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>out</b>                          | (Optional) Initiates inbound or outbound reconfiguration. If neither the <b>in</b> nor <b>out</b> keywords are specified, both inbound and outbound sessions are reset.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>slow</b>                         | (Optional) Clears slow-peer status forcefully and moves it to original update group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>soft</b>                         | (Optional) Initiates a soft reset. Does not tear down the session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

The **clear proximity ip bgp** command can be used to initiate a hard reset or soft reconfiguration. A hard reset tears down and rebuilds the specified peering sessions and rebuilds the BGP routing tables. A soft reconfiguration uses stored prefix information to reconfigure and activate BGP routing tables without tearing down existing peering sessions. Soft reconfiguration uses stored update information, at the cost of additional memory for storing the updates, to allow you to apply new BGP policy without disrupting the network. Soft reconfiguration can be configured for inbound or outbound sessions.

#### Note

Due to the complexity of some of the keywords available for the **clear proximity ip bgp** command, some of the keywords are documented as separate commands. All of the complex keywords that are documented separately start with **clear ip bgp**. For example, for information on resetting BGP connections using hard or soft reconfiguration for all BGP neighbors in IPv4 address family sessions, refer to the **clear ip bgp ipv4** command.

### Generating Updates from Stored Information

To generate new inbound updates from stored update information (rather than dynamically) without resetting the BGP session, you must preconfigure the local BGP router using the **neighbor soft-reconfiguration inbound** command. This preconfiguration causes the software to store all received updates without modification regardless of whether an update is accepted by the inbound policy. Storing updates is memory intensive and should be avoided if possible.

Outbound BGP soft configuration has no memory overhead and does not require any preconfiguration. You can trigger an outbound reconfiguration on the other side of the BGP session to make the new inbound policy take effect.

Use this command whenever any of the following changes occur:

- Additions or changes to the BGP-related access lists
- Changes to BGP-related weights
- Changes to BGP-related distribution lists
- Changes to BGP-related route maps

### Dynamic Inbound Soft Reset

The route refresh capability, as defined in RFC 2918, allows the local router to reset inbound routing tables dynamically by exchanging route refresh requests to supporting peers. The route refresh capability does not store update information locally for non-disruptive policy changes. It instead relies on dynamic exchange with supporting peers. Route refresh is advertised through BGP capability negotiation. All BGP routers must support the route refresh capability.

To determine if a BGP router supports this capability, use the **show ip bgp neighbors** command. The following message is displayed in the output when the router supports the route refresh capability:

```
Received route refresh capability from peer.
```

If all BGP routers support the route refresh capability, use the **clear proximity ip bgp** command with the **in** keyword. You need not use the **soft** keyword, because soft reset is automatically assumed when the route refresh capability is supported.

**Note**

After configuring a soft reset (inbound or outbound), it is normal for the BGP routing process to hold memory. The amount of memory that is held depends on the size of routing tables and the percentage of the memory chunks that are utilized. Partially used memory chunks will be used or released before more memory is allocated from the global router pool.

**Examples**

In the following example, a soft reconfiguration is initiated for the inbound session with the neighbor 10.100.0.1, and the outbound session is unaffected:

```
Device#clear proximity ip bgp 10.100.0.1 soft in
```

In the following example, the route refresh capability is enabled on the BGP neighbor routers and a soft reconfiguration is initiated for the inbound session with the neighbor 172.16.10.2, and the outbound session is unaffected:

```
Device#clear proximity ip bgp 172.16.10.2 in
```

In the following example, a hard reset is initiated for sessions with all routers in the autonomous system numbered 35700:

```
Device#clear proximity ip bgp 35700
```

In the following example, a hard reset is initiated for sessions with all routers in the 4-byte autonomous system numbered 65538 in asplain notation. This example requires Cisco IOS Release 12.0(32)SY8, 12.0(33)S3, 12.2(33)SRE, 12.2(33)XNE, 12.2(33)SX11, Cisco IOS XE Release 2.4, or a later release.

```
Device#clear proximity ip bgp 65538
```

In the following example, a hard reset is initiated for sessions with all routers in the 4-byte autonomous system numbered 1.2 in asdot notation. This example requires Cisco IOS Release 12.0(32)SY8, 12.0(32)S12, 12.2(33)SRE, 12.2(33)XNE, 12.2(33)SX11, 12.4(24)T, and Cisco IOS XE Release 2.3, or a later release.

```
Device#clear proximity ip bgp 1.2
```

| <b>neighbor soft-reconfiguration</b>                           | Configures the Cisco IOS software to start storing updates.                                  |
| <b>router bgp</b>                                              | Configures the BGP routing process.                                                          |
| <b>show ip bgp</b>                                             | Displays entries in the BGP routing table.                                                   |
| <b>show ip bgp neighbors</b>                                   | Displays information about BGP and TCP connections to neighbors.                             |
| <b>slow-peer split-update-group dynamic permanent</b>          | Moves a dynamically detected slow peer to a slow update group.                               |

## default-information originate (OSPF)

To generate a default external route into an Open Shortest Path First (OSPF) routing domain, use the **default-information originate** command in router configuration or router address family topology configuration mode. To disable this feature, use the **no** form of this command.

**default-information originate** [**always**] [**metric** *metric-value*] [**metric-type** *type-value*] [**route-map** *map-name*]

**no default-information originate** [**always**] [**metric** *metric-value*] [**metric-type** *type-value*] [**route-map** *map-name*]

### Syntax Description

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>always</b>                        | (Optional) Always advertises the default route regardless of whether the software has a default route.<br><br><b>Note</b> The <b>always</b> keyword includes the following exception when the route map is used. When a route map is used, the origination of the default route by OSPF is not bound to the existence of a default route in the routing table and the <b>always</b> keyword is ignored. |
| <b>metric</b> <i>metric-value</i>    | (Optional) Metric used for generating the default route. If you omit a value and do not specify a value using the <b>default-metric</b> router configuration command, the default metric value is 10. The value used is specific to the protocol.                                                                                                                                                       |
| <b>metric-type</b> <i>type-value</i> | (Optional) External link type associated with the default route that is advertised into the OSPF routing domain. It can be one of the following values: <ul style="list-style-type: none"> <li>Type 1 external route.</li> <li>Type 2 external route.</li> </ul> The default is type 2 external route.                                                                                                  |
| <b>route-map</b> <i>map-name</i>     | (Optional) The routing process will generate the default route if the route map is satisfied.                                                                                                                                                                                                                                                                                                           |

### Command Default

This command is disabled by default. No default external route is generated into the OSPF routing domain.

### Command Modes

Router configuration (config-router) Router address family topology configuration (config-router-af-topology)

### Command History

|                              |                              |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |
|------------------------------|------------------------------|

### Usage Guidelines

Whenever you use the **redistribute** or the **default-information** router configuration command to redistribute routes into an OSPF routing domain, the Cisco IOS software automatically becomes an Autonomous System Boundary Router (ASBR). However, an ASBR does not, by default, generate a default route into the OSPF routing domain. The software must still have a default route for itself before it generates one, except when you have specified the **always** keyword.

When a route map is used, the origination of the default route by OSPF is not bound to the existence of a default route in the routing table.

**Release 12.2(33)SRB**

If you plan to configure the Multi-Topology Routing (MTR) feature, you need to enter the **default-information originate** command in router address family topology configuration mode in order for this OSPF router configuration command to become topology-aware.

**Examples**

The following example specifies a metric of 100 for the default route that is redistributed into the OSPF routing domain and specifies an external metric type of 1:

```
router ospf 109
redistribute eigrp 108 metric 100 subnets
default-information originate metric 100 metric-type 1
```

**Related Commands**

| Command                    | Description                                                                                                |
|----------------------------|------------------------------------------------------------------------------------------------------------|
| <b>default-information</b> | Accepts exterior or default information into Enhanced Interior Gateway Routing Protocol (EIGRP) processes. |
| <b>default-metric</b>      | Sets default metric values for routes.                                                                     |
| <b>redistribute (IP)</b>   | Redistributes routes from one routing domain into another routing domain.                                  |

## default-metric (BGP)

To set a default metric for routes redistributed into Border Gateway Protocol (BGP), use the **default-metric** command in address family or router configuration mode. To remove the configured value and return BGP to default operation, use the **no** form of this command.

**default-metric** *number*

**no default-metric** *number*

### Syntax Description

|               |                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>number</i> | Default metric value applied to the redistributed route. The range of values for this argument is from 1 to 4294967295. |
|---------------|-------------------------------------------------------------------------------------------------------------------------|

### Command Default

The following is default behavior if this command is not configured or if the **no** form of this command is entered:

- The metric of redistributed interior gateway protocol (IGP) routes is set to a value that is equal to the interior BGP (iBGP) metric.
- The metric of redistributed connected and static routes is set to 0.

When this command is enabled, the metric for redistributed connected routes is set to 0.

### Command Modes

Address family configuration (config-router-af)

Router configuration (config-router)

### Command History

*Table 131:*

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

The **default-metric** command is used to set the metric value for routes redistributed into BGP and can be applied to any external BGP (eBGP) routes received and subsequently advertised internally to iBGP peers.

This value is the Multi Exit Discriminator (MED) that is evaluated by BGP during the best path selection process. The MED is a non-transitive value that is processed only within the local autonomous system and adjacent autonomous systems. The default metric is not set if the received route has a MED value.

#### Note

When enabled, the **default-metric** command applies a metric value of 0 to redistributed connected routes. The **default-metric** command does not override metric values that are applied with the **redistribute** command.

### Examples

In the following example, a metric of 1024 is set for routes redistributed into BGP from OSPF:

```
Device(config)#router bgp 50000
Device(config-router)#address-family ipv4 unicast

Device(config-router-af)#default-metric 1024
```

```
Device(config-router-af)#redistribute ospf 10
Device(config-router-af)#end
```

In the following configuration and output examples, a metric of 300 is set for eBGP routes received and advertised internally to an iBGP peer.

```
Device(config)#router bgp 65501
Device(config-router)#no synchronization
Device(config-router)#bgp log-neighbor-changes
Device(config-router)#network 172.16.1.0 mask 255.255.255.0
Device(config-router)#neighbor 172.16.1.1 remote-as 65501
Device(config-router)#neighbor 172.16.1.1 soft-reconfiguration inbound
Device(config-router)#neighbor 192.168.2.2 remote-as 65502
Device(config-router)#neighbor 192.168.2.2 soft-reconfiguration inbound
Device(config-router)#default-metric 300
Device(config-router)#no auto-summary
```

After the above configuration, some routes are received from the eBGP peer at 192.168.2.2 as shown in the output from the **show ip bgp neighbors received-routes** command.

```
Device#show ip bgp neighbors 192.168.2.2 received-routes

BGP table version is 7, local router ID is 192.168.2.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
              Network        Next Hop           Metric LocPrf Weight Path
*> 172.17.1.0/24      192.168.2.2                0   65502 i
```

After the received routes from the eBGP peer at 192.168.2.2 are advertised internally to iBGP peers, the output from the **show ip bgp neighbors received-routes** command shows that the metric (MED) has been set to 300 for these routes.

```
Device#show ip bgp neighbors 172.16.1.2 received-routes

BGP table version is 2, local router ID is 172.16.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
              Network        Next Hop           Metric LocPrf Weight Path
* i172.16.1.0/24      172.16.1.2                0   100      0 i
* i172.17.1.0/24      192.168.2.2            300   100      0 65502 i
Total number of prefixes 2
```

#### Related Commands

| Command                  | Description                                                               |
|--------------------------|---------------------------------------------------------------------------|
| <b>redistribute (IP)</b> | Redistributes routes from one routing domain into another routing domain. |

## distance (OSPF)

To define an administrative distance, use the **distance** command in router configuration mode or VRF configuration mode. To remove the **distance** command and restore the system to its default condition, use the **no** form of this command.

**distance** *weight*

[*ip-address wildcard-mask* [*access-list name*]]

**no distance** *weight ip-address wildcard-mask* [*access-list-name*]

### Syntax Description

|                         |                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>weight</i>           | Administrative distance. Range is 10 to 255. Used alone, the <i>weight</i> argument specifies a default administrative distance that the software uses when no other specification exists for a routing information source. Routes with a distance of 255 are not installed in the routing table. The table in the “Usage Guidelines” section lists the default administrative distances. |
| <i>ip-address</i>       | (Optional) IP address in four-part dotted-decimal notation.                                                                                                                                                                                                                                                                                                                               |
| <i>wildcard-mask</i>    | (Optional) Wildcard mask in four-part, dotted-decimal format. A bit set to 1 in the <i>wildcard-mask</i> argument instructs the software to ignore the corresponding bit in the address value.                                                                                                                                                                                            |
| <i>access-list-name</i> | (Optional) Name of an IP access list to be applied to incoming routing updates.                                                                                                                                                                                                                                                                                                           |

### Command Default

If this command is not specified, the administrative distance is the default. The table in the “Usage Guidelines” section lists the default administrative distances.

### Command Modes

Router configuration (config-router)

VRF configuration (config-vrf)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes the appropriate task IDs. If the user group assignment is preventing you from using a command contact your AAA administrator for assistance.

An administrative distance is an integer from 10 to 255. In general, the higher the value, the lower the trust rating. An administrative distance of 255 means that the routing information source cannot be trusted at all and should be ignored. Weight values are subjective; no quantitative method exists for choosing weight values.

If an access list is used with this command, it is applied when a network is being inserted into the routing table. This behavior allows you to filter networks based on the IP prefix supplying the routing information. For example, you could filter possibly incorrect routing information from networking devices not under your administrative control.

The order in which you enter **distance** commands can affect the assigned administrative distances, as shown in the “Examples” section. The following table lists default administrative distances.

Table 132: Default Administrative Distances

| Rate Source                   | Default Distance |
|-------------------------------|------------------|
| Connected interface           | 0                |
| Static route out on interface | 0                |
| Static route to next hop      | 1                |
| EIGRP summary route           | 5                |
| External BGP                  | 20               |
| Internal EIGRP                | 90               |
| OSPF                          | 110              |
| IS-IS                         | 115              |
| RIP version 1 and 2           | 120              |
| External EIGRP                | 170              |
| Internal BGP                  | 200              |
| Unknown                       | 255              |

**Task ID**

| Task ID | Operations  |
|---------|-------------|
| ospf    | read, write |

**Examples**

In the following example, the **router ospf** command sets up Open Shortest Path First (OSPF) routing instance 1. The first **distance** command sets the default administrative distance to 255, which instructs the software to ignore all routing updates from networking devices for which an explicit distance has not been set. The second **distance** command sets the administrative distance for all devices on the network 192.168.40.0 to 90.

```
Device#configure terminal
Device(config)#router ospf 1
Device(config-ospf)#distance 255
Device(config-ospf)#distance 90 192.168.40.0 0.0.0.255
```

**Related Commands**

| Command              | Description                                                                                                            |
|----------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>distance bgp</b>  | Allows the use of external, internal, and local administrative distances that could be a better route to a BGP node.   |
| <b>distance ospf</b> | Allows the use of external, internal, and local administrative distances that could be a better route to an OSPF node. |

| Command            | Description                          |
|--------------------|--------------------------------------|
| <b>router ospf</b> | Configures the OSPF routing process. |

# eigrp log-neighbor-changes

To enable the logging of changes in Enhanced Interior Gateway Routing Protocol (EIGRP) neighbor adjacencies, use the **eigrp log-neighbor-changes** command in router configuration mode, address-family configuration mode, or service-family configuration mode. To disable the logging of changes in EIGRP neighbor adjacencies, use the **no** form of this command.

**eigrp log-neighbor-changes**  
**no eigrp log-neighbor-changes**

|                           |                                            |
|---------------------------|--------------------------------------------|
| <b>Syntax Description</b> | This command has no arguments or keywords. |
|---------------------------|--------------------------------------------|

|                        |                               |
|------------------------|-------------------------------|
| <b>Command Default</b> | Adjacency changes are logged. |
|------------------------|-------------------------------|

|                      |                                                                                                                                      |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Command Modes</b> | Router configuration (config-router) Address-family configuration (config-router-af) Service-family configuration (config-router-sf) |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------|

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

|                         |                                                                                                                                                                                                                                                                         |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Guidelines</b> | This command enables the logging of neighbor adjacency changes to monitor the stability of the routing system and to help detect problems. Logging is enabled by default. To disable the logging of neighbor adjacency changes, use the <b>no</b> form of this command. |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To enable the logging of changes for EIGRP address-family neighbor adjacencies, use the **eigrp log-neighbor-changes** command in address-family configuration mode.

To enable the logging of changes for EIGRP service-family neighbor adjacencies, use the **eigrp log-neighbor-changes** command in service-family configuration mode.

## Examples

The following configuration disables logging of neighbor changes for EIGRP process 209:

```
Device(config)# router eigrp 209
Device(config-router)# no eigrp log-neighbor-changes
```

The following configuration enables logging of neighbor changes for EIGRP process 209:

```
Device(config)# router eigrp 209
Device(config-router)# eigrp log-neighbor-changes
```

The following example shows how to disable logging of neighbor changes for EIGRP address-family with autonomous-system 4453:

```
Device(config)# router eigrp virtual-name
Device(config-router)# address-family ipv4 autonomous-system 4453
Device(config-router-af)# no eigrp log-neighbor-changes
Device(config-router-af)# exit-address-family
```

The following configuration enables logging of neighbor changes for EIGRP service-family process 209:

```
Device(config)# router eigrp 209  
Device(config-router)# service-family ipv4 autonomous-system 4453  
Device(config-router-sf)# eigrp log-neighbor-changes  
Device(config-router-sf)# exit-service-family
```

**Related Commands**

| Command                       | Description                                                                      |
|-------------------------------|----------------------------------------------------------------------------------|
| <b>address-family (EIGRP)</b> | Enters address-family configuration mode to configure an EIGRP routing instance. |
| <b>exit-address-family</b>    | Exits address-family configuration mode.                                         |
| <b>exit-service-family</b>    | Exits service-family configuration mode.                                         |
| <b>router eigrp</b>           | Configures the EIGRP routing process.                                            |
| <b>service-family</b>         | Specifies service-family configuration mode.                                     |

## ip authentication key-chain eigrp

To enable authentication of Enhanced Interior Gateway Routing Protocol (EIGRP) packets, use the **ip authentication key-chain eigrp** command in interface configuration mode. To disable such authentication, use the **no** form of this command.

**ip authentication key-chain eigrp** *as-number* *key-chain*  
**no ip authentication key-chain eigrp** *as-number* *key-chain*

### Syntax Description

|                  |                                                               |
|------------------|---------------------------------------------------------------|
| <i>as-number</i> | Autonomous system number to which the authentication applies. |
| <i>key-chain</i> | Name of the authentication key chain.                         |

### Command Default

No authentication is provided for EIGRP packets.

### Command Modes

Interface configuration (config-if) Virtual network interface (config-if-vnet)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Examples

The following example applies authentication to autonomous system 2 and identifies a key chain named SPORTS:

```
Device(config-if) #ip authentication key-chain eigrp 2 SPORTS
```

### Related Commands

| Command                             | Description                                                                                   |
|-------------------------------------|-----------------------------------------------------------------------------------------------|
| <b>accept-lifetime</b>              | Sets the time period during which the authentication key on a key chain is received as valid. |
| <b>ip authentication mode eigrp</b> | Specifies the type of authentication used in EIGRP packets.                                   |
| <b>key</b>                          | Identifies an authentication key on a key chain.                                              |
| <b>key chain</b>                    | Enables authentication of routing protocols.                                                  |
| <b>key-string (authentication)</b>  | Specifies the authentication string for a key.                                                |
| <b>send-lifetime</b>                | Sets the time period during which an authentication key on a key chain is valid to be sent.   |

# ip authentication mode eigrp

To specify the type of authentication used in Enhanced Interior Gateway Routing Protocol (EIGRP) packets, use the **ip authentication mode eigrp** command in interface configuration mode. To disable that type of authentication, use the **no** form of this command.

**ip authentication mode eigrp *as-number* md5**  
**no ip authentication mode eigrp *as-number* md5**

## Syntax Description

|                  |                                               |
|------------------|-----------------------------------------------|
| <i>as-number</i> | Autonomous system number.                     |
| <b>md5</b>       | Keyed Message Digest 5 ( MD5) authentication. |

## Command Default

No authentication is provided for EIGRP packets.

## Command Modes

Interface configuration (config-if) Virtual network interface (config-if-vnet)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Configure authentication to prevent unapproved sources from introducing unauthorized or false routing messages. When authentication is configured, an MD5 keyed digest is added to each EIGRP packet in the specified autonomous system.

## Examples

The following example configures the interface to use MD5 authentication in EIGRP packets in autonomous system 10:

```
Device(config-if)#ip authentication mode eigrp 10 md5
```

## Related Commands

|------------------------------------------|-----------------------------------------------------------------------------------------------|
| <b>accept-lifetime</b>                   | Sets the time period during which the authentication key on a key chain is received as valid. |
| <b>ip authentication key-chain eigrp</b> | Enables authentication of EIGRP packets.                                                      |
| <b>key</b>                               | Identifies an authentication key on a key chain.                                              |
| <b>key chain</b>                         | Enables authentication of routing protocols.                                                  |
| <b>key-string (authentication)</b>       | Specifies the authentication string for a key.                                                |
| <b>send-lifetime</b>                     | Sets the time period during which an authentication key on a key chain is valid to be sent.   |

## ip bandwidth-percent eigrp

To configure the percentage of bandwidth that may be used by Enhanced Interior Gateway Routing Protocol (EIGRP) on an interface, use the **ip bandwidth-percent eigrp** command in interface configuration mode. To restore the default value, use the **no** form of this command.

**ip bandwidth-percent eigrp** *as-number percent*  
**no ip bandwidth-percent eigrp** *as-number percent*

### Syntax Description

|                  |                                          |
|------------------|------------------------------------------|
| <i>as-number</i> | Autonomous system number.                |
| <i>percent</i>   | Percent of bandwidth that EIGRP may use. |

### Command Default

EIGRP may use 50 percent of available bandwidth.

### Command Modes

Interface configuration (config-if) Virtual network interface (config-if-vnet)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

EIGRP will use up to 50 percent of the bandwidth of a link, as defined by the **bandwidth** interface configuration command. This command may be used if some other fraction of the bandwidth is desired. Note that values greater than 100 percent may be configured. The configuration option may be useful if the bandwidth is set artificially low for other reasons.

### Examples

The following example allows EIGRP to use up to 75 percent (42 kbps) of a 56-kbps serial link in autonomous system 209:

```
Device(config)#interface serial 0
Device(config-if)#bandwidth 56
Device(config-if)#ip bandwidth-percent eigrp 209 75
```

### Related Commands

| Command                      | Description                              |
|------------------------------|------------------------------------------|
| <b>bandwidth (interface)</b> | Sets a bandwidth value for an interface. |

# ip cef load-sharing algorithm

To select a Cisco Express Forwarding load-balancing algorithm, use the **ip cef load-sharing algorithm** command in global configuration mode. To return to the default universal load-balancing algorithm, use the **no** form of this command.

**ip cef load-sharing algorithm** {**original** | [**universal** [*id*]]}  
**no ip cef load-sharing algorithm**

## Syntax Description

|                  |                                                                                                                 |
|------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>original</b>  | Sets the load-balancing algorithm to the original algorithm based on a source and destination hash.             |
| <b>universal</b> | Sets the load-balancing algorithm to the universal algorithm that uses a source and destination and an ID hash. |
| <i>id</i>        | (Optional) Fixed identifier.                                                                                    |

## Command Default

The universal load-balancing algorithm is selected by default. If you do not configure the fixed identifier for a load-balancing algorithm, the router automatically generates a unique ID.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The original Cisco Express Forwarding load-balancing algorithm produced distortions in load sharing across multiple devices because of the use of the same algorithm on every device. When the load-balancing algorithm is set to universal mode, each device on the network can make a different load sharing decision for each source-destination address pair, and that resolves load-balancing distortions.

## Examples

The following example shows how to enable the Cisco Express Forwarding original load-balancing algorithm:

```
Device> enable
Device# configure terminal
Device(config)# ip cef load-sharing algorithm original
Device(config)# exit
```

## Related Commands

| Command                | Description                                          |
|------------------------|------------------------------------------------------|
| <b>ip load-sharing</b> | Enables load balancing for Cisco Express Forwarding. |

## ip community-list

To configure a BGP community list and to control which routes are permitted or denied based on their community values, use the **ip community-list** command in global configuration mode. To delete the community list, use the **no** form of this command.

### Standard Community Lists

**ip community-list** {*standard* | **standard** *list-name*} {**deny** | **permit**} [*community-number*] [*AA:NN*] [**internet**] [**local-as**] [**no-advertise**] [**no-export**] [**gshut**]  
**no ip community-list** {*standard* | **standard** *list-name*}

### Expanded Community Lists

**ip community-list** {*expanded* | **expanded** *list-name*} {**deny** | **permit**} *regex*  
**no ip community-list** {*expanded* | **expanded** *list-name*}

### Syntax Description

|                                  |                                                                                                                                                     |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>standard</i>                  | Standard community list number from 1 to 99 to identify one or more permit or deny groups of communities.                                           |
| <b>standard</b> <i>list-name</i> | Configures a named standard community list.                                                                                                         |
| <b>deny</b>                      | Denies routes that match the specified community or communities.                                                                                    |
| <b>permit</b>                    | Permits routes that match the specified community or communities.                                                                                   |
| <i>community-number</i>          | (Optional) 32-bit number from 1 to 4294967200. A single community can be entered or multiple communities can be entered, each separated by a space. |

|                     |                                                                                                                                                                                                                                                                                                                                                |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>AA :NN</i>       | (Optional) Autonomous system number and network number entered in the 4-byte new community format. This value is configured with two 2-byte numbers separated by a colon. A number from 1 to 65535 can be entered for each 2-byte number. A single community can be entered or multiple communities can be entered, each separated by a space. |
| <b>internet</b>     | (Optional) Specifies the Internet community. Routes with this community are advertised to all peers (internal and external).                                                                                                                                                                                                                   |
| <b>local-as</b>     | (Optional) Specifies the local-as community. Routes with community are advertised to only peers that are part of the local autonomous system or to only peers within a subautonomous system of a confederation. These routes are not advertised to external peers or to other subautonomous systems within a confederation.                    |
| <b>no-advertise</b> | (Optional) Specifies the no-advertise community. Routes with this community are not advertised to any peer (internal or external).                                                                                                                                                                                                             |
| <b>no-export</b>    | (Optional) Specifies the no-export community. Routes with this community are advertised to only peers in the same autonomous system or to only other subautonomous systems within a confederation. These routes are not advertised to external peers.                                                                                          |

|                                  |                                                                                                                                                                               |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>gshut</b>                     | (Optional) Specifies the Graceful Shutdown (GSHUT) community.                                                                                                                 |
| <i>expanded</i>                  | Expanded community list number from 100 to 500 to identify one or more permit or deny groups of communities.                                                                  |
| <b>expanded</b> <i>list-name</i> | Configures a named expanded community list.                                                                                                                                   |
| <i>regex</i>                     | Regular expression that is used to specify a pattern to match against an input string.<br><br><b>Note</b> Regular expressions can be used only with expanded community lists. |

**Command Default** BGP community exchange is not enabled by default.

**Command Modes** Global configuration (config)

**Command History** *Table 133:*

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **ip community-list** command is used to filter BGP routes based on one or more community values. BGP community values are configured as a 32-bit number (old format) or as a 4-byte number (new format). The new community format is enabled when the **ip bgp-community new-format** command is entered in global configuration mode. The new community format consists of a 4-byte value. The first two bytes represent the autonomous system number, and the trailing two bytes represent a user-defined network number. Named and numbered community lists are supported.

BGP community exchange is not enabled by default. The exchange of BGP community attributes between BGP peers is enabled on a per-neighbor basis with the **neighbor send-community** command. The BGP community attribute is defined in RFC 1997 and RFC 1998.

The Internet community is applied to all routes or prefixes by default, until any other community value is configured with this command or the **set community** command.

Use a route map to reference a community list and thereby apply policy routing or set values.

### Community List Processing

Once a **permit** value has been configured to match a given set of communities, the community list defaults to an implicit deny for all other community values. Unlike an access list, it is feasible for a community list to contain only **deny** statements.

- When multiple communities are configured in the same **ip community-list** statement, a logical AND condition is created. All community values for a route must match the communities in the community list statement to satisfy an AND condition.
- When multiple communities are configured in separate **ip community-list** statements, a logical OR condition is created. The first list that matches a condition is processed.

### Standard Community Lists

Standard community lists are used to configure well-known communities and specific community numbers. A maximum of 16 communities can be configured in a standard community list. If you attempt to configure more than 16 communities, the trailing communities that exceed the limit are not processed or saved to the running configuration file.

### Expanded Community Lists

Expanded community lists are used to filter communities using a regular expression. Regular expressions are used to configure patterns to match community attributes. The order for matching using the \* or + character is longest construct first. Nested constructs are matched from the outside in. Concatenated constructs are matched beginning at the left side. If a regular expression can match two different parts of an input string, it will match the earliest part first. For more information about configuring regular expressions, see the “Regular Expressions” appendix of the *Terminal Services Configuration Guide*.

## Examples

In the following example, a standard community list is configured that permits routes from network 10 in autonomous system 50000:

```
Device(config)#ip community-list 1 permit 50000:10
```

In the following example, a standard community list is configured that permits only routes from peers in the same autonomous system or from subautonomous system peers in the same confederation:

```
Device(config)#ip community-list 1 permit no-export
```

In the following example, a standard community list is configured to deny routes that carry communities from network 40 in autonomous system 65534 and from network 60 in autonomous system 65412. This example shows a logical AND condition; all community values must match in order for the list to be processed.

```
Device(config)#ip community-list 2 deny 65534:40 65412:60
```

In the following example, a named, standard community list is configured that permits all routes within the local autonomous system or permits routes from network 20 in autonomous system 40000. This example shows a logical OR condition; the first match is processed.

```
Device(config)#ip community-list standard RED permit local-as
Device(config)#ip community-list standard RED permit 40000:20
```

In the following example, a standard community list is configured that denies routes with the GSHUT community and permits routes with the local-AS community. This example shows a logical OR condition; the first match is processed.

```
Device(config)#ip community-list 18 deny gshut
Device(config)#ip community-list 18 permit local-as
```

In the following example, an expanded community list is configured that denies routes that carry communities from any private autonomous system:

```
Device(config)#ip community-list 500 deny _64[6-9][0-9][0-9]_|_65[0-9][0-9][0-9]_
```

In the following example, a named expanded community list is configured that denies routes from network 1 to 99 in autonomous system 50000:

```
Device(config)#ip community-list expanded BLUE deny 50000:[0-9][0-9]_
```

#### Related Commands

| Command                           | Description                                                                                                         |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>match community</b>            | Defines a BGP community that must match the community of a route.                                                   |
| <b>neighbor send-community</b>    | Allows BGP community exchange with a neighbor.                                                                      |
| <b>neighbor shutdown graceful</b> | Configures the BGP Graceful Shutdown feature.                                                                       |
| <b>route-map (IP)</b>             | Defines the conditions for redistributing routes from one routing protocol into another, or enables policy routing. |
| <b>set community</b>              | Sets the BGP communities attribute.                                                                                 |
| <b>set comm-list delete</b>       | Removes communities from the community attribute of an inbound or outbound update.                                  |
| <b>show ip bgp community</b>      | Displays routes that belong to specified BGP communities.                                                           |
| <b>show ip bgp regexp</b>         | Displays routes that match a locally configured regular expression.                                                 |

## ip prefix-list

To create a prefix list or to add a prefix-list entry, use the **ip prefix-list** command in global configuration mode. To delete a prefix-list entry, use the **no** form of this command.

```
ip prefix-list {list-name [seq number] {deny | permit} network/length [ge ge-length] [le le-length]
| description description | sequence-number}
no ip prefix-list {list-name [seq number] [{deny | permit} network/length [ge ge-length] [le
le-length]] | description description | sequence-number}
```

### Syntax Description

|                         |                                                                                                                                                                                                                                                                                  |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>list-name</i>        | Configures a name to identify the prefix list. Do not use the word “detail” or “summary” as a list name because they are keywords in the <b>show ip prefix-list</b> command.                                                                                                     |
| <b>seq</b>              | (Optional) Applies a sequence number to a prefix-list entry.                                                                                                                                                                                                                     |
| <i>number</i>           | (Optional) Integer from 1 to 4294967294. If a sequence number is not entered when configuring this command, default sequence numbering is applied to the prefix list. The number 5 is applied to the first prefix entry, and subsequent unnumbered entries are incremented by 5. |
| <b>deny</b>             | Denies access for a matching condition.                                                                                                                                                                                                                                          |
| <b>permit</b>           | Permits access for a matching condition.                                                                                                                                                                                                                                         |
| <i>network / length</i> | Configures the network address and the length of the network mask in bits. The network number can be any valid IP address or prefix. The bit mask can be a number from 1 to 32.                                                                                                  |
| <b>ge</b>               | (Optional) Specifies the lesser value of a range (the “from” portion of the range description) by applying the <i>ge-length</i> argument to the range specified.<br><b>Note</b> The <b>ge</b> keyword represents the greater than or equal to operator.                          |
| <i>ge-length</i>        | (Optional) Represents the minimum prefix length to be matched.                                                                                                                                                                                                                   |
| <b>le</b>               | (Optional) Specifies the greater value of a range (the “to” portion of the range description) by applying the <i>le-length</i> argument to the range specified.<br><b>Note</b> The <b>le</b> keyword represents the less than or equal to operator.                              |
| <i>le-length</i>        | (Optional) Represents the maximum prefix length to be matched.                                                                                                                                                                                                                   |
| <b>description</b>      | (Optional) Configures a descriptive name for the prefix list.                                                                                                                                                                                                                    |
| <i>description</i>      | (Optional) Descriptive name of the prefix list, from 1 to 80 characters in length.                                                                                                                                                                                               |
| <b>sequence-number</b>  | (Optional) Enables or disables the use of sequence numbers for prefix lists.                                                                                                                                                                                                     |

### Command Default

No prefix lists or prefix-list entries are created.

### Command Modes

Global configuration (config)

## Command History

Table 134:

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **ip prefix-list** command to configure IP prefix filtering. Prefix lists are configured with **permit** or **deny** keywords to either permit or deny a prefix based on a matching condition. An implicit deny is applied to traffic that does not match any prefix-list entry.

A prefix-list entry consists of an IP address and a bit mask. The IP address can be for a classful network, a subnet, or a single host route. The bit mask is a number from 1 to 32.

Prefix lists are configured to filter traffic based on a match of an exact prefix length or a match within a range when the **ge** and **le** keywords are used. The **ge** and **le** keywords are used to specify a range of prefix lengths and provide more flexible configuration than using only the *network/length* argument. A prefix list is processed using an exact match when neither the **ge** nor **le** keyword is specified. If only the **ge** value is specified, the range is the value entered for the **ge ge-length** argument to a full 32-bit length. If only the **le** value is specified, the range is from the value entered for the *network/length* argument to the **le le-length** argument. If both the **ge ge-length** and **le le-length** keywords and arguments are entered, the range is between the values used for the *ge-length* and *le-length* arguments.

The following formula shows this behavior:

*length* < **ge ge-length** < **le le-length** <= 32

If the **seq** keyword is configured without a sequence number, the default sequence number is 5. In this scenario, the first prefix-list entry is assigned the number 5 and subsequent prefix list entries increment by 5. For example, the next two entries would have sequence numbers 10 and 15. If a sequence number is entered for the first prefix list entry but not for subsequent entries, the subsequent entry numbers increment by 5. For example, if the first configured sequence number is 3, subsequent entries will be 8, 13, and 18. Default sequence numbers can be suppressed by entering the **no ip prefix-list** command with the **seq** keyword.

Evaluation of a prefix list starts with the lowest sequence number and continues down the list until a match is found. When an IP address match is found, the permit or deny statement is applied to that network and the remainder of the list is not evaluated.

## Tip

For best performance, the most frequently processed prefix list statements should be configured with the lowest sequence numbers. The **seq number** keyword and argument can be used for resequencing.

A prefix list is applied to inbound or outbound updates for a specific peer by entering the **neighbor prefix-list** command. Prefix list information and counters are displayed in the output of the **show ip prefix-list** command. Prefix-list counters can be reset by entering the **clear ip prefix-list** command.

## Examples

In the following example, a prefix list is configured to deny the default route 0.0.0.0/0:

```
Device(config)#ip prefix-list RED deny 0.0.0.0/0
```

In the following example, a prefix list is configured to permit traffic from the 172.16.1.0/24 subnet:

```
Device(config)#ip prefix-list BLUE permit 172.16.1.0/24
```

In the following example, a prefix list is configured to permit routes from the 10.0.0.0/8 network that have a mask length that is less than or equal to 24 bits:

```
Device(config)#ip prefix-list YELLOW permit 10.0.0.0/8 le 24
```

In the following example, a prefix list is configured to deny routes from the 10.0.0.0/8 network that have a mask length that is greater than or equal to 25 bits:

```
Device(config)#ip prefix-list PINK deny 10.0.0.0/8 ge 25
```

In the following example, a prefix list is configured to permit routes from any network that have a mask length from 8 to 24 bits:

```
Device(config)#ip prefix-list GREEN permit 0.0.0.0/0 ge 8 le 24
```

In the following example, a prefix list is configured to deny any route with any mask length from the 10.0.0.0/8 network:

```
Device(config)#ip prefix-list ORANGE deny 10.0.0.0/8 le 32
```

#### Related Commands

| Command                           | Description                                                                                                                                                            |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>clear ip prefix-list</b>       | Resets the prefix list entry counters.                                                                                                                                 |
| <b>ip prefix-list description</b> | Adds a text description of a prefix list.                                                                                                                              |
| <b>ip prefix-list sequence</b>    | Enables or disables default prefix-list sequencing.                                                                                                                    |
| <b>match ip address</b>           | Distributes any routes that have a destination network number address that is permitted by a standard or extended access list, and performs policy routing on packets. |
| <b>neighbor prefix-list</b>       | Filters routes from the specified neighbor using a prefix list.                                                                                                        |
| <b>show ip prefix-list</b>        | Displays information about a prefix list or prefix list entries.                                                                                                       |

# ip hello-interval eigrp

To configure the hello interval for an Enhanced Interior Gateway Routing Protocol (EIGRP) process, use the **ip hello-interval eigrp** command in interface configuration mode. To restore the default value, use the **no** form of this command.

**ip hello-interval eigrp** *as-number* *seconds*  
**no ip hello-interval eigrp** *as-number* [*seconds*]

## Syntax Description

|                  |                                                            |
|------------------|------------------------------------------------------------|
| <i>as-number</i> | Autonomous system number.                                  |
| <i>seconds</i>   | Hello interval (in seconds). The range is from 1 to 65535. |

## Command Default

The hello interval for low-speed, nonbroadcast multiaccess (NBMA) networks is 60 seconds and 5 seconds for all other networks.

## Command Modes

Interface configuration (config-if) Virtual network interface (config-if-vnet)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The default of 60 seconds applies only to low-speed, NBMA media. Low speed is considered to be a rate of T1 or slower, as specified with the **bandwidth** interface configuration command. Note that for the purposes of EIGRP, Frame Relay and Switched Multimegabit Data Service (SMDS) networks may be considered to be NBMA. These networks are considered NBMA if the interface has not been configured to use physical multicasting; otherwise, they are considered not to be NBMA.

## Examples

The following example sets the hello interval for Ethernet interface 0 to 10 seconds:

```
Device(config)#interface ethernet 0  
Device(config-if)#ip hello-interval eigrp 109 10
```

## Related Commands

|------------------------------|-------------------------------------------------------------------------------------------------------------|
| <b>bandwidth (interface)</b> | Sets a bandwidth value for an interface.                                                                    |
| <b>ip hold-time eigrp</b>    | Configures the hold time for a particular EIGRP routing process designated by the autonomous system number. |

# ip hold-time eigrp

To configure the hold time for an Enhanced Interior Gateway Routing Protocol (EIGRP) process, use the **ip hold-time eigrp** command in interface configuration mode. To restore the default value, use the **no** form of this command.

**ip hold-time eigrp** *as-number seconds*  
**no ip hold-time eigrp** *as-number seconds*

## Syntax Description

|                  |                                                       |
|------------------|-------------------------------------------------------|
| <i>as-number</i> | Autonomous system number.                             |
| <i>seconds</i>   | Hold time (in seconds). The range is from 1 to 65535. |

## Command Default

The EIGRP hold time is 180 seconds for low-speed, nonbroadcast multiaccess (NBMA) networks and 15 seconds for all other networks.

## Command Modes

Interface configuration (config-if) Virtual network interface (config-if-vnet)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

On very congested and large networks, the default hold time might not be sufficient time for all routers and access servers to receive hello packets from their neighbors. In this case, you may want to increase the hold time.

We recommend that the hold time be at least three times the hello interval. If a router does not receive a hello packet within the specified hold time, routes through this router are considered unavailable.

Increasing the hold time delays route convergence across the network.

The default of 180 seconds hold time and 60 seconds hello interval apply only to low-speed, NBMA media. Low speed is considered to be a rate of T1 or slower, as specified with the **bandwidth** interface configuration command.

## Examples

The following example sets the hold time for Ethernet interface 0 to 40 seconds:

```
Device(config)#interface ethernet 0
Device(config-if)#ip hold-time eigrp 109 40
```

|--------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>bandwidth (interface)</b>   | Sets a bandwidth value for an interface.                                                               |
| <b>ip hello-interval eigrp</b> | Configures the hello interval for the EIGRP routing process designated by an autonomous system number. |

# ip load-sharing

To enable load balancing for Cisco Express Forwarding on an interface, use the **ip load-sharing** command in interface configuration mode. To disable load balancing for Cisco Express Forwarding on the interface, use the **no** form of this command.

**ip load-sharing {per-packet | per-destination }**  
**no ip load-sharing per-packet**

|                           |                        |                                                                                                                                                                                                  |
|---------------------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>per-packet</b>      | Enables per-packet load balancing for Cisco Express Forwarding on the interface. This functionality and keyword are not supported on all platforms. See "Usage Guidelines" for more information. |
|                           | <b>per-destination</b> | Enables per-destination load balancing for Cisco Express Forwarding on the interface.                                                                                                            |

**Command Default** Per-destination load balancing is enabled by default when you enable Cisco Express Forwarding.

**Command Modes** Interface configuration (config-if)

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Per-packet load balancing allows the router to send data packets over successive equal-cost paths without regard to individual destination hosts or user sessions. Path utilization is good, but packets destined for a given destination host might take different paths and might arrive out of order.

Per-destination load balancing allows the device to use multiple, equal-cost paths to achieve load sharing. Packets for a given source-destination host pair are guaranteed to take the same path, even if multiple, equal-cost paths are available. Traffic for different source-destination host pairs tends to take different paths.

**Note** If you want to enable per-packet load sharing to a particular destination, then all interfaces that can forward traffic to the destination must be enabled for per-packet load sharing.

## Examples

The following example shows how to enable per-packet load balancing:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 1/0/1
Device(config-if)# ip load-sharing per-packet
```

The following example shows how to enable per-destination load balancing:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 1/0/1
Device(config-if)# ip load-sharing per-destination
```

# ip network-broadcast

To receive and accept the network-prefix-directed broadcast packets, configure the **ip network-broadcast** command at the interface of the device.

```
ip network-broadcast
```

| Syntax Description | This command has no arguments or keywords.                                                                                                                                                                                                                                                                                                                                                                                                           |                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| Command Default    | This command is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                 |                              |
| Command Modes      | Interface configuration (config-if)                                                                                                                                                                                                                                                                                                                                                                                                                  |                              |
| Command History    | Release                                                                                                                                                                                                                                                                                                                                                                                                                                              | Modification                 |
|                    | Cisco IOS XE Amsterdam 17.3.1                                                                                                                                                                                                                                                                                                                                                                                                                        | This command was introduced. |
| Usage Guidelines   | <p>Configure the <b>ip network-broadcast</b> command at the ingress interface before configuring the <b>ip directed-broadcast</b> command at the egress interface. This ensures that the network-prefix-directed broadcast packets are received and accepted.</p> <p>The <b>ip network-broadcast</b> command is disabled by default. If you do not configure this command, the network-prefix-directed broadcast packets are silently discarded.</p> |                              |

## Example

The following example shows how to enable the network to accept the network-prefix-directed broadcast packets at ingress and then configure the directed broadcast-to-physical broadcast translation on the egress interface.

```
Device# configure terminal
Device(config)#interface gigabitethernet 1/0/2
Device(config-if)#ip network-broadcast
Device(config-if)#exit
Device(config)#interface gigabitethernet 1/0/3
Device(config-if)#ip directed-broadcast
Device(config-if)#exit
```

# ip ospf database-filter all out

To filter outgoing link-state advertisements (LSAs) to an Open Shortest Path First (OSPF) interface, use the **ip ospf database-filter all out** command in interface or virtual network interface configuration modes. To restore the forwarding of LSAs to the interface, use the **no** form of this command.

**ip ospf database-filter all out [disable]**  
**no ip ospf database-filter all out**

## Syntax Description

|                |                                                                                                                                                                                                               |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>disable</b> | (Optional) Disables the filtering of outgoing LSAs to an OSPF interface; all outgoing LSAs are flooded to the interface.<br><br><b>Note</b> This keyword is available only in virtual network interface mode. |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Default

This command is disabled by default. All outgoing LSAs are flooded to the interface.

## Command Modes

Interface configuration (config-if)  
Virtual network interface (config-if-vnet)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

This command performs the same function that the **neighbor database-filter** command performs on a neighbor basis.

If the **ip ospf database-filter all out** command is enabled for a virtual network and you want to disable it, use the **disable** keyword in virtual network interface configuration mode.

## Examples

The following example prevents filtering of OSPF LSAs to broadcast, nonbroadcast, or point-to-point networks reachable through Ethernet interface 0:

```
Device(config)#interface ethernet 0  
Device(config-if)#ip ospf database-filter all out
```

## Related Commands

## ip split-horizon eigrp

To enable Enhanced Interior Gateway Routing Protocol (EIGRP) split horizon, use the **ip split-horizon eigrp** command in interface configuration mode. To disable split horizon, use the **no** form of this command.

**ip split-horizon eigrp** *as-number*  
**no ip split-horizon eigrp** *as-number*

### Syntax Description

|                  |                           |
|------------------|---------------------------|
| <i>as-number</i> | Autonomous system number. |
|------------------|---------------------------|

### Command Default

The behavior of this command is enabled by default.

### Command Modes

Interface configuration (config-if)  
Virtual network interface (config-if-vnet)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Use the **no ip split-horizon eigrp** command to disable EIGRP split horizon in your configuration.

### Examples

The following is an example of how to enable EIGRP split horizon:

```
Device(config-if)#ip split-horizon eigrp 101
```

### Related Commands

| Command                       | Description                                                              |
|-------------------------------|--------------------------------------------------------------------------|
| <b>ip split-horizon (RIP)</b> | Enables the split horizon mechanism.                                     |
| <b>neighbor (EIGRP)</b>       | Defines a neighboring router with which to exchange routing information. |

# ip summary-address eigrp

To configure address summarization for the Enhanced Interior Gateway Routing Protocol (EIGRP) on a specified interface, use the **ip summary-address eigrp** command in interface configuration or virtual network interface configuration mode. To disable the configuration, use the **no** form of this command.

**ip summary-address eigrp** *as-number ip-address mask* [*admin-distance*] [**leak-map** *name*]  
**no ip summary-address eigrp** *as-number ip-address mask*

## Syntax Description

|                             |                                                                                                                                                                                                                                                  |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>as-number</i>            | Autonomous system number.                                                                                                                                                                                                                        |
| <i>ip-address</i>           | Summary IP address to apply to an interface.                                                                                                                                                                                                     |
| <i>mask</i>                 | Subnet mask.                                                                                                                                                                                                                                     |
| <i>admin-distance</i>       | (Optional) Administrative distance. Range: 0 to 255.<br><br><b>Note</b> Starting with Cisco IOS XE Release 3.2S, the <i>admin-distance</i> argument was removed. Use the <b>summary-metric</b> command to configure the administrative distance. |
| <b>leak-map</b> <i>name</i> | (Optional) Specifies the route-map reference that is used to configure the route leaking through the summary.                                                                                                                                    |

## Command Default

- An administrative distance of 5 is applied to EIGRP summary routes.
- EIGRP automatically summarizes to the network level, even for a single host route.
- No summary addresses are predefined.
- The default administrative distance metric for EIGRP is 90.

## Command Modes

Interface configuration (config-if)

Virtual network interface configuration (config-if-vnet)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

The **ip summary-address eigrp** command is used to configure interface-level address summarization. EIGRP summary routes are given an administrative-distance value of 5. The administrative-distance metric is used to advertise a summary without installing it in the routing table.

By default, EIGRP summarizes subnet routes to the network level. The **no auto-summary** command can be entered to configure the subnet-level summarization.

The summary address is not advertised to the peer if the administrative distance is configured as 255.

### EIGRP Support for Leaking Routes

Configuring the **leak-map** keyword allows a component route that would otherwise be suppressed by the manual summary to be advertised. Any component subset of the summary can be leaked. A route map and access list must be defined to source the leaked route.

The following is the default behavior if an incomplete configuration is entered:

- If the **leak-map** keyword is configured to reference a nonexistent route map, the configuration of this keyword has no effect. The summary address is advertised but all component routes are suppressed.
- If the **leak-map** keyword is configured but the access list does not exist or the route map does not reference the access list, the summary address and all component routes are advertised.

If you are configuring a virtual-network trunk interface and you configure the **ip summary-address eigrp** command, the *admin-distance* value of the command is not inherited by the virtual networks running on the trunk interface because the administrative distance option is not supported in the **ip summary-address eigrp** command on virtual network subinterfaces.

## Examples

The following example shows how to configure an administrative distance of 95 on Ethernet interface 0/0 for the 192.168.0.0/16 summary address:

```
Device(config)#router eigrp 1
Device(config-router)#no auto-summary
Device(config-router)#exit
Device(config)#interface Ethernet 0/0
Device(config-if)#ip summary-address eigrp 1 192.168.0.0 255.255.0.0 95
```

The following example shows how to configure the 10.1.1.0/24 subnet to be leaked through the 10.2.2.0 summary address:

```
Device(config)#router eigrp 1
Device(config-router)#exit
Device(config)#access-list 1 permit 10.1.1.0 0.0.0.255
Device(config)#route-map LEAK-10-1-1 permit 10
Device(config-route-map)#match ip address 1
Device(config-route-map)#exit
Device(config)#interface Serial 0/0
Device(config-if)#ip summary-address eigrp 1 10.2.2.0 255.0.0.0 leak-map LEAK-10-1-1
Device(config-if)#end
```

The following example configures GigabitEthernet interface 0/0/0 as a virtual network trunk interface:

```
Device(config)#interface gigabitethernet 0/0/0
Device(config-if)#vnet global
Device(config-if-vnet)#ip summary-address eigrp 1 10.3.3.0 255.0.0.0 33
```

## Related Commands

|-----------------------------|-------------------------------------------------------------------------------------------------|
| <b>auto-summary (EIGRP)</b> | Configures automatic summarization of subnet routes to network-level routes (default behavior). |
| <b>summary-metric</b>       | Configures fixed metrics for an EIGRP summary aggregate address.                                |

# ip route static bfd

To specify static route bidirectional forwarding detection (BFD) neighbors, use the **ip route static bfd** command in global configuration mode. To remove a static route BFD neighbor, use the **no** form of this command

**ip route static bfd** { *interface-type interface-number ip-address* | **vrf** *vrf-name* } [**group** *group-name*] [**passive**] [**unassociate**]  
**no ip route static bfd** { *interface-type interface-number ip-address* | **vrf** *vrf-name* } [**group** *group-name*] [**passive**] [**unassociate**]

|                           |                                        |                                                                                                                            |
|---------------------------|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <i>interface-type interface-number</i> | Interface type and number.                                                                                                 |
|                           | <i>ip-address</i>                      | IP address of the gateway, in A.B.C.D format.                                                                              |
|                           | <b>vrf</b> <i>vrf-name</i>             | Specifies Virtual Routing and Forwarding (VRF) instance and the destination vrf name.                                      |
|                           | <b>group</b> <i>group-name</i>         | (Optional) Assigns a BFD group. The group-name is a character string of up to 32 characters specifying the BFD group name. |
|                           | <b>unassociate</b>                     | (Optional) Unassociates the static route configured for a BFD.                                                             |
|                           |                                        |                                                                                                                            |

**Command Default** No static route BFD neighbors are specified.

**Command Modes** Global configuration (config)

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

Use the **ip route static bfd** command to specify static route BFD neighbors. All static routes that have the same interface and gateway specified in the configuration share the same BFD session for reachability notification.

All static routes that specify the same values for the *interface-type*, *interface-number*, and *ip-address* arguments will automatically use BFD to determine gateway reachability and take advantage of fast failure detection.

The **group** keyword assigns a BFD group. The static BFD configuration is added to the VPN routing and forwarding (VRF) instance with which the interface is associated. The **passive** keyword specifies the passive member of the group. Adding static BFD in a group without the **passive** keyword makes the BFD an active member of the group. A static route should be tracked by the active BFD configuration in order to trigger a BFD session for the group. To remove all the static BFD configurations (active and passive) of a specific group, use the **no ip route static bfd** command and specify the BFD group name.

The **unassociate** keyword specifies that a BFD neighbor is not associated with static route, and the BFD sessions are requested if an interface has been configured with BFD. This is useful in bringing up a BFDv4 session in the absence of an IPv4 static route. If the unassociate keyword is not provided, then the IPv4 static routes are associated with BFD sessions.

BFD requires that BFD sessions are initiated on both endpoint devices. Therefore, this command must be configured on each endpoint device.

The BFD static session on a switch virtual interface (SVI) is established only after the **bfd interval milliseconds min\_rx milliseconds multiplier multiplier-value** command is disabled and enabled on that SVI.

To enable the static BFD sessions, perform the following steps:

1. Enable BFD timers on the SVI.

```
bfd interval milliseconds min_rx milliseconds multiplier multiplier-value
```

2. Enable BFD for the static IP route

```
ip route static bfd interface-type interface-number ip-address
```

3. Disable and enable the BFD timers on the SVI again.

```
no bfd interval milliseconds min_rx milliseconds multiplier multiplier-value
```

```
bfd interval milliseconds min_rx milliseconds multiplier multiplier-value
```

## Examples

The following example shows how to configure BFD for all static routes through a specified neighbor, group, and active member of the group:

```
Device#configuration terminal  
Device(config)#ip route static bfd GigabitEthernet 1/0/1 10.1.1.1 group group1
```

The following example shows how to configure BFD for all static routes through a specified neighbor, group, and passive member of the group:

```
Device#configuration terminal  
Device(config)#ip route static bfd GigabitEthernet 1/0/1 10.2.2.2 group group1 passive
```

The following example shows how to configure BFD for all static routes in an unassociated mode without the group and passive keywords:

```
Device#configuration terminal  
Device(config)#ip route static bfd GigabitEthernet 1/0/1 10.2.2.2 unassociate
```

# ipv6 route static bfd

To specify static route Bidirectional Forwarding Detection for IPv6 (BFDv6) neighbors, use the **ipv6 route static bfd** command in global configuration mode. To remove a static route BFDv6 neighbor, use the **no** form of this command

**ipv6 route static bfd** [**vrf** *vrf-name*] *interface-type interface-number ipv6-address* [**unassociated**]  
**no ipv6 route static bfd**

|                           |                                        |                                                                                                                  |
|---------------------------|----------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Syntax Description</b> | <b>vrf</b> <i>vrf-name</i>             | (Optional) Name of the virtual routing and forwarding (VRF) instance by which static routes should be specified. |
|                           | <i>interface-type interface-number</i> | Interface type and number.                                                                                       |
|                           | <i>ipv6-address</i>                    | IPv6 address of the neighbor.                                                                                    |
|                           | <b>unassociated</b>                    | (Optional) Moves a static BFD neighbor from associated mode to unassociated mode.                                |

**Command Default** No static route BFDv6 neighbors are specified.

**Command Modes** Global configuration (config)

|                        |                              |                              |
|------------------------|------------------------------|------------------------------|
| <b>Command History</b> | <b>Release</b>               | <b>Modification</b>          |
|                        | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** Use the **ipv6 route static bfd** command to specify static route neighbors. All of the static routes that have the same interface and gateway specified in the configuration share the same BFDv6 session for reachability notification. BFDv6 requires that BFDv6 sessions are initiated on both endpoint routers. Therefore, this command must be configured on each endpoint router. An IPv6 static BFDv6 neighbor must be fully specified (with the interface and the neighbor address) and must be directly attached.

All static routes that specify the same values for **vrf vrf-name**, **interface-type interface-number**, and **ipv6-address** will automatically use BFDv6 to determine gateway reachability and take advantage of fast failure detection.

## Examples

The following example creates a neighbor on Ethernet interface 0/0 with an address of 2001::1:

```
Device#configuration terminal
Device(config)#ipv6 route static bfd ethernet 0/0 2001::1
```

The following example converts the neighbor to unassociated mode:

```
Device#configuration terminal
Device(config)#ipv6 route static bfd ethernet 0/0 2001::1 unassociated
```

## metric weights (EIGRP)

To tune the Enhanced Interior Gateway Routing Protocol (EIGRP) metric calculations, use the **metric weights** command in router configuration mode or address family configuration mode. To reset the values to their defaults, use the **no** form of this command.

### Router Configuration

**metric weights** *tos k1 k2 k3 k4 k5*

**no metric weights**

### Address Family Configuration

**metric weights** *tos [k1 [k2 [k3 [k4 [k5 [k6]]]]]]]*

**no metric weights**

#### Syntax Description

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>tos</i>               | Type of service. This value must always be zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <i>k1 k2 k3 k4 k5 k6</i> | (Optional) Constants that convert an EIGRP metric vector into a scalar quantity. Valid values are 0 to 255. Given below are the default values: <ul style="list-style-type: none"><li>• <i>k1</i>: 1</li><li>• <i>k2</i>: 0</li><li>• <i>k3</i>: 1</li><li>• <i>k4</i>: 0</li><li>• <i>k5</i>: 0</li><li>• <i>k6</i>: 0</li></ul> <p><b>Note</b> In address family configuration mode, if the values are not specified, default values are configured. The <i>k6</i> argument is supported only in address family configuration mode.</p> |

#### Command Default

EIGRP metric K values are set to their default values.

#### Command Modes

Router configuration (config-router)

Address family configuration (config-router-af)

#### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

#### Usage Guidelines

Use this command to alter the default behavior of EIGRP routing and metric computation and to allow the tuning of the EIGRP metric calculation for a particular type of service (ToS).

If *k5* equals 0, the composite EIGRP metric is computed according to the following formula:

metric = [*k1* \* bandwidth + (*k2* \* bandwidth)/(256 – load) + *k3* \* delay + *K6* \* extended metrics]

If k5 does not equal zero, an additional operation is performed:

$$\text{metric} = \text{metric} * [\text{k5}/(\text{reliability} + \text{k4})]$$

Scaled Bandwidth =  $10^7 / \text{minimum interface bandwidth (in kilobits per second)} * 256$

Delay is in tens of microseconds for classic mode and pico seconds for named mode. In classic mode, a delay of hexadecimal FFFFFFFF (decimal 4294967295) indicates that the network is unreachable. In named mode, a delay of hexadecimal FFFFFFFFFF (decimal 281474976710655) indicates that the network is unreachable.

Reliability is given as a fraction of 255. That is, 255 is 100 percent reliability or a perfectly stable link.

Load is given as a fraction of 255. A load of 255 indicates a completely saturated link.

## Examples

The following example shows how to set the metric weights to slightly different values than the defaults:

```
Device(config)#router eigrp 109
Device(config-router)#network 192.168.0.0
Device(config-router)#metric weights 0 2 0 2 0 0
```

The following example shows how to configure an address-family metric weight to ToS: 0; K1: 2; K2: 0; K3: 2; K4: 0; K5: 0; K6:1:

```
Device(config)#router eigrp virtual-name
Device(config-router)#address-family ipv4 autonomous-system 4533
Device(config-router-af)#metric weights 0 2 0 2 0 0 1
```

## Related Commands

| Command                       | Description                                                                                                                                      |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>address-family (EIGRP)</b> | Enters address family configuration mode to configure an EIGRP routing instance.                                                                 |
| <b>bandwidth (interface)</b>  | Sets a bandwidth value for an interface.                                                                                                         |
| <b>delay (interface)</b>      | Sets a delay value for an interface.                                                                                                             |
| <b>ipv6 router eigrp</b>      | Configures an IPv6 EIGRP routing process.                                                                                                        |
| <b>metric holddown</b>        | Keeps new EIGRP routing information from being used for a certain period of time.                                                                |
| <b>metric maximum-hops</b>    | Causes IP routing software to advertise routes with a hop count higher than what is specified by the command (EIGRP only) as unreachable routes. |
| <b>router eigrp</b>           | Configures an EIGRP routing process.                                                                                                             |

# neighbor advertisement-interval

To set the minimum route advertisement interval (MRAI) between the sending of BGP routing updates, use the **neighbor advertisement-interval** command in address family or router configuration mode. To restore the default value, use the **no** form of this command.

**neighbor** {*ip-address**peer-group-name*} **advertisement-interval** *seconds*  
**no neighbor** {*ip-address**peer-group-name*} **advertisement-interval** *seconds*

## Syntax Description

|                        |                                                                     |
|------------------------|---------------------------------------------------------------------|
| <i>ip-address</i>      | IP address of the neighbor.                                         |
| <i>peer-group-name</i> | Name of a BGP peer group.                                           |
| <i>seconds</i>         | Time (in seconds) is specified by an integer ranging from 0 to 600. |

## Command Default

eBGP sessions not in a VRF: 30 seconds

eBGP sessions in a VRF: 0 seconds

iBGP sessions: 0 seconds

## Command Modes

Router configuration (config-router)

## Command History

*Table 135:*

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

When the MRAI is equal to 0 seconds, BGP routing updates are sent as soon as the BGP routing table changes.

If you specify a BGP peer group by using the *peer-group-name* argument, all the members of the peer group will inherit the characteristic configured with this command.

## Examples

The following router configuration mode example sets the minimum time between sending BGP routing updates to 10 seconds:

```
router bgp 5
 neighbor 10.4.4.4 advertisement-interval 10
```

The following address family configuration mode example sets the minimum time between sending BGP routing updates to 10 seconds:

```
router bgp 5
 address-family ipv4 unicast
  neighbor 10.4.4.4 advertisement-interval 10
```

| <b>address-family vpnv4</b>           | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard VPNv4 address prefixes. |
| <b>neighbor peer-group (creating)</b> | Creates a BGP peer group.                                                                                                                                                      |

# neighbor default-originate

To allow a BGP speaker (the local router) to send the default route 0.0.0.0 to a neighbor for use as a default route, use the **neighbor default-originate** command in address family or router configuration mode. To send no route as a default, use the **no** form of this command.

**neighbor** {*ip-address**peer-group-name*} **default-originate** [**route-map** *map-name*]  
**no neighbor** {*ip-address**peer-group-name*} **default-originate** [**route-map** *map-name*]

## Syntax Description

|                                  |                                                                                                    |
|----------------------------------|----------------------------------------------------------------------------------------------------|
| <i>ip-address</i>                | IP address of the neighbor.                                                                        |
| <i>peer-group-name</i>           | Name of a BGP peer group.                                                                          |
| <b>route-map</b> <i>map-name</i> | (Optional) Name of the route map. The route map allows route 0.0.0.0 to be injected conditionally. |

## Command Default

No default route is sent to the neighbor.

## Command Modes

Address family configuration (config-router-af)

Router configuration (config-router)

## Command History

**Table 136:**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

This command does not require the presence of 0.0.0.0 in the local router. When used with a route map, the default route 0.0.0.0 is injected if the route map contains a **match ip address** clause and there is a route that matches the IP access list exactly. The route map can contain other match clauses also.

You can use standard or extended access lists with the **neighbor default-originate** command.

## Examples

In the following router configuration example, the local router injects route 0.0.0.0 to the neighbor 172.16.2.3 unconditionally:

```
router bgp 109
network 172.16.0.0
neighbor 172.16.2.3 remote-as 200
neighbor 172.16.2.3 default-originate
```

In the following example, the local router injects route 0.0.0.0 to the neighbor 172.16.2.3 only if there is a route to 192.168.68.0 (that is, if a route with any mask exists, such as 255.255.255.0 or 255.255.0.0):

```
router bgp 109
network 172.16.0.0
neighbor 172.16.2.3 remote-as 200
neighbor 172.16.2.3 default-originate route-map default-map
!
```

```

route-map default-map 10 permit
  match ip address 1
!
access-list 1 permit 192.168.68.0

```

In the following example, the last line of the configuration has been changed to show the use of an extended access list. The local router injects route 0.0.0.0 to the neighbor 172.16.2.3 only if there is a route to 192.168.68.0 with a mask of 255.255.0.0:

```

router bgp 109
  network 172.16.0.0
  neighbor 172.16.2.3 remote-as 200
  neighbor 172.16.2.3 default-originate route-map default-map
!
route-map default-map 10 permit
  match ip address 100
!
access-list 100 permit ip host 192.168.68.0 host 255.255.0.0

```

#### Related Commands

| Command                          | Description                                                                                                                                                                    |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>address-family ipv4 (BGP)</b> | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard IPv4 address prefixes.  |
| <b>address-family vpnv4</b>      | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard VPNv4 address prefixes. |
| <b>neighbor ebgp-multihop</b>    | Accepts and attempts BGP connections to external peers residing on networks that are not directly connected.                                                                   |

# neighbor description

To associate a description with a neighbor, use the **neighbor description** command in router configuration mode or address family configuration mode. To remove the description, use the **no** form of this command.

**neighbor** {*ip-address**peer-group-name*} **description** *text*  
**no neighbor** {*ip-address**peer-group-name*} **description** [*text*]

## Syntax Description

|                        |                                                                                                   |
|------------------------|---------------------------------------------------------------------------------------------------|
| <i>ip-address</i>      | IP address of the neighbor.                                                                       |
| <i>peer-group-name</i> | Name of an EIGRP peer group. This argument is not available in address-family configuration mode. |
| <i>text</i>            | Text (up to 80 characters in length) that describes the neighbor.                                 |

## Command Default

There is no description of the neighbor.

## Command Modes

Router configuration (config-router) Address family configuration (config-router-af)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Examples

In the following examples, the description of the neighbor is “peer with example.com”:

```
Device(config)#router bgp 109  
Device(config-router)#network 172.16.0.0  
Device(config-router)#neighbor 172.16.2.3 description peer with example.com
```

In the following example, the description of the address family neighbor is “address-family-peer”:

```
Device(config)#router eigrp virtual-name  
Device(config-router)#address-family ipv4 autonomous-system 4453  
Device(config-router-af)#network 172.16.0.0  
Device(config-router-af)#neighbor 172.16.2.3 description address-family-peer
```

## Related Commands

| Command                       | Description                                                                      |
|-------------------------------|----------------------------------------------------------------------------------|
| <b>address-family (EIGRP)</b> | Enters address family configuration mode to configure an EIGRP routing instance. |
| <b>network (EIGRP)</b>        | Specifies the network for an EIGRP routing process.                              |
| <b>router eigrp</b>           | Configures the EIGRP address family process.                                     |

# neighbor ebgp-multihop

To accept and attempt BGP connections to external peers residing on networks that are not directly connected, use the **neighbor ebgp-multihop** command in router configuration mode. To return to the default, use the **no** form of this command.

**neighbor** {*ip-address**ipv6-address**peer-group-name*} **ebgp-multihop** [*ttl*]  
**no neighbor** {*ip-address**ipv6-address**peer-group-name*} **ebgp-multihop**

## Syntax Description

|                        |                                                          |
|------------------------|----------------------------------------------------------|
| <i>ip-address</i>      | IP address of the BGP-speaking neighbor.                 |
| <i>ipv6-address</i>    | IPv6 address of the BGP-speaking neighbor.               |
| <i>peer-group-name</i> | Name of a BGP peer group.                                |
| <i>ttl</i>             | (Optional) Time-to-live in the range from 1 to 255 hops. |

## Command Default

Only directly connected neighbors are allowed.

## Command Modes

Router configuration (config-router)

## Command History

**Table 137:**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

This feature should be used only under the guidance of Cisco technical support staff.

If you specify a BGP peer group by using the *peer-group-name* argument, all the members of the peer group will inherit the characteristic configured with this command.

To prevent the creation of loops through oscillating routes, the multihop will not be established if the only route to the multihop peer is the default route (0.0.0.0).

## Examples

The following example allows connections to or from neighbor 10.108.1.1, which resides on a network that is not directly connected:

```
Device(config)#router bgp 109
Device(config-router)#neighbor 10.108.1.1 ebgp-multihop
```

## Related Commands

| Command                                     | Description                                                                                                         |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>neighbor advertise-map non-exist-map</b> | Allows a BGP speaker (the local router) to send the default route 0.0.0.0 to a neighbor for use as a default route. |
| <b>neighbor peer-group (creating)</b>       | Creates a BGP peer group.                                                                                           |
| <b>network (BGP and multiprotocol BGP)</b>  | Specifies the list of networks for the BGP routing process.                                                         |

## neighbor maximum-prefix (BGP)

To control how many prefixes can be received from a neighbor, use the **neighbor maximum-prefix** command in router configuration mode. To disable this function, use the **no** form of this command.

**neighbor** {*ip-address**peer-group-name*} **maximum-prefix** *maximum* [*threshold*] [**restart** *restart-interval*] [**warning-only**]  
**no neighbor** {*ip-address**peer-group-name*} **maximum-prefix** *maximum*

### Syntax Description

|                         |                                                                                                                                                                                                                                                           |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip-address</i>       | IP address of the neighbor.                                                                                                                                                                                                                               |
| <i>peer-group-name</i>  | Name of a Border Gateway Protocol (BGP) peer group.                                                                                                                                                                                                       |
| <i>maximum</i>          | Maximum number of prefixes allowed from the specified neighbor. The number of prefixes that can be configured is limited only by the available system resources on a router.                                                                              |
| <i>threshold</i>        | (Optional) Integer specifying at what percentage of the <i>maximum-prefix</i> limit the router starts to generate a warning message. The range is from 1 to 100; the default is 75.                                                                       |
| <b>restart</b>          | (Optional) Configures the router that is running BGP to automatically reestablish a peering session that has been disabled because the maximum-prefix limit has been exceeded. The restart timer is configured with the <i>restart-interval</i> argument. |
| <i>restart-interval</i> | (Optional) Time interval (in minutes) that a peering session is reestablished. The range is from 1 to 65535 minutes.                                                                                                                                      |
| <b>warning-only</b>     | (optional) Allows the router to generate a sys-log message when the <i>maximum-prefix</i> limit is exceeded, instead of terminating the peering session.                                                                                                  |

### Command Default

This command is disabled by default. Peering sessions are disabled when the maximum number of prefixes is exceeded. If the *restart-interval* argument is not configured, a disabled session will stay down after the maximum-prefix limit is exceeded.

*threshold* : 75 percent

### Command Modes

Router configuration (config-router)

### Command History

Table 138:

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

The **neighbor maximum-prefix** command allows you to configure a maximum number of prefixes that a Border Gateway Protocol (BGP) routing process will accept from the specified peer. This feature provides a mechanism (in addition to distribute lists, filter lists, and route maps) to control prefixes received from a peer.

When the number of received prefixes exceeds the maximum number configured, BGP disables the peering session (by default). If the **restart** keyword is configured, BGP will automatically reestablish the peering

session at the configured time interval. If the **restart** keyword is not configured and a peering session is terminated because the maximum prefix limit has been exceeded, the peering session will not be reestablished until the **clear ip bgp** command is entered. If the **warning-only** keyword is configured, BGP sends only a log message and continues to peer with the sender.

There is no default limit on the number of prefixes that can be configured with this command. Limitations on the number of prefixes that can be configured are determined by the amount of available system resources.

## Examples

In the following example, the maximum prefixes that will be accepted from the 192.168.1.1 neighbor is set to 1000:

```
Device(config)#router bgp 40000
Device(config-router)#network 192.168.0.0
Device(config-router)#neighbor 192.168.1.1 maximum-prefix 1000
```

In the following example, the maximum number of prefixes that will be accepted from the 192.168.2.2 neighbor is set to 5000. The router is also configured to display warning messages when 50 percent of the maximum-prefix limit (2500 prefixes) has been reached.

```
Device(config)#router bgp 40000
Device(config-router)#network 192.168.0.0
Device(config-router)#neighbor 192.168.2.2 maximum-prefix 5000 50
```

In the following example, the maximum number of prefixes that will be accepted from the 192.168.3.3 neighbor is set to 2000. The router is also configured to reestablish a disabled peering session after 30 minutes.

```
Device(config)#router bgp 40000
Device(config-router)#network 192.168.0.0
Device(config-router)#neighbor 192.168.3.3 maximum-prefix 2000 restart 30
```

In the following example, warning messages will be displayed when the threshold of the maximum-prefix limit ( $500 \times 0.75 = 375$ ) for the 192.168.4.4 neighbor is exceeded:

```
Device(config)#router bgp 40000
Device(config-router)#network 192.168.0.0
Device(config-router)#neighbor 192.168.4.4 maximum-prefix 500 warning-only
```

## Related Commands

| Command             | Description                                             |
|---------------------|---------------------------------------------------------|
| <b>clear ip bgp</b> | Resets a BGP connection using BGP soft reconfiguration. |

## neighbor peer-group (assigning members)

To configure a BGP neighbor to be a member of a peer group, use the **neighbor peer-group** command in address family or router configuration mode. To remove the neighbor from the peer group, use the **no** form of this command.

**neighbor** {*ip-address*|*ipv6-address*} **peer-group** *peer-group-name*  
**no neighbor** {*ip-address*|*ipv6-address*} **peer-group** *peer-group-name*

### Syntax Description

|                        |                                                                                                                   |
|------------------------|-------------------------------------------------------------------------------------------------------------------|
| <i>ip-address</i>      | IP address of the BGP neighbor that belongs to the peer group specified by the <i>peer-group-name</i> argument.   |
| <i>ipv6-address</i>    | IPv6 address of the BGP neighbor that belongs to the peer group specified by the <i>peer-group-name</i> argument. |
| <i>peer-group-name</i> | Name of the BGP peer group to which this neighbor belongs.                                                        |

### Command Default

There are no BGP neighbors in a peer group.

### Command Modes

Address family configuration (config-router-af)

Router configuration (config-router)

### Command History

*Table 139:*

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

The neighbor at the IP address indicated inherits all the configured options of the peer group.

#### Note

Using the **no** form of the **neighbor peer-group** command removes all of the BGP configuration for that neighbor, not just the peer group association.

### Examples

The following router configuration mode example assigns three neighbors to the peer group named internal:

```
Device(config)#router bgp 100
Device(config-router)#neighbor internal peer-group
Device(config-router)#neighbor internal remote-as 100
Device(config-router)#neighbor internal update-source loopback 0
Device(config-router)#neighbor internal route-map set-med out
Device(config-router)#neighbor internal filter-list 1 out
Device(config-router)#neighbor internal filter-list 2 in
Device(config-router)#neighbor 172.16.232.53 peer-group internal
Device(config-router)#neighbor 172.16.232.54 peer-group internal
```

## neighbor peer-group (assigning members)

```
Device(config-router)#neighbor 172.16.232.55 peer-group internal
Device(config-router)#neighbor 172.16.232.55 filter-list 3 in
```

The following address family configuration mode example assigns three neighbors to the peer group named internal:

```
Device(config)#router bgp 100
Device(config-router)#address-family ipv4 unicast
Device(config-router)#neighbor internal peer-group
Device(config-router)#neighbor internal remote-as 100
Device(config-router)#neighbor internal update-source loopback 0
Device(config-router)#neighbor internal route-map set-med out
Device(config-router)#neighbor internal filter-list 1 out
Device(config-router)#neighbor internal filter-list 2 in
Device(config-router)#neighbor 172.16.232.53 peer-group internal
Device(config-router)#neighbor 172.16.232.54 peer-group internal
Device(config-router)#neighbor 172.16.232.55 peer-group internal
Device(config-router)#neighbor 172.16.232.55 filter-list 3 in
```

## Related Commands

| Command                               | Description                                                                                                                                                                    |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>address-family ipv4 (BGP)</b>      | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard IPv4 address prefixes.  |
| <b>address-family vpnv4</b>           | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard VPNv4 address prefixes. |
| <b>neighbor peer-group (creating)</b> | Creates a BGP peer group.                                                                                                                                                      |
| <b>neighbor shutdown</b>              | Disables a neighbor or peer group.                                                                                                                                             |

## neighbor peer-group (creating)

To create a BGP or multiprotocol BGP peer group, use the **neighbor peer-group** command in address family or router configuration mode. To remove the peer group and all of its members, use the **no** form of this command.

**neighbor** *peer-group-name* **peer-group**  
**no neighbor** *peer-group-name* **peer-group**

### Syntax Description

|                        |                             |
|------------------------|-----------------------------|
| <i>peer-group-name</i> | Name of the BGP peer group. |
|------------------------|-----------------------------|

### Command Default

There is no BGP peer group.

### Command Modes

Address family configuration (config-router-af)  
Router configuration (config-router)

### Command History

Table 140:

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

Often in a BGP or multiprotocol BGP speaker, many neighbors are configured with the same update policies (that is, same outbound route maps, distribute lists, filter lists, update source, and so on). Neighbors with the same update policies can be grouped into peer groups to simplify configuration and make update calculation more efficient.

#### Note

Peer group members can span multiple logical IP subnets, and can transmit, or pass along, routes from one peer group member to another.

Once a peer group is created with the **neighbor peer-group** command, it can be configured with the **neighbor** commands. By default, members of the peer group inherit all the configuration options of the peer group. Members also can be configured to override the options that do not affect outbound updates.

All the peer group members will inherit the current configuration as well as changes made to the peer group. Peer group members will always inherit the following configuration options by default:

- remote-as (if configured)
- version
- update-source
- outbound route-maps
- outbound filter-lists
- outbound distribute-lists

- minimum-advertisement-interval
- next-hop-self

If a peer group is not configured with a remote-as option, the members can be configured with the **neighbor {ip-address | peer-group-name} remote-as** command. This command allows you to create peer groups containing external BGP (eBGP) neighbors.

## Examples

The following example configurations show how to create these types of neighbor peer group:

- internal Border Gateway Protocol (iBGP) peer group
- eBGP peer group
- Multiprotocol BGP peer group

In the following example, the peer group named internal configures the members of the peer group to be iBGP neighbors. By definition, this is an iBGP peer group because the **router bgp** command and the **neighbor remote-as** command indicate the same autonomous system (in this case, autonomous system 100). All the peer group members use loopback 0 as the update source and use set-med as the outbound route map. The **neighbor internal filter-list 2 in** command shows that, except for 172.16.232.55, all the neighbors have filter list 2 as the inbound filter list.

```
router bgp 100
neighbor internal peer-group
neighbor internal remote-as 100
neighbor internal update-source loopback 0
neighbor internal route-map set-med out
neighbor internal filter-list 1 out
neighbor internal filter-list 2 in
neighbor 172.16.232.53 peer-group internal
neighbor 172.16.232.54 peer-group internal
neighbor 172.16.232.55 peer-group internal
neighbor 172.16.232.55 filter-list 3 in
```

The following example defines the peer group named external-peers without the **neighbor remote-as** command. By definition, this is an eBGP peer group because each individual member of the peer group is configured with its respective autonomous system number separately. Thus the peer group consists of members from autonomous systems 200, 300, and 400. All the peer group members have the set-metric route map as an outbound route map and filter list 99 as an outbound filter list. Except for neighbor 172.16.232.110, all of them have 101 as the inbound filter list.

```
router bgp 100
neighbor external-peers peer-group
neighbor external-peers route-map set-metric out
neighbor external-peers filter-list 99 out
neighbor external-peers filter-list 101 in
neighbor 172.16.232.90 remote-as 200
neighbor 172.16.232.90 peer-group external-peers
neighbor 172.16.232.100 remote-as 300
neighbor 172.16.232.100 peer-group external-peers
neighbor 172.16.232.110 remote-as 400
neighbor 172.16.232.110 peer-group external-peers
neighbor 172.16.232.110 filter-list 400 in
```

In the following example, all members of the peer group are multicast-capable:

```
router bgp 100
neighbor 10.1.1.1 remote-as 1
neighbor 172.16.2.2 remote-as 2
address-family ipv4 multicast
neighbor mygroup peer-group
neighbor 10.1.1.1 peer-group mygroup
neighbor 172.16.2.2 peer-group mygroup
neighbor 10.1.1.1 activate
neighbor 172.16.2.2 activate
```

|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>address-family ipv4 (BGP)</b> | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard IPv4 address prefixes.  |
| <b>address-family vpnv4</b>      | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard VPNv4 address prefixes. |
| <b>clear ip bgp peer-group</b>   | Removes all the members of a BGP peer group.                                                                                                                                   |
| <b>show ip bgp peer-group</b>    | Displays information about BGP peer groups.                                                                                                                                    |

# neighbor route-map

To apply a route map to incoming or outgoing routes, use the **neighbor route-map** command in address family or router configuration mode. To remove a route map, use the **no** form of this command.

**neighbor** {*ip-address* *peer-group-name* | *ipv6-address* [%]} **route-map** *map-name* {**in** | **out**}  
**no neighbor** {*ip-address* *peer-group-name* | *ipv6-address* [%]} **route-map** *map-name* {**in** | **out**}

## Syntax Description

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip-address</i>      | IP address of the neighbor.                                                                                                                                    |
| <i>peer-group-name</i> | Name of a BGP or multiprotocol BGP peer group.                                                                                                                 |
| <i>ipv6-address</i>    | IPv6 address of the neighbor.                                                                                                                                  |
| %                      | (Optional) IPv6 link-local address identifier. This keyword needs to be added whenever a link-local IPv6 address is used outside the context of its interface. |
| <i>map-name</i>        | Name of a route map.                                                                                                                                           |
| <b>in</b>              | Applies route map to incoming routes.                                                                                                                          |
| <b>out</b>             | Applies route map to outgoing routes.                                                                                                                          |

## Command Default

No route maps are applied to a peer.

## Command Modes

Router configuration (config-router)

## Command History

Table 141:

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

When specified in address family configuration mode, this command applies a route map to that particular address family only. When specified in router configuration mode, this command applies a route map to IPv4 or IPv6 unicast routes only.

If an outbound route map is specified, it is proper behavior to only advertise routes that match at least one section of the route map.

If you specify a BGP or multiprotocol BGP peer group by using the *peer-group-name* argument, all the members of the peer group will inherit the characteristic configured with this command. Specifying the command for a neighbor overrides the inbound policy that is inherited from the peer group.

The % keyword is used whenever link-local IPv6 addresses are used outside the context of their interfaces. This keyword does not need to be used for non-link-local IPv6 addresses.

## Examples

The following router configuration mode example applies a route map named internal-map to a BGP incoming route from 172.16.70.24:

```
router bgp 5
```

```
neighbor 172.16.70.24 route-map internal-map in
route-map internal-map
match as-path 1
set local-preference 100
```

The following address family configuration mode example applies a route map named internal-map to a multiprotocol BGP incoming route from 172.16.70.24:

```
router bgp 5
address-family ipv4 multicast
neighbor 172.16.70.24 route-map internal-map in
route-map internal-map
match as-path 1
set local-preference 100
```

| <b>address-family ipv6</b>       | Enters address family configuration mode for configuring routing sessions such as BGP that use standard IPv6 address prefixes.                                                         |
| <b>address-family vpnv4</b>      | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard VPN Version 4 address prefixes. |
| <b>address-family vpnv6</b>      | Places the router in address family configuration mode for configuring routing sessions that use standard VPNv6 address prefixes.                                                      |
| <b>neighbor remote-as</b>        | Creates a BGP peer group.                                                                                                                                                              |

# neighbor update-source

To have the Cisco software allow Border Gateway Protocol (BGP) sessions to use any operational interface for TCP connections, use the **neighbor update-source** command in router configuration mode. To restore the interface assignment to the closest interface, which is called the best local address, use the **no** form of this command.

**neighbor** {*ip-address* | *ipv6-address* [%]} [*peer-group-name*] **update-source** *interface-type* *interface-number*  
**neighbor** {*ip-address* | *ipv6-address* [%]} [*peer-group-name*] **update-source** *interface-type* *interface-number*

## Syntax Description

|                         |                                                                                                                                                                |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip-address</i>       | IPv4 address of the BGP-speaking neighbor.                                                                                                                     |
| <i>ipv6-address</i>     | IPv6 address of the BGP-speaking neighbor.                                                                                                                     |
| %                       | (Optional) IPv6 link-local address identifier. This keyword needs to be added whenever a link-local IPv6 address is used outside the context of its interface. |
| <i>peer-group-name</i>  | Name of a BGP peer group.                                                                                                                                      |
| <i>interface-type</i>   | Interface type.                                                                                                                                                |
| <i>interface-number</i> | Interface number.                                                                                                                                              |

## Command Default

Best local address

## Command Modes

Router configuration (config-router)

## Command History

*Table 142:*

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

This command can work in conjunction with the loopback interface feature described in the “Interface Configuration Overview” chapter of the Cisco IOS Interface and Hardware Component Configuration Guide.

If you specify a BGP peer group by using the *peer-group-name* argument, all the members of the peer group will inherit the characteristic configured with this command.

The **neighbor update-source** command must be used to enable IPv6 link-local peering for internal or external BGP sessions.

The % keyword is used whenever link-local IPv6 addresses are used outside the context of their interfaces and for these link-local IPv6 addresses you must specify the interface they are on. The syntax becomes <IPv6 local-link address>%<interface name>, for example, FE80::1%Ethernet1/0. Note that the interface type and number must not contain any spaces, and be used in full-length form because name shortening is not supported in this situation. The % keyword and subsequent interface syntax is not used for non-link-local IPv6 addresses.

## Examples

The following example sources BGP TCP connections for the specified neighbor with the IP address of the loopback interface rather than the best local address:

```

Device(config)#router bgp 65000
Device(config-router)#network 172.16.0.0
Device(config-router)#neighbor 172.16.2.3 remote-as 110
Device(config-router)#neighbor 172.16.2.3 update-source Loopback0

```

The following example sources IPv6 BGP TCP connections for the specified neighbor in autonomous system 65000 with the global IPv6 address of loopback interface 0 and the specified neighbor in autonomous system 65400 with the link-local IPv6 address of Fast Ethernet interface 0/0. Note that the link-local IPv6 address of FE80::2 is on Ethernet interface 1/0.

```

Device(config)#router bgp 65000
Device(config-router)#neighbor 3ffe::3 remote-as 65000
Device(config-router)#neighbor 3ffe::3 update-source Loopback0
Device(config-router)#neighbor fe80::2%Ethernet1/0 remote-as 65400
Device(config-router)#neighbor fe80::2%Ethernet1/0 update-source FastEthernet 0/0
Device(config-router)#address-family ipv6
Device(config-router)#neighbor 3ffe::3 activate
Device(config-router)#neighbor fe80::2%Ethernet1/0 activate
Device(config-router)#exit-address-family

```

#### Related Commands

|---------------------------|--------------------------------------------------------------------|
| <b>neighbor activate</b>  | Enables the exchange of information with a BGP neighboring router. |
| <b>neighbor remote-as</b> | Adds an entry to the BGP or multiprotocol BGP neighbor table.      |

# network (BGP and multiprotocol BGP)

To specify the networks to be advertised by the Border Gateway Protocol (BGP) and multiprotocol BGP routing processes, use the **network** command in address family or router configuration mode. To remove an entry from the routing table, use the **no** form of this command.

**network** {*network-number* [**mask** *network-mask*]*nsap-prefix*} [**route-map** *map-tag*]  
**no network** {*network-number* [**mask** *network-mask*]*nsap-prefix*} [**route-map** *map-tag*]

## Syntax Description

|                                 |                                                                                                                                                                                                                                                                          |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>network-number</i>           | Network that BGP or multiprotocol BGP will advertise.                                                                                                                                                                                                                    |
| <b>mask</b> <i>network-mask</i> | (Optional) Network or subnetwork mask with mask address.                                                                                                                                                                                                                 |
| <i>nsap-prefix</i>              | Network service access point (NSAP) prefix of the Connectionless Network Service (CLNS) network that BGP or multiprotocol BGP will advertise. This argument is used only under NSAP address family configuration mode.                                                   |
| <b>route-map</b> <i>map-tag</i> | (Optional) Identifier of a configured route map. The route map should be examined to filter the networks to be advertised. If not specified, all networks are advertised. If the keyword is specified, but no route map tags are listed, no networks will be advertised. |

## Command Default

No networks are specified.

## Command Modes

Address family configuration (config-router-af)  
 Router configuration (config-router)

## Command History

**Table 143:**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

BGP and multiprotocol BGP networks can be learned from connected routes, from dynamic routing, and from static route sources.

The maximum number of **network** commands you can use is determined by the resources of the router, such as the configured NVRAM or RAM.

## Examples

The following example sets up network 10.108.0.0 to be included in the BGP updates:

```
Device(config)#router bgp 65100
Device(config-router)#network 10.108.0.0
```

The following example sets up network 10.108.0.0 to be included in the multiprotocol BGP updates:

```
Device(config)#router bgp 64800
```

```
Device(config-router)#address family ipv4 multicast
Device(config-router)#network 10.108.0.0
```

The following example advertises NSAP prefix 49.6001 in the multiprotocol BGP updates:

```
Device(config)#router bgp 64500
Device(config-router)#address-family nsap
Device(config-router)#network 49.6001
```

**Related Commands**

| Command                                    | Description                                                                                                                                                                           |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>address-family ipv4 (BGP)</b>           | Enters the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard IP Version 4 address prefixes. |
| <b>address-family vpnv4</b>                | Enters the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard VPNv4 address prefixes.        |
| <b>default-information originate (BGP)</b> | Allows the redistribution of network 0.0.0.0 into BGP.                                                                                                                                |
| <b>route-map (IP)</b>                      | Defines the conditions for redistributing routes from one routing protocol into another.                                                                                              |
| <b>router bgp</b>                          | Configures the BGP routing process.                                                                                                                                                   |

# network (EIGRP)

To specify the network for an Enhanced Interior Gateway Routing Protocol (EIGRP) routing process, use the **network** command in router configuration mode or address-family configuration mode. To remove an entry, use the **no** form of this command.

**network** *ip-address* [*wildcard-mask*]  
**no network** *ip-address* [*wildcard-mask*]

|                    |                      |                                                                                                              |
|--------------------|----------------------|--------------------------------------------------------------------------------------------------------------|
| Syntax Description | <i>ip-address</i>    | IP address of the directly connected network.                                                                |
|                    | <i>wildcard-mask</i> | (Optional) EIGRP wildcard bits. Wildcard mask indicates a subnetwork, bitwise complement of the subnet mask. |

**Command Default** No networks are specified.

**Command Modes** Router configuration (config-router) Address-family configuration (config-router-af)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** When the **network** command is configured for an EIGRP routing process, the router matches one or more local interfaces. The **network** command matches only local interfaces that are configured with addresses that are within the same subnet as the address that has been configured with the **network** command. The router then establishes neighbors through the matched interfaces. There is no limit to the number of network statements (**network** commands) that can be configured on a router.

Use a wildcard mask as a shortcut to group networks together. A wildcard mask matches everything in the network part of an IP address with a zero. Wildcard masks target a specific host/IP address, entire network, subnet, or even a range of IP addresses.

When entered in address-family configuration mode, this command applies only to named EIGRP IPv4 configurations. Named IPv6 and Service Advertisement Framework (SAF) configurations do not support this command in address-family configuration mode.

## Examples

The following example configures EIGRP autonomous system 1 and establishes neighbors through network 172.16.0.0 and 192.168.0.0:

```
Device(config)#router eigrp 1
Device(config-router)#network 172.16.0.0
Device(config-router)#network 192.168.0.0
Device(config-router)#network 192.168.0.0 0.0.255.255
```

The following example configures EIGRP address-family autonomous system 4453 and establishes neighbors through network 172.16.0.0 and 192.168.0.0:

```
Device(config)#router eigrp virtual-name
Device(config-router)#address-family ipv4 autonomous-system 4453
```

```
Device(config-router-af)#network 172.16.0.0  
Device(config-router-af)#network 192.168.0.0
```

|-------------------------------|----------------------------------------------------------------------------------|
| <b>address-family (EIGRP)</b> | Enters address-family configuration mode to configure an EIGRP routing instance. |
| <b>router eigrp</b>           | Configures the EIGRP address-family process.                                     |

## nsf (EIGRP)

To enable Cisco nonstop forwarding (NSF) operations for the Enhanced Interior Gateway Routing Protocol (EIGRP), use the **nsf** command in router configuration or address family configuration mode. To disable EIGRP NSF and to remove the EIGRP NSF configuration from the running-configuration file, use the **no** form of this command.

**nsf**  
**no nsf**

**Syntax Description** This command has no arguments or keywords.

**Command Default** EIGRP NSF is disabled.

**Command Modes** Router configuration (config-router)  
 Address family configuration (config-router-af)

| Command History | Release                      | Modification                 |
|-----------------|------------------------------|------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines** The **nsf** command is used to enable or disable EIGRP NSF support on an NSF-capable router. NSF is supported only on platforms that support High Availability.

**Examples** The following example shows how to disable NSF:

```
Device#configure terminal
Device(config)#router eigrp 101
Device(config-router)#no nsf
Device(config-router)#end
```

The following example shows how to enable EIGRP IPv6 NSF:

```
Device#configure terminal
Device(config)#router eigrp virtual-name-1
Device(config-router)#address-family ipv6 autonomous-system 10
Device(config-router-af)#nsf
Device(config-router-af)#end
```

|                  | <b>debug ip eigrp notifications</b>                  | Displays information and notifications for an EIGRP routing process.                  |

| Command                                   | Description                                                                                                                                       |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show ip protocols</b>                  | Displays the parameters and the current state of the active routing protocol process.                                                             |
| <b>show ipv6 protocols</b>                | Displays the parameters and the current state of the active IPv6 routing protocol process.                                                        |
| <b>timers graceful-restart purge-time</b> | Sets the graceful-restart purge-time timer to determine how long an NSF-aware router that is running EIGRP must hold routes for an inactive peer. |
| <b>timers nsf converge</b>                | Sets the maximum time that the restarting router must wait for the end-of-table notification from an NSF-capable or NSF-aware peer.               |
| <b>timers nsf signal</b>                  | Sets the maximum time for the initial restart period.                                                                                             |

## offset-list (EIGRP)

To add an offset to incoming and outgoing metrics to routes learned via Enhanced Interior Gateway Routing Protocol (EIGRP), use the **offset-list** command in router configuration mode or address family topology configuration mode. To remove an offset list, use the **no** form of this command.

**offset-list** {*access-list-number**access-list-name*} {**in** | **out**} *offset* [*interface-type* *interface-number*]  
**no offset-list** {*access-list-number**access-list-name*} {**in** | **out**} *offset* [*interface-type* *interface-number*]

### Syntax Description

|                                                     |                                                                                                                                                                                      |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>access-list-number</i>   <i>access-list-name</i> | Standard access list number or name to be applied. Access list number 0 indicates all networks (networks, prefixes, or routes). If the <i>offset</i> value is 0, no action is taken. |
| <b>in</b>                                           | Applies the access list to incoming metrics.                                                                                                                                         |
| <b>out</b>                                          | Applies the access list to outgoing metrics.                                                                                                                                         |
| <i>offset</i>                                       | Positive offset to be applied to metrics for networks matching the access list. If the offset is 0, no action is taken.                                                              |
| <i>interface-type</i>                               | (Optional) Interface type to which the offset list is applied.                                                                                                                       |
| <i>interface-number</i>                             | (Optional) Interface number to which the offset list is applied.                                                                                                                     |

### Command Default

No offset values are added to incoming or outgoing metrics to routes learned via EIGRP.

### Command Modes

Router configuration (config-router) Address family topology configuration (config-router-af-topology)

### Command History

*Table 144:*

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

The offset value is added to the routing metric. An offset list with an interface type and interface number is considered extended and takes precedence over an offset list that is not extended. Therefore, if an entry passes the extended offset list and the normal offset list, the offset of the extended offset list is added to the metric.

### Examples

In the following example, the router applies an offset of 10 to the delay component of the router only to access list 21:

```
Device(config-router)#offset-list 21 out 10
```

In the following example, the router applies an offset of 10 to routes learned from Ethernet interface 0:

```
Device(config-router)#offset-list 21 in 10 ethernet 0
```

In the following example, the router applies an offset of 10 to routes learned from Ethernet interface 0 in an EIGRP named configuration:

```
Device(config)#router eigrp virtual-name  
Device(config-router)#address-family ipv4 autonomous-system 1  
Device(config-router-af)#topology base  
Device(config-router-af-topology)#offset-list 21 in 10 ethernet0
```

# redistribute (IP)

To redistribute routes from one routing domain into another routing domain, use the **redistribute** command in the appropriate configuration mode. To disable all or some part of the redistribution (depending on the protocol), use the **no** form of this command. See the “Usage Guidelines” section for detailed, protocol-specific behaviors.

```

redistribute protocol [process-id] {level-1 | level-1-2 | level-2} [autonomous-system-number] [metric {metric-value | transparent}] [metric-type type-value] [match {internal | external 1 | external 2}] [tag tag-value] [route-map map-tag] [subnets] [nssa-only]
no redistribute protocol [process-id] {level-1 | level-1-2 | level-2} [autonomous-system-number] [metric {metric-value | transparent}] [metric-type type-value] [match {internal | external 1 | external 2}] [tag tag-value] [route-map map-tag] [subnets] [nssa-only]
    
```

Syntax Description

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| protocol | <p>Source protocol from which routes are being redistributed. It can be one of the following keywords: <b>application</b>, <b>bgp</b>, <b>connected</b>, <b>eigrp</b>, <b>isis</b>, <b>mobile</b>, <b>ospf</b>, <b>rip</b>, or <b>static [ip]</b>.</p> <p>The <b>static [ip]</b> keyword is used to redistribute IP static routes. The optional <b>ip</b> keyword is used when redistributing into the Intermediate System-to-Intermediate System (IS-IS) protocol.</p> <p>The <b>application</b> keyword is used to redistribute an application from one routing domain to another. You can redistribute more than one application to different routing protocols such as IS-IS, OSPF, Border Gateway Protocol (BGP), Enhanced Interior Gateway Routing Protocol (EIGRP) and Routing Information Protocol (RIP).</p> <p>The <b>connected</b> keyword refers to routes that are established automatically by virtue of having enabled IP on an interface. For routing protocols such as Open Shortest Path First (OSPF) and IS-IS, these routes will be redistributed as external to the autonomous system.</p> |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>process-id</i>                 | <p>(Optional) For the <b>application</b> keyword, this is the name of an application.</p> <p>For the <b>bgp</b> or <b>eigrp</b> keyword, this is an autonomous system number, which is a 16-bit decimal number.</p> <p>For the <b>isis</b> keyword, this is an optional <i>tag</i> value that defines a meaningful name for a routing process. Creating a name for a routing process means that you use names when configuring routing. You can configure a router in two routing domains and redistribute routing information between these two domains.</p> <p>For the <b>ospf</b> keyword, this is an appropriate OSPF process ID from which routes are to be redistributed. This identifies the routing process. This value takes the form of a nonzero decimal number.</p> <p>For the <b>rip</b> keyword, no <i>process-id</i> value is needed.</p> <p>For the <b>application</b> keyword, this is the name of an application.</p> <p>By default, no process ID is defined.</p> |
| <b>level-1</b>                    | Specifies that, for IS-IS, Level 1 routes are redistributed into other IP routing protocols independently.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>level-1-2</b>                  | Specifies that, for IS-IS, both Level 1 and Level 2 routes are redistributed into other IP routing protocols.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>level-2</b>                    | Specifies that, for IS-IS, Level 2 routes are redistributed into other IP routing protocols independently.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <i>autonomous-system-number</i>   | <p>(Optional) Autonomous system number for the redistributed route. The range is from 1 to 65535.</p> <ul style="list-style-type: none"> <li>4-byte autonomous system numbers are supported in the range from 1.0 to 65535.65535 in asdot notation only.</li> </ul> <p>For more details about autonomous system number formats, see the <b>router bgp</b> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>metric</b> <i>metric-value</i> | (Optional) When redistributing from one OSPF process to another OSPF process on the same router, the metric will be carried through from one process to the other if no metric value is specified. When redistributing other processes to an OSPF process, the default metric is 20 when no metric value is specified. The default value is 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>metric transparent</b>         | (Optional) Causes RIP to use the routing table metric for redistributed routes as the RIP metric.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>metric-type</b> <i>type value</i>                                   | <p>(Optional) For OSPF, specifies the external link type associated with the default route advertised into the OSPF routing domain. It can be one of two values:</p> <ul style="list-style-type: none"> <li>• <b>1</b>—Type 1 external route</li> <li>• <b>2</b>—Type 2 external route</li> </ul> <p>If a <b>metric-type</b> is not specified, the Cisco IOS software adopts a Type 2 external route.</p> <p>For IS-IS, it can be one of two values:</p> <ul style="list-style-type: none"> <li>• <b>internal</b>—IS-IS metric that is &lt; 63.</li> <li>• <b>external</b>—IS-IS metric that is &gt; 64 &lt; 128.</li> </ul> <p>The default is <b>internal</b>.</p> |
| <b>match</b> { <b>internal</b>   <b>external1</b>   <b>external2</b> } | <p>(Optional) Specifies the criteria by which OSPF routes are redistributed into other routing domains. It can be one of the following:</p> <ul style="list-style-type: none"> <li>• <b>internal</b>—Routes that are internal to a specific autonomous system.</li> <li>• <b>external 1</b>—Routes that are external to the autonomous system, but are imported into OSPF as Type 1 external routes.</li> <li>• <b>external 2</b>—Routes that are external to the autonomous system, but are imported into OSPF as Type 2 external routes.</li> </ul> <p>The default is <b>internal</b>.</p>                                                                        |
| <b>tag</b> <i>tag-value</i>                                            | <p>(Optional) Specifies the 32-bit decimal value attached to each external route. This is not used by OSPF itself. It may be used to communicate information between Autonomous System Boundary Routers (ASBRs). If none is specified, the remote autonomous system number is used for routes from BGP and Exterior Gateway Protocol (EGP); for other protocols, zero (0) is used.</p>                                                                                                                                                                                                                                                                              |
| <b>route-map</b>                                                       | <p>(Optional) Specifies the route map that should be interrogated to filter the importation of routes from this source routing protocol to the current routing protocol. If not specified, all routes are redistributed. If this keyword is specified, but no route map tags are listed, no routes will be imported.</p>                                                                                                                                                                                                                                                                                                                                            |
| <i>map-tag</i>                                                         | <p>(Optional) Identifier of a configured route map.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>subnets</b>                                                         | <p>(Optional) For redistributing routes into OSPF, the scope of redistribution for the specified protocol. By default, no subnets are defined.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|           |                                                                                 |
|-----------|---------------------------------------------------------------------------------|
| nssa-only | (Optional) Sets the nssa-only attribute for all routes redistributed into OSPF. |
|-----------|---------------------------------------------------------------------------------|

**Command Default**

Route redistribution is disabled.

**Command Modes**

Router configuration (config-router)

Address family configuration (config-af)

Address family topology configuration (config-router-af-topology)

**Command History**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Using the no Form of the redistribute Command****Caution**

Removing options that you have configured for the **redistribute** command requires careful use of the **no** form of the **redistribute** command to ensure that you obtain the result that you are expecting. Changing or disabling any keyword may or may not affect the state of other keywords, depending on the protocol.

It is important to understand that different protocols implement the **no** form of the **redistribute** command differently:

- In BGP, OSPF, and RIP configurations, the **no redistribute** command removes only the specified keywords from the **redistribute** commands in the running configuration. They use the *subtractive keyword* method when redistributing from other protocols. For example, in the case of BGP, if you configure **no redistribute static route-map interior**, *only the route map* is removed from the redistribution, leaving **redistribute static** in place with no filter.
- The **no redistribute isis** command removes the IS-IS redistribution from the running configuration. IS-IS removes the entire command, regardless of whether IS-IS is the redistributed or redistributing protocol.
- EIGRP used the subtractive keyword method prior to EIGRP component version rel5. Starting with EIGRP component version rel5, the **no redistribute** command removes the entire **redistribute** command when redistributing from any other protocol.
- An EIGRP routing process is configured when you issue the **router eigrp** command and then specify a network for the process using the **network** sub-command. Suppose that you have not configured an EIGRP routing process, and that you have configured redistribution of routes from such an EIGRP process into BGP, OSPF, or RIP. If you use the **no redistribute eigrp** command to change or disable a parameter in the **redistribute eigrp** command, the **no redistribute eigrp** command removes the entire **redistribute eigrp** command instead of changing or disabling a specific parameter.

**Additional Usage Guidelines for the redistribute Command**

A router receiving a link-state protocol with an internal metric will consider the cost of the route from itself to the redistributing router plus the advertised cost to reach the destination. An external metric only considers the advertised metric to reach the destination.

Routes learned from IP routing protocols can be redistributed at Level 1 into an attached area or at Level 2. The **level-1-2** keyword allows both Level 1 and Level 2 routes in a single command.

Redistributed routing information must be filtered by the **distribute-list out** router configuration command. This guideline ensures that only those routes intended by the administrator are passed along to the receiving routing protocol.

Whenever you use the **redistribute** or the **default-information** router configuration commands to redistribute routes into an OSPF routing domain, the router automatically becomes an ASBR. However, an ASBR does not, by default, generate a default route into the OSPF routing domain.

When routes are redistributed into OSPF from protocols other than OSPF or BGP, and no metric has been specified with the **metric-type** keyword and *type-value* argument, OSPF will use 20 as the default metric. When routes are redistributed into OSPF from BGP, OSPF will use 1 as the default metric. When routes are redistributed from one OSPF process to another OSPF process, autonomous system external and not-so-stubby-area (NSSA) routes will use 20 as the default metric. When intra-area and inter-area routes are redistributed between OSPF processes, the internal OSPF metric from the redistribution source process is advertised as the external metric in the redistribution destination process. (This is the only case in which the routing table metric will be preserved when routes are redistributed into OSPF.)

When routes are redistributed into OSPF, only routes that are not subnetted are redistributed if the **subnets** keyword is not specified.

**Note** Depending on your release the **subnets** keyword is automatically appended when you use the **redistribute ospf** command. This automatic addition results in the redistribution of classless OSPF routes.

On a router internal to an NSSA area, the **nssa-only** keyword causes the originated type-7 NSSA LSAs to have their propagate (P) bit set to zero, which prevents area border routers from translating these LSAs into type-5 external LSAs. On an area border router that is connected to an NSSA and normal areas, the **nssa-only** keyword causes the routes to be redistributed only into the NSSA areas.

Routes configured with the **connected** keyword affected by this **redistribute** command are the routes not specified by the **network** router configuration command.

You cannot use the **default-metric** command to affect the metric used to advertise connected routes.

**Note** The **metric** value specified in the **redistribute** command supersedes the **metric** value specified in the **default-metric** command.

The default redistribution of Interior Gateway Protocol (IGP) or Exterior Gateway Protocol (EGP) into BGP is not allowed unless the **default-information originate** router configuration command is specified.

#### 4-Byte Autonomous System Number Support

The Cisco implementation of 4-byte autonomous system numbers uses asplain—65538 for example—as the default regular expression match and output display format for autonomous system numbers, but you can configure 4-byte autonomous system numbers in both the asplain format and the asdot format as described in RFC 5396. To change the default regular expression match and output display of 4-byte autonomous system numbers to asdot format, use the **bgp asnotation dot** command.

## Examples

The following example shows how OSPF routes are redistributed into a BGP domain:

```
Device(config)# router bgp 109
Device(config-router)# redistribute ospf
```

The following example shows how to redistribute EIGRP routes into an OSPF domain:

```
Device(config)# router ospf 110
Device(config-router)# redistribute eigrp
```

The following example shows how to redistribute the specified EIGRP process routes into an OSPF domain. The EIGRP-derived metric will be remapped to 100 and RIP routes to 200.

```
Device(config)# router ospf 109
Device(config-router)# redistribute eigrp 108 metric 100 subnets
Device(config-router)# redistribute rip metric 200 subnets
```

The following example shows how to configure BGP routes to be redistributed into IS-IS. The link-state cost is specified as 5, and the metric type is set to external, indicating that it has lower priority than internal metrics.

```
Device(config)# router isis
Device(config-router)# redistribute bgp 120 metric 5 metric-type external
```

The following example shows how to redistribute an application into an OSPF domain and specify a metric value of 5:

```
Device(config)# router ospf 4
Device(config-router)# redistribute application am metric 5
```

In the following example, network 172.16.0.0 will appear as an external LSA in OSPF 1 with a cost of 100 (the cost is preserved):

```
Device(config)# interface ethernet 0
Device(config-if)# ip address 172.16.0.1 255.0.0.0
Device(config-if)# exit
Device(config)# ip ospf cost 100
Device(config)# interface ethernet 1
Device(config-if)# ip address 10.0.0.1 255.0.0.0
!
Device(config)# router ospf 1
Device(config-router)# network 10.0.0.0 0.255.255.255 area 0
Device(config-if)# exit
Device(config-router)# redistribute ospf 2 subnet
Device(config)# router ospf 2
Device(config-router)# network 172.16.0.0 0.255.255.255 area 0
```

The following example shows how BGP routes are redistributed into OSPF and assigned the local 4-byte autonomous system number in asplain format.

```
Device(config)# router ospf 2
Device(config-router)# redistribute bgp 65538
```

The following example shows how to remove the **connected metric 1000 subnets** options from the **redistribute connected metric 1000 subnets** command and leave the **redistribute connected** command in the configuration:

```
Device(config-router)# no redistribute connected metric 1000 subnets
```

The following example shows how to remove the **metric 1000** options from the **redistribute connected metric 1000 subnets** command and leave the **redistribute connected subnets** command in the configuration:

```
Device(config-router)# no redistribute connected metric 1000
```

The following example shows how to remove the **subnets** option from the **redistribute connected metric 1000 subnets** command and leave the **redistribute connected metric 1000** command in the configuration:

```
Device(config-router)# no redistribute connected subnets
```

The following example shows how to remove the **redistribute connected** command, and any of the options that were configured for the **redistribute connected** command, from the configuration:

```
Device(config-router)# no redistribute connected
```

The following example shows how EIGRP routes are redistributed into an EIGRP process in a named EIGRP configuration:

```
Device(config)# router eigrp virtual-name
Device(config-router)# address-family ipv4 autonomous-system 1
Device(config-router-af)# topology base
Device(config-router-af-topology)# redistribute eigrp 6473 metric 1 1 1 1 1
```

The following example shows how to set and disable the redistributions in EIGRP configuration. Note that, in the case of EIGRP, the **no** form of the commands removes the entire set of **redistribute** commands from the running configuration.

```
Device(config)# router eigrp 1
Device(config-router)# network 0.0.0.0
Device(config-router)# redistribute eigrp 2 route-map x
Device(config-router)# redistribute ospf 1 route-map x
Device(config-router)# redistribute bgp 1 route-map x
Device(config-router)# redistribute isis level-2 route-map x
Device(config-router)# redistribute rip route-map x

Device(config)# router eigrp 1
Device(config-router)# no redistribute eigrp 2 route-map x
Device(config-router)# no redistribute ospf 1 route-map x
Device(config-router)# no redistribute bgp 1 route-map x
Device(config-router)# no redistribute isis level-2 route-map x
Device(config-router)# no redistribute rip route-map x
Device(config-router)# end
```

```
Device# show running-config | section router eigrp 1
```

```
router eigrp 1
 network 0.0.0.0
```

The following example shows how to set and disable the redistributions in OSPF configuration. Note that the **no** form of the commands removes only the specified keywords from the **redistribute** command in the running configuration.

```

Device(config)# router ospf 1
Device(config-router)# network 0.0.0.0
Device(config-router)# redistribute eigrp 2 route-map x
Device(config-router)# redistribute ospf 1 route-map x
Device(config-router)# redistribute bgp 1 route-map x
Device(config-router)# redistribute isis level-2 route-map x
Device(config-router)# redistribute rip route-map x

Device(config)# router ospf 1
Device(config-router)# no redistribute eigrp 2 route-map x
Device(config-router)# no redistribute ospf 1 route-map x
Device(config-router)# no redistribute bgp 1 route-map x
Device(config-router)# no redistribute isis level-2 route-map x
Device(config-router)# no redistribute rip route-map x
Device(config-router)# end

Device# show running-config | section router ospf 1

router ospf 1
 redistribute eigrp 2
 redistribute ospf 1
 redistribute bgp 1
 redistribute rip
 network 0.0.0.0

```

The following example shows how to remove only the route map filter from the redistribution in BGP; redistribution itself remains in force without a filter:

```

Device(config)# router bgp 65000
Device(config-router)# no redistribute eigrp 2 route-map x

```

The following example shows how to remove the EIGRP redistribution to BGP:

```

Device(config)# router bgp 65000
Device(config-router)# no redistribute eigrp 2

```

#### Related Commands

| Command                                     | Description                                            |
|---------------------------------------------|--------------------------------------------------------|
| <b>default-information originate (OSPF)</b> | Generates a default route into an OSPF routing domain. |
| <b>router bgp</b>                           | Configures the BGP routing process.                    |
| <b>router eigrp</b>                         | Configures the EIGRP address-family process.           |

## redistribute (IPv6)

To redistribute IPv6 routes from one routing domain into another routing domain, use the **redistribute** command in IPv6 address family configuration mode. To disable redistribution, use the **no** form of this command.

**redistribute** *protocol* [*{process-id}*] [**include-connected** {**level-1** | **level-1-2** | **level-2**}] [*{as-number}*] [**metric** *metric-value*] [**metric-type** *type-value*] [**nssa-only**] [**tag** *tag-value*] [**route-map** *map-tag*]

**no redistribute** *protocol* [*{process-id}*] [**include-connected** {**level-1** | **level-1-2** | **level-2**}] [*{as-number}*] [**metric** *metric-value*] [**metric-type** *type-value*] [**nssa-only**] [**tag** *tag-value*] [**route-map** *map-tag*]

### Syntax Description

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>protocol</i>                      | Source protocol from which routes are redistributed. It can be one of the following keywords: <b>bgp</b> , <b>connected</b> , <b>eigrp</b> , <b>isis</b> , <b>lisp</b> , <b>nd</b> , <b>omp</b> , <b>ospf</b> (ospfv3), <b>rip</b> , or <b>static</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <i>process-id</i>                    | <p>(Optional) For the <b>bgp</b> or <b>eigrp</b> keyword, the process ID is an autonomous system number, which is a 16-bit decimal number.</p> <p>For the <b>isis</b> keyword, the process ID is an optional value that defines a meaningful name for a routing process. You can specify only one Intermediate System-to-Intermediate System (IS-IS) process per router. Creating a name for a routing process means that you use names when configuring routing.</p> <p>For the <b>ospf</b> keyword, the process ID is the number that is assigned administratively when the Open Shortest Path First (OSPF) for the IPv6 routing process is enabled.</p> <p>For the <b>rip</b> keyword, the process ID is an optional value that defines a meaningful name for an IPv6 Routing Information Protocol (RIP) routing process.</p> |
| <b>include-connected</b>             | (Optional) Allows the target protocol to redistribute routes that are learned by the source protocol and connected prefixes on those interfaces over which the source protocol is running.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>level-1</b>                       | Specifies that for IS-IS, Level 1 routes are redistributed into other IPv6 routing protocols independently.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>level-1-2</b>                     | Specifies that for IS-IS, both Level 1 and Level 2 routes are redistributed into other IPv6 routing protocols.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>level-2</b>                       | Specifies that for IS-IS, Level 2 routes are redistributed into other IPv6 routing protocols independently.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <i>as-number</i>                     | (Optional) Autonomous system number for the redistributed route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>metric</b><br><i>metric-value</i> | (Optional) When redistributing from one OSPF process to another OSPF process on the same router, the metric is carried through from one process to the other if no metric value is specified. When redistributing other processes to an OSPF process, the default metric is 20 when no metric value is specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                                         |                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>metric-type</b><br><i>type-value</i> | <p>(Optional) Specifies the external link type that is associated with the default route that is advertised into the routing domain. It can be one of two values:</p> <ul style="list-style-type: none"> <li>• 1: Type 1 external route</li> <li>• 2: Type 2 external route</li> </ul> <p>If no value is specified for the <b>metric-type</b> keyword, the Cisco IOS software adopts a Type 2 external route.</p> |
| <b>nssa-only</b>                        | (Optional) Limits redistributed routes to not-so-stubby area (NSSA)                                                                                                                                                                                                                                                                                                                                               |
| <b>tag</b> <i>tag-value</i>             | (Optional) Specifies the 32-bit decimal value that is attached to each external route. This is not used by OSPF itself. It might be used to communicate information between Autonomous System Boundary Routers (ASBRs). If none is specified, then the remote autonomous system number is used for routes from the BGP and the Exterior Gateway Protocol (EGP); for other protocols, zero (0) is used.            |
| <b>route-map</b>                        | (Optional) Specifies the route map that is checked to filter the import of routes from this source routing protocol to the current routing protocol. If the <b>route-map</b> keyword is not specified, all the routes are redistributed. If this keyword is specified, but no route map tags are listed, no routes are imported.                                                                                  |
| <i>map-tag</i>                          | (Optional) Identifier of a configured route map.                                                                                                                                                                                                                                                                                                                                                                  |

**Command Modes**

Router configuration (config-router)  
Address family configuration (config-router-af)

**Command History**

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

**Usage Guidelines**

Changing or disabling a keyword does not affect the state of other keywords.

IS-IS ignores configured redistribution of routes, if any that are configured with the **include-connected** keyword. IS-IS advertises a prefix on an interface if either IS-IS is running over the interface or the interface is configured as passive.

Routes that are learned from IPv6 routing protocols are redistributed into IPv6 IS-IS at Level 1 into an attached area, or at Level 2. The **level-1-2** keyword allows both Level 1 and Level 2 routes in a single command.

For IPv6 RIP, use the **redistribute** command to advertise static routes as if they were directly connected routes.

**Note**

Advertising static routes as directly connected routes might cause routing loops if improperly configured.

Redistributed IPv6 RIP routing information is always filtered by the **distribute-list prefix-list** command in router configuration mode. Using the **distribute-list prefix-list** command ensures that only those routes that are intended by the administrator are passed along to the receiving routing protocol.

**Note** The **metric** value that is specified in the **redistribute** command for IPv6 RIP supersedes the **metric** value that is specified using the **default-metric** command.

In IPv4, if you redistribute a protocol, by default, you also redistribute the subnet on the interfaces over which the protocol is running. In IPv6, this is not the default behavior. To redistribute the subnet on the interfaces over which the protocol is running in IPv6, use the **include-connected** keyword. In IPv6, this functionality is not supported when the source protocol is BGP.

When the **no redistribute** command is configured, the parameter settings are ignored when the client protocol is IS-IS or EIGRP.

IS-IS redistribution is removed completely when IS-IS Level 1 and Level 2 are removed by you. IS-IS level settings can be configured using the **redistribute** command only.

The default redistribute type is restored to OSPFv3 when all route type values are removed by you.

Specify the **nssa-only** keyword to clear the propagate bit (P-bit) when external routes are redistributed into an NSSA. Doing so prevents corresponding NSSA external link state advertisements (LSAs) from being translated into other areas.

## Examples

The following example shows how to configure IPv6 IS-IS to redistribute IPv6 BGP routes. The metric is specified as 5, and the metric type is set to 1.

```
Device> enable
Device# configure terminal
Device(config)# router isis
Device(config-router)# address-family ipv6
Device(config-router-af)# redistribute bgp 64500 metric 5 metric-type 1
```

The following example shows how to redistribute IPv6 BGP routes into the IPv6 RIP routing process named cisco:

```
Device> enable
Device# configure terminal
Device(config)# router rip cisco
Device(config-router)# redistribute bgp 42
```

The following example shows how to redistribute IS-IS for IPv6 routes into the OSPFv3 for IPv6 routing process 1:

```
Device> enable
Device# configure terminal
Device(config)# router ospfv3 1
Device(config-router)# address-family ipv6
Device(config-router-af)# redistribute isis 1 metric 32 metric-type 1 tag 85
```

# redistribute maximum-prefix (OSPF)

To limit the number of prefixes that are redistributed into Open Shortest Path First (OSPF) or to generate a warning when the number of prefixes that are redistributed into OSPF reaches a maximum, use the **redistribute maximum-prefix** command in router configuration mode. To remove the values, use the **no** form of this command.

**redistribute maximum-prefix** *maximum* [{*percentage*}][{**warning-only**}]  
**no redistribute**

| <b>Syntax Description</b>    | <div data-bbox="386 600 1533 667"> <p><i>maximum</i> Integer from 1 to 4294967295 that specifies the maximum number of IP or IPv6 prefixes that can be redistributed into OSPF.</p> <p>When the <b>warning-only</b> keyword is configured, the maximum value specifies the number of prefixes that can be redistributed into OSPF before the system logs a warning message. Redistribution is not limited.</p> <p>The maximum number of IP or IPv6 prefixes that are allowed to be redistributed into OSPF, or the number of prefixes that are allowed to be redistributed into OSPF before the system logs a warning message, depends on whether the <b>warning-only</b> keyword is present.</p> <p>There is no default value for the maximum argument.</p> <p>If the <b>warning-only</b> keyword is also configured, this value does not limit redistribution; it is simply the number of redistributed prefixes that, when reached, causes a warning message to be logged.</p> </div> <div data-bbox="386 1073 1533 1188"> <p><i>percentage</i> (Optional) Integer from 1 to 100 that specifies the threshold value, as a percentage, at which a warning message is generated.</p> <p>The default percentage is 75.</p> </div> <div data-bbox="386 1209 1533 1318"> <p><b>warning-only</b> (Optional) Causes a warning message to be logged when the number of prefixes that are defined by the <i>maximum</i> argument has been exceeded. | Cisco IOS XE Everest 16.5.1a | This command was introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |         |              |                              |                              |
| <b>Usage Guidelines</b>      | <p>A network can be severely flooded if many IP or IPv6 prefixes are injected into the OSPF, perhaps by redistributing Border Gateway Protocol (BGP) into OSPF. Limiting the number of redistributed prefixes prevents this potential problem.</p> <p>When the <b>redistribute maximum-prefix</b> command is configured and the number of redistributed prefixes reaches the maximum value that is configured, no more prefixes are redistributed (unless the <b>warning-only</b> keyword is configured).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |              |                              |                              |

## Examples

The following example shows how two warning messages are logged; the first if the number of prefixes redistributed reaches 85 percent of 600 (510 prefixes), and the second if the number of redistributed routes reaches 600. However, the number of redistributed routes is not limited.

```
Device> enable
Device# configure terminal
Device(config)# router ospfv3 11
Device(config-router)# address-family ipv6
Device(config-router-af)# redistribute eigrp 10 subnets
Device(config-router-af)# redistribute maximum-prefix 600 85 warning-only
```

The following example shows how to set a maximum of 10 prefixes that can be redistributed into an OSPFv3 process:

```
Device> enable
Device# configure terminal
Device(config)# router ospfv3 10
Device(config-router)# address-family ipv6 unicast
Device(config-router-af)# redistribute maximum-prefix 10
Device(config-router-af)# redistribute connected
```

## rewrite-evpn-rt-asn

To enable the rewrite of the autonomous system number (ASN) portion of the EVPN route target extended community with the ASN of the target eBGP EVPN peer, use the **rewrite-evpn-rt-asn** command in address family configuration mode. Use the **no** form of the command to disable the rewrite of ASN.

**rewrite-evpn-rt-asn**  
**no rewrite-evpn-rt-asn**

### Syntax Description

This command has no arguments or keywords.

### Command Modes

Address-family configuration (config-router-af)

### Command History

| Release                        | Modification                |
|--------------------------------|-----------------------------|
| Cisco IOS XE Gibraltar 16.12.1 | The command was introduced. |

### Usage Guidelines

The **rewrite-evpn-rt-asn** command is required for the route target auto feature to be used to configure EVPN route targets. Route target auto feature is implemented on all border leaf switches that support BGP EVPN.

The **rewrite-evpn-rt-asn** command only affects the following:

- EVPN address family.
- Inbound route-reception.
- Routes from eBGP peers.
- Route-type 2 and route-type 5 of EVPN prefixes.
- route target extended community inside the BGP update.

The **rewrite-evpn-rt-asn** command only works on type 0 and on type 2 of route-target extended communities.

#### Note

Run this command only when route target auto feature is being used and matching route targets are not manually configured on all switches.

The following example shows how to enable rewrite of ASN using the **rewrite-evpn-rt-asn** command:

```
Device# configure terminal
Device(config)# router bgp 10000
Device(config-router)# address-family l2vpn evpn
Device(config-router-af)# rewrite-evpn-rt-asn
```

# route-map

To define conditions for redistributing routes from one routing protocol to another routing protocol, or to enable policy routing, use the **route-map** command in global configuration mode. To delete an entry, use the **no** form of this command.

**route-map** *map-tag* [{**permit** | **deny**}] [*sequence-number*] **ordering-seq** *sequence-name*  
**no route-map** *map-tag* [{**permit** | **deny**}] [*sequence-number*] **ordering-seq** *sequence-name*

## Syntax Description

|                                          |                                                                                                                                          |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>map-tag</i>                           | Name for the route map.                                                                                                                  |
| <b>permit</b>                            | (Optional) Permits only the routes matching the route map to be forwarded or redistributed.                                              |
| <b>deny</b>                              | (Optional) Blocks routes matching the route map from being forwarded or redistributed.                                                   |
| <i>sequence-number</i>                   | (Optional) Number that indicates the position a new route map will have in the list of route maps already configured with the same name. |
| <b>ordering-seq</b> <i>sequence-name</i> | (Optional) Orders the route maps based on the string provided.                                                                           |

## Command Default

Policy routing is not enabled, and conditions for redistributing routes from one routing protocol to another routing protocol are not configured.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **route-map** command to enter route-map configuration mode.

Use route maps to redistribute routes, or to subject packets to policy routing. Both these purposes are described here.

### Redistribution

Use the **route-map** global configuration command and the **match** and **set** route-map configuration commands to define the conditions for redistributing routes from one routing protocol to another. Each **route-map** command has a list of **match** and **set** commands associated with it. The **match** commands specify the *match criteria*, that is, the conditions under which redistribution is allowed for the current **route-map** command. The **set** commands specify the *set actions*, that is, the redistribution actions to be performed if the criteria enforced by the **match** commands are met. If the **route-map** command is enabled and the user does not specify any action, then the **permit** action is applied by default. The **no route-map** command deletes the route map.

The **match** route-map configuration command has multiple formats. The **match** commands can be run in any order, and all the **match** commands must match to cause the route to be redistributed according to the *set actions* specified with the **set** commands. The **no** forms of the **match** commands remove the specified match criteria.

Use route maps when you want detailed control over how routes are redistributed between routing processes. The destination routing protocol is the one you specify with the **router** global configuration command. The source routing protocol is the one you specify with the **redistribute** router configuration command. See the examples section for an illustration of how route maps are configured.

When passing routes through a route map, the route map can have several parts. Any route that does not match at least one **match** clause relating to a **route-map** command is ignored, that is, the route is not advertised for outbound route maps, and is not accepted for inbound route maps. If you want to modify only some data, configure a second route map section with an explicit match specified.

The **redistribute** router configuration command uses the name specified by the *map-tag* argument to reference a route map. Multiple route maps can share the same map tag name.

If the match criteria are met for this route map, and the **permit** keyword is specified, the route is redistributed as controlled by the set actions. In the case of policy routing, the packet is policy routed. If the match criteria are not met, and the **permit** keyword is specified, the next route map with the same map tag is tested. If a route passes none of the match criteria for the set of route maps sharing the same name, it is not redistributed by that set.

If the match criteria are met for the route map, and the **deny** keyword is specified, the route is not redistributed. In the case of policy routing, the packet is not policy routed, and no other route maps sharing the same map tag name are examined. If the packet is not policy routed, the normal forwarding algorithm is used.

### Policy Routing

Another purpose of route maps is to enable policy routing. Use the **ip policy route-map** or **ipv6 policy route-map** command in addition to the **route-map** command, and the **match** and **set** commands to define the conditions for policy-routing packets. The **match** commands specify the conditions under which policy routing occurs. The **set** commands specify the routing actions to be performed if the criteria enforced by the **match** commands are met. We recommend that you policy route packets some way other than the obvious shortest path.

The *sequence-number* argument works as follows:

- If no entry is defined with the supplied tag, an entry is created with the *sequence-number* argument set to 10.
- If only one entry is defined with the supplied tag, that entry becomes the default entry for the **route-map** command. The *sequence-number* argument of this entry is unchanged.
- If more than one entry is defined with the supplied tag, an error message is displayed to indicate that the *sequence-number* argument is required.

If the **no route-map map-tag** command is specified (without the *sequence-number* argument), the entire route map is deleted.

### Examples

The following example shows how to redistribute Routing Information Protocol (RIP) routes with a hop count equal to 1 to the Open Shortest Path First (OSPF). These routes will be redistributed to the OSPF as external link-state advertisements (LSAs) with a metric of 5, metric type of type1, and a tag equal to 1.

```
Device> enable
Device# configure terminal
Device(config)# router ospf 109
Device(config-router)# redistribute rip route-map rip-to-ospf
Device(config-router)# exit
Device(config)# route-map rip-to-ospf permit
```

```
Device(config-route-map)# match metric 1
Device(config-route-map)# set metric 5
Device(config-route-map)# set metric-type type1
Device(config-route-map)# set tag 1
```

The following example for IPv6 shows how to redistribute RIP routes with a hop count equal to 1 to the OSPF. These routes will be redistributed to the OSPF as external LSAs, with a tag equal to 42, and a metric type equal to type1.

```
Device> enable
Device# configure terminal
Device(config)# ipv6 router ospf 1
Device(config-router)# redistribute rip one route-map rip-to-ospfv3
Device(config-router)# exit
Device(config)# route-map rip-to-ospfv3
Device(config-route-map)# match tag 42
Device(config-route-map)# set metric-type type1
```

The following named configuration example shows how to redistribute Enhanced Interior Gateway Routing Protocol (EIGRP) addresses with a hop count equal to 1. These addresses are redistributed to the EIGRP as external, with a metric of 5, and a tag equal to 1:

```
Device> enable
Device# configure terminal
Device(config)# router eigrp virtual-name1
Device(config-router)# address-family ipv4 autonomous-system 4453
Device(config-router-af)# topology base
Device(config-router-af-topology)# redistribute eigrp 6473 route-map
virtual-name1-to-virtual-name2
Device(config-router-af-topology)# exit-address-topology
Device(config-router-af)# exit-address-family
Device(config-router)# router eigrp virtual-name2
Device(config-router)# address-family ipv4 autonomous-system 6473
Device(config-router-af)# topology base
Device(config-router-af-topology)# exit-af-topology
Device(config-router-af)# exit-address-family
Device(config)# route-map virtual-name1-to-virtual-name2
Device(config-route-map)# match tag 42
Device(config-route-map)# set metric 5
Device(config-route-map)# set tag 1
```

## Related Commands

| Command                      | Description                                                       |
|------------------------------|-------------------------------------------------------------------|
| <b>ip policy route-map</b>   | Identifies a route map to use for policy routing on an interface. |
| <b>ipv6 policy route-map</b> | Configures IPv6 PBR on an interface.                              |
| <b>match</b>                 | Matches values from the routing table.                            |
| <b>router eigrp</b>          | Configures the EIGRP address-family process.                      |
| <b>set</b>                   | Sets values in the destination routing protocol                   |
| <b>show route-map</b>        | Displays all route maps configured or only the one specified.     |

# router-id

To use a fixed router ID, use the **router-id** command in router configuration mode. To force Open Shortest Path First (OSPF) to use the previous OSPF router ID behavior, use the **no** form of this command.

**router-id** *ip-address*  
**no router-id** *ip-address*

## Syntax Description

|                   |                                 |
|-------------------|---------------------------------|
| <i>ip-address</i> | Router ID in IP address format. |
|-------------------|---------------------------------|

## Command Default

No OSPF routing process is defined.

## Command Modes

Router configuration

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

You can configure an arbitrary value in the IP address format for each router. However, each router ID must be unique.

If this command is used on an OSPF router process which is already active (has neighbors), the new router-ID is used at the next reload or at a manual OSPF process restart. To manually restart the OSPF process, use the `clear ip ospf` command.

## Examples

The following example specifies a fixed router-id:

```
router-id 10.1.1.1
```

|----------------------|-------------------------------------------------------------|
| <b>clear ip ospf</b> | Clears redistribution based on the OSPF routing process ID. |
| <b>router ospf</b>   | Configures the OSPF routing process.                        |

# router bgp

To configure the Border Gateway Protocol (BGP) routing process, use the **router bgp** command in global configuration mode. To remove a BGP routing process, use the **no** form of this command.

**router bgp** *autonomous-system-number*  
**no router bgp** *autonomous-system-number*

## Syntax Description

|                                 |                                                                                                                                                                            |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>autonomous-system-number</i> | Number of an autonomous system that identifies the router to other BGP routers and tags the routing information that is passed along. Number in the range from 1 to 65535. |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Command Default

No BGP routing process is enabled by default.

## Command Modes

Global configuration (config)

## Command History

| Release                        | Modification                 |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.12.1 | This command was introduced. |

## Usage Guidelines

This command allows you to set up a distributed routing core that automatically guarantees the loop-free exchange of routing information between autonomous systems.

Cisco has implemented the following two methods of representing autonomous system numbers:

- **Asplain**—Decimal value notation where both 2-byte and 4-byte autonomous system numbers are represented by their decimal value. For example, 65526 is a 2-byte autonomous system number and 234567 is a 4-byte autonomous system number.
- **Asdot**—Autonomous system dot notation where 2-byte autonomous system numbers are represented by their decimal value and 4-byte autonomous system numbers are represented by a dot notation. For example, 65526 is a 2-byte autonomous system number and 1.169031 is a 4-byte autonomous system number (this is dot notation for the 234567 decimal number).

For details about the third method of representing autonomous system numbers, see [RFC 5396](#).

### Note

In Cisco IOS releases that include 4-byte ASN support, command accounting and command authorization that include a 4-byte ASN number are sent in the asplain notation irrespective of the format that is used on the command-line interface.

### Asplain as Default Autonomous System Number Formatting

The Cisco implementation of 4-byte autonomous system numbers uses asplain as the default display format for autonomous system numbers, but you can configure 4-byte autonomous system numbers in both the asplain and asdot format. In addition, the default format for matching 4-byte autonomous system numbers in regular expressions is asplain, so you must ensure that any regular expressions to match 4-byte autonomous system numbers are written in the asplain format. If you want to change the default **show** command output to display 4-byte autonomous system numbers in the asdot format, use the **bgp asnotation dot** command under router

configuration mode. When the asdot format is enabled as the default, any regular expressions to match 4-byte autonomous system numbers must be written using the asdot format, or the regular expression match will fail. The tables below show that although you can configure 4-byte autonomous system numbers in either asplain or asdot format, only one format is used to display **show** command output and control 4-byte autonomous system number matching for regular expressions, and the default is asplain format. To display 4-byte autonomous system numbers in **show** command output and to control matching for regular expressions in the asdot format, you must configure the **bgp asnotation dot** command. After enabling the **bgp asnotation dot** command, a hard reset must be initiated for all BGP sessions by entering the **clear ip bgp \*** command.

**Note** If you are upgrading to an image that supports 4-byte autonomous system numbers, you can still use 2-byte autonomous system numbers. The **show** command output and regular expression match are not changed and remain in asplain (decimal value) format for 2-byte autonomous system numbers regardless of the format configured for 4-byte autonomous system numbers.

**Table 146: Default Asplain 4-Byte Autonomous System Number Format**

| Format  | Configuration Format                           | Show Command Output and Regular Expression Match Format |
|---------|------------------------------------------------|---------------------------------------------------------|
| asplain | 2-byte: 1 to 65535 4-byte: 65536 to 4294967295 | 2-byte: 1 to 65535 4-byte: 65536 to 4294967295          |
| asdot   | 2-byte: 1 to 65535 4-byte: 1.0 to 65535.65535  | 2-byte: 1 to 65535 4-byte: 65536 to 4294967295          |

**Table 147: Asdot 4-Byte Autonomous System Number Format**

| Format  | Configuration Format                           | Show Command Output and Regular Expression Match Format |
|---------|------------------------------------------------|---------------------------------------------------------|
| asplain | 2-byte: 1 to 65535 4-byte: 65536 to 4294967295 | 2-byte: 1 to 65535 4-byte: 1.0 to 65535.65535           |
| asdot   | 2-byte: 1 to 65535 4-byte: 1.0 to 65535.65535  | 2-byte: 1 to 65535 4-byte: 1.0 to 65535.65535           |

### Reserved and Private Autonomous System Numbers

The Cisco implementation of BGP supports [RFC 4893](#). RFC 4893 was developed to allow BGP to support a gradual transition from 2-byte autonomous system numbers to 4-byte autonomous system numbers. A new reserved (private) autonomous system number, 23456, was created by RFC 4893 and this number cannot be configured as an autonomous system number in the Cisco IOS CLI.

[RFC 5398](#), *Autonomous System (AS) Number Reservation for Documentation Use*, describes new reserved autonomous system numbers for documentation purposes. Use of the reserved numbers allow configuration examples to be accurately documented and avoids conflict with production networks if these configurations are literally copied. The reserved numbers are documented in the IANA autonomous system number registry. Reserved 2-byte autonomous system numbers are in the contiguous block, 64496 to 64511 and reserved 4-byte autonomous system numbers are from 65536 to 65551 inclusive.

Private 2-byte autonomous system numbers are still valid in the range from 64512 to 65534 with 65535 being reserved for special use. Private autonomous system numbers can be used for internal routing domains but must be translated for traffic that is routed out to the Internet. BGP should not be configured to advertise

private autonomous system numbers to external networks. Cisco IOS software does not remove private autonomous system numbers from routing updates by default. Cisco recommends that ISPs filter private autonomous system numbers.

**Note** Autonomous system number assignment for public and private networks is governed by the IANA. For information about autonomous system numbers, including reserved number assignment, or to apply to register an autonomous system number, see the following URL: <http://www.iana.org/>.

## Examples

The following example shows how to configure a BGP process for autonomous system 45000 and configures two external BGP neighbors in different autonomous systems using 2-byte autonomous system numbers:

```
Device> enable
Device# configure terminal
Device(config)# router bgp 45000
Device(config-router)# neighbor 192.168.1.2 remote-as 40000
Device(config-router)# neighbor 192.168.3.2 remote-as 50000
Device(config-router)# neighbor 192.168.3.2 description finance
Device(config-router)# address-family ipv4
Device(config-router-af)# neighbor 192.168.1.2 activate
Device(config-router-af)# neighbor 192.168.3.2 activate
Device(config-router-af)# no auto-summary
Device(config-router-af)# no synchronization
Device(config-router-af)# network 172.17.1.0 mask 255.255.255.0
Device(config-router-af)# exit-address-family
```

The following example shows how to configure a BGP process for autonomous system 65538 and configures two external BGP neighbors in different autonomous systems using 4-byte autonomous system numbers in asplain notation. This example is supported in Cisco IOS Release 12.0(32)SY8, 12.0(33)S3, 12.2(33)SRE, 12.2(33)XNE, 12.2(33)SX11, Cisco IOS XE Release 2.4, and later releases.

```
Device> enable
Device# configure terminal
Device(config)# router bgp 65538
Device(config-router)# neighbor 192.168.1.2 remote-as 65536
Device(config-router)# neighbor 192.168.3.2 remote-as 65550
Device(config-router)# neighbor 192.168.3.2 description finance
Device(config-router)# address-family ipv4
Device(config-router-af)# neighbor 192.168.1.2 activate
Device(config-router-af)# neighbor 192.168.3.2 activate
Device(config-router-af)# no auto-summary
Device(config-router-af)# no synchronization
Device(config-router-af)# network 172.17.1.0 mask 255.255.255.0
Device(config-router-af)# exit-address-family
```

## Related Commands

| Command                                    | Description                                                   |
|--------------------------------------------|---------------------------------------------------------------|
| <b>neighbor remote-as</b>                  | Adds an entry to the BGP or multiprotocol BGP neighbor table. |
| <b>network (BGP and multiprotocol BGP)</b> | Specifies the list of networks for the BGP routing process.   |

# router eigrp

To configure the EIGRP routing process, use the **router eigrp** command in global configuration mode. To remove an EIGRP routing process, use the **no** form of this command.

**router eigrp** {*autonomous-system-number**virtual-instance-name*}  
**no router eigrp** {*autonomous-system-number**virtual-instance-name*}

## Syntax Description

|                                 |                                                                                                                                                                                    |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>autonomous-system-number</i> | Autonomous system number that identifies the EIGRP services to the other EIGRP address-family routers. It is also used to tag routing information. Valid range is from 1 to 65535. |
| <i>virtual-instance-name</i>    | EIGRP virtual instance name. This name must be unique among all the address-family router processes on a single router, but need not be unique among routers.                      |

## Command Default

No EIGRP processes are configured.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Configuring the **router eigrp** command with the *autonomous-system-number* argument creates an EIGRP configuration referred to as autonomous system (AS) configuration. An EIGRP AS configuration creates an EIGRP routing instance that can be used for tagging routing information.

Configuring the **router eigrp** command with the *virtual-instance-name* argument creates an EIGRP configuration referred to as EIGRP named configuration. An EIGRP named configuration does not create an EIGRP routing instance by itself. An EIGRP named configuration is a base configuration that is required to define address-family configurations under it that are used for routing.

## Examples

The following example shows how to configure EIGRP process 109:

```
Device> enable
Device# configure terminal
Device(config)# router eigrp 109
```

The following example configures an EIGRP address-family routing process and assigns it the name *virtual-name*:

```
Device> enable
Device# configure terminal
Device(config)# router eigrp virtual-name
```

# router ospf

To configure an OSPF routing process, use the **router ospf** command in global configuration mode. To terminate an OSPF routing process, use the **no** form of this command.

**router ospf** *process-id* [**vrf** *vrf-name*]  
**no router ospf** *process-id* [**vrf** *vrf-name*]

## Syntax Description

|                            |                                                                                                                                                                                        |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>process-id</i>          | Internally used identification parameter for an OSPF routing process. It is locally assigned, and can be a positive integer. A unique value is assigned for each OSPF routing process. |
| <b>vrf</b> <i>vrf-name</i> | (Optional) Specifies the name of the VPN routing and forwarding (VRF) instance to associate with the OSPF VRF processes.                                                               |

## Command Default

No OSPF routing process is defined.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

You can specify multiple OSPF routing processes in each router.

After you enter the **router ospf** command, you can enter the maximum number of paths. There can be between 1 and 32 paths.

## Examples

The following example shows how to configure an OSPF routing process and assign a process number of 109:

```
Device(config)# router ospf 109
```

The following example shows a basic OSPF configuration using the **router ospf** command to configure the OSPF VRF instance processes for the first, second, and third VRFs:

```
Device> enable
Device# configure terminal
Device(config)# router ospf 12 vrf first
Device(config)# router ospf 13 vrf second
Device(config)# router ospf 14 vrf third
Device(config)# exit
```

The following example shows how to use the **maximum-paths** option:

```
Device> enable
Device# configure terminal
Device(config)# router ospf
Device(config-router)# maximum-paths 2
Device(config-router)# exit
```

**Related Commands**

| Command             | Description                                                                              |
|---------------------|------------------------------------------------------------------------------------------|
| <b>network area</b> | Defines the interfaces on which OSPF runs, and defines the area ID for those interfaces. |

# router ospfv3

To enter Open Shortest Path First Version 3 (OSPFv3) through router configuration mode, use the **router ospfv3** command in global configuration mode.

**router ospfv3** [{*process-id*}]

## Syntax Description

*process-id* (Optional) Internal identification. The number that is used here is the number assigned administratively when enabling the OSPFv3 routing process. The range is 1-65535.

## Command Default

OSPFv3 routing process is disabled by default.

## Command Modes

Global configuration (config)

## Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

Use the **router ospfv3** command to enter OSPFv3 router configuration mode. From this mode, you can enter taddress-family configuration mode for IPv6 or IPv4, and then configure the IPv6 or IPv4 address family.

## Examples

The following example shows how to enter OSPFv3 router configuration mode:

```
Device> enable
Device# configure terminal
Device(config)# router ospfv3 1
Device(config-router)#
```

## Related Commands

| Command                    | Description                                    |
|----------------------------|------------------------------------------------|
| <b>address-family ipv6</b> | Enters IPv6 address family configuration mode. |

# send-lifetime

To set the time period during which an authentication key on a key chain is valid to be sent, use the **send-lifetime** command in key chain key configuration mode. To revert to the default value, use the **no** form of this command.

**send-lifetime** [ **local** ] *start-time* { **infinite** *end-time* | **duration** *seconds* }  
**no** **send-lifetime**

| Syntax Description | local                          | Specifies the time in local timezone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | <i>start-time</i>              | Beginning time that the key specified by the <b>key</b> command is valid to be sent. The syntax can be either of the following:<br><br><i>hh : mm : ss month date year</i><br><i>hh : mm : ss date month year</i> <ul style="list-style-type: none"> <li><i>hh</i>: Hours</li> <li><i>mm</i>: Minutes</li> <li><i>ss</i>: Seconds</li> <li><i>month</i>: First three letters of the month</li> <li><i>date</i>: Date (1-31)</li> <li><i>year</i>: Year (four digits)</li> </ul> The default start time and the earliest acceptable date is January 1, 1993. |
|                    | <b>infinite</b>                | Key is valid to be sent from the <i>start-time</i> value on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                    | <i>end-time</i>                | Key is valid to be sent from the <i>start-time</i> value until the <i>end-time</i> value. The syntax is the same as that for the <i>start-time</i> value. The <i>end-time</i> value must be after the <i>start-time</i> value. The default end time is an infinite time period.                                                                                                                                                                                                                                                                             |
|                    | <b>duration</b> <i>seconds</i> | Length of time (in seconds) that the key is valid to be sent. The range is from 1 to 2147483646.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Command Default** Forever (the starting time is January 1, 1993, and the ending time is infinite)

**Command Modes** Key chain key configuration (config-keychain-key)

| Command History | Release                       | Modification                                                          |
|-----------------|-------------------------------|-----------------------------------------------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a  | This command was introduced.                                          |
|                 | Cisco IOS XE Bengaluru 17.5.1 | The new range of the <b>duration</b> keyword is from 1 to 2147483646. |

**Usage Guidelines** Specify a *start-time* value and one of the following values: **infinite**, *end-time*, or **duration** *seconds*.

We recommend running Network Time Protocol (NTP) or some other time synchronization method if you intend to set lifetimes on keys.

If the last key expires, authentication will continue and an error message will be generated. To disable authentication, you must manually delete the last valid key.

## Examples

The following example configures a key chain named chain1. The key named key1 will be accepted from 1:30 p.m. to 3:30 p.m. and be sent from 2:00 p.m. to 3:00 p.m. The key named key2 will be accepted from 2:30 p.m. to 4:30 p.m. and be sent from 3:00 p.m. to 4:00 p.m. The overlap allows for migration of keys or a discrepancy in the set time of the router. There is a 30-minute leeway on each side to handle time differences.

```
Device(config)# interface GigabitEthernet1/0/1
Device(config-if)# ip rip authentication key-chain chain1
Device(config-if)# ip rip authentication mode md5
Device(config-if)# exit
Device(config)# router rip
Device(config-router)# network 172.19.0.0
Device(config-router)# version 2
Device(config-router)# exit
Device(config)# key chain chain1
Device(config-keychain)# key 1
Device(config-keychain-key)# key-string key1
Device(config-keychain-key)# accept-lifetime 13:30:00 Jan 25 1996 duration 7200
Device(config-keychain-key)# send-lifetime 14:00:00 Jan 25 1996 duration 3600
Device(config-keychain-key)# exit
Device(config-keychain)# key 2
Device(config-keychain)# key-string key2
Device(config-keychain)# accept-lifetime 14:30:00 Jan 25 1996 duration 7200
Device(config-keychain)# send-lifetime 15:00:00 Jan 25 1996 duration 3600
```

The following example configures a key chain named chain1 for EIGRP address-family. The key named key1 will be accepted from 1:30 p.m. to 3:30 p.m. and be sent from 2:00 p.m. to 3:00 p.m. The key named key2 will be accepted from 2:30 p.m. to 4:30 p.m. and be sent from 3:00 p.m. to 4:00 p.m. The overlap allows for migration of keys or a discrepancy in the set time of the router. There is a 30-minute leeway on each side to handle time differences.

```
Device(config)# router eigrp 10
Device(config-router)# address-family ipv4 autonomous-system 4453
Device(config-router-af)# network 10.0.0.0
Device(config-router-af)# af-interface ethernet0/0
Device(config-router-af-interface)# authentication key-chain trees
Device(config-router-af-interface)# authentication mode md5
Device(config-router-af-interface)# exit
Device(config-router-af)# exit
Device(config-router)# exit
Device(config)# key chain chain1
Device(config-keychain)# key 1
Device(config-keychain-key)# key-string key1
Device(config-keychain-key)# accept-lifetime 13:30:00 Jan 25 1996 duration 7200
Device(config-keychain-key)# send-lifetime 14:00:00 Jan 25 1996 duration 3600
Device(config-keychain-key)# exit
Device(config-keychain)# key 2
Device(config-keychain-key)# key-string key2
Device(config-keychain-key)# accept-lifetime 14:30:00 Jan 25 1996 duration 7200
Device(config-keychain-key)# send-lifetime 15:00:00 Jan 25 1996 duration 3600
```

**Related Commands**

| Command                            | Description                                                                                   |
|------------------------------------|-----------------------------------------------------------------------------------------------|
| <b>accept-lifetime</b>             | Sets the time period during which the authentication key on a key chain is received as valid. |
| <b>key</b>                         | Identifies an authentication key on a key chain.                                              |
| <b>key chain</b>                   | Defines an authentication key chain needed to enable authentication for routing protocols.    |
| <b>key-string (authentication)</b> | Specifies the authentication string for a key.                                                |
| <b>show key chain</b>              | Displays authentication key information.                                                      |

# set community

To set the BGP communities attribute, use the **set community** route map configuration command. To delete the entry, use the **no** form of this command.

**set community** {*community-number* [**additive**] [*well-known-community*] | **none**}  
**no set community**

## Syntax Description

|                             |                                                                                                                                                                                                                  |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>community-number</i>     | Specifies that community number. Valid values are from 1 to 4294967200, <b>no-export</b> , or <b>no-advertise</b> .                                                                                              |
| <b>additive</b>             | (Optional) Adds the community to the already existing communities.                                                                                                                                               |
| <i>well-known-community</i> | (Optional) Well know communities can be specified by using the following keywords: <ul style="list-style-type: none"> <li>• internet</li> <li>• local-as</li> <li>• no-advertise</li> <li>• no-export</li> </ul> |
| <b>none</b>                 | (Optional) Removes the community attribute from the prefixes that pass the route map.                                                                                                                            |

## Command Default

No BGP communities attributes exist.

## Command Modes

Route-map configuration (config-route-map)

## Command History

*Table 148:*

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

## Usage Guidelines

You must have a match clause (even if it points to a “permit everything” list) if you want to set tags.

Use the **route-map** global configuration command, and the **match** and **set** route map configuration commands, to define the conditions for redistributing routes from one routing protocol into another. Each **route-map** command has a list of **match** and **set** commands associated with it. The **match** commands specify the *match criteria* --the conditions under which redistribution is allowed for the current **route-map** command. The **set** commands specify the *set actions* --the particular redistribution actions to perform if the criteria enforced by the **match** commands are met. The **no route-map** command deletes the route map.

The **set** route map configuration commands specify the redistribution *set actions* to be performed when all of the match criteria of a route map are met. When all match criteria are met, all set actions are performed.

## Examples

In the following example, routes that pass the autonomous system path access list 1 have the community set to 109. Routes that pass the autonomous system path access list 2 have the community set to no-export (these routes will not be advertised to any external BGP [eBGP] peers).

```
route-map set_community 10 permit
match as-path 1
set community 109
route-map set_community 20 permit
match as-path 2
set community no-export
```

In the following similar example, routes that pass the autonomous system path access list 1 have the community set to 109. Routes that pass the autonomous system path access list 2 have the community set to local-as (the router will not advertise this route to peers outside the local autonomous system).

```
route-map set_community 10 permit
match as-path 1
set community 109
route-map set_community 20 permit
match as-path 2
set community local-as
```

## Related Commands

|------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>ip community-list</b>     | Creates a community list for BGP and control access to it.                                                          |
| <b>match community</b>       | Matches a BGP community.                                                                                            |
| <b>route-map (IP)</b>        | Defines the conditions for redistributing routes from one routing protocol into another, or enables policy routing. |
| <b>set comm-list delete</b>  | Removes communities from the community attribute of an inbound or outbound update.                                  |
| <b>show ip bgp community</b> | Displays routes that belong to specified BGP communities.                                                           |

## set ip next-hop (BGP)

To indicate where to output packets that pass a match clause of a route map for policy routing, use the **set ip next-hop** command in route-map configuration mode. To delete an entry, use the **no** form of this command.

```
set ip next-hop ip-address[ {...ip-address} ][ {peer-address} ]
no set ip next-hop ip-address[ {...ip-address} ][ {peer-address} ]
```

### Syntax Description

|                     |                                                                                            |
|---------------------|--------------------------------------------------------------------------------------------|
| <i>ip-address</i>   | IP address of the next hop to which packets are output. It need not be an adjacent router. |
| <b>peer-address</b> | (Optional) Sets the next hop to be the BGP peering address.                                |

### Command Default

This command is disabled by default.

### Command Modes

Route-map configuration (config-route-map)

### Command History

| Release                      | Modification                 |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

### Usage Guidelines

An ellipsis (...) in the command syntax indicates that your command input can include multiple values for the *ip-address* argument.

Use the **ip policy route-map** interface configuration command, the **route-map** global configuration command, and the **match** and **set** route-map configuration commands to define the conditions for policy routing packets. The **ip policy route-map** command identifies a route map by name. Each **route-map** command has a list of **match** and **set** commands associated with it. The **match** commands specify the *match criteria* --the conditions under which policy routing occurs. The **set** commands specify the *set actions* --the particular routing actions to perform if the criteria enforced by the **match** commands are met.

If the first next hop specified with the **set ip next-hop** command is down, the optionally specified IP addresses are tried in turn.

When the **set ip next-hop** command is used with the **peer-address** keyword in an inbound route map of a BGP peer, the next hop of the received matching routes will be set to be the neighbor peering address, overriding any third-party next hops. So the same route map can be applied to multiple BGP peers to override third-party next hops.

When the **set ip next-hop** command is used with the **peer-address** keyword in an outbound route map of a BGP peer, the next hop of the advertised matching routes will be set to be the peering address of the local router, thus disabling the next hop calculation. The **set ip next-hop** command has finer granularity than the (per-neighbor) **neighbor next-hop-self** command, because you can set the next hop for some routes, but not others. The **neighbor next-hop-self** command sets the next hop for all routes sent to that neighbor.

The set clauses can be used in conjunction with one another. They are evaluated in the following order:

1. **set ip next-hop**
2. **set interface**
3. **set ip default next-hop**

#### 4. set default interface

**Note** To avoid a common configuration error for reflected routes, do not use the **set ip next-hop** command in a route map to be applied to BGP route reflector clients.

Configuring the **set ip next-hop ...ip-address** command on a VRF interface allows the next hop to be looked up in a specified VRF address family. In this context, the *...ip-address* argument matches that of the specified VRF instance.

#### Examples

In the following example, three routers are on the same FDDI LAN (with IP addresses 10.1.1.1, 10.1.1.2, and 10.1.1.3). Each is in a different autonomous system. The **set ip next-hop peer-address** command specifies that traffic from the router (10.1.1.3) in remote autonomous system 300 for the router (10.1.1.1) in remote autonomous system 100 that matches the route map is passed through the router **bgp 200**, rather than sent directly to the router (10.1.1.1) in autonomous system 100 over their mutual connection to the LAN.

```
Device(config)#router bgp 200
Device(config)#neighbor 10.1.1.3 remote-as 300
Device(config)#neighbor 10.1.1.3 route-map set-peer-address out
Device(config)#neighbor 10.1.1.1 remote-as 100
Device(config)#route-map set-peer-address permit 10
Device(config)#set ip next-hop peer-address
```

#### Related Commands

| Command                        | Description                                                                                                                                                               |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip policy route-map</b>     | Identifies a route map to use for policy routing on an interface.                                                                                                         |
| <b>match ip address</b>        | Distributes any routes that have a destination network number address that is permitted by a standard or extended access list, and performs policy routing on packets.    |
| <b>match length</b>            | Bases policy routing on the Level 3 length of a packet.                                                                                                                   |
| <b>neighbor next-hop-self</b>  | Disables next hop processing of BGP updates on the router.                                                                                                                |
| <b>route-map (IP)</b>          | Defines the conditions for redistributing routes from one routing protocol to another, or enables policy routing.                                                         |
| <b>set default interface</b>   | Indicates where to output packets that pass a match clause of a route map for policy routing and that have no explicit route to the destination.                          |
| <b>set interface</b>           | Indicates where to output packets that pass a match clause of a route map for policy routing.                                                                             |
| <b>set ip default next-hop</b> | Indicates where to output packets that pass a match clause of a route map for policy routing and for which the Cisco IOS software has no explicit route to a destination. |

## show ip bgp

To display entries in the Border Gateway Protocol (BGP) routing table, use the **show ip bgp** command in user EXEC or privileged EXEC mode.

```
show ip bgp [{ip-address [{mask [{longer-prefixes [{injected}] | shorter-prefixes [{length}] |
best-path-reason | bestpath | multipaths | subnets}] | best-path-reason | bestpath | internal |
multipaths}] | all | oer-paths | prefix-list name | pending-prefixes | route-map name | version
{version-number | recent offset-value}]]]
```

### Syntax Description

|                               |                                                                                                                                                                                      |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip-address</i>             | (Optional) IP address entered to filter the output to display only a particular host or network in the BGP routing table.                                                            |
| <i>mask</i>                   | (Optional) Mask to filter or match hosts that are part of the specified network.                                                                                                     |
| <b>longer-prefixes</b>        | (Optional) Displays the specified route and all more-specific routes.                                                                                                                |
| <b>injected</b>               | (Optional) Displays more-specific prefixes injected into the BGP routing table.                                                                                                      |
| <b>shorter-prefixes</b>       | (Optional) Displays the specified route and all less-specific routes.                                                                                                                |
| <i>length</i>                 | (Optional) The prefix length. The range is a number from 0 to 32.                                                                                                                    |
| <b>bestpath</b>               | (Optional) Displays the best path for this prefix.                                                                                                                                   |
| <b>best-path-reason</b>       | (Optional) Displays the reason why a path loses to the bestpath.<br><b>Note</b> If the best-path is yet to be selected, then the output will be 'Best Path Evaluation: No best path' |
| <b>internal</b>               | (Optional) Displays the internal details for this prefix.                                                                                                                            |
| <b>multipaths</b>             | (Optional) Displays multipaths for this prefix.                                                                                                                                      |
| <b>subnets</b>                | (Optional) Displays the subnet routes for the specified prefix.                                                                                                                      |
| <b>all</b>                    | (Optional) Displays all address family information in the BGP routing table.                                                                                                         |
| <b>oer-paths</b>              | (Optional) Displays Optimized Edge Routing (OER) controlled prefixes in the BGP routing table.                                                                                       |
| <b>prefix-list name</b>       | (Optional) Filters the output based on the specified prefix list.                                                                                                                    |
| <b>pending-prefixes</b>       | (Optional) Displays prefixes that are pending deletion from the BGP routing table.                                                                                                   |
| <b>route-map name</b>         | (Optional) Filters the output based on the specified route map.                                                                                                                      |
| <b>version version-number</b> | (Optional) Displays all prefixes with network versions greater than or equal to the specified version number. The range is from 1 to 4294967295.                                     |
| <b>recent offset-value</b>    | (Optional) Displays the offset from the current routing table version. The range is from 1 to 4294967295.                                                                            |

|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cisco IOS XE Everest 16.5.1a   | This command was introduced.                                                                                                                                                                                            |
| Cisco IOS XE Gibraltar 16.10.1 | The <b>best-path-reason</b> keyword was added to this command.<br><br>BGP Path Installation Time-Stamp was added to the output of the command.<br><br>BGP Peak Prefix Watermark was added to the output of the command. |

**Usage Guidelines**

The **show ip bgp** command is used to display the contents of the BGP routing table. The output can be filtered to display entries for a specific prefix, prefix length, and prefixes injected through a prefix list, route map, or conditional advertisement.

When changes are made to the network address, the network version number is incremented. Use the **version** keyword to view a specific network version.

**show ip bgp: Example**

The following sample output displays the BGP routing table:

```
Device#show ip bgp

BGP table version is 6, local router ID is 10.0.96.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               r RIB-failure, S Stale, m multipath, b backup-path, x best-external, f
RT-Filter, a additional-path
Origin codes: i - IGP, e - EGP, ? - incomplete
RPKI validation codes: V valid, I invalid, N Not found

      Network          Next Hop           Metric LocPrf Weight Path
-----

```

The table below describes the significant fields shown in the display.

Table 149: show ip bgp Field Descriptions

| Field                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BGP table version     | Internal version number of the table. This number is incremented whenever the table changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| local router ID       | IP address of the router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Status codes          | <p>Status of the table entry. The status is displayed at the beginning of each line in the table. It can be one of the following values:</p> <ul style="list-style-type: none"> <li>• s—The table entry is suppressed.</li> <li>• d—The table entry is dampened.</li> <li>• h—The table entry history.</li> <li>• *—The table entry is valid.</li> <li>• &gt;—The table entry is the best entry to use for that network.</li> <li>• i—The table entry was learned via an internal BGP (iBGP) session.</li> <li>• r—The table entry is a RIB-failure.</li> <li>• S—The table entry is stale.</li> <li>• m—The table entry has multipath to use for that network.</li> <li>• b—The table entry has a backup path to use for that network.</li> <li>• x—The table entry has a best external route to use for the network.</li> </ul> |
| Origin codes          | <p>Origin of the entry. The origin code is placed at the end of each line in the table. It can be one of the following values:</p> <ul style="list-style-type: none"> <li>• a—Path is selected as an additional path.</li> <li>• i—Entry originated from an Interior Gateway Protocol (IGP) and was advertised with a <b>network</b> router configuration command.</li> <li>• e—Entry originated from an Exterior Gateway Protocol (EGP).</li> <li>• ?—Origin of the path is not clear. Usually, this is a router that is redistributed into BGP from an IGP.</li> </ul>                                                                                                                                                                                                                                                          |
| RPKI validation codes | If shown, the RPKI validation state for the network prefix, which is downloaded from the RPKI server. The codes are shown only if the <b>bgp rpki server</b> or <b>neighbor announce rpki state</b> command is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Network               | IP address of a network entity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Next Hop              | IP address of the next system that is used when forwarding a packet to the destination network. An entry of 0.0.0.0 indicates that the router has some non-BGP routes to this network.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Metric                | If shown, the value of the interautonomous system metric.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Field      | Description                                                                                                                      |
|------------|----------------------------------------------------------------------------------------------------------------------------------|
| LocPrf     | Local preference value as set with the <b>set local-preference</b> route-map configuration command. The default value is 100.    |
| Weight     | Weight of the route as set via autonomous system filters.                                                                        |
| Path       | Autonomous system paths to the destination network. There can be one entry in this field for each autonomous system in the path. |
| (stale)    | Indicates that the following path for the specified autonomous system is marked as “stale” during a graceful restart process.    |
| Updated on | The time at which the path is received or updated.                                                                               |

### show ip bgp (4-Byte Autonomous System Numbers): Example

The following sample output shows the BGP routing table with 4-byte autonomous system numbers, 65536 and 65550, shown under the Path field. This example requires Cisco IOS Release 12.0(32)SY8, 12.0(33)S3, 12.2(33)SRE, 12.2(33)XNE, 12.2(33)SXII, Cisco IOS XE Release 2.4, or a later release.

Device#**show ip bgp**

```

BGP table version is 4, local router ID is 172.16.1.99
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop           Metric LocPrf Weight Path
*> 10.1.1.0/24     192.168.1.2             0           0 65536  i
*> 10.2.2.0/24     192.168.3.2             0           0 65550  i
*> 172.16.1.0/24   0.0.0.0                 0           32768  i

```

The table below describes the significant fields shown in the display.

**Table 150: show ip bgp ip-address Field Descriptions**

| Field                       | Description                                                                                                                                                                                                                                                   |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BGP routing table entry for | IP address or network number of the routing table entry.                                                                                                                                                                                                      |
| version                     | Internal version number of the table. This number is incremented whenever the table changes.                                                                                                                                                                  |
| Paths                       | The number of available paths, and the number of installed best paths. This line displays “Default-IP-Routing-Table” when the best path is installed in the IP routing table.                                                                                 |
| Multipath                   | This field is displayed when multipath load sharing is enabled. This field will indicate if the multipaths are iBGP or eBGP.                                                                                                                                  |
| Advertised to update-groups | The number of each update group for which advertisements are processed.                                                                                                                                                                                       |
| Origin                      | Origin of the entry. The origin can be IGP, EGP, or incomplete. This line displays the configured metric (0 if no metric is configured), the local preference value (100 is default), and the status and type of route (internal, external, multipath, best). |
| Extended Community          | This field is displayed if the route carries an extended community attribute. The attribute code is displayed on this line. Information about the extended community is displayed on a subsequent line.                                                       |

### show ip bgp all: Example

The following is sample output from the **show ip bgp** command entered with the **all** keyword. Information about all configured address families is displayed.

Device#show ip bgp all

For address family: IPv4 Unicast \*\*\*\*\*

BGP table version is 27, local router ID is 10.1.1.1

Status codes: s suppressed, d damped, h history, \* valid, > best, i - internal,  
r RIB-failure

Origin codes: i - IGP, e - EGP, ? - incomplete

*                  10.0.0.2                0          0 200 ?
```

**show ip bgp (Additional Paths): Example**

The following output indicates (for each neighbor) whether any of the additional path tags (group-best, all, best 2 or best 3) are applied to the path. A line of output indicates rx pathid (received from neighbor) and tx pathid (announcing to neighbors). Note that the “Path advertised to update-groups:” is now per-path when the BGP Additional Paths feature is enabled.

```

```

### show ip bgp version: Example

The following is sample output from the **show ip bgp version** command:

```

Device#show ip bgp version

BGP table version is 5, local router ID is 10.2.4.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
r RIB-failure, S Stale, m multipath, b backup-path, x best-external
Origin codes: i - IGP, e - EGP, ? - incomplete
Network Next Hop Metric LocPrf Weight Path
*> 192.168.34.2/24 10.0.0.1 0 0 1 ?

```

```
*> 192.168.35.2/24 10.0.0.1 0 0 1 ?
```

The following example shows how to display the network version:

```
Device#show ip bgp 192.168.34.2 | include version
```

BGP routing table entry for 192.168.34.2/24, version 5

The following sample output from the **show ip bgp version recent** command displays the prefix changes in the specified version:

```
Device#show ip bgp version recent 2
```

```
BGP table version is 5, local router ID is 10.2.4.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
r RIB-failure, S Stale, m multipath, b backup-path, x best-external
Origin codes: i - IGP, e - EGP, ? - incomplete
```

| Network              | Next Hop | Metric | LocPrf | Weight | Path |

|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bgp asnotation dot</b>          | Changes the default display and the regular expression match format of BGP 4-byte autonomous system numbers from asplain (decimal values) to dot notation. |
| <b>clear ip bgp</b>                | Resets BGP connections using hard or soft reconfiguration.                                                                                                 |
| <b>ip bgp community new-format</b> | Configures BGP to display communities in the format AA:NN.                                                                                                 |
| <b>ip prefix-list</b>              | Creates a prefix list or adds a prefix-list entry.                                                                                                         |
| <b>route-map</b>                   | Defines the conditions for redistributing routes from one routing protocol into another routing protocol.                                                  |
| <b>router bgp</b>                  | Configures the BGP routing process.                                                                                                                        |

## show ip bgp neighbors

To display information about Border Gateway Protocol (BGP) and TCP connections to neighbors, use the **show ip bgp neighbors** command in user or privileged EXEC mode.

```
show ip bgp [{ipv4 {multicast|unicast}|vpnv4 all|vpnv6 unicast all}] neighbors [{slowip-address
| ipv6-address [{advertised-routes|dampened-routes|flap-statistics|paths [reg-exp]|policy [detail]
|received prefix-filter|received-routes|routes}}}]
```

### Syntax Description

|                               |                                                                                                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ipv4</b>                   | (Optional) Displays peers in the IPv4 address family.                                                                                                                                       |
| <b>multicast</b>              | (Optional) Specifies IPv4 multicast address prefixes.                                                                                                                                       |
| <b>unicast</b>                | (Optional) Specifies IPv4 unicast address prefixes.                                                                                                                                         |
| <b>vpnv4 all</b>              | (Optional) Displays peers in the VPNv4 address family.                                                                                                                                      |
| <b>vpnv6 unicast all</b>      | (Optional) Displays peers in the VPNv6 address family.                                                                                                                                      |
| <b>slow</b>                   | (Optional) Displays information about dynamically configured slow peers.                                                                                                                    |
| <i>ip-address</i>             | (Optional) IP address of the IPv4 neighbor. If this argument is omitted, information about all neighbors is displayed.                                                                      |
| <i>ipv6-address</i>           | (Optional) IP address of the IPv6 neighbor.                                                                                                                                                 |
| <b>advertised-routes</b>      | (Optional) Displays all routes that have been advertised to neighbors.                                                                                                                      |
| <b>dampened-routes</b>        | (Optional) Displays the dampened routes received from the specified neighbor.                                                                                                               |
| <b>flap-statistics</b>        | (Optional) Displays the flap statistics of the routes learned from the specified neighbor (for external BGP peers only).                                                                    |
| <b>paths</b> <i>reg-exp</i>   | (Optional) Displays autonomous system paths learned from the specified neighbor. An optional regular expression can be used to filter the output.                                           |
| <b>policy</b>                 | (Optional) Displays the policies applied to this neighbor per address family.                                                                                                               |
| <b>detail</b>                 | (Optional) Displays detailed policy information such as route maps, prefix lists, community lists, access control lists (ACLs), and autonomous system path filter lists.                    |
| <b>received prefix-filter</b> | (Optional) Displays the prefix list (outbound route filter [ORF]) sent from the specified neighbor.                                                                                         |
| <b>received-routes</b>        | (Optional) Displays all received routes (both accepted and rejected) from the specified neighbor.                                                                                           |
| <b>routes</b>                 | (Optional) Displays all routes that are received and accepted. The output displayed when this keyword is entered is a subset of the output displayed by the <b>received-routes</b> keyword. |

**Command Default** The output of this command displays information for all neighbors.

**Command Modes** User EXEC (>)  
Privileged EXEC (#)

### Command History

| Command History | Release                        | Modification                                               |
|-----------------|--------------------------------|------------------------------------------------------------|
|                 | Cisco IOS XE Everest 16.5.1a   | This command was introduced.                               |
|                 | Cisco IOS XE Gibraltar 16.10.1 | BGP Peak Prefix Watermark was added to the command output. |

**Usage Guidelines** Use the **show ip bgp neighbors** command to display BGP and TCP connection information for neighbor sessions. For BGP, this includes detailed neighbor attribute, capability, path, and prefix information. For TCP, this includes statistics related to BGP neighbor session establishment and maintenance.

Prefix activity is displayed based on the number of prefixes that are advertised and withdrawn. Policy denials display the number of routes that were advertised but then ignored based on the function or attribute that is displayed in the output.

### Examples

Example output is different for the various keywords available for the **show ip bgp neighbors** command. Examples using the various keywords appear in the following sections.

#### show ip bgp neighbors: Example

The following example shows output for the BGP neighbor at 10.108.50.2. This neighbor is an internal BGP (iBGP) peer. This neighbor supports the route refresh and graceful restart capabilities.

```
Device#show ip bgp neighbors 10.108.50.2

BGP neighbor is 10.108.50.2, remote AS 1, internal link
  BGP version 4, remote router ID 192.168.252.252
  BGP state = Established, up for 00:24:25
  Last read 00:00:24, last write 00:00:24, hold time is 180, keepalive interval is
    60 seconds
  Neighbor capabilities:
    Route refresh: advertised and received(old & new)
    MPLS Label capability: advertised and received
    Graceful Restart Capability: advertised
    Address family IPv4 Unicast: advertised and received
  Message statistics:
    InQ depth is 0
    OutQ depth is 0

              Sent          Rcvd
  Opens:              3           3
  Notifications:      0           0
  Updates:            0           0
  Keepalives:        113         112
  Route Refresh:       0           0
  Total:             116         115
  Default minimum time between advertisement runs is 5 seconds
  For address family: IPv4 Unicast
  BGP additional-paths computation is enabled
```

```

BGP advertise-best-external is enabled

The table below describes the significant fields shown in the display. Fields that are preceded by the asterisk character (\*) are displayed only when the counter has a nonzero value.

**Table 151: show ip bgp neighbors Field Descriptions**

| Field                                          | Description                                                                                                                                                                                                                  |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BGP neighbor                                   | IP address of the BGP neighbor and its autonomous system number.                                                                                                                                                             |
| remote AS                                      | Autonomous system number of the neighbor.                                                                                                                                                                                    |
| local AS 300 no-prepend (not shown in display) | Verifies that the local autonomous system number is not prepended to received external routes. This output supports the hiding of the local autonomous systems when a network administrator is migrating autonomous systems. |

| Field                       | Description                                                                                                                                                          |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| internal link               | “internal link” is displayed for iBGP neighbors; “external link” is displayed for external BGP (eBGP) neighbors.                                                     |
| BGP version                 | BGP version being used to communicate with the remote router.                                                                                                        |
| remote router ID            | IP address of the neighbor.                                                                                                                                          |
| BGP state                   | Finite state machine (FSM) stage of session negotiation.                                                                                                             |
| up for                      | Time, in hh:mm:ss, that the underlying TCP connection has been in existence.                                                                                         |
| Last read                   | Time, in hh:mm:ss, since BGP last received a message from this neighbor.                                                                                             |
| last write                  | Time, in hh:mm:ss, since BGP last sent a message to this neighbor.                                                                                                   |
| hold time                   | Time, in seconds, that BGP will maintain the session with this neighbor without receiving messages.                                                                  |
| keepalive interval          | Time interval, in seconds, at which keepalive messages are transmitted to this neighbor.                                                                             |
| Neighbor capabilities       | BGP capabilities advertised and received from this neighbor. “advertised and received” is displayed when a capability is successfully exchanged between two routers. |
| Route refresh               | Status of the route refresh capability.                                                                                                                              |
| MPLS Label capability       | Indicates that MPLS labels are both sent and received by the eBGP peer.                                                                                              |
| Graceful Restart Capability | Status of the graceful restart capability.                                                                                                                           |
| Address family IPv4 Unicast | IP Version 4 unicast-specific properties of this neighbor.                                                                                                           |
| Message statistics          | Statistics organized by message type.                                                                                                                                |
| InQ depth is                | Number of messages in the input queue.                                                                                                                               |
| OutQ depth is               | Number of messages in the output queue.                                                                                                                              |
| Sent                        | Total number of transmitted messages.                                                                                                                                |
| Revd                        | Total number of received messages.                                                                                                                                   |
| Opens                       | Number of open messages sent and received.                                                                                                                           |
| Notifications               | Number of notification (error) messages sent and received.                                                                                                           |
| Updates                     | Number of update messages sent and received.                                                                                                                         |
| Keepalives                  | Number of keepalive messages sent and received.                                                                                                                      |

| Field                           | Description                                                                                                                                                                                           |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Route Refresh                   | Number of route refresh request messages sent and received.                                                                                                                                           |
| Total                           | Total number of messages sent and received.                                                                                                                                                           |
| Default minimum time between... | Time, in seconds, between advertisement transmissions.                                                                                                                                                |
| For address family:             | Address family to which the following fields refer.                                                                                                                                                   |
| BGP table version               | Internal version number of the table. This is the primary routing table with which the neighbor has been updated. The number increments when the table changes.                                       |
| neighbor version                | Number used by the software to track prefixes that have been sent and those that need to be sent.                                                                                                     |
| 1 update-group member           | Number of the update-group member for this address family.                                                                                                                                            |
| Prefix activity                 | Prefix statistics for this address family.                                                                                                                                                            |
| Prefixes Current                | Number of prefixes accepted for this address family.                                                                                                                                                  |
| Prefixes Total                  | Total number of received prefixes.                                                                                                                                                                    |
| Implicit Withdraw               | Number of times that a prefix has been withdrawn and readvertised.                                                                                                                                    |
| Explicit Withdraw               | Number of times that a prefix has been withdrawn because it is no longer feasible.                                                                                                                    |
| Used as bestpath                | Number of received prefixes installed as best paths.                                                                                                                                                  |
| Used as multipath               | Number of received prefixes installed as multipaths.                                                                                                                                                  |
| * Saved (soft-reconfig)         | Number of soft resets performed with a neighbor that supports soft reconfiguration. This field is displayed only if the counter has a nonzero value.                                                  |
| * History paths                 | This field is displayed only if the counter has a nonzero value.                                                                                                                                      |
| * Invalid paths                 | Number of invalid paths. This field is displayed only if the counter has a nonzero value.                                                                                                             |
| Local Policy Denied Prefixes    | Prefixes denied due to local policy configuration. Counters are updated for inbound and outbound policy denials. The fields under this heading are displayed only if the counter has a nonzero value. |
| * route-map                     | Displays inbound and outbound route-map policy denials.                                                                                                                                               |
| * filter-list                   | Displays inbound and outbound filter-list policy denials.                                                                                                                                             |
| * prefix-list                   | Displays inbound and outbound prefix-list policy denials.                                                                                                                                             |
| * Ext Community                 | Displays only outbound extended community policy denials.                                                                                                                                             |
| * AS_PATH too long              | Displays outbound AS_PATH length policy denials.                                                                                                                                                      |

| Field                                   | Description                                                                                                       |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| * AS_PATH loop                          | Displays outbound AS_PATH loop policy denials.                                                                    |
| * AS_PATH confed info                   | Displays outbound confederation policy denials.                                                                   |
| * AS_PATH contains AS 0                 | Displays outbound denials of autonomous system 0.                                                                 |
| * NEXT_HOP Martian                      | Displays outbound martian denials.                                                                                |
| * NEXT_HOP non-local                    | Displays outbound nonlocal next-hop denials.                                                                      |
| * NEXT_HOP is us                        | Displays outbound next-hop-self denials.                                                                          |
| * CLUSTER_LIST loop                     | Displays outbound cluster-list loop denials.                                                                      |
| * ORIGINATOR loop                       | Displays outbound denials of local originated routes.                                                             |
| * unsuppress-map                        | Displays inbound denials due to an unsuppress map.                                                                |
| * advertise-map                         | Displays inbound denials due to an advertise map.                                                                 |
| * VPN Imported prefix                   | Displays inbound denials of VPN prefixes.                                                                         |
| * Well-known Community                  | Displays inbound denials of well-known communities.                                                               |
| * SOO loop                              | Displays inbound denials due to site-of-origin.                                                                   |
| * Bestpath from this peer               | Displays inbound denials because the best path came from the local router.                                        |
| * Suppressed due to dampening           | Displays inbound denials because the neighbor or link is in a dampening state.                                    |
| * Bestpath from iBGP peer               | Displays inbound denials because the best path came from an iBGP neighbor.                                        |
| * Incorrect RIB for CE                  | Displays inbound denials due to RIB errors for a customer edge (CE) router.                                       |
| * BGP distribute-list                   | Displays inbound denials due to a distribute list.                                                                |
| Number of NLRIs...                      | Number of network layer reachability attributes in updates.                                                       |
| Current session network count peaked... | Displays the peak number of networks observed in the current session.                                             |
| Highest network count observed at...    | Displays the peak number of networks observed since startup.                                                      |
| Connections established                 | Number of times a TCP and BGP connection has been successfully established.                                       |
| dropped                                 | Number of times that a valid session has failed or been taken down.                                               |
| Last reset                              | Time, in hh:mm:ss, since this peering session was last reset. The reason for the reset is displayed on this line. |

| Field                                          | Description                                                                                                                                                            |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| External BGP neighbor may be...                | Indicates that the BGP time to live (TTL) security check is enabled. The maximum number of hops that can separate the local and remote peer is displayed on this line. |
| Connection state                               | Connection status of the BGP peer.                                                                                                                                     |
| unread input bytes                             | Number of bytes of packets still to be processed.                                                                                                                      |
| Connection is ECN Disabled                     | Explicit congestion notification status (enabled or disabled).                                                                                                         |
| Local host: 10.108.50.1, Local port: 179       | IP address of the local BGP speaker. BGP port number 179.                                                                                                              |
| Foreign host: 10.108.50.2, Foreign port: 42698 | Neighbor address and BGP destination port number.                                                                                                                      |
| Enqueued packets for retransmit:               | Packets queued for retransmission by TCP.                                                                                                                              |
| Event Timers                                   | TCP event timers. Counters are provided for starts and wakeups (expired timers).                                                                                       |
| Retrans                                        | Number of times a packet has been retransmitted.                                                                                                                       |
| TimeWait                                       | Time waiting for the retransmission timers to expire.                                                                                                                  |
| AckHold                                        | Acknowledgment hold timer.                                                                                                                                             |
| SendWnd                                        | Transmission (send) window.                                                                                                                                            |
| KeepAlive                                      | Number of keepalive packets.                                                                                                                                           |
| GiveUp                                         | Number of times a packet is dropped due to no acknowledgment.                                                                                                          |
| PmtuAger                                       | Path MTU discovery timer.                                                                                                                                              |
| DeadWait                                       | Expiration timer for dead segments.                                                                                                                                    |
| iss:                                           | Initial packet transmission sequence number.                                                                                                                           |
| snduna:                                        | Last transmission sequence number that has not been acknowledged.                                                                                                      |
| sndnxt:                                        | Next packet sequence number to be transmitted.                                                                                                                         |
| sndwnd:                                        | TCP window size of the remote neighbor.                                                                                                                                |
| irs:                                           | Initial packet receive sequence number.                                                                                                                                |
| rcvnxt:                                        | Last receive sequence number that has been locally acknowledged.                                                                                                       |
| revwnd:                                        | TCP window size of the local host.                                                                                                                                     |

| Field                | Description                                                                                                                                                                                                                                                                                                        |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| delrcvwnd:           | Delayed receive window—data the local host has read from the connection, but has not yet subtracted from the receive window the host has advertised to the remote host. The value in this field gradually increases until it is higher than a full-sized packet, at which point it is applied to the rcvwnd field. |
| SRTT:                | A calculated smoothed round-trip timeout.                                                                                                                                                                                                                                                                          |
| RTTO:                | Round-trip timeout.                                                                                                                                                                                                                                                                                                |
| RTV:                 | Variance of the round-trip time.                                                                                                                                                                                                                                                                                   |
| KRTT:                | New round-trip timeout (using the Karn algorithm). This field separately tracks the round-trip time of packets that have been re-sent.                                                                                                                                                                             |
| minRTT:              | Shortest recorded round-trip timeout (hard-wire value used for calculation).                                                                                                                                                                                                                                       |
| maxRTT:              | Longest recorded round-trip timeout.                                                                                                                                                                                                                                                                               |
| ACK hold:            | Length of time the local host will delay an acknowledgment to carry (piggyback) additional data.                                                                                                                                                                                                                   |
| IP Precedence value: | IP precedence of the BGP packets.                                                                                                                                                                                                                                                                                  |
| Datagrams            | Number of update packets received from a neighbor.                                                                                                                                                                                                                                                                 |
| Rcvd:                | Number of received packets.                                                                                                                                                                                                                                                                                        |
| out of order:        | Number of packets received out of sequence.                                                                                                                                                                                                                                                                        |
| with data            | Number of update packets sent with data.                                                                                                                                                                                                                                                                           |
| total data bytes     | Total amount of data received, in bytes.                                                                                                                                                                                                                                                                           |
| Sent                 | Number of update packets sent.                                                                                                                                                                                                                                                                                     |
| Second Congestion    | Number of update packets with data sent.                                                                                                                                                                                                                                                                           |
